> *Kant* (trans.), Fundamental Principles of the Meta- [physic of Ethics, p. 40.

4. Having to do with pragmatism as a philosophy: as, the *pragmatic* movement; *pragmatic* thought. See ★*pragmatism*, 3.

pragmaticism (prag-mat′i-sizm), *n.* [*pragmatic* + *-ism*.] A special and limited form of pragmatism, in which the pragmatism is restricted to the determining of the meaning of concepts (particularly of philosophic concepts) by consideration of the experimental differences in the conduct of life which would conceivably result from the affirmation or denial of the meaning in question.

> He [the writer] framed the theory that a conception, that is, the rational purport of a word or other expression, lies exclusively in its conceivable bearing upon the conduct of life. . . . To serve the precise purpose of expressing the original definition, he begs to announce the birth of the word "*pragmaticism*."
> *C. S. Peirce*, in The Monist, April, 1905, p. 166.

pragmatism, *n.* 3. In *philos.*, a method of thought, a general movement or tendency of thought, and a specific school, in which stress is placed upon practical consequences and practical values as standards for explicating philosophic conceptions and as tests for determining their value and, especially, their truth. The word is used in a variety of senses, of greater or less breadth and definiteness. The following meanings of the term are arranged in the order of descending generality: (*a*) An attitude of mind, namely that of "looking away from first things, principles, 'categories, supposed necessities, and of looking toward last things, fruits, consequences, facts." *W. James*, Pragmatism, a New Name for Some Old Ways of Thinking, p. 55. (*b*) A theory concerning the proper method of determining the meaning of conceptions. "Consider what effects, that might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object." *C. S. Peirce*, in Baldwin's Dict. of Philos. and Psychol., II. This theory was first propounded by Mr. Peirce in an article upon "How to Make our Ideas Clear" in the "Popular Science Monthly" in 1878. The term 'pragmatism' does not, however, appear there. In an article in the "Monist" for 1905, Mr. Peirce says that he "has used it continually in philosophic conversation, since, perhaps, the mid-seventies." The term was publicly introduced in print by Professor William James in 1898 in an address upon "Philosophic Conceptions and Practical Realities," in which the authorship of the term and of the method is credited to Mr. Peirce. The latter has recently used the term 'pragmaticism' to express this meaning. (*c*) The theory that the processes and the materials of knowledge are determined by practical or purposive considerations—that there is no such thing as knowledge determined by exclusively theoretical, speculative, or abstract intellectual considerations. This definition expresses the net or mean sense of the term in its various uses. "Now quite the most striking feature of the new theory was its recognition of an inseparable connection between rational cognition and rational purpose; and that consideration it was which determined the preference for the name 'pragmatism.'" *C. S. Peirce*, in The Monist, 1905. F. C. S. Schiller has defined pragmatism as "the thorough recognition that the purposive character of mental life generally must influence and pervade also our most remotely cognitive activities." Humanism, Philosophic Essays, p. 8.

> *Pragmatism*—by which I mean the doctrine that reality possesses practical character and that this character is most efficaciously expressed in the function of intelligence.
> *J. Dewey*, in Essays Philosophical and Psychological, p. [59.

(*d*) A theory of the nature of truth, namely, that the correspondence between fact and idea which constitutes truth consists in the power of the idea in question to work satisfactorily, or to produce the results intended by it.

> Such then would be the scope of *pragmatism*—first, a method, and second, a genetic theory of what is meant by truth. *W. James*, Pragmatism, p. 65.

(*e*) A metaphysical theory regarding the nature of reality, namely that it is still in process of making, and that human ideas and efforts play a fundamental rôle in its making: the equivalent of *humanism* as a metaphysical term.

> The essential contrast is that for rationalism reality is ready-made and complete from all eternity, while for *pragmatism* it is still in the making, and awaits part of its complexion from the future.
> *W. James*, Pragmatism, p. 257.

> *Pragmatism* . . . is a conscious application to epistemology (or logic) of a teleological psychology, which implies, ultimately, a voluntaristic metaphysic.
> *F. C. S. Schiller*, Studies in Humanism, p. 12.

pragmatist, *n.* 2. One who adheres to or professes the philosophy of pragmatism; more loosely, an opponent of rationalism and absolutism in philosophy; a supporter of the experimental method of reasoning in philosophy; a supporter of empiricism, but, unlike other empiricists, one who judges by consequences rather than by antecedents. See ★*pragmatism*, 3.

prairie, *n.* 2. Any small open space in a forest. See the extract. [Local, California.]

> The word "*prairie*," as used in Mendocino and Humboldt counties, may be broadly defined as any small open space among the timber, whether covered with grass or with dwarf brush. Along the coast of Mendocino County the name is applied to the areas of light, sandy "white-ash" soil covered with dwarf scrub and surrounded by timber. In the interior the "*prairies*" are open pastures surrounded by either timber or brush.
> *U. S. Dept. Agr.*, Bureau of Plant Industry, Bulletin 12, [1902, p. 27.

Bald prairie, a local type of prairie. See the extract. [Alabama.]

> The eminences of the lower swells of the plain with the strata of the limestone near the surface and destitute of arboreal growth are called *bald prairies*.
> *C. Mohr*, Plant Life of Alabama, p. 104.

Prairie region. Same as ★*cane-brake region*.—**Prairie twister.** Same as ★*twister*, 1 (*h*).—**Salt prairies**, nearly level tracts, in arid countries, covered with saline deposits.—**Soda-prairie, water-prairie.** See ★*soda-prairie*, ★*water-prairie*.

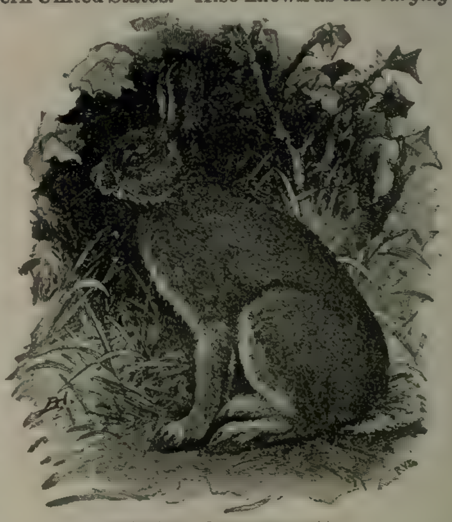
prairie-breaker (prā′ri-brā″kėr), *n.* A plow for cutting a wide, shallow furrow, and completely inverting the furrow slice. *N. E. D.*

prairie-dock, *n.* 2. The American feverfew, *Parthenium integrifolium*.

prairie-fowl (prā′ri-foul), *n.* The prairie-hen.

prairie-grouse (prā′ri-grous), *n.* The prairie-hen.

prairie-hare (prā′ri-hãr), *n.* A common light gray hare, *Lepus campestris*, of the western United States. Also known as the *varying hare* because in the northern portion of its range it turns white in winter.



Prairie-hare (*Lepus campestris*).

prairie-itch (prā'ri-ich), *n.* A skin affection, pruritus hiemalis, occurring in those engaged in agricultural pursuits and others wearing coarse, dyed clothes; winter itch. *Dunglison.*

prairie-larkspur (prā'ri-lärk″spėr), *n.* See ★*larkspur.*

prairie-lily (prā'ri-lil″i), *n.* See ★*lily.*

prairie-oats (prā'ri-ōts), *n.* Same as ★*side-oats.*

Praline powder, equal parts of shelled almonds and shelled filberts cooked in a syrup of sugar and water, and, when cold, pounded in a mortar to a coarse powder: used for café or chocolat praliné, to make the coating for nuts pralinés, or to fill chocolate and other hollow confections, which are then said to be *pralinés* (fem. *pralinées*).

praliné (prä-lē-nā'), *a.* [Fem. *pralinée:* F., < *praline*, praline.] Noting the addition of praline powder, as to a café- or chocolat-parfait mixture before freezing, or as a coating to nuts, or as a filling to confections. See ★*praline powder.*

pralltriller (präl'tril-ėr), *n.* [G., < *prallen*, bounce, + *triller*, < *trillen*, trill.] The German name for the inverted mordent or passing trill (which see, under *trill*[2]).

pram[2], *n.* **2.** A sort of push-cart for carrying milk on a route to customers.

praseodidymium (prā″sē-ọ-dī-dim'i-um), *n.* [NL.] Same as ★*praseodymium.*

praseodyme (prā'sẹ-ọ-dīm), *n.* Same as ★*praseodymium.*

praseodymia (prā″sẹ-ọ-dim'i-ạ̈), *n.* [NL.] In *chem.*, one of the so-called rare earths, the oxid of praseodymium.

praseodymium (prā″sẹ-ō-dim'i-um), *n.* [NL. for **praseodidymium* (prop. *prasio-*), < Gr. πράσιος adj., < πράσον, a leek, + NL. *didymium.*] One of the two elements into which, in 1885, Auer von Welsbach succeeded in resolving what had previously been known as didymium. See ★*neodymium.* Praseodymium forms two oxids—Pr_2O_3, which is of a dingy greenish-white color, and PrO_2, which is dark blackish-brown. The salts are bright leek-green when crystallized or in solution, and give an absorption-spectrum which contains few of the lines of the original didymium. A characteristic spark-spectrum can also be obtained. The atomic weight of praseodymium is 139.4 (H = 1) or 140.5 (O = 16).

Praxillean (prak-si-lē'ạn), *a.* [L. *Praxilleus*, < Gr. Πραξίλλειος, adj., < Gr. Πράξιλλα (> L. *Praxilla*), a poetess of Sicyon.] Of or pertaining to Praxilla, a poetess of Sicyon: applied to a form of logaœdic verse consisting of three dactyls followed by two trochees.

prayer[1], *n.*—**Prayer of process,** in *law*, a formal petition in a bill in equity for the issuance of a subpœna against the defendant.—**Signature-prayer.** See ★*signature-prayer.*

prayer-cylinder (prãr'sil″in-dėr), *n.* A form of praying-wheel. See *praying-wheel.*

A window in which was fixed a *prayer-cylinder* revolved by the wind, which whirred monotonously by day and night. *Geog. Jour.* (R. G. S.), X. 35.

prayer-flag (prãr'flag), *n.* A tall votive flag called *da-cha* (written 'dar-lch'og'), inscribed with pious sentences, prayers, charms, etc., set up by pious Buddhists in Tibet and elsewhere for the purpose of obtaining merit and of bringing luck to the whole neighborhood.

The religion of the Mantzu [of western China] is Buddhism or Lamaism of the Tibetan type. Except in Western Tibet, I have never seen a country in which the externals of religion are so prominent. Nearly all the larger villages have lamaserais on heights above them; rock Buddhas and Buddhas in relief on tablets are numerous; poles 20 feet long, with narrow *prayer-flags* of nearly the same length, flutter from every house-roof; groups of *prayer-flags* in memory of the dead are planted beside every village. *Geog. Jour.* (R. G. S.), X. 44.

prayer-paper (prãr'pā″pėr), *n.* A written prayer that is burned by the natives of Siam, China, Tibet, etc., to propitiate the devil and other demons.

Not only did every man shout continuously at the top of his voice, but great flares were continually made on the poop by the ignition of *prayer-papers*, burnt to propitiate the devil that was in that current.
Geog. Jour. (R. G. S.), XI. 468.

praying-cylinder (prā'ing-sil″in-dėr), *n.* Same as ★*prayer-cylinder.*

praying-flag (prā'ing-flag), *n.* See ★*prayer-flag.*

pre-. **2.** In *petrog.*, in the quantitative system of classification of igneous rocks (see ★*rock*[1]), a prefix used to indicate that one factor predominates over another to an extent greater than 5:3: as, ★*prealkalic*, ★*precalcic*, ★*prefelic*, etc.

preabdomen, *n.* See ★*præabdomen.*

preacher-bird (prē'chėr-bėrd), *n.* A toucan.

preadamitism (prē-ad'ạ-mīt-izm), *n.* [*pre-adamit(e)* + *-ism.*] The belief that there were human beings on the earth before Adam.

preadult (prē-ạ-dult'), *a.* [*pre-* + *adult.*] Youthful; prior to the advent of adult life. *Buck*, Med. Handbook, IV. 527.

preagonal (prē-ag'ọ-nạl), *a.* [L. *præ*, before, + Gr. ἀγών, a contest, + *-al*[1].] Immediately preceding death. *Buck*, Med. Handbook, I. 563.

preagonic (prē-a-gon'ik), *a.* Same as ★*preagonal.* *Buck*, Med. Handbook, II. 777.

prealkalic (prē-al-kal'ik), *a.* [*pre-*, 2, + *alkali* + *-ic.*] Predominantly alkalic: said of salic minerals when the ratio of $K_2O' + Na_2O'$ to CaO' is greater than 5:3; of femic minerals when the ratio of $K_2O'' + Na_2O''$ to $MgO + FeO + CaO''$ is greater than 5:3.

preanal, *a.* **II.** *n.* A preanal process; specifically, in *herpet.*, a preanal scale, one of those immediately in front of the anus. *Proc. Zool. Soc. London*, 1903, p. 125.

preantepenult (prē-an″tẹ-pẹ-nult'), *a.* Immediately preceding the antepenult.

preantiseptic (prē″an-ti-sep'tik), *a.* [*pre-* + *antiseptic.*] Occurring before the introduction of the practice of antiseptic surgery. *Buck*, Med. Handbook, IV. 448.

pre-Aryan (prē-är'yạn), *a.* [*pre-* + *Aryan.*] Prior to the Aryan period or the Aryans.

In Europe a case in point are the Basques, shown by their speech to be at least partly descended from a *pre-Aryan* or a non-Aryan race, which has elsewhere apparently disappeared, but which has far more probably become amalgamated with the intruding Aryan peoples.
Keane, Ethnology, p. 204.

preaseptic (prē-a-sep'tik), *a.* [L. *præ*, before, + E. *sepsis* (*sept-*) + *-ic.*] Prior to the establishment of asepsis; antedating the period of introduction of aseptic surgery.

The much-dreaded secondary hemorrhage of the *preaseptic* times. *Buck*, Med. Handbook, II. 98.

preassurance (prē-ạ-shör'ạns), *n.* Assurance or assumption in advance.

preataxic (prē-a-tak'sik), *a.* [L. *præ*, before, + NL. *ataxia* + *-ic.*] Antedating the appearance of ataxia or muscular incoördination.

preauricular (prē-â-rik'ụ-lạ̈r), *a.* [*pre-* + *auricula* + *-ar*[3].] Situated in advance of the ear, as a tuft of hair; specifically, in *anthrop.*, relating to that part of the skull, particularly of the circumference of the skull, which is situated in front of the outer ear. *Amer. Anthropologist*, Jan.–March, 1901, p. 38.

preaxiad (prē-ak'si-ad), *adv.* [*pre-* + *axi(al)* + *-ad*[3].] Forward; toward the head. *Proc. Zool. Soc. London*, 1895, p. 372.

preaxially (prē-ak'si-al-i), *adv.* Forward; anteriorly; preaxiad of the median line of a limb which is extended at right angles to the body.

preb. An abbreviation of *prebend*, *prebendal*, *prebendary.*

prebacteriologic (prē-bak-tē″ri-ọ-loj'ik), *a.* Prior to the development of the science of bacteriology. *Buck*, Med. Handbook, IV. 391.

prebronchial, præbronchial (prẹ-brong'ki-al), *a.* and *n.* **I.** *a.* Situated in advance of the bronchi: as, the *prebronchial* air-sacs of birds.

II. *n.* A prebronchial process; specifically, one of a pair of air-sacs which lie in front of the windpipe in birds. *Proc. Zool. Soc. London*, 1890, p. 146.

precalcic (prē-kal'sik), *a.* [*pre-*, 2, + *calcic.*] Predominantly calcic: said of salic minerals when the ratio of CaO' to $K_2O' + Na_2O'$ is greater than 5:3, and of femic minerals when the ratio of CaO'' to $MgO + FeO$ is greater than 5:3.

precalculate (prē-kal'kụ-lāt), *v. t.*; pret. and pp. *precalculated*, ppr. *precalculating.* To calculate or reckon in advance.

Precambrian (prē-kam'bri-ạn), *a.* and *n.* **I.** *a.* Noting rocks older than the Cambrian or first fossiliferous strata: used by many writers as preferable to *azoic*, *eozoic*, *archæan*, *primitive*, etc., because it is non-committal.

II. *n.* Precambrian strata.

The western province in the arctic regions was shut out from the eastern by a belt of *pre-Cambrian* extending from eastern Mackenzie through Boothia, Prince of Wales Land and North Somerset.
Amer. Geol., Sept., 1903, p. 154.

precancerous (prē-kan'sẹ-rus), *a.* [L. *præ*, before, + E. *cancer* + *-ous.*] Prior to the occurrence of cancer. *Med. Record*, Feb. 28, 1903, p. 349.

precantation (prē-kan-tā'shọn), *n.* [LL. *præcantatio*, < L. *præcantare*, pretell.] A foretelling or prophesying.

The sea, the mountain-ridge, Niagara, and every flower-bed, pre-exist, or super-exist, in the *pre-cantations*, which sail like odors in the air, and when any man goes by with an ear sufficiently fine, he overhears them and endeavors to write down the notes without diluting or depraving them. *Emerson*, Essays, The Poet, p. 25.

precarcinomatous (prē-kär-si-nom'ạ-tus), *a.* Preceding the development of a carcinoma.

This seems to continue, as Ribbert stated, until the whole *precarcinomatous* area is exhausted.
Lancet, May 23, 1908, p. 1467.

precartilage (prē-kär'ti-lạ̄j), *n.* [*pre-* + *cartilage.*] Embryonic tissue which is not yet developed into cartilage proper. *Biol. Bulletin*, June, 1904, p. 39.

Precaval sinus. Same as *ductus Cuvieri.* *Parker and Haswell*, Zoology, II. 146.

precentorial (prē-sen-tō'ri-ạl), *a.* [*precentor* + *-ial.*] Of or pertaining to a precentor.

Precentral gyrus. See ★*gyrus.*

precentrum, *n.* See ★*præcentrum.*

preceptoral (prẹ-sep'tọ-rạl), *a.* [*preceptor* + *-al*[1].] Of or pertaining to a preceptor.

preceptual (prẹ-sep'tụ̄-ạl), *a.* [Irreg. < L. *præceptus.* See *precept.*] Of the nature of a precept, or containing precepts.

precess (prẹ-ses'), *v. i.* [Cf. *precession.*] To undergo an east to west movement like that of the equinoxes. *Jour. Brit. Inst. Elect. Engin.*, 1902–03, p. 83.

precession, *n.* **4.** In *mech.*, the cyclic movement of the axis of rotation of a body which revolves about a free axis in a field of force. In order that precession shall occur the body must not be a homogeneous sphere and the axis of rotation must be inclined to the lines of force of the field.—**Constant of precession.** See ★*constant.*—**Gyroscopic precession,** the steady motion in which the axis of the top describes a right circular cone about the vertical.

precessional, *a.* **2.** Of or pertaining to the phenomenon of precession in general. See ★*precession*, 4.

For instance, the *precessional* motion of a top cannot be reversed unless we reverse the spin.
Encyc. Brit., XXVII. 571.

Precessional motion. Same as *gyroscopic* ★*precession.*

precheliceral (prē-kẹ-lis'ẹ-rạl), *a.* [*pre-* + *cheliceral.*] Situated anteriorly to the chelicerae, as in scorpions.

In the scorpion embryo he found three *precheliceral* neuromeres, each with a pair of optic ganglia. In each optic ganglion was an invagination.
Biol. Bulletin, Dec., 1904, p. 41.

précieuse (prā-syėz'), *n.* [F., fem. of *précieux*, *a.*, nice; fastidious. See ★*precious*, 6.] A woman who is affectedly fastidious in language or taste; a woman who is over-refined: from the title of Molière's "Les précieuses ridicules."

precinctive (prẹ-singk'tiv), *a.* [*precinct* + *-ive.*] Pertaining to or of the nature of a precinct; restricted to a given (geographical) area.

"*Precinctive* forms" means therefore forms that are confined to the area specified.
Fauna Hawaiiensis, II. iii. 91, note.

preciosity, *n.* **4.** The character of being precious in sense 6 or 7. See ★*precious*, 6.

On this superb ground there is worked a bold architectural design of compartments with figures, relieved in gold and silver thread, but with here and there notes of colour used with a *preciosity* and perfection of taste which leave one wondering what sort of people they were that had this exquisite refinement of sensibility.
Athenæum, May 20, 1905, p. 632.

precious, *a.* **6.** Affectedly fastidious, especially in the use of words; finically refined in one's literary style or artistic taste.

The design of the Annunciation in these is of surpassing beauty, comparable to the finest Italian draughtsmanship of a slightly later period. Quite different in effect from the restrained and *precious* beauty of these religious designs is the flaunting magnificence of a chasuble made from a horse-trapping (Case I).
Athenæum, May 20, 1905, p. 633.

7. Characterized by a strained or affected refinement of style, in literature or art; affectedly fine.

The author's style is not always unintelligible and *precious*, and by dint of a great deal of quotation we are brought fairly near to that strange inspirer of Newman.
Athenæum, March 27, 1905, p. 656.

Imitation precious stones, compositions of strass or crystal glass with a large proportion of lead, colored by the addition of certain metallic oxids in imitation of the real gems. Since the surface of such imitation stones is very easily scratched, it is sometimes protected by a thin plate of rock-crystal or light-colored garnet, thus forming what are called *doublets.* An extensive sale is found for imitation precious stones both in civilized countries and among savages.

precipitate, *n.*—**White precipitate**, either of two different substances: (*a*) *Infusible white precipitate*, an insoluble white powder (probably of the composition $NHg_2Cl.NH_4Cl$) which decomposes below a red heat without melting: produced by precipitating with ammonia a solution of mercuric chlorid. (*b*) *Fusible white precipitate*, colorless crystals, soluble in water (probably of the composition $NHg_2Cl.3NH_4Cl$), which melt and then decompose on being heated: produced by boiling the infusible white precipitate with a solution of ammonium chlorid.—**Yellow precipitate**, in *chem.*: (*a*) Mercuric oxid as produced by precipitation of a mercuric salt in solution with potassium or sodium hydroxid. (*b*) An abbreviated term sometimes used to signify the bright yellow precipitate of ammonium phosphomolybdate frequently obtained in analysis as a proof of the presence of, or as the means of quantitatively determining, phosphorus or the radical of phosphoric acid and phosphates.

precipitation, *n.*—**Fractional** or **partial precipitation**, in *chem.*, a process by which different substances are sometimes separated, advantage being taken of the different degrees of ease with which they undergo precipitation, so that under the influence of the same precipitant gradually added they are found apart in successive portions of the deposit formed.—**Latent heat of precipitation.** See ★*heat.*

precipitation-tank (prẹ-sip-i-tā'shọn-tangk″), *n.* A receptacle into which a liquid is run to give an opportunity for any solid matter carried in it to be precipitated. Sometimes precipitation is promoted in such a tank by adding certain ingredients or by a change of temperature.

precipitin (prẹ-sip'i-tin), *n.* [*precipit*(*ate*) + *-in*^{2}.] An adaptation-product which is formed in the blood-serum of an animal of one species when immunized with albumins or albuminous derivatives obtained from an animal of an alien species. When the sera of the two animals are brought together a precipitate results, in the formation of which the immunizing substance plays the active and the immune substance the passive rôle.

precipitinogen (prẹ-sip-i-tin'ọ-jen), *n.* [*precipitin* + *-o-* + *-gen.*] An antigen of albuminous character which upon immunization will give rise to a precipitin as the corresponding antibody. *Jour. Med. Research*, Dec., 1907, p. 232.

precipitinophoric (prẹ-sip″i-tin-ọ-for'ik), *a.* [*precipitin* + Gr. -φορος, -bearing, + *-ic.*] Pertaining or referring to that group of the precipitins to which their specific properties are due.

precipitogen (prẹ-sip'i-tō-jen), *n.* Same as ★*precipitinogen.* *Jour. Med. Research*, May, 1907, p. 173.

precipitoid (prẹ-sip'i-toid), *n.* [*precipit*(*in*) + *-oid.*] A precipitin which has lost its precipitinophoric group. Such bodies result from the precipitins on heating. In the simultaneous presence of precipitins and precipitoids no precipitation occurs, or the process is incomplete.

precisional (prẹ-sizh'ọn-a̤l), *a.* [*precision* + *-al*^{1}.] Of the nature of, or exhibiting, precision.

precision-screw (prē-sizh'ọn-skrö), *n.* The screw by means of which the fine adjustment of an instrument, as a telescope upon a star, a microscope to its focus, or a spectrometer upon a line, is made.

precleavage (prē-klē'vạj), *n.* [*pre-* + *cleavage.*] A collective term for the stages of the egg preceding cleavage or segmentation.

> Lyon also found this summer that Arbacia eggs required more oxygen during *precleavage* and gave off more CO_2 during cleavage than at other times.
> *Biol. Bulletin*, April, 1904, p. 225.

preclitellar (prē-kḷi-tel'ạ̈r), *a.* [*pre-* + *clitel-l*(*um*) + *-ar*^{3}.] Situated in front of, or preceding, the clitellum; preclitellian. *Proc. Zool. Soc. London*, 1901, p. 192.

preclival (prē-klī'va̤l), *a.* and *n.* [L. *præ*, before, + *cliv*(*us*) + *-al*^{1}.] **I.** *a.* Anterior to any clivus, especially the clivus of the cerebellum.

II. *n.* A preclival process; specifically, same as ★*fissura præclivalis* or ★*fissura prima.* *Nature*, May 22, 1902, p. 94.

precocious, *a.* **5.** In *biol.*, present in an egg or embryo at a very early stage in an imperceptible condition; present before becoming manifest.—**6.** Noting birds that, like chickens, are able to run about as soon as hatched; precocial. See *Præcoces.* *Parker and Haswell*, Zoology, II. 382.

precociously, *adv.* **2.** In *biol.*, at a very early stage and in an imperceptible way: said of eggs and embryos. See the extract.

> Eggs that admit of complete orientation at the first or second cleavage, or even before cleavage begins, are commonly supposed to reflect *precociously* the later organization, while eggs in which such early orientation is impossible are supposed to be more or less completely isotropic and destitute of organization.
> *E. B. Wilson*, Biol. Lectures, 1893, p. 13.

precognizable (prē-kog'ni-za̤-bl), *a.* That may be known beforehand.

precognizant (prē-kog'ni-za̤nt), *a.* Knowing beforehand; capable of previous knowledge (of a subject).

precombustion (prē-kọm-bus'cho̤n), *n.* Same as ★*preignition.*

precommissural, præcommissural (prē-kọ-miṣ'ụ-ra̤l), *a.* [*precommissure* + *-al*^{1}.] Of or pertaining to the precommissure. *Trans. Linnean. Soc.*, Zool., Feb., 1903, p. 332.—**Precommissural fibers.** See ★*fiber*^{1}.

precommissure (prē-kom'i-ṣūr), *n.* [L. *præ*, before, + *commissura*, commissure.] The anterior commissure of the brain. See ★*commissura ventralis.*

preconcept (prē-kon'sept), *n.* [*pre-* + *concept.*] In *psychol.*, a higher recept: a type of intellectual process which, according to G. J. Romanes, "occupies the interval between the receptual life of brute and the earliest dawn of the conceptual life of man."

> Higher Recepts, then, are what may be conveniently termed *Pre-concepts.*
> *G. J. Romanes*, Mental Evolution in Man, p. 185.

preconceptional (prē-kọn-sep'sho̤n-a̤l), *a.* [L. *præ*, before, + *conceptio*(*n-*), conception, + *-al*^{1}.] Formed in advance of mental conception or actual knowledge.

> In every stage of development, knowledge is a resultant of preconception and observation; and it is a striking and at first sight paradoxical fact that knowledge advances chiefly through the weakening and gradual elimination of the *preconceptional* component.
> *J. W. Powell*, An. Rep. Bur. Amer. Ethnol., 1894–95, [p. lxxxix.

precondylar, præcondylar (prē-kon'di-lạ̈r), *a.* [*pre-* + *condylar.*] Lying in front of a condyle; specifically, in *ornith.*, in front of the occipital condyle. *Proc. Zool. Soc. London*, 1903, p. 260.

preconsider (prē-kọn-sid'ėr), *v. t.* To consider in advance.

preconsideration (prē-kọn-sid-ẹ-rā'sho̤n), *n.* The act of preconsidering; a preliminary consideration.

precontact (prē-kon'takt), *a.* In *anthrop.*, relating to the period before contact between a primitive culture and the trade and influence of a higher.

precooler (prē-kö'lėr), *n.* A box or cylinder in which a substance is cooled just before it is to be used or operated upon. A precooler is sometimes used to cool air before it enters the cylinder of an air-compressor, thus preventing the compressor from getting too hot.

> From the compressor, the air passes successively through an aftercooler; a separator; two cylinders, containing potassium hydroxide in sticks and calcium chloride respectively, in order to remove the carbon dioxide and water vapor; and finally through a *precooler* charged with broken ice or snow—reaching the liquefier at a temperature of about 2°. *Phys. Rev.*, Nov., 1904, p. 330.

Precoracoid arch. See ★*arch*^{1}.—**Precoracoid process**, in *ornith.*, a process from the outer face of the coracoid, near the distal end. Same as ★*procoracoid.* See cut under ★*acrocoracoid.* *Proc. Zool. Soc. London*, 1898, p. 95.

Precordial fright. See ★*fright.*

precornu, precornual. Same as *præcornu*, ★*præcornual.*

precostal (prē-kos'ta̤l), *a.* [*pre-* + *costal.*] Situated in front of the ribs.

precranial, præcranial (prē-krā'ni-a̤l), *a.* [*pre-* + *cranial.*] Situated on or located in the anterior portion of the cranium. *Proc. Zool. Soc. London*, 1895, p. 383.

precreate (prē-krē-āt'), *v. t.*; pret. and pp. *precreated*, ppr. *precreating.* [*pre-* + *create.*] To create in imagination before the event; create before (something else occurs).

precreative (prē-krẹ-ā'tiv), *a.* [*pre-* + *creative.*] Being before the creation. [Rare.]

precritical, *a.* **2.** In *pathol.*, noting the time prior to the occurrence of a crisis.

> The febrile period lasts 24 or 36 to 40 hours, is marked by a pseudo-crisis and *precritical* elevation, the fever describing, in the three-hourly chart, a characteristic course which differs from that of the mild or common tertian paroxysm.
> *J. Ewing*, in Jour. Exper. Med., March 25, 1901, p. 453.

precrucial (prē-krö'shia̤l), *a.* [*pre-* + *crucial.*] Situated, in the brain, in front of the crucial sulcus.

precrural (prẹ-crö'ral), *a.* and *n.* [L. *præ*, before, + *crus* (*crur-*), leg, + *-al*^{1}.] **I.** *a.* Anterior to the leg in animals.

II. *n.* **1.** The region directly in front of the thigh of animals.—**2.** Any one of the lymph-glands situated in front of the thigh in animals.

precursor, *n.* **2.** Specifically, in the history of the fine arts, an early artist of a school or period, or an artist who preceded such a school or period. The precursors of the Renaissance in Italy are the sculptors and painters of the thirteenth and fourteenth centuries, such as Niccola Pisano, Giotto, etc.

predacity (prẹ-das'i-ti), *n.* [*pred*(*acious*) + *-acity.*] The character of being predacious.

pre-Darwinian (prē-där-win'i-a̤n), *a.* Preceding the time of Charles Darwin: noting, specifically, the doctrines or opinions of biologists at an earlier date than that of the publication of Darwin's "Origin of Species."

> There is no system of biological doctrine which is pre-Darwinian as such. Lamarck, who still has many disciples, was an earnest defender of the mutability of species, as were other naturalists, although the most distinctive doctrine of those who opposed Darwin's account of the origin of species is that which is commonly called the doctrine of the immutability or fixity of species. According to this doctrine, a biological species (the 'genus' or 'kind' of the logicians) is an entity or reality which its representatives exhibit or manifest but do not constitute, since it is held to be independent of them and of everything else in the natural world—the self-sufficient reality of which its representatives are only the expression. Traces of this doctrine are still to be found in the opinion that variation is departure from a type, and that the aberrant individual is qualitatively different from the mediocre individual, although Darwin has shown that the species or type or kind is neither in the representatives nor independent of them, since it consists in that interaction between them and their external world which he has summarized under the phrases 'struggle for existence' and 'survival of the fittest.'

predazzite (prē-dät'sīt), *n.* [*Predazzo*, in the Tyrol, + *-ite*^{2}.] In *petrog.*, a crystalline rock composed of calcite and brucite, sometimes with periclase and hydromagnesite: a product of contact metamorphism of dolomite in the neighborhood of syenite.

Predentata, *n. pl.* See ★*Prædentata.*

predentate, *a.* **II.** *n.* A member of the suborder *Prædentata*, a group of extinct reptiles.

predication, *n.*—**Primitive predication**, a synthetic proposition of the type, 'It is A,' which necessarily implies the existence of its subject.

prediction, *n.*—**Horary prediction**, in *astrol.*, a prediction derived from the figure of the heavens erected at the moment the question is asked.

predigital, prædigital (prē-dij'i-ta̤l), *a.* and *n.* [*pre-* + *digital.*] **I.** *a.* Preceding a digit or the digits.

II. *n.* One of the two outermost primaries in the wing of a bird which are attached to the second phalanx of the second digit. The outermost predigital is very small and is that called the *spurious primary*, or *remicle.* *Parker and Haswell*, Zoology, II. 357.

predikant (pre-di-känt'), *n.* [D.] A minister of the Dutch Protestant Church, especially in South Africa. *N. E. D.*

Predominant group. See *subdominant* ★*group.*

pre-Dravidic (prē-dra-vid'ik), *a.* Of or pertaining to a people which occupied, or is supposed to have occupied, India before the Dravidian race. *Ratzel* (trans.), Hist. of Mankind, III. 356.

predrift (prē-drift'), *a.* In *geol.*, preglacial. [Rare.]

> The filling up, during a period of subsidence, of the *predrift* glen. *Geog. Jour.* (R. G. S.), XVIII. 83.

predunal (prē-dū'na̤l), *a.* [*pre-* + *dune* + *-al*^{1}.] In *phytogeog.*, established before the formation of dunes: said of vegetation. See quotation under ★*dunal.*

predynastic (prē-dī-nas'tik), *a.* Of or pertaining to that period of ancient Egypt which preceded the first-known dynasty.

> Prof. Flinders Petrie has, I believe, recently discovered a vase of immeasurable antiquity of the "*Pre-Dynastic*" period in Lower Egypt which is incised with a delineation of the Kudu antelope.
> *Sir Harry Johnston*, The Nile Quest, p. 5.

pre-eclamptic (prē-ek-lamp'tik), *a.* [L. *præ*, before, + NL. *eclampsia* (*eclampt-*) + *-ic.*] Before the appearance of convulsions. *Buck*, Med. Handbook, VI. 310.

preëfficient (prē-e-fish'ẹnt), *n.* [L. *præ*, before, + E. *efficient.*] An external cause which precedes its effect in time.

preëmpt (prẹ-empt'), *n.* [*preëmpt*, *v.*] A right to preëmpt; a preëmptive right. *E. E. Morris*, Austral English.

> My friend has the run and the stock and the *pre-empts* all in his own hands. He'll do well out of 'em, or I'm much mistaken.
> *Rolf Boldrewood*, Colonial Reformer, xxiv.

Preëmption claimant, one who settles upon land subject to preemption, intending and proceeding to acquire full title thereto.—**Preëmption right,** a preference given by law to settlers upon public lands of the United States to purchase the lands in limited quantities. Such settlers must reside on the land and declare their intent to take title. The preëmption laws were repealed in 1891.

preëmptioner (prẹ-emp'shọn-ėr), *n.* One who preëmpts; a preëmptor.

preëxilian (prē-eg-zil'i-ạn), *a.* Same as *preëxilic.*

preëxistentism (prē-eg-zis'tẹn-tizm), *n.* [*preëxistent* + *-ism.*] The doctrine that the soul has a preëxistent state before it is united with the body.

Prefect apostolic, a priest invested by the Pope with episcopal powers, but without the rank or dignity of a bishop.

The government of the various mission-fields is generally carried on by "Vicars-Apostolic" (i.e., titular bishops acting as vicars or delegates of the Apostolic See) or "*Prefects-Apostolic*" (i.e., priests with similar powers, but without episcopal rank). *Encyc. Brit.*, XXXII. 276.

Prefect of discipline. See ★*discipline.*—**Prefect of studies,** the director of the curriculum of studies in Jesuit schools.

prefecundation (prē-fek-un-dā'shọn), *n.* [*pre-* + *fecundation.*] In *embryol.*, the changes or conditions exhibited by the egg previous to its fertilization, or fecundation.

prefecundatory (prē-fẹ-kun'dạ-tō-ri), *a.* Of or pertaining to the prefecundation of the ovum.

prefelic (prē-fel'ik), *a.* [*pre-*, 2, + *felic.*] Predominantly felic; having normative feldspar more than 5:3 of normative quartz or lenads: said of the feldspathoid minerals.

preference, *n.* 5. A European game of cards, something like boston.—**Law of preference.** See ★*law*^{1}.—**Surrender of preference.** See ★*surrender.*

Preferential dividend. See ★*dividend.*—**Preferential mating.** See ★*mating.*—**Preferential rules,** in *evidence*, the rules by which the best evidence or that admissible is selected. *Wigmore*, Evidence, § 1172.

prefixed (prẹ-fixt'), *p. a.* [*prefix, v.*] Being in the location or condition resulting from the act denoted by the verb 'prefix'; specifically, in *comp. anat.*, noting certain muscular and cutaneous areas in which some of the nerves of supply originate at a more cephalic level than in allied species. *Philos. Trans. Roy. Soc.* (London), 1898, ser. B, p. 85.

prefixture, *n.* 2. In *comp. anat.*, the condition (viewed from a comparative point of view) in which nerve-fibers from a higher cephalic level are distributed to given muscular and cutaneous areas. See ★*prefixed. Philos. Trans. Roy. Soc.* (London), 1898, ser. B, p. 82.

preformationism (prē-fôr-mā'shọn-izm), *n.* Same as ★*preformism.*

preformism (prē-fôr'mizm), *n.* [Irreg. < *preform* + *-ism.*] 1. The doctrine of preformation or evolution.—2. Belief in this doctrine. See *theory of preformation* (under *preformation*) and *doctrine of* ★*evolution.*

preformist (prē-fôr'mist), *a.* [Irreg. < *preform* + *-ist.*] Of or pertaining to the theory of preformation.

prefossette (prē-fo-set'), *n.* [*pre-* + *fossette.*] The depression or pit which lies in front of the second cross-crest, or metaloph, in such a tooth as that of a horse or rhinoceros. *Amer. Mus. Jour.* Sup., Jan., 1903, Guide Leaflet No. 9, p. 20.

prefrontal. I. *a.*—**Prefrontal lobe.** See ★*lobe.*—**Prefrontal process,** in *ornith.*, a bony projection directed backward from the prefrontal, typically present in some parrots.—**Prefrontal shield,** in *herpet.*, a shield or horny plate which forms part of the covering of the head and lies in advance of the frontal shield in about the position of the prefrontal bone.

II. *n.* 1. In fishes it is a lateral bone in the anterior part of the cranium slightly under the end of the frontal. It is articulated below with the vomer and, usually, with the parasphenoid, and at the side with the ethmoid. The olfactory nerve typically pierces it, though sometimes the neural foramen is between it and the ethmoid.

2. A prefrontal process or shield.

pregammation (prē-ga-mā'shi-on), *n.*; pl. *pregammatia* (-ạ̈). [L. *præ*, before, + MGr. *γαμμάτιον*, a figure like gamma (Γ).] An element, in the anatomical structure of the head of the Devonian fish *Palæospondylus*, which lies in front of the gammation. See ★*gammation*, 2.

preganglionic (prē"gang-gli-on'ik), *a.* [*pre-* + *ganglionic.*] Of or pertaining to nerve-fibrillæ or other structures that are proximal with reference to a ganglion. *Nature*, Oct. 13, 1904, p. 588.

pregastrular (prē-gas'trọ̈-lạ̈r), *a.* [*pre-* + *gastrular.*] Of an earlier stage of development than the gastrula-stage.

This consideration led some morphologists to insist on the need of a more precise investigation of the *prægastrular* stages. *E. B. Wilson*, Biol. Lectures, 1889, p. 2.

pregenetic (prē-jẹ-net'ik), *a.* [L. *præ*, before, + Gr. *γένεσις*, birth (see *genetic*).] 1. Before birth; antenatal.—2. Literally, before genesis; noting views, theories, etc., held in science before the introduction of the genetic method and point of view. [Rare.]

Before their day, everything was classification, nomenclature, fixed species, just as with the *pregenetic* psychologists everything was faculties and processes, analyses and categories. *G. S. Hall*, Adolescence, II. 62.

pregenial (prē-jẹ-nī'ạl), *a.* and *n.* I. *a.* [*pre-* + *genial*^{2}.] Situated before the chin or mentum.

II. *n.* A pregenial process; in *herpet.*, one of the anterior of two pairs of shields, or scutes, lying back of the mental and between the infralabials, on the under side of the jaw; an anterior chin-shield: correlated with ★*postgenial.*

pregeological (prē"jē-ọ-loj'i-kạl), *a.* [*pre-* + *geological.*] Occurring before the beginning of trustworthy geological records; cosmical.

Another theory that attributes the formation of the main geographical lines to *pre-geological* incidents is given in a paper by Prinz, "Sur les similitudes que presentent les cartes terrestes et planétaires." *Geog. Jour.* (R. G. S.), XIII. 229.

pregeologically (prē"jē-ọ-loj'i-kạl-i), *adv.* In pregeological time. *Geog. Jour.* (R. G. S.), XIII. 234.

Preglacial drift. See ★*drift.*

preglobulin (prē-glob'ụ-lin), *n.* [*pre-* + *globulin.*] A complex albuminous substance, described by A. Schmidt as occurring in animal cells: probably a nucleoproteid.

preglottidean (prē-glo-tid'ẹ-ạn), *a.* [*pre-* + *glottidean.*] Situated in advance of the glottis. *Proc. Zool. Soc. London*, 1899, p. 92.

pregnancy, *n.*—**Abdominal pregnancy.** Same as ★*abdominal gestation.*—**Ampullar pregnancy,** development of the ovum which has been arrested in the first or expanded portion of the Fallopian tube.—**Cervical pregnancy,** the development of the impregnated ovum in the canal of the cervix uteri.—**Hydatid pregnancy,** the presence in the uterus of a hydatid mole.—**Multiple pregnancy,** a pregnancy in which there is more than one fetus.—**Mural pregnancy.** Same as *mural* ★*gestation.*

pregnant, *a.*—**Affirmative pregnant,** an affirmation which implies a negative favorable to the adverse party, or from which an inference of such a negative may be drawn.

pregonium (prẹ-gō'ni-um), *n.*; pl. *pregonia* (-ạ̈). [L. *præ*, before, + Gr. *γωνία*, angle.] In *craniom.*, the recess on the lower margin of the body of the lower jaw in advance of the angle. *Harrison Allen.*

pregracile^1 (prẹ-gras'il), *a.* [L. *prægracilis*, very slender, < *præ*, before, + *gracilis*, slender: see *gracile.*] Very slender.

pregracile^2 (prē-gras'il), *a.* [L. *præ*, before, + (lobus) *gracilis.*] Anterior to the slender lobe of the cerebellum. See *lobus gracilis.*—**Pregracile fissure.** See ★*fissure.*

preheated (prē-hē'ted), *p. a.* That has been through a preheater; heated before using or being used.

An enormous extent of brickwork surface, which we will assume for the moment has been highly *preheated*, so that they [gases] are heated by contact with it to a light yellow heat, say 1100° C. (2012° F.). *Encyc. Brit.*, XXIX. 582.

preheater (prē-hē'tėr), *n.* A chamber or cylinder in which a substance is heated before being used or operated upon. Compressed air which is to be used in an engine is usually passed through a preheater, thus raising its temperature, increasing its energy, and preventing the very low temperatures to which the air would otherwise expand. The blast for blast-furnaces is usually passed through a preheater called a *stove.*

preheating (prē-hē'ting), *n.* The act or process of passing a substance, as air or gas, through a preheater before using it or operating upon it.

This method of *preheating* may follow either the regenerative or the recuperative system. *Engin. Mag.*, Nov., 1898, p. 245.

prehensility (prē-hen-sil'i-ti), *n.* [*prehensile* + *-ity.*] The character of being prehensile.

prehensive (prẹ-hen'siv), *a.* [L. *prehensus*, ppr. of *prehendere*, seize, + *-ive.*] Seizing or laying hold of; of the mind, apprehending.

prehensorial (prē-hen-sō'ri-ạl), *a.* Same as *prehensile.*

One cannot but wonder how the spider maintains a secure hold back downwards, especially when the powerful *prehensorial* legs of the first and second pairs are released, as released they must surely be, to seize an alighting butterfly. [New "Bird's-dung" Spider from Ceylon.] *Proc. Roy. Zool. Soc. London*, 1903, p. 51.

prehepaticus (prē-hẹ-pat'i-kus), *n.* [NL. *præhepaticus*, < L. *præ*, before, + Gr. *ἡπατικός*, of the liver.] In *embryol.*, an accumulation of connective and vascular tissue in the septum transversum. The entodermal diverticula, to form the liver, grow into the prehepaticus, which becomes the interstitial hepatic tissue.

preheterocercal (prē-het"ẹ-rọ-sėr'kạl), *a.* [*pre-* + *heterocercal.*] Protocercal or horizontal and pointed: applied to a fish's tail before it becomes turned upward at the end or heterocercal. But the latter stage may sometimes precede the former.

prehnidine (pren'i-din), *n.* [*prehn*(*ite*) + *-id-* + *-ine*^{2}.] A crystalline substance, $C_{10}H_{13}$.-NH_2; aminoprehnitene or 5-amino-1,2,3,-4-tetramethylbenzene, a homologue of aniline. It is made by reducing nitroprehnitene with iron and acetic acid. It melts at 64–66° C.

prehnitene (pren'i-tēn), *n.* [*prehnit*(*e*) + *-ene.*] Vicinal or 1,2,3,4-tetramethylbenzene, $C_6H_2(CH_3)_4$, an oily hydrocarbon which boils at 204° C. Also called *prehnitol.*

prehnitic (pre-nit'ik), *a.* [*prehnit*(*e*) + *-ic.*] Derived from prehnitene.—**Prehnitic acid,** a crystalline acid, $C_6H_2(COOH)_4 + 2H_2O$, or 1,2,3,4-benzenetetracarboxylic acid, made by oxidizing prehnitene with potassium permanganate, and in other ways.

prehnitol (pren'i-tol), *n.* [*prehnite* + *-ol.*] Same as ★*prehnitene.*

prehypophysis (prē-hī-pof'i-sis), *n.*; pl. *prehypophyses* (-sēz). [L. *præ*, before, + NL. *hypophysis.*] The anterior lobe of the hypophysis of the brain.

preignition (prē-ig-ni'shọn), *n.* [*pre-* + *ignition.*] An ignition of the combustible charge of fuel and air in an internal-combustion engine before the piston, on its compressing stroke, has reached the inner dead-center, or completed the normal compression of the charge. See ★*ignition*, 5.

preinsula (prē-in'sụ-lạ̈), *n.*; pl. *preinsulæ* (-lē). [L. *præ*, before, + *insula*, island.] The anterior portion of the island of Reil. *Amer. Anthropologist*, Oct.–Dec., 1903, p. 615.

preinsular (prē-in'sụ-lạ̈r), *a.* [L. *præ*, before, + *insul*(*a*), island, + *-ar*^{3}.] In *anat.*, anterior to the island of Reil.

The left insula in both was the better developed, and in the younger Seguin, whose linguistic powers were indisputably remarkable, the *preinsular* portion was so redundant that the surrounding opercular parts have been crowded apart and a small triangular portion of the insular pole is thus made visible on the lateral aspect. *Amer. Anthropologist*, Oct.–Dec., 1903, p. 615.

prelabial (prē-lā'bi-ạl), *a.* [*pre-* + *labial.*] Situated in front of the lips or of a labium.

prelabrum (prē-lā'brum), *n.*; pl. *prelabra* (-brạ̈). [L. *præ*, before, + *labrum*, lip.] In *entom.*, same as *clypeus.*

prelacteal (prē-lak'tẹ-ạl), *a.* and *n.* [*pre-* + *lacteal.*] I. *a.* Coming before the milk-teeth: applied to certain structures in the jaws of embryonic marsupials which are considered to be vestiges of a dentition preceding the milk-teeth.

II. *n.* Any tooth-like structure which precedes the milk-teeth.

The conviction that the deciduous premolar . . . must belong to the same series as the so-called "*prelacteals.*" (*E. D.*) *Quart. Jour. Micros. Sci.*, Jan., 1897, p. 441.

prelaryngoscopic (prē-lạ-ring-gọ-skop'ik), *a.* [*pre-* + *laryngoscope* + *-ic.*] Antedating the invention of the laryngoscope. *Buck*, Med. Handbook, V. 431.

prelenic (prẹ-len'ik), *a.* [*pre-*, 2, + *lenic.*] In *petrol.*, predominantly lenic; having lenads more than 5:3 of the normative feldspars.

prélèvement (prạ-lāv-moṅ'), *n.* [F.] In *Fr. law*, that portion of partnership property to which a member of a solvent firm is entitled before any division of further assets is made between the partners.

prelimen (prel'i-men), *n.* [L. *præ*, before, + *limen*, threshold.] Something to be done before the main proceeding; a preliminary step. [Rare.]

The requisite *prelimen* to the original aim of the inquiry. *Philos. Trans. Roy. Soc.* (London), 1898, ser. B, p. 50.

preliminary, *n.* 2. *pl.* In college use, tests in certain elementary subjects previous to the final examinations for entrance. [U. S.]

pre-Linnean (prē-li-nē'ạn), *a.* Before the time or work of Linnæus; existing, written, or proposed, before Linnæus: as *pre-Linnean* writers. *Pop. Sci. Mo.*, Jan., 1903, p. 211.

prelithic (prē-lith'ik), *a.* [L. *præ*, before, + Gr. *λιθος*, stone, + *-ic.*] Preceding the use of stone implements; antedating the stone age proper. Compare ★*zoömimetic.*

> In general, the stage would seem to be antecedent to that defined by the chance-dominated use of stone, which has already been characterized as protolithic; it corresponds with the stage provisionally outlined by Cushing as *prelithic;* but, taking due account of the materials, processes, and motives characteristic of the stage, it may be distinguished as hylozoic, or perhaps better as zoomimic. *Smithsonian Rep.*, 1900, p. 63.

prelocalization (prē-lō"ka̤l-i-zā'sho̤n), *n.* [*pre-* + *localization.*] In *embryol.*, the supposed original localization of the various organs of the adult, as specific substances or structures, in different regions of the unsegmented egg.

> A second general division of his work included the experimental study of *prelocalization* in the unsegmented egg, which yielded results of no less interest than the cleavage stages. *Carnegie Inst. Yearbook*, 1903, p. xliv.

prelusion (prē-lū'zho̤n), *n.* [L. *prælusio(n-)*, < *præludere*, rehearse, prelude.] A prelude.

premandibula (prē-man-dib'ṳ-lä̤), *n.*; pl. *premandibulæ* (-lē). [NL., < L. *præ*, before, + *mandibula.* See *mandible.*] A median bilaterally symmetrical bone in front of the anterior end of the mandible in certain fishes, especially the *Aspidorhynchidæ* of Mesozoic age: similar to the predentary bone of certain dinosaurs. Also called *presymphysial.*

Premandibular segment. See ★*segment.*

Premaxillary process, in *ornith.*, a process running upward and backward from the anterior part of the premaxillary. The culmen is formed by this process. *Proc. Zool. Soc. London*, 1903, p. 262.

premaximal (prē-mak'si-ma̤l), *a.* [L. *præ*, before, + *maxim(um)* + *-al*^{1}.] Preceding a maximum in any sense. *Buck*, Med. Handbook, I. 139.

premedia (prē-mē'di-ä̤), *n.*; pl. *premediæ* (-ē). [L. *præ*, before, + *media*, fem. of middle.] One of the longitudinal veins in an insect's wing lying between the media and the radius. It is vein IV of Comstock's system. *Comstock*, Manual of Insects, p. 65.

premedical (prē-med'i-ka̤l), *a.* [*pre-* + *medical.*] Occurring before (the scientific study of) medicine; preceding medicine; not yet having entered upon the study of medicine. [Rare.]

> This general text-book of botany is written for *premedical* and pharmaceutical students in particular and the nonprofessional undergraduate incidentally. *Bot. Gazette*, March, 1904, p. 225.

premegalithic (prē"meg-a̤-lith'ik), *a.* [*pre-* + *megalith* + *-ic.*] Of or pertaining to time previous to the erection of megaliths; antedating the erection of megaliths. *Amer. Anthropologist*, Jan.–March, 1902, p. 78.

premetallic (prē-me-tal'ik), *a.* [*pre-* + *metal* + *-ic.*] Of or pertaining to a period anterior to that in which metals were used for the manufacture of artifacts.

premier, *n.* **2.** In *roulette*, a bet that one of the numbers from 1 to 12 inclusive will win.

première, *n.* **2.** The first performance of a drama or opera.

premiership, *n.* **2.** Specifically, the first prize in any competitive show, as for dogs or horses.

> The secretary was directed to write to the Duchess of Newcastle, offering the *premierships* and medals for competition at any show to be given by the Ladies' Branch of the English Kennel Club. *Field and Fancy*, April 6, 1900.

premiotic (prē-mī-ot'ik), *a.* [*pre-* + *miotic.*] Of or pertaining to a stage in spermatogenesis which precedes the maturation, or miotic divisions. Also incorrectly written *premaiotic. Nature*, June 15, 1905, p. 164.

premis, *n.* A simplified spelling of *premise*, *n.*

Premium pudicitiæ [L., 'price of chastity'], in *law*, a sum of money paid or promised as consideration of a contract for illicit cohabitation. The contract must be under seal, and the money paid or promised must be for past cohabitation. A parole promise, or a contract for future cohabitation is void.

premoral (prē-mor'a̤l), *a.* [*pre-* + *moral.*] In *sociol.*, prior to the existence of morality or a moral code in society. *Ward*, Outlines of Sociol., p. 112.

premortal (prē-môr'ta̤l), *a.* [L. *præ*, before, + *mors* (*mort-*), death, + *-al*^{1}.] Immediately preceding death.

> The *premortal* rise of nitrogen excretion. *Jour. Exper. Med.*, March 17, 1902, p. 238.

premorula (prē-mor'ọ-lä̤), *n.*; pl. *premorulæ* (-lē). [L. *præ*, before, + NL. *morula.*] In *embryol.*, a stage preceding the morula.

premundane (prē-mun'dān), *a.* [L. *præ*, before, + E. *mundane.*] Existing or occurring before this world was created; antemundane.

premuscle (prē-mus'l), *n.* [*pre-* + *muscle.*] In *embryol.*, dense mesoblastic or mesenchymatous tissue just before its conversion into true muscular tissue. [Rare.]

> This is surrounded by a mass of dense mesenchyma, evidently *premuscle* tissue. *Biol. Bulletin*, June, 1904, p. 39.

premutative (prē-mū'tạ̄-tiv), *a.* [*pre-* + *mutative.*] Inflected by means of prefixes, as a language. *N. E. D.* [Rare.]

pre-Mycenæan (prē-mī-sẹ-nē'a̤n), *a.* Belonging to a civilization apparently earlier than the Mycenæan. See ★*Mycenæan.*

> Primitive pottery of days long anterior to the Mycenæan period has been found at Phaistos, and in the near neighbourhood is Agios Onouphrios, where one of the most important discoveries in Crete, that of burials of the primitive *pre-Mycenæan* or "Amorgian" period, containing Egyptian scarabs of the twelfth dynasty (*c.* 2200 B.C.), was made in 1887. *Nature*, Nov. 20, 1902, p. 59.

prenarcotic (prē-när-kot'ik), *a.* [*pre-* + *narcosis* (*narcot-*) + *-ic.*] Prior to the occurrence of narcosis.

> The *prenarcotic* period — that is, the time from the beginning of the anesthetic to the pupilary dilatation — varies from thirty seconds to five minutes. *Therapeutic Gazette*, Feb. 15, 1903, p. 100.

prenarial, *a.* and *n.* See ★*prænarial.*

prenaris, *n.* See *prænaris.*

prenebular (prē-neb'ṳ-lä̤r), *a.* [*pre-* + *nebular.*] Existing or occurring before the nebular state, as the universe.

preneural, præneural (prē-nū'ra̤l), *a.* and *n.* [*pre-* + *neural.*] **I.** *a.* Situated in front of a neural.

> There is a *preneural* bone, whose anterior border has occupied a notch in the hinder border of the nuchal. *Amer. Jour. Sci.*, Oct., 1904, p. 274.

II. *n.* A preneural structure; specifically, a bone lying just in advance of the first neural and forming part of the carapace of some turtles: unlike the neurals it is not connected with an underlying vertebra.

pre-Noachian (prē-nọ-ā'ki-a̤n), *a.* Prior to Noah; of or pertaining to the period preceding Noah's deluge.

prenodal (prē-nō'da̤l), *a.* and *n.* [L. *præ*, before, + *nodus*, node, + *-al*^{1}.] **I.** *a.* In *entom.*, before, or proximad of, the node on the wing of a dragon-fly: as, the *prenodal* cells.

II. *n.* A prenodal cell.

> Six *prenodals* and 5 postnodals on the fore wing. Dragonflies. *Proc. Zool. Soc. London*, 1902, I. 67.

prenoid (prē'noid), *n.* [Gr. *πρηνής*, prone, + *εἶδος*, form.] In *bot.*, a minute body imbedded in the chromatophores of many algæ and of one of the hepatics. Its function is not definitely known, although it is supposed by some to be a reserve proteid.

prenuncial (prē-nun'ṣi-a̤l), *a.* [Irreg. < L. *prænuntiare*, announce beforehand, predict, + *-al*^{1}.] Announcing; presaging; in *geol.*, pertaining to a brief, precurrent, transient appearance of a migrating exotic fossil fauna in the midst of an indigene fauna of an earlier formation than that in which the exotic fauna eventually makes its permanent habitation and presents its full development.

prenuptial (prē-nup'sha̤l), *a.* [*pre-* + *nuptial.*] Prior to marriage: as, a *prenuptial* contract.

Preocular shield, in *herpet.*, a horny plate forming part of the covering of the head and lying just in advance of the eye.

preoperative (prē-op'ẹ-rạ̄-tiv), *a.* [*pre-* + *operate* + *-ive.*] In *surg.*, relating to the period preceding an operation. *Buck*, Med. Handbook, II. 455.

preopercular, *a.* **II.** *n.* Same as *præoperculum*, 2. *Starks*, Synonymy of the Fish Skeleton, p. 515.

Preoral circlet, in *embryol.*, a preoral band of cilia in the larvæ of certain marine worms. Usually called the *prototroch.*—**Preoral lobe.** (*a*) In *Chætopoda* and some other worm-like animals, the prostomium. (*b*) The anterior end of the lancelet, which projects beyond the mouth, or oral opening.—**Preoral pit.** See ★*pit*^{1}.

preorbital (prē-ôr'bi-ta̤l), *a.* and *n.* [L. *præ*, before, + *orbita*, orbit, + *-al*^{1}.] **I.** *a.* Placed in front of the orbit of the eye.—**Preorbital process**, a bony projection situated on the anterior side of the bony orbit of the eye: typically present in the skull of a rabbit. *Proc. Zool. Soc. London*, 1899, p. 11.

II. *n.* In *ichth.*, a bone in front of the eye which belongs to the suborbital series of dermal bones. It usually bears a sensory tube continued from the suborbitals.

preorganic (prē-ôr-gan'ik), *a.* [*pre-* + *organic.*] Pertaining to the indefinite period of the earth's history which was antecedent to the first appearance of life, or to rocks which were formed during that period and are without traces of fossil organisms: not recognized as the name of a unit of geologic time. See *archæan* and *azoic.*

preorganized (prē-ôr'ga̤-nīzd), *p. a.* [*pre-* + *organized.*] Organized beforehand; specifically, occurring or apprehended by virtue of antecedent organization.

> First, we are told that it is not the emotion that gives rise to the bodily expression, but that, on the contrary, "the bodily changes follow directly the perception of the existing fact," it being beyond doubt "that objects do excite bodily changes by a *pre-organized* mechanism." *Encyc. Brit.*, XXXII. 65.

preosseous (prē-os'ẹ̄-us), *a.* [L. *præ*, before, + *osseus*, bony.] Of or relating to embryonic tissue which is on the way to become bone: as, *preosseous* substance. *Proc. Zool. Soc. London*, 1902, I. 206.

preparateur (pre-par-ä-tėr'), *n.* [F.] Same as *preparator*, 1. *Science*, Sept. 18, 1903, p. 362.

preparator, *n.* **2.** Same as ★*amboceptor.*

prepared (prẹ-pãrd'), *p. a.* Being in a state or condition of preparation; specifically, in *math.*, transformed in certain ways so as to be brought to a shape convenient for discussion: said of an equation, form, or function.

preparietal (prē-pạ̄-rī'e-ta̤l), *a.* [*pre-* + *parietal.*] Relating to the anterior portion of the parietal lobe of the brain; noting the artery which supplies this part. *Buck*, Med. Handbook, II. 253.

preparin (prep'a̤-rin), *n.* [L. *præpar(are)*, prepare, + *-in*^{2}.] Same as ★*amboceptor.*

preparing-machine (prẹ-pãr'ing-ma̤-shēn"), *n.* In *calico-printing*, a machine for padding the cloth in the open width with olein oil, after bleaching and before printing. *G. Duerr*, Bleaching and Calico-printing, p. 25.

prepatagial (prē-pat-ạ̄-jī'a̤l), *a.* [NL. *prepatagi(um)* + *-al*^{1}.] Pertaining to or connected with the prepatagium. *Proc. Zool. Soc. London*, 1901, p. 322.

prepelvic (prē-pel'vik), *a.* [*pre-* + *pelvic.*] Situated in advance of the pelvis. *Parker and Haswell*, Zoology, II. 61.—**Prepelvic ridge**, a ridge running forward from the anterior border of the pelvic fin of a shark. [Rare.]

prepenial (prē-pē'ni-a̤l), *a.* [L. *præ*, before, + *pen(is)* + *-i-al*^{1}.] Lying in advance of the penis, as the scrotum of marsupials. *Proc. Zool. Soc. London*, 1892, p. 369.

prepercept (prē-pėr'sept), *n.* In *psychol.*, an anticipatory perception; a memory-idea aroused by, and clustering round, the presentation of an element or elements of a familiar perception.

> The sight of ice yields a forefeel of its coldness, the smell of baked meats a foretaste of their savour. Such *prepercepts* differ from free ideas just as after-percepts do: they are still sense-bound and sense-sustained. *Encyc. Brit.*, XXXII. 59.

preperitoneal (prē-per"i-tọ-nē'a̤l), *a.* [*pre-* + *peritoneum* + *-al*^{1}.] Anterior to the peritoneum. *Buck*, Med. Handbook, VII. 521.

pre-Persian (prē-pėr'sha̤n), *a.* In *Gr. archæol.*, a term applied to the monuments in Athens which were built before the second Persian invasion in 480 B.C. and which were destroyed at that time. Many interesting remains have been recovered.

> His view that the *Pre-Persian* temple was a temple of Athena Polias is merely a deduction from his supposed demonstration that the Parthenon was so. *J. G. Frazer*, in Jour. Hellenic Studies, XIII. 177.

prepineal (prē-pin'ẹ̄-a̤l), *a.* [L. *præ*, before, + E. *pineal.*] Situated in advance of, or anterior to, the pineal body. *Phil. Trans. Roy. Soc.* (London), 1891, ser. B, p. 108.

prepontile, *a.* **II.** *n.* Same as ★*prepontine.*

prepontine (prē-pon'tin), *a.* and *n.* [*pre-* + *pontine*^{2}.] **I.** *a.* Same as *prepontile.*

II. *n.* The region just cephalad or anterior to the pons Varolii. Also *prepontile. Philos. Trans. Roy. Soc.* (*London*), 1898, ser. B, p. 128.

prepotency, *n.* **2.** In *biol.*, the preponderating power or tendency of one germ-cell, one parent, or one ancestor to fix the character of descendants.

> *Prepotency* is the preponderating transmission from one parent. *C. B. Davenport*, Biol. Lectures, 1899, p. 271.

Differential prepotency, the difference between the parents or other ancestors, in value or significance (in ancestral inheritance) considered or investigated in reference to specific points of difference between them.

Consequently though some of the evidence to be adduced bears on the question of *differential prepotency*, we can offer as yet no plain answer to the original question.
Bateson and Saunders, Rep. Evol. Com. Roy. Soc., [1902, I. 5.

Intermittent prepotency, the resemblance of some, but not of all of the children to one parent, as respects any quality, to the partial or complete exclusion of the influence of the other parent as respects this quality.

Now the fundamental point . . . is this, that apart from sex-prepotency, neither unit prepotency nor *intermittent prepotency* need in any way influence the parental correlations. *Biometrika*, Nov., 1903, p. 390.

Sex-prepotency. (*a*) The impression upon descendants of its own characteristics by some one ancestor to the total or partial exclusion of the influence of other ancestors. (*b*) The resemblance of a child to its parent of the same sex as regards any quality.

By *sex-prepotency* I understand that the offspring of one or other sex or of both sexes are more like the male or the female parent as the case may be.
K. Pearson, in Biometrika, Nov., 1903, p. 389.

prepotent, *a.* **3.** In *biol.*, exhibiting or possessed of prepotency.

prepubertal (prē-pū′bėr-tal̤), *a.* [*pre-* + *pubert*(*y*) + *-al*^{1}.] Prior to the occurrence of puberty. *G. S. Hall*, Adolescence, I. 250.

prepubescent (prē-pū̦-bes′e̤nt), *a.* [*pre-* + *pubescent.*] Prior to the occurrence of puberty. *G. S. Hall*, Adolescence, I. x.

prepyramid (prē-pir′a̤-mid), *n.* [*pre-* + *pyramid.*] The anterior pyramid in the medulla oblongata.

prepyramidal (prē-pi-ram′i-dal̤), *a.* [*pre-* + *pyramid* + *-al*^{1}.] Of or pertaining to the anterior pyramid in the medulla oblongata.

prequadrate, præquadrate (prē-kwod′rāt), *a.* and *n.* [*pre-* + *quadrate.*] **I.** *a.* Lying in advance of the quadrate: as, the *prequadrate* process of the sphenotic. *Proc. Zool. Soc. London*, 1895, p. 399.

II. *n.* A prequadrate process.

prequaric (prē-kwor′ik), *a.* [*pre-*, 2, + *quaric.*] In *petrol.*, predominantly quaric; having nominative quartz more than 5:3 of the nominative feldspars.

preradial (prē-rā′di-al̤), *a.* [L. *præ*, before, + *radius*, ray, + *-al*^{1}.] In *cytol.*, preceding the formation of the achromatic rays of the spindle: as, the *preradial* stage of mitotic cell-division.

Five stages in the formation of the spindle are described, viz., the *preradial* stages, the radial stages, formation of the felt, the multipolar spindle, and the completion of the spindle.
Bot. Gazette, Sept., 1903, p. 234.

Preraphaelite, *a.* **2.** Said of painting done according to the methods or style of the Preraphaelite Brotherhood.—**Preraphaelite Brotherhood**, the name given to a group of painters which appeared in England in the middle of the nineteenth century. The movement began in 1848 when Dante Gabriel Rossetti entered the studio of Ford Madox Brown. He was soon after joined by William Holman Hunt and John Everett Millais. Later were added Thomas Woolner (sculptor), James Collinson (replaced afterward by Walter Howell Deverell), Frederick George Stephens, and W. M. Rossetti. Their purpose was to protest against the conventionality of modern English art and to bring about a return of the sincerity and high endeavor of the earlier part of the *Quattro-cento*, the period in Italian art which preceded Raphael. With this were combined great poetic feeling, delicacy of color, and fine appreciation of nature. The name Preraphaelite is sometimes applied to similar movements in other countries, notably to an earlier one in Germany.

II. *n.* **2.** A member of the Preraphaelite Brotherhood.

Preraphaelitism, *n.* **2.** The cult of the Preraphaelite Brotherhood.

prerational (prē-rash′o̤n-al), *a.* [*pre-* + *rational.*] Antecedent to the maturation of intelligence.

Not reasoning, but some deep *pre-rational* instinct, like that on which our faith in memory rests, is the basis of our belief in other minds.
C. A. Strong, Why the Mind has a Body, p. 274.

prerelease (prē-rē-lēs′), *n.* [*pre-* + *release.*] Early release; release before the right time; in an engine, the opening of the exhaust-port before the piston has reached the end of its stroke. This is done to allow the steam or gases time to escape before the piston starts on its return stroke.

Prerogative court. (*b*) A court having jurisdiction of wills and decedents' estates; specifically, in New Jersey, a court presided over by the chancellor for the hearing of appeals from the Orphans' Court.

pre-Rolandic (prē-rō̦-lan′dik), *a.* Anterior to the fissure of Rolando in the brain. *Buck*, Med. Handbook, II. 400.

pre-Roman (prē-rō′ma̤n), *a.* Noting the history or art of a country before its occupation by the Romans.

The *pre-Roman* architecture of the Haurân includes successively three general divisions of style.
H. C. Butler, Architecture and Other Arts, p. 321.

Pres., Presb., Presby′n. Abbreviations of *Presbyterian.*

presacral, *a.* **II.** *n.* Any vertebra in front of the sacrals, generally used in the plural.

This compares closely with the supposed number of *presacrals* in the Eusuchia.
Amer. Jour. Sci., April, 1904, p. 320.

presbyacousia (pres″bi-a̤-kö′si-ạ̈), *n.* [NL.] Same as ★*presbycousis.*

presbycousis, presbykousis (pres-bi-kö′sis), *n.* [NL., ‹ Gr. πρέσβυς, an old man, + ἄκουσις, hearing.] Partial deafness due to senile changes in the ear.

Presbyterian Alliance, an organization founded in London in 1875, similar to the Evangelical Alliance, but confined to the Reformed churches holding the Presbyterian system. Its object is to promote closer relations between the Presbyterian churches of the world, without compromising their separate existence and independence. The first of the triennial councils was held in Edinburgh in 1877, at which were present representatives from twenty-five different countries. Also, *Alliance of the Reformed Churches.*

presbytia (pres-bish′i-ạ̈), *n.* [NL., ‹ Gr. πρεσβυτής, old age.] Same as *presbyopia.*

prescriptorial (prē-skrip-tō′ri-al̤), *a.* [L. *præ*, before, + *scriptor*, writer, + *-ial.*] Of or pertaining to the period before the use of writing; anterior to the use of writing.

In the several languages the names are associative or symbolic in the vague fashion characteristic of *prescriptorial* ideation.
J. W. Powell, An. Rep. Bur. Amer. Ethnol., 1894–95, [p. xcvi.

prescutellum, *n.* See *præscutellum.*

presedentary (prē-sed′e̤n-tạ̄-ri), *a.* [*pre-* + *sedentary.*] Preceding the sedentary or attached stage, as in the development of organisms that are free-swimming in their earlier life. *E. R. Cumings*, in Amer. Jour. Sci., Jan., 1904, p. 49.

presegmenting (prē-seg′men-ting), *a.* [*pre-* + *segment*, *v.*] Segmenting or dividing in advance (of some other process).—**Presegmenting bodies.** See ★*body.*

presence, *n.*—**The presence**, an obsequious title used in India by a servant speaking to his master.

"Dinner for '*the presence*' is laid at some distance" . . . "and also the easy chair. With aged persons how shall argument be made? If '*the presence*' himself would be pleased to give an order, the ancient will doubtless obey."
A. I. R. Glasfurd, Rifle and Romance in the Indian [Jungle, xv.

presenile (prē̦-sē′nil), *a.* [*pre-* + *senile.*] Relating to or showing the lesions of presenility.

The patients in the severe cases are men as a rule in the *pre-senile* stage and they present well-marked cardiovascular lesions. *Lancet*, Aug. 22, 1903, p. 517.

presenility (prē-sē̦-nil′i̤-ti), *n.* [*pre-* + *senility.*] Premature old age; a condition in which the arterial and other changes characteristic of advanced age occur in one in middle life.

present^2, *v. i.* **2.** In *obstet.*, to appear first: said of the part of the fetus which is in advance during labor. See *presentation*^{1}, 6.

presentational (prez-en-tā′sho̤n-al̤), *a.* [*presentation* + *-al*^{1}.] In *psychol.*, relating to, due to, or composed of, presentations.

Again, the continuous differentiation and redintegration of the *presentational* continuum which mark the progress of perceptual experience are resolved into an original multiplicity of presentational atoms which are associated by "adhesion" of the contiguous.
Encyc. Brit., XXXII. 58.

presentativeness (prē̦-zen′ta̤-tiv-nes), *n.* The character of being presentative; specifically used by H. Nichols to express "the ultimate and irreducible fact . . . that . . . sensory components or qualities can be and commonly are combined in . . . entirely unique togetherness," that is, in one consciousness, while they "might perfectly well exist in as many separate minds."

presentative-representative (prē̦-zen′ta̤-tiv-rep-rē̦-zen′ta̤-tiv), *a.* In *psychol.*, containing both presentative and representative elements; partaking of the nature of both presentation and representation.

Thus pleasure becomes an anticipation, as in the case of the dog when his food is being brought to him; to employ the term used by Herbert Spencer, it is a *presentative-representative* state.
T. Ribot (trans.), Psychol. of Emotions, p. 55.

Yet it is saying too much, regardless of this defect, to describe a percept as a *presentative-representative* complex, if representation is to imply the presence of a free or independent idea. *Encyc. Brit.*, XXXII. 59.

presentoir, *n.* **3.** A shallow bowl supported on a tall stem, designed to hold fruit or flowers.

preseptal (prē-sep′ta̤l), *a.* [L. *præ*, before, + *septum*, a fence, partition, + *-al*^{1}. See *septum.*] Lying before the septum.—**Preseptal cone**, in certain genera of the Silurian nautiloid cephalopods (*Endoceras*, *Nanno*), the unchambered apical portion of the conch.

preserv, *v.* and *n.* A simplified spelling of *preserve.*

preservaline (prē-zėr′va-lin), *n.* [*preserve* + *-al*^{3} + *-ine*^{2}.] The trade-name of a substance used to prevent the decay of foods.

Presidential year. See ★*year.*

presocial (prē-sō′sha̤l), *a.* [*pre-* + *social.*] Prior to the establishment of the social instincts and habits. *L. F. Ward*, Outlines of Sociol., p. 112.

presodic (prē-sō′dik), *a.* [*pre*(*dominantly*) + *sodic.*] Moderately rich in soda: applied in the quantitative system of classification of igneous rocks to those in which both soda and potash are present, but soda predominates over potash, the ratio of the former to the latter being greater that 5:3, but less than 7:1.

prespinous (prē-spī′nus), *a.* [*pre-* + *spinous.*] In advance of the spine of the scapula; prespinal: as, the *prespinous* fossa. *Parker and Haswell*, Zoology, II. 488.—**Prespinous fossa**, the depression on the anterior side of the spine of the scapula: more commonly called *prescapular fossa.*

prespiracular (prē-spī-rak′ū̦-lạ̈r), *a.* [*pre-* + *spiracular.*] Lying in advance of the spiracle. *Nature*, Oct. 16, 1902, p. 604.

presplenial (prē-splē′ni-al̤), *n.* [*pre-* + *splenial.*] Applied by Baur to the splenial of turtles under the impression that the bone termed by Kingsley *dermarticulare* was the splenial. *Science*, Dec. 25, 1903, p. 830.

press^1, *v.* **I.** *trans.*—**To press a bet.** See ★*bet*^{2}.

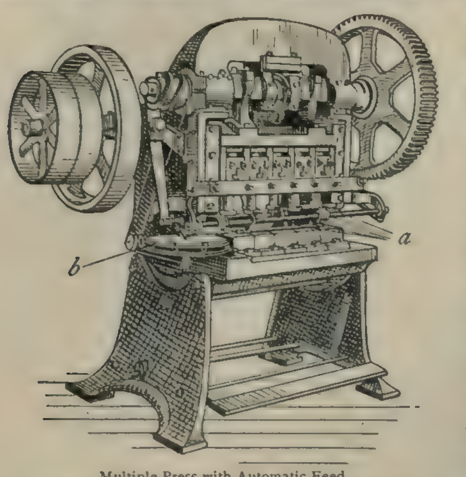
II. *intrans.* **8.** In *golf*, to strive to hit the ball harder than usual, or harder than it can be hit with accuracy, in order to gain greater distance.

press^1, *n.* **14.** A machine for forming, shaping, or working metal by stamping, drawing, or cutting. It consists essentially of a gate carrying a punch, to which a reciprocating motion is given by a crank-shaft and connecting-rod or pitman, or by a cam, and a die on which the material to be worked is placed. Such a machine is called a *drawing-*, *coining-*, *stamping-*, *punching-press*, etc., according to its use, and an *arch*, *open-front*, *pillar*, *inclinable*, *single-acting*, or *double-acting press* according to its construction. It may also be classified according to the articles made on it, as *cartridge-*, *primer-*, *tin-can*, *shot-shell press*, etc.

15. A chitinous structure with attached pyramidal muscles in the silk-duct of lepidopterous and trichopterous larvæ (and certain hymenopterous larvæ as well) which serves to regulate the diameter of the silk threads and the amount of gum surrounding them.

In the case of Apanteles glomeratus the *press* is highly developed. It commences at the union of the two conducting tubes in the region of the labium and occupies more than half of the common duct. Dorsally the *press* is concave, traversed by a longitudinal furrow into which pass the dorsal pair of muscles.
Amer. Nat., Sept., 1907, p. 573.

Associated Press. See ★*associated.*—**Cox duplex press**, a flat-bed perfecting-press in which the type beds are stationary, one above the other, the cylinders rolling back and forth upon them. The paper is fed in from a roll and is cut and folded in printing. As the printing is done from type forms without stereotyping it is much used by newspapers having small editions.—**Double-action press**, a press having two plungers for operating double-action dies that perform more than one operation; a cutting-, drawing-, and stamping-press.—**Double-supplement press**, a rotary printing-machine constructed to print with the main or larger outer sheet, and to insert in it, one or more supplemental pages or sheets. *Census Bulletin* 216, June 28, 1902, p. 63.—**Double-tub press**, a form of cider-press in which the fruit is placed in an annular space between two concentric perforated tubs. A corresponding annular piston is forced down into the space between the tubs, and the juice escapes both outward and inward.—**Inclined press**, a drawing- or stamping-press the bed and die of which are inclined to the horizontal to facilitate the insertion and withdrawing of the work.—**Multiple-die press.** Same as ★*gang-press.*—**Multiple press**, in sheet-metal work, a stamping-press employing two or more separate similar dies, used at the same time and making the same thing; or a press with a gang of different dies, each performing a different piece of work upon a series of blanks fed to them in succession by a dial-feed or other feeding device; a gang-press. The term is a general one applied to presses employing dies in gangs, but not properly to one employing a perforating-die, even though the die stamps many holes in a sheet-metal blank at the same time. See ★*dial-feed* and ★*die*^{3}, 9.—**Octuple press,** a rotary printing-machine, used for newspapers, which combines the operations of eight single machines.



Multiple Press with Automatic Feed.

a, dies, moving together and each forming a progressive step from cutting out the blank to delivering the finished article; *b*, feed-mechanism carrying the blank from die to die, in turn, till finished.

The *octuple* is sometimes constructed by piling four double presses one above another.

Census Bulletin 216, June 28, 1902, p. 63.

Quadruple press, a rotary printing-machine that combines four machines in one construction and does the work of four single machines: first made by R. Hoe & Co. in 1887. It produced eight-page newspapers at the speed of 48,000 copies in one hour.—**Sextuple press,** a rotary printing-machine that combines six machines in one construction and does the work of six single machines. Form-cylinders and impression-cylinders are placed parallel and not at right angles, as in the quadruple and double-supplement machines. It is fed from three rolls and prints twenty-six miles of paper, five feet wide, in one hour, or 24,000 copies pasted, folded, and ready for delivery.—**Sheet-metal press,** a press for cutting, bending, drawing, or otherwise working sheet-metal.—**Sheet-perfecting press,** a printing-machine that, by one operation of sheet-feeding, delivers the sheet perfectly printed on both sides. Two impression-cylinders are used, one for the first side, and another for the second side.—**Single-rotary press,** a printing-machine that has its type or stereotype plates fastened on a rotating cylinder, and is automatically fed from a roll of paper. The first practical machine on this principle was made by William Bullock of New York, in 1865. R. Hoe & Co., in 1871, made for the use of the New York *Tribune* a single rotary press that produced 14,000 copies in one hour, properly cut, folded, and ready for delivery. This machine was the beginning of enlargements now known as quadruple, sextuple, octuple, etc., presses.—**Upsetting-press,** a tire-upsetting machine; a machine for reducing the girth of a wheel tire by compressing it at one place while it is hot.—**Web perfecting-press,** a printing-machine, automatically fed from a roll of paper, that prints on both sides of the paper and cuts and folds in separate sheets for instant delivery at a high rate of speed. See *rotary press*, under *rotary*, *quadruple* ★*press*, and *sextuple* ★*press*.—**Yellow press.** See ★*yellow*.

press-bed, *n.* 2. In *printing*: (*a*) In the cylinder printing-machine, a flat table of iron which upholds the form of type and passes to and fro under the impression cylinder. (*b*) In the hand-press, an iron table upholding the form of type that passes to and fro under the platen. See cut of stop-cylinder machine at *printing-machine*.

press-board (pres′bōrd), *n.* 1. Millboard; pasteboard.—2. An ironing-board; a board used in pressing cloth.—3. *pl.* See *press-boards*.

press-cake, *n.* 1. It is the product obtained by the application of hydraulic pressure to powder-meal which has been formed by crushing between rolls the mill-cake or wheel-cake which comes from the incorporating mill. The object of the pressing, which precedes granulation, is to give uniform density and the particular degree of density desired.

2. In the manufacture of fatty acids for candles, the residual cake of stearic and palmitic acids from which the 'red oil' or oleic acid has been removed by pressure.

press-drill (pres′dril), *n.* 1. A drill or seed-planter fitted with a pressing-device for firming or pressing down the soil after the seed is dropped. It is only available on very dry soils and is not in general use. *Yearbook U. S. Dept. Agr.*, 1900, p. 541.—2. An obsolete form of drilling-machine in which the drill was fed to its work by being pressed down by a weighted lever.

pressel (pres′l), *n.* [*press*^{1}, *v. t.*] In *elect.*, a push-button; specifically, a push-button attached to a flexible conductor.

Pressel. A press switch or push connected to the end of a flexible, pendant conductor. *Houston*, Dict. Elect.

presser, *n.* 3. (*e*) A part in a foundry molding-machine which presses down or rams the sand in the mold.

presser-bar, *n.* 2. Same as *presser*, 3 (*b*).—3. The vertical bar which carries the presser-foot of a sewing-machine at its lower end.

presser-eye (pres′ėr-ī), *n.* The aperture at the end of the spindle-flier, on a cotton-roving machine, through which the roving passes to the bobbin. *Nasmith*, Cotton Spinning, p. 340.

pressing, *n.* 3. In *ceram.*, the process of forming vessels with plastic clay, in a mold or on a jigger, by hand.

press-mark, *n.* 2. The letter or number, printed on the margin of a newspaper, that specifies the press on which it was printed.

press-number (pres′num″bėr), *n.* The number which identifies a particular book and fixes its location in a press or bookcase.

pressor (pres′o̤r), *a.* [L. *pressor*(*ius*), that serves for pressing.] Causing constriction of the smaller blood-vessels and a consequent rise of blood-pressure.

Inequality of Accessibility to local reflex *pressor* Impulses.

Philos. Trans. Roy. Soc. (London), 1898, ser. B, p. 161.

press-revise (pres′rē-vīz″), *n.* The first impression of a form of type, prepared for press, which is revised by the last proof, for the detection of possible uncorrected faults.

pressure, *n.* 7. In *elect.*, a term sometimes used for *voltage*, *electromotive force*, or *difference of potential*.—8. In *psychol.*, the specific quality of sensation furnished by the pressure-spots of the skin and by the organs of the articular sensitivity; pressure-sensation.

The quality of articular sensation, like that of muscular, is not distinguishable from *pressure*.

E. B. Titchener, Outline of Psychol., p. 69.

Active pressure, in *elect.*, the impressed electromotive force in an electric circuit minus the counter-electromotive force: the term is used chiefly in dealing with alternating currents.—**Belt of high pressure,** a long, irregular, rather narrow region over which the barometric pressure, reduced to sea-level, is higher than on either side. Such ridges frequently connect two areas of higher pressure and last for a day or two. The belt that nearly surrounds the earth near the tropic of Capricorn is quite permanent; the corresponding belt near the tropic of Cancer in the northern hemisphere varies much with the seasons of the year.—**Center of pressure.** (*c*) See ★*center*^{1}.—**Critical pressure,** the pressure exerted by the gaseous phase of a substance when at the critical temperature. A gas can be liquefied only when reduction of its volume will not raise the pressure to the critical pressure.—**Effective pressure,** the unbalanced pressure on a piston; the net pressure available for doing work; the absolute pressure on the pressure side of an engine-piston minus the back pressure or absolute pressure on the exhaust-side of the piston: usually called *mean effective pressure*.—**Equatorial belt of low pressure,** a long narrow region nearly encircling the earth near the equator over which low barometric pressure, with warm showery weather and light winds or calms, prevails. Ferrel has shown that the low pressure is due to the existence of the northeast and southeast trade-winds and the deflecting force due to the earth's rotation. The trade-winds are not due to the low pressure, but the reverse.—**Goldscheider's' secondary pressure,** in *psychophys.*, a sharp, thrilling sensation following the primary pressure sensation when the point of a pin which is held loosely between the thumb and forefinger of the one hand is dropped lightly upon the back of the other hand. The secondary sensation is due to the coexcitation of a pain spot. The experiment was described by A. Goldscheider in 1891.—**High pressure.** (*c*) In *meteor.*, a reading of the barometric column above its normal value for the locality and date; a condition of the atmosphere such that its elastic pressure is greater than the average. For stations near the level of the ocean the high pressure would be somewhat more than 15 pounds to the square inch.—**Hydrostatic pressure,** that type of stress in which the three mutually perpendicular components are equal; the pressure of a fluid at rest upon an element of a surface with which it is in contact.

Hydrostatic pressure is a stress in which all three pulls are equal.

Nichols and Franklin, Elements of Physics, I. 101.

Initial pressure, the pressure exerted by the fluid in a thermal engine at the beginning of the stroke.—**Intrinsic pressure,** the pressure due to the attraction between two portions of a fluid, separated by an imaginary plane.

The intrinsic pressure K is $K = \sigma^2\int_0^a(\psi)z\,dz$, where σ is the density of the fluid and $(\psi)z$ is the attraction of an infinite layer of a fluid of unit density, bounded by a plane, upon a unit mass at a distance z from the plane.—**Low pressure.** (*b*) In *meteor.*, a reading of the barometric column below the normal value for the locality and date. a condition of the atmosphere such that its elastic pressure is less than the average. For stations near the level of the ocean a low pressure would be somewhat less than 15 pounds to the square inch.—**Low-pressure cylinder.** See ★*cylinder*.—**Magnetic pressure,** pressure exerted at right angles to the lines of a magnetic field upon a substance within the field.

These changes are due to the differences of the "*magnetic pressures*" perpendicular to the lines of force in the liquid and the surrounding gas.

Nature, April 24, 1902, p. 589.

Maxwell-Bartholi pressure, the exceedingly minute mechanical pressure to which a surface exposed to radiation is subjected by impact of the ether-waves.—**Mean effective pressure.** See *effective* ★*pressure*.—**Mean pressure,** the average pressure in a steam-cylinder from the beginning to the end of a stroke.—**Osmotic pressure.** See ★*osmotic*.—**Pascal's principle of fluid pressures.** Same as *Pascal's* ★*law*.—**Pressure gradient.** See ★*gradient*.—**Pressure harness.** See ★*harness*.—**Pressure neuritis.** See ★*neuritis*.—**Pressure sensation.** See ★*sensation*.—**Radiation pressure,** the mechanical pressure due to the impact of the ether-waves constituting radiation upon a body placed in their path. The radiation pressure due to sunlight upon a square centimeter of surface of a black body is equivalent to a weight of 4×10^{-5} milligrams. The first actual measurements of radiation pressure were made independently by Nichols and Hull and by Lebedew (1901). Same as ★*light-pressure*.—**Solution pressure,** in *phys. chem.*, the force acting to bring into solution the molecules of a solid immersed in the solvent. The osmotic pressure of the molecules already in solution opposes this solution pressure. When the osmotic pressure equals the solution pressure the amount dissolved in unit volume of the solution no longer increases, if the temperature is not changed. *Electrochem. Industry*, March, 1904, p. 98.—**Standard pressure,** the pressure adopted as the standard or fundamental condition to which all measurements are to be reduced in so far as they depend upon the pressure. In steam-engineering, standard pressures are expressed in pounds per square inch. In anemometry, wind-pressure is expressed in pounds per square foot. In hydraulic engineering, water-pressure is expressed in pounds per square inch or by the height in feet of the column of water. In meteorology, atmospheric pressure is expressed in a variety of terms: occasionally as pounds per square inch or kilograms per square meter; more generally as inches or millimeters of the mercurial barometric column; frequently in atmospheres. The standard pressure of one atmosphere is defined by the International Bureau of Weights and Measures as the weight of a column of pure mercury 760 millimeters high under the standard force of gravity, namely, that which prevails on the average at sea-level at latitude 45°. This value of gravity is that computed from numerous observations made in all parts of the globe and is deduced on the assumption that the earth is a homogeneous spheroid. Slightly different standard atmospheres have been used. Bird and Troughton and early English authors adopted 30 inches of mercury at 62° F. at London, which is equivalent to 29.924 at 32° F. at 45° latitude and sea-level; a committee of the Royal Society, in 1777, adopted 29.3 inches of mercury at 50° F. at London; Sir George Shuckburgh-Evelyn, in 1779, chose 30.0 inches at 50° F. at London; Welsh, about 1840, selected for Kew Observatory 29.922 inches, or 760 millimeters, at 32° F. under the force of gravity at Kew, which is equivalent to 760.46 millimeters under a normal gravity; Regnault's standard atmosphere was 760 millimeters under gravity at his laboratory in Paris, latitude 48° 50′ 14″ and altitude 60 meters above sea-level, which is equivalent to 760.25 millimeters under normal gravity. At the present time the international value of 760 millimeters under gravity at 45° latitude and sea-level is in general use among meteorologists.—**Subpermanent areas of pressure,** the areas of high pressure over the continents in the winter but over the oceans in the summer; also, the complementary areas of low pressure over the continents in the summer and the oceans in winter. Both of these retain their characteristics for several months while temporary highs and lows are moving around them.—**Terminal pressure.** (*a*) In an engine, the pressure of the steam or gas in the cylinder at the end of the stroke, or the pressure it would have if the exhaust-port were not opened until the end of the stroke. (*b*) In a compressor, the pressure of the air or gas at the end of the stroke after it is compressed.—**Vapor pressure,** the pressure exerted by an atmosphere of vapor. If a small quantity of any liquid is introduced into the vacuum above the mercury of a barometer its vapor will depress the mercury column. This depression measures its vapor pressure at the temperature at which the experiment is made. Same as *vapor-tension*.—**Vapor pressure of a solution,** the pressure exerted by the vapor in a closed vessel which is partly filled by the solution in question. This is always less than the corresponding pressure over the solvent.

pressure-balance (presh′ṳr-bal″ans), *n.* In *exper. psychol.*, an instrument for applying pressure-stimuli to the cutaneous surface. The apparatus is constructed in various forms, but always upon the model of the physical balance. It may be used for the determination of the limen of continuous change (application of a continuously increasing or decreasing pressure), for the determination of the stimulus limen or difference limen (application of a graded series of minimally different pressures), or for the bisection of a pressure distance (method of mean gradations with successive stimuli). *E. B. Titchener*, Exper. Psychol., II. ii. 136.

pressure-bar, *n.* 2. In *car-building*, an iron bar which connects the draw-bar with the buffer-spring and unites the draft-spring with it so that either may be used to relieve the other. It also serves to control the buffer-plate and keep it in position between the cars when they are in motion.

pressure-block (presh′ṳr-blok), *n.* In Japanese wood-engraving, an engraved but uninked block used to give texture to the surface of paper in printing.

An uninked *pressure block* was sometimes brought into service either to give a damask surface to white drapery, or to produce an effect like that of impasto.

W. Anderson, in Portfolio, N. S., XVII. 32.

pressure-boiler (presh′ṳr-boi″lėr), *n.* A closed vessel of sufficiently strong material (often iron, steel, or gun-metal) and commonly furnished with a safety-valve, in which liquids may be heated above their normal boiling-points as a result of the pressure produced by the tension of accumulated vapor. *Sadtler*, Handbook of Indust. Chem., p. 180.

pressure-bottle (presh′ṳr-bot″l), *n.* A bottle of strong glass, with a stopper held down by a metallic clamp, used in chemical laboratories as a ★pressure-boiler (which see) on a small scale. Water may, in such a vessel, be applied at a temperature of 130° C. or even more. Also called *pressure-flask.*

pressure-bowl (presh′ṳr-bōl), *n.* In *calico-printing*, the large roller against which the cloth to be printed presses on one side, while on the other it is pressed against by the copper cylinder on which the pattern is engraved.

pressure-flask (presh′ṳr-flȧsk), *n.* Same as ★*pressure-bottle.*

pressure-height (presh′ṳr-hīt), *n.* Atmospheric pressure expressed in terms of the height of a barometric column of fluid of uniform density equal to that of the air at the point where the pressure is to be measured. Same as *height of a homogeneous* ★*atmosphere.*

pressure-key (presh′ṳr-kē), *n.* In *exper. psychol.*: (*a*) A pneumatic key, pressure upon which moves the writing lever of a Marey tambour to which the key is connected. *Amer. Jour. Psychol.*, XII. 327. (*b*) A reaction-key, pressure upon which breaks the reaction-circuit.

pressure-log (presh′ṳr-log), *n.* An instrument which records the velocity of a stream, measured by the height of the water in a tube. It is also referred to as a pressure-gage, which indicates the pressure of fluids.

> By means of a number of ingenious *pressure-logs*, the velocities of the streams at different points were measured by the heights of water in tubes.
> *White*, Manual of Naval Architecture, p. 455.

pressure-plate (presh′ṳr-plāt), *n.* In a steam-engine, a cover-plate; a plate on the back of a slide-valve designed to relieve the pressure of the valve on the seat; a balance-plate designed to receive the pressure of the steam against a fixed abutment, so that such pressure does not reach the sliding valve and force it against its seat.

pressure-point (presh′ṳr-point), *n.* **1.** A point on the surface of the body, pressure on which may excite or arrest a paroxysm of hystero-epilepsy.—**2.** A spot on the skin which is sensitive to pressure.

pressure-pump (presh′ṳr-pump), *n.* A force-pump; a pump for compressing or applying pressure to a fluid, as distinguished from a pump in which the action is by suction or exhaust.

pressure-ridge (presh′ṳr-rij), *n.* A ridge produced in a solidifying lava by the influence of a force applied in the flowing of subcrustal molten matter. These ridges vary in size, with the energy of the movement and the thickness of the forming crust, from a few inches to 30 feet in height. The term was introduced by I. C. Russell. *U. S. Geol. Surv.*, Bulletin 199, 1902, p. 94.

pressure-sense (presh′ṳr-sens), *n.* Passive touch; the sense which furnishes the sensation-qualities of tickle, contact, and pressure.

pressure-shift (presh′ṳr-shift), *n.* The change of position of lines in the spectrum of a gas due to the pressure to which the radiating gas is subjected. With increase of pressure the displacement is generally toward the red end of the spectrum.

pressure-table (presh′ṳr-tā″bl), *n.* A table of figures which show the pressure sustained by a gun.

pressure-touch (presh′ṳr-tuch), *n.* In *pianoforte-playing*, a method of using the fingers so as to depress the keys with a steady, clinging pressure, instead of with a sharp blow.

pressure-tube (presh′ṳr-tūb), *n.* **1.** A tube of thick glass originally closed at one end and, after the introduction of liquid reagents, closed also, by fusion, at the other. On cautiously heating such a tube interaction of its contents may be brought about at a much higher temperature than would be possible in an open vessel and therefore under ordinary atmospheric pressure.—**2.** The brass, or German silver, or highly elastic steel tube used in the Bourdon pressure-gage.

presternal, *a.*—**Presternal process,** a projection from the anterior border of the sternum such as is found in pterodactyls. *Amer. Jour. Sci.*, April, 1904, p. 319.

II. *n.* A presternal process.

Preston beds. See ★*bed*¹.

Prestwichia (prest-wich′i-ä), *n.* [NL., named after the English geologist Sir Joseph *Prestwich.*] A genus of fossil limuloid arthropods of the order *Xiphosura*, similar in form to the modern horseshoe-crab, *Limulus*, but with seven spiny abdominal segments and a short caudal spine: found in the Carboniferous of Europe and North America.

presume, *v. t.* **3**†. To take; to take to oneself: with *of.*

> *Presume of* what thou wilt at his house, for he is out of the way by this time .
> . . . .
> *Presume* you & your friend . . . *of* what may satisfie you at your vncles. *Chapman*, May-Day, iii.

presumption, *n.*—**Natural presumption,** in *law*, the conclusion, from given facts, reached through probable reasoning by one of average intelligence.

Presumptive title. See ★*title.*

presymphysial, *a.* **II.** *n.* Same as ★*premandibula.*

presynsacral (prē-sin-sā′kra̤l), *a.* and *n.* **I.** *a.* Situated in advance of the synsacrum; specifically, in *ornith.*, noting any vertebra in advance of the synsacrum, or that mass of united vertebræ commonly spoken of as the sacrum.

> All the *presynsacral* vertebræ [of cuckoos] are heterocœlous and all the thoracic vetebrae are free.
> *Proc. Zool. Soc. London*, 1903, p. 271.

II. *n.* A presynsacral vertebra.

pretemporal (prē-tem′pọ-ra̤l), *a.* [*pre-* + *temporal.*] Preceding time; antemundane.

preternormal (prē-tėr-nôr′ma̤l), *a.* [*preter-* + *normal.*] Beyond the normal. *Outlook*, Jan. 21, 1899, p. 188.

pretertiary (prē-tėr′shi-ạ̄-ri), *a.* [*pre-* + *tertiary.*] Living or occurring before the Tertiary.

> All are marine and many are pelagic and of very wide distribution. No *prætertiary* members of this division, as here defined, have yet been found.
> *Annals and Mag. Nat. Hist.*, March, 1904, p. 181.

prethoracic (prē-thō-ras′ik), *a.* [*pre-* + *thoracic.*] Situated in front of the thorax.

prethyroid (prē-thī′roid), *a.* [*pre-* + *thyroid.*] Anterior to the thyroid gland or to the thyroid cartilage.

> A small, probably congenital, *prethyroid* cyst.
> *Med. Record*, Feb. 7, 1903, p. 234.

prethyroidal (prē-thī-roi′da̤l), *a.* Same as ★*prethyroid* and ★*prethyroideal.*

prethyroideal (prē-thī-roi′dẹ-a̤l), *a.* In advance of the thyroid cartilage of the larynx. *Proc. Zool. Soc. London*, 1901, p. 297.

prethyroidean (prē-thī-roi′dẹ̄-a̤n), *a.* Same as ★*prethyroid.*

Pretorian front, the front of a Roman camp toward the enemy. In its center was the pretorian gate, porta pretoria, one of the terminations of the via pretoria, one of two main streets which quartered the camp, the other being the via principalis.

pretracheal (prē-trā′kẹ-a̤l), *a.* [L. *præ*, before, + NL. *trachea* + *-al*¹.] Anterior to the trachea.

> Some of these trunks end, according to Poirier, in the prelaryngeal glands, others in a *pretracheal* gland, and still others in one of the glands of the middle or inferior sterno-mastoid chain (Most).
> *Lancet*, June 18, 1904, p. 1711.

pretrochal (prē-trō′ka̤l), *a.* [*pre-* + *trochal.*] **1.** Anterior to the trochal disk.

> The entire ectoblast of the trochal and *prae-trochal* regions. *E. B. Wilson*, Biol. Lectures, 1893, p. 10.

2. Lying in front of the prototroch: said of the position of cells or organs in the trochophore larva of the marine annelids.

pretty-face (prit′i-fās), *n.* A small kangaroo. *E. E. Morris*, Austral English.

pretuberculous (prē-tū-bėr′kụ̄-lus), *a.* [*pre-* + *tuberculous.*] Preceding the onset of tuberculosis. *Buck*, Med. Handbook, II. 809.

preumbonal (prē-um′bọ̄-na̤l), *a.* [L. *præ*, before, + *umbo*, a projection, + *-al*¹.] Lying in front of the beaks or umbones: used in descriptive zoölogy with reference to the shells of pelecypod mollusks.

prevaccinal (prē-vak′si-na̤l), *a.* [*pre-* + *vaccine* + *-al*¹.] Before vaccination: noting usually the period before the adoption of vaccination as a preventive of smallpox. *Buck*, Med. Handbook, VII. 245.

preventer, *n.*—**Single preventer,** in *cotton-manuf.*, a device attached to a drawing-frame for actuating a mechanism for immediately stopping the machine upon the breakage or omission of a single end or strand of sliver. *Taggart*, Cotton Spinning, II. 23.

preventer-bolt (prẹ̄-ven′tėr-bōlt), *n.* See ★*preventer-plate.*

preventer-plate (prẹ̄-ven′tėr-plāt), *n.* In *wood ship-building*, a plate or bar fitted on the side and forming an extension downward of the chain-plate. Together with the chain-plate, it is bolted at its upper end through the side of the vessel by a chain-bolt and at its lower end it is bolted through the side by a preventer-bolt.

preventer-stays (prẹ̄-ven′tėr-stāz), *n. pl.* Same as ★*jumper-stays.*

prevernal (prē-vėr′na̤l), *a.* [L. *pre-* + *vernal.*] **1.** Elapsing just before the leafing of the earliest trees: as, the *prevernal* period.—**2.** Blooming at this period. Prevernal bloomers comprise proteranthous trees, such as the silver and red maples and white elm, and low bulbous herbs, such as skunk-cabbage and *Erigenia. Science*, Feb. 7, 1908, p. 206.

prevomer (prē-vō′mėr), *n.* [*pre-* + *vomer.*] A median bone of the under side of the cranium, which occupies the place of the vomer but develops in connection with the paraseptal cartilages: found in *Platypus* and lizards. *Nature*, Dec. 18, 1902, p. 168.

prey-brother (prā′bruᴛʜ″ėr), *n.* A member of a secret society of the Zuñi Indians in whose charge the ceremonial of the prey-god is placed. *F. H. Cushing.*

prey-god (prā′god), *n.* A deity of the Zuñi Indians representing an animal of prey. *F. H. Cushing*, in An. Rep. Bur. Amer. Ethnol., 1880–81, p. 16.

prezoic (prē-zō′ik), *a.* [L. *præ*, before, + Gr. *ζωή*, life.] Antedating or preceding the appearance of life upon the earth. *Smithsonian Rep.*, 1899, p. 233.

prezonal (prē-zō′na̤l), *a.* [*pre-* + *zone* + *-al*¹.] Anterior to the pelvic arch.

P. R. I. An abbreviation of *President of the Royal Institute* (of Painters in Water-colors).

Priapulidæ (prī-a-pū′li-dē), *n. pl.* [NL. *Priapul*(*us*) + *-idæ.*] The single family of the *Priapuloidea*, which has the characters of the group. It includes two genera, *Priapulus* and *Halicryptus.*

Priapuloidea (prī-ā-pṳ-loi′dẹ̄-ä), *n. pl.* [NL. *Priapul*(*us*) + *-oidea.*] A group of unsegmented vermiform animals having an anterior and a posterior terminal opening of the alimentary canal, the central nervous system not separated from the ectoderm, and the renal and reproductive organs entirely separate from the body-cavity. They are marine animals found in the sand and mud of the North Sea. The sexes are separate and the development is unknown. It contains the single family *Priapulidæ.*

Priapulus (prī-ap′ṳ-lus), *n.* [NL. dim. of *Priapus.*] The typical genus of the family *Priapulidæ. Lamarck.*

Priapus, *n.* **4.** [*l. c.*] In medieval warfare, some kind of projecting machine, probably an early form of cannon. *Meyrick*, Ancient Armour, III. Glossary.

pribble-prabble, *n.* A Welshman's rendering of *bribble-brabble*, a reduplication of *brabble* (which see).

> It were a goot motion if we leave our *pribbles* and *prabbles*, and desire a marriage between Master Abraham and Mistress Anne Page. *Shak.*, M. W. of W., i. 1.
>
> All these squabbles and jokes, and *pribbles* and *prabbles*, look you, may be omitted.
> *Thackeray*, Newcomes, I. ii.

price, *n.*—**Certain price,** in foreign exchanges, the fixed sum in one currency of which the value is expressed by a varying sum in another. *N. E. D.*—**Competition** or **competitive price.** See ★*competitive price.*—**Contract prices.** See ★*contract.*—**Long price,** the full retail price, without deduction, discount, or rebate.—**Spot price,** the price set or quoted for payment on delivery.—**Time prices,** prices set for goods sold on credit or to be paid at a future date.

price-changer (prīs′chān″jėr), *n.* A mechanical device, forming part of the mechanism of a prepayment gas-meter, by which the number of cubic feet of gas delivered for a coin of a certain size placed in the slot is adjusted to the price the gas is sold at in the district. *W. J. Dibdin*, Public Lighting, p. 170.

price-mark (prīs′märk), *n.* A label or ticket, placed on goods for sale, with the price marked on it.

pricing-machine (prī′sing-ma̤-shēn″), *n.* A machine for printing prices on cards or tickets, similar in construction to a ★dating-machine (which see). *Engin. Mag.*, July, 1904, p. 606.

prick-bar (prik'bär), *n.* A firing-tool; a long iron bar used for pricking or breaking up a bituminous coal fire and for cleaning clinker from the grate. *Witham*, Const. Steam Engineer., p. 724.

pricker, *n.* 1. (*k*) In machine telegraphy, one of the vertical rods in a Wheatstone transmitter which makes the signal-contacts through perforations in the tape. (*l*) A prick-bar.

prick-fish (prik'fish), *n.* One of the lantern-fishes, *Macrostoma angustidens*, of the family of *Myctophidæ*, found in the Atlantic and Indian oceans.

prickfoot (prik'fůt), *n.* A prickly, prostrate plant of the parsley family, *Eryngium vesiculosum*, found in Australia, Tasmania, and New Zealand.

pricking, *n.* 6. *Naut.*, an English term referring to the propulsion of a punt in shallow water by means of a long pole thrust against the bottom. In America it is called *punting*, or *poling*.

prickle-machine (prik'l-mạ-shēn″), *n.* In *cheese-making*, see the extract.

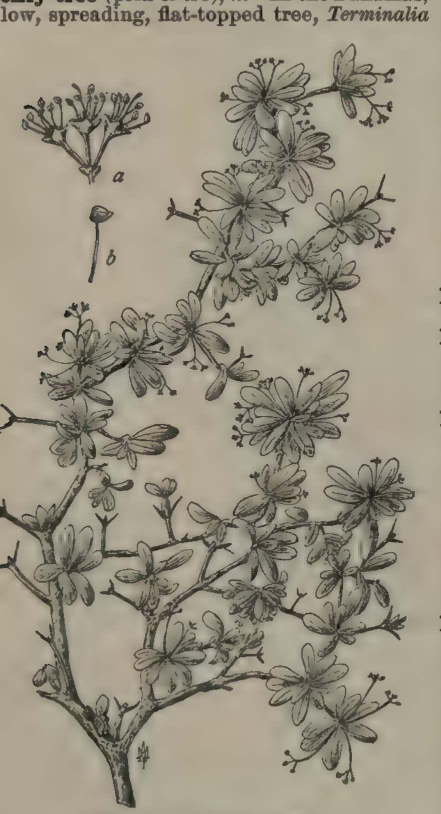
> In the caves the cheeses are salted at least twice with a coarse hard-grained salt. In this process they are first salted on one side and then laid in piles of three for the salt to diffuse into the cheese. At the second salting the other side receives the salt. They are allowed to drain some time after salting. After the surface has dried somewhat they are run through a brushing machine which leaves a clean surface. They then go through the *prickle-machine*. This machine has a disk set with long parallel needle-like spikes which make numerous holes through the cheese to let in the air for the growth of mold.
> *Rep. Bureau of Animal Industry*, 1905, p. 102.

prickly-cedar, *n.* 2. See ★*cedar*.

prickly-elder (prik'li-el″dėr), *n.* See ★*elder*^{2}.

prickly-fern (prik'li-fėrn), *n.* See ★*fern*^{1}.

prickly-tree (prik'li-trē), *n.* In the Bahamas, a low, spreading, flat-topped tree, *Terminalia spinosa*, of the family *Combretaceæ*, with horizontal spiny branches, bearing fascicles of thick, smooth, obtuse leaves, and axillary spikes of small greenish flowers.



Prickly-tree (*Terminalia spinosa*).
a, flower; *b*, stamen.

prick-mark (prik'märk), *n.* In old English silver, decoration or inscription composed of fine depressions made with a sharp point or punch.

> They are almost always found with the initials in *prick-mark* letters of donor and recipient together with the date.
> *Percy Macquoid*, in Burlington Mag., I. 174.

pride^1, *n.*—**Pride of the morning** (*meteor.*), a mist or light shower at sunrise, through which the tropical sunbeams sometimes penetrate with beautiful prismatic effect.

pride^2, *n.* 2. The larval lamprey. [Prov. Eng.]

Priests' code. See ★*code*.

primage, *n.* 3. A duty of one per cent. imposed by the Victorian Parliament 1893–95, on the prime, or first entry of goods. *E. E. Morris*, Austral English.

Primal figure. See ★*figure*.

primary. I. *a.*—**Primary belief.** See ★*belief*.—**Primary circuit**, in a transformer or induction-coil, the circuit in which the inducing current flows.—**Primary coil**, the coil of a transformer or apparatus for the production of induced current, in which the inducing current flows.—**Primary cortex.** (*a*) Same as *periblem*. (*b*) The body of the bark which lies between the epidermis and stele (central cylinder) in the stems of phanerogams, as also the corresponding zone in the root. In this sense sometimes simply *cortex*. *Strasburger*.—**Primary current**, the inducing current in a transformer or induction-coil.—**Primary resistance**, the resistance of the inducing circuit of a transformer or induction-coil.—**Primary terminals**, the free ends of the coil in the inducing circuit of a transformer.—**Primary turns**, in a transformer or induction-coil, the ampere-turns in the inducing coil.—**Primary voltage**, the voltage applied to the terminals of the inducing coil of a transformer.—**Primary winding**, the coil of the inducing circuit of a transformer.

II. *n.* 6. In *elect.*: (*a*) In an alternating-current transformer, induction-motor, or other apparatus containing two circuits in inductive relation to one another, that circuit which receives power from the impressed electromotive force. (*b*) Sometimes, in an alternating-current transformer, the high potential coil, the low potential coil being the secondary.—7. In *physiol. optics*, one of the primary colors or primary color-sensations.

> As a matter of scientific analysis, the *primaries* of white light are red, green, and purple, but the pigmental *primaries* are red, yellow, and blue.
> *Encyc. Brit.*, XXXII. 16.

8. A lesion of the initial stage of syphilis, a chancre: usually in the plural.—9. In *Echinodermata*: (*a*) In echinoids, a plate which extends from the outer edge of an ambulacral area to the median suture of that area. (*b*) In echinoids, a spine of the largest order extending beyond the shorter secondaries. (*c*) In crinoids, according to Bather's terminology, any one of those plates which are first developed in the ontogeny and phylogeny, including the abactinal system of columnals, cirrals, infrabasals, basals, radials, brachials, pinnulars, and the actinal system of orals and ambulacrals. (*d*) In the *Echinoidea*, one of the large and completely developed tubercles on the surface of the test, which serve as articulating bases for the spines.—**Spurious primary.** See ★*predigital*.

primate, *n.* II. *a.* Relating to or characteristic of the order *Primates*.

prime, *n.* 12. The golden number: so called because it shows the prime of the moon.—13. The grade next below the finest variety of a fleece of merino wool.

prime, *v.* I. *intrans.* 4. To occur or come in advance of others: thus, flood-tide lags between new moon and full moon, but *primes* between full and new.—5. To have precedence, as one claim over another. [Rare.]

II. *trans.* 3. In *tobacco-growing*: (*a*) To gather the ripe lower leaves from: said of the plant. (*b*) To gather as ripe: said of leaves. (*c*) To gather later instalments of (leaves). See ★*priming*, 5.

primer^2, *n.*—**Detonating primer**, a primer for detonating high explosives upon being itself exploded by a fuse or by electricity.—**Electric primer**, a primer which is fired by passing an electric current through it. See *primer*^{2}, 1 (*a*).—**External primer**, in *ordnance*. The external friction-primer is the same as the *vent-sealing* ★*primer*, but is exploded by means of a wire and lanyard (as in the ordinary friction-primer) instead of a firing-lock. This primer is employed in case of damage to the firing-lock.—**Quill friction-primer**, in *ordnance*, a primer made of two quills, one being inside the other, and filled with antimony trisulphid, potassium chlorate, flour of sulphur, and a small amount of gum-arabic. Within the quills are wires, and when the lanyard is pulled these wires are withdrawn, and the primer is exploded by friction.—**Quill tube-primer**, in *ordnance*, a friction-primer.—**Vent-sealing primer**, in *ordnance*, a primer used in modern breech-loading guns, on the principle of a pistol-cartridge, and fired by a mechanism called a "firing-lock." The flame from the primer passes through the stem of the mushroom, into the powder charge in the chamber of the gun, and the lead bullet closes the vent and prevents the escape of gas rearward.

primibrach (prī'mi-brak), *n.* [L. *primus*, first, + *brachium*, arm.] In Bather's terminology of crinoid morphology, one of the ossicles (*primibrachialia*) of a pinnulate dichotomous arm situated between the upper margins of the radials and below the first axillaries, which by other writers have been called radials of the first order, and costals.

primicerius (pri-mi-sē'ri-us), *n.*; pl. *primicerii* (-ī). [LL., lit. 'one of the first page,' one named on the first page or at the head of a list, < L. *prima cera*, the first tablet or page: *primus*, first (see *prime*), *cera*, a wax tablet, lit. wax. See *cere*.] In medieval use, a leader or superintendent in various relations, chiefly ecclesiastical; specifically, a precentor or cantor in a cathedral.

priming, *n.* 5. In *tobacco-growing*: (*a*) The act of gathering an instalment of leaves. (*b*) The leaves of one of the gatherings. See ★*prime*, 3 (*a*).

> The first *priming*, which means the first four leaves taken from the stalk, also the last *priming*, which means the last four or six leaves taken from the top of the stalk, are kept separate. *U. S. Dept. Agr.*, Rep. 62, p. 14.

6. In *brewing*, an addition of sugar to the beer in the settling back, furnishing material for further fermentation.

priming-valve (prī'ming-valv), *n.* 1. A relief-valve; a pet-cock; a valve to permit the water of condensation to escape from an engine.—2. A valve which affords communication to the top of a pump so that water can be poured in to prime the pump, filling the clearances, displacing the air, and causing the valves to operate with certainty in starting.

primite (prī'mīt), *n.* [L. *primus*, first, + *-ite*^{1}.] In gregarines, the first member of a chain-like association or colony. Compare ★*satellite*, 5. *Sedgwick*, Text-book of Zool., I. 57.

Primitia (pri-mish'i-ä), *n.* [NL., < L. *primitiæ*, the first-fruits. See *primitiæ*.] A genus of small fossil *Crustacea* of the order *Ostracoda*, with ovate or oblong bivalve shells. They occur abundantly in some shales and limestones of Lower Paleozoic age.

primitiv, *a.* and *n.* A simplified spelling of *primitive*.

primitive, *a.* 7. In the history of art, belonging to an early and not fully developed period.—8. In *group-theory*, not imprimitive.—**Primitive band.** See ★*band*^{2}.—**Primitive form.** (*b*) In *crystal.*, see *decrement*, 4.—**Primitive predication.** See ★*predication*.—**Primitive solution**, in *math.*, same as *complete primitive*. See *primitive*, 3.

II. *n.* 4. [*cap.*] In the *fine arts*, a craftsman or artist who belongs to an early or underdeveloped period; especially, in the history of European painting, those painters of Italy, Flanders, Germany, and France who flourished in the fourteenth and fifteenth centuries, at the close of the medieval period and the beginning of the Renaissance. See ★*painting*, 1.

> If, as is said, this picture was painted when Madox Brown was in Antwerp under Wappers, it is really the archetype of the whole school. It shows, indeed, that the term Pre-Raphaelite was a misnomer, for these artists did not really go to the Italian *primitives*, but to the Flemish.
> *Athenæum*, April 1, 1905, p. 408.

5. A work of art produced by one of the primitives.

> Now it is a very beautiful Italian *primitive*, a cassone front of the great Florentine period.
> *N. Y. Times*, May 6, 1903.

Primitive of a differential equation. See ★*equation*.

primogenito (prē-mō-hā'nẹ-tō), *n.* [Sp., < L. *primogenitus*, first-born. See *primogeniture*.] In the Philippine Islands, the official birth of the eldest son of a cabeza de barangay, who has to act as substitute in the absence of his father. See ★*barangay*.

primordium, *n.* 3. In *embryol.*, the first trace of a future organ.

primrose, *n.*—**Native primrose**, a perennial herbaceous Australian and Tasmanian plant, *Goodenia geniculata*, which has yellow flowers, from one half to one inch long, and leaves resembling the common primrose.—**Primrose day.** See ★*day*^{1}.

primsign (prim'sīn), *v. t.* [Icel. *primsigna*, < ML. *prima signatio*, 'the first signing' with the sign of the cross: see *prime* and *signation*, and cf. *sign*, *v.*, 1.] In reference to Old Norse use, to mark or sign with the sign of the cross: a religious act preliminary to christening.

> In Greece, he [Olaf] had, according to the legend, only been *primsigned*—i.e., marked with the sign of the cross. This was regarded as a sort of compromise between the old faith and the new, and was supposed to secure a certain favor from Christ the White, without entirely forfeiting the good-will of the old gods.
> *Boyesen*, Story of Norway, p. 138.

Primula, *n.* 3. [*l. c.*] In *dyeing*, Hofmann's violet.

primulin, *n.* 2. A direct cotton coal-tar color of the thiazol type. It dyes unmordanted cotton yellow in a neutral or slightly alkaline bath. When yarn dyed in this way is diazotized and developed with β-naphthol, the yellow color is changed to a bright red which possesses good fastness to washing.—**Primulin process.** Same as ★*diazotype*.

prin. An abbreviation of *principal.*

prince, *n.*—**Prince Albert coat.** See ★*coat*2.—**Prince of the blood,** the son, brother, or uncle of a reigning sovereign.

Princess of the blood, the daughter, sister, or aunt of a reigning sovereign.

princewood, *n.* 2. A small West Indian rubiaceous tree, *Exostema Caribæum.* See *Exostema, Caribbean bark* (under *bark*2), and *seaside beech* (under *beech*1).

principal. I. *a.*—**Principal axis of symmetry, principal plane of symmetry.** See ★*symmetry,* 6.—**Principal triangle.** See ★*triangle.*

II. *n.* 8. (*b*) A main truss, as of a roof, where there may be many principals.—13. In the Philippine Islands, every member, present or past, of the council of a pueblo; also, a first-born son of a gobernadorcillo or of a cabeza de barangay. See ★*barangay.*

principale (prin-si-pā′lē), *n.*; pl. *principalia* (-li-ạ̈). [L. neut. of *principalis,* principal.] In hexactinellidan sponges, one of the large, regular hexactinal spicules arranged to correspond with the intervals between the thimble-shaped chambers.

principal-work (prin′si-pạ̈l-wėrk), *n.* In *organ-building,* a collective term for all the flue-stops which have open metal pipes, yielding tones of either the diapason or the string class.

principle, *n.*—**Active principle,** a substance, either alkaloid or glucoside, contained in a crude vegetable drug, upon which the chief medicinal property of the drug depends: thus morphine is one of the active principles of opium.—**Babinet's principle** or **theorem,** a theorem, dealing with the diffraction of light, which may be stated thus: complementary screens produce diffraction patterns which are identical with the exception of the central region, corresponding to zero angle of diffraction. *C. S. Hastings,* Light, p. 130.—**Clausius's principle of the increase of entropy.** See ★*entropy.*—**Hadley's principle,** an arbitrary rule, assumed by George Hadley in 1744, to the effect that a body projected meridionally north or south from any point on the earth's surface gradually deviates to the east or west respectively because it retains its original eastward velocity while passing over regions that move with less or greater eastward diurnal rotatory speed. Hadley's explanation of trade-winds and anti-trade winds was first overthrown by Ferrel in 1856.—**Hamilton's principle,** the principle that if a system of bodies is at A at the time t_0 and at B at the time t_1, it always goes from the first situation to the second in such a way that the mean value of the difference between the kinetic and potential energy, in the interval of time which separates the two epochs t_0 and t_1, may be as small as possible.—**Lavoisier's principle.** Same as *the* ★*principle of the conservation of mass.*—**Mayer's principle.** Same as *the law of the conservation of energy.*—**Newton's principle,** the principle that action is equal to reaction.—**Pascal's principle.** See *Pascal's* ★*law.*—**Principle of least time.** See *Fermat's* ★*law.*—**Principle of motor excess.** See ★*excess.*—**Principle of relativity,** the principle that the laws of physical phenomena should be the same for a fixed observer and one carried along in a uniform motion of translation.—**Principle of Soret.** See *Soret* ★*phenomenon.*—**Principle of the conservation of mass,** the principle that the quantity of matter as tested by the balance is unchangeable by any transmutation of form or state.—**Thermokinetic principle** the principle that if a thermodynamic system, the energy of which consists of two parts, T and U (the potential energy), receives increments of energy δT and δU, while the work done upon it is $\Sigma P_i\,dq_i$ and the heat absorbed is δQ, then the integral for the time interval $t_1 \ldots t_0$,

$$\int_{t_0}^{t_1} dt\,(\delta T - \delta U + \Sigma P_i dq_i + \delta Q),$$

is equal to zero.—**Zymotic principle.** Same as *contagium,* 2.

pringle (pring′gl), *v. t.* and *i.*; pret. and pp. *pringled,* ppr. *pringling.* To crackle or crunch.

> I . . . dropped upon my knees on her sacred soil [France] and, with the strong smell of the seaweed in my nostrils, pressed my lips upon the wet and *pringling* gravel.
>
> *A. Conan Doyle,* Uncle Bernac, in Cosmopolitan Mag., [Jan., 1897, p. 263.

print, *n.* In *founding:* (*a*) A core-print; a projection on the pattern which leaves a recess in the sand in which to rest the end of the core for a hollow casting. (*b*) The impression left in the sand by a projecting part of the pattern, in which the end of the core is to rest.—**Contact print.** See ★*contact*1.—**Hammered print,** an early engraving in which the design was worked out with a sharp point and hammer; dotted print. See *dotted manner* (under *dot*1). *Singer and Strang,* Etching, Engraving, etc., p. 105.—**Point print.** See ★*point-print.*—**Tangible print,** raised or embossed letters or groups of dots impressed upon paper by means of an embossing-typewriter or by means of embossed plates used in a press to transfer the marks to paper. See ★*kleidograph,* ★*point-printing,* and ★*point system.*—**Tartaric-acid print,** in *photog.,* a silver print made on paper immersed in a solution of tartaric acid previous to being floated in a bath of aceto-silver nitrate. *E. L. Wilson,* Cyclopædic Photog., p. 379.

print-butter (print′but″ėr), *n.* See ★*butter*1.

print-color (print′kul″ọr), *n.* A color applied to a textile fabric on a printing-machine.

printing, *n.*—**Contact-printing.** See ★*contact.*—**Dry printing,** a method of printing from relief surfaces on dry paper that has not been subjected to the old preliminary process of dampening to make it more pliable under the impression of the press. For illustrations of delicacy, as in the half-tones of photo-engraving, with shallow counters liable to be choked with ink, calendered or surfaced papers are preferred. The dry paper confines impression to the surface only of the engraving; it does not overlap and thicken lines, as was almost unavoidable when impression was made on damp paper.—**Embossed printing,** the stamping of letters or designs with enough force to raise them above the surface of the paper, so that they can be read by the blind by sense of touch. This method is also used in decorative printing to enforce contrast of light and shade.—**Point printing.** See ★*point-printing.*—**Stigmatypic printing,** the printing on boards from types hot enough to burn or brand: brand-printing: descriptive of prints or plates made from compositions of stigmatype.—**Vigoureux printing,** a method of printing the sliver from a wool- or cotton-combing machine for the production of variegated yarn.

printing-machine, *n.*—**Cylinder printing-machine,** a machine that gives impression to type or plates upon a flat surface by a cylinder. When the type or plates are on one cylinder, and receive impression from another cylinder, the machine so constructed is known as a *rotary.*

printing-press, *n.*—**Double-feeding printing-press,** a press which requires two feeders, each handling a separate sheet of paper: usually a cylinder-machine.—**Duplex printing-press,** a press having two cylinders and two end-plates, which prints one side with the forward and the other with the backward movement of the bed.—**Eight-cylinder printing-press,** a type-revolving press having eight impression-cylinders.—**Eighth-medium printing-press,** a job-printing press made to print type or plates on paper about 6 × 10 inches in size. See *half-medium* ★*printing-press.*—**Half-medium printing-press,** a press for job-work, made to print forms of half-medium size, about 10 × 12 inches.—**Perrotine printing-press,** in *calico-printing,* a block-printing machine operated without manual labor. The pattern is cut in relief on the blocks, which are equal in length to the width of the fabric and from two to five inches wide: used only to a very limited extent outside of Alsace and Belgium. Invented by Perrot of Rouen in 1834.—**Quarter-medium printing-press,** a small printing-machine made for job-work, to print a sheet about 10 × 12 inches in size.

print-meter (print′mē″tėr), *n.* In *photog.,* an instrument which shows the time of exposure in contact-printing. Also used for testing speeds of plates and papers.

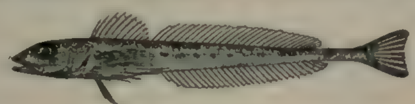
> A "*Print meter*" is also made for showing the exposures in contact-printing on sensitive papers, but it can also be used for testing speeds of plates and papers.
>
> *Encyc. Brit.,* XXXI. 702.

priocerous (prī-os′e̤-rus), *a.* [Irreg. < Gr. *πρίων,* saw, + *κέρας,* horn.] In *entom.,* having serrate antennæ.

priodont (prī′ō-dont), *n.* [Irreg. < Gr. *πρίων,* saw, + *ὀδούς* (*ὀδοντ-*), tooth.] A form of mandible in the coleopterous family *Lucanidæ* which exhibits the simplest development.

Prionace (prī-on′ạ-sē), *n.* [NL., < Gr. *πρίων,* saw, + *ἀκή,* a point.] A genus of sharks, of the family *Galeidæ,* found in warm seas.

Prionistius (prī-ọ̄-nis′ti-us), *n.* [NL., so called in allusion to the form of the dorsal fin; < Gr. *πρίων,* saw, + *ἱστίον,* sail.] A genus of cottoid fishes found on the Alaska coast.



Prionistius macellus.
(From Bulletin 47, U. S. Nat. Museum.)

Prionites, *n.* 2. A genus of discocampylous ammonoid cephalopods found in the Triassic rocks.

prionodesmacean (prī″ọ̄-nọ̄-des-mā′sẹ̄-ạn), *a.* Of or pertaining to the *Prionodesmacea.*

prionodesmaceous (prī″ọ̄-nọ̄-des-mā′shius), *a.* Same as ★*prionodesmacean.*

prionodesmatic (prī″ọ̄-nọ̄-des-mat′ik), *a.* Same as ★*prionodesmacean.*

prionoid (prī′ọ̄-noid), *a.* [*πρίων,* a saw, + *-oid.*] Notched or toothed like a saw.

Prionotus (prī-ọ̄-nō′tus), *n.* [NL., for **Priononotus,* < Gr. *πρίων,* saw, + *νῶτος,* back.] A genus of fishes of the family *Triglidæ* having numerous species, most of which are American. See cut at *striped* ★*gurnard.*

Prionus, *n.* 2. [*l. c.*] A beetle of this genus.—**Broad-necked prionus,** an American cerambycid beetle, *Prionus laticollis.* See *Prionus.*—**Tile-horned prionus,** a large American cerambycid beetle, *Prionus imbricornis.* See cut under *Prionus.*

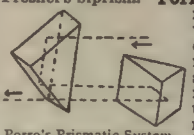
priority, *n.*—**Law of priority.** See ★*law*1.

Priscian, *n.*—**To scratch Priscian,** to make a small grammatical error. See *to break Priscian's head,* under *break.*

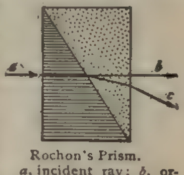
> Bon, bon, fort bon! *Priscian* a little *scratched,* 't will serve.
>
> *Shak.,* L. L. L., v. 1.

Priscillian (pri-sil′yạn), *a.* Of or pertaining to Priscillian or the Priscillianists. See *Priscillianist.*

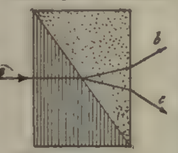
prism, *n.* 1. According to some authors any form having two pairs of parallel faces is called a *prism;* in this sense the term includes the domes of the orthorhombic system (this name being then restricted to a form having two faces only intersecting in an edge) and the hemipyramids of the monoclinic system.—**Foucault prism,** a modification of Nicol's prism for the polarization of light, in which an air-film is substituted for the layer of Canada balsam and the length of the rhomb of calcite is greatly reduced.—**Govi's prism,** a combination of two similar right-angled prisms of equal size with the hypotenusal faces half-silvered and placed together so as to form a rectangular body of glass with a diagonal reflecting surface.—**Objective prism,** a large prism of small refracting angle placed in front of the object-glass of a telescope to form, at the focus, the spectra of all the stars included in the field of view: first used by Fraunhofer, and reintroduced by Secchi. The combination constitutes a slitless spectroscope. The term is sometimes, though rarely, used to denote a reflecting prism placed outside the object-glass to deflect the rays as they enter the instrument.—**Ohm's prism,** a form of biprism for the production of interference-fringes which consists of two similar wedges of glass of very small angle placed with their thicker edges in contact and two of the faces in the same plane. The other faces then form a very obtuse angle, as in Fresnel's biprism.—**Porro's prisms,** a system of totally reflecting prisms of glass placed within a telescope or within each of the tubes of a binocular field-glass, between objective and eyepiece, for the purpose of increasing the focal length of the instrument. The arrangement of Porro's prisms is shown in the diagram.—**Rochon's prism,** a prism of doubly refracting material which polarizes a ray of common light and also effects a divergence of the extraordinary from the ordinary ray. It consists of two prisms, one cut parallel and the other cut perpendicular to the optic axis, cemented together. The deviation of the extraordinary ray, *c,* is toward the apex of the second prism if the crystal is positive (calc-spar) or toward the base if it is negative (as some quartz).—**Sun-prism,** an attachment to the telescope devised by Colzi, an Italian astronomer, for reducing the brightness of the solar image. The beam of light at the eye end of the telescope is reflected from the interface between a glass prism and a liquid having nearly but not quite the same index of refraction as the glass. Under these conditions the reflected ray, which goes to form the image, is greatly diminished in intensity.—**Wollaston's prism,** a prism of doubly refracting material similar in construction and effect to Rochon's (which see). Both the ordinary and the extraordinary rays undergo deviation.



Porro's Prismatic System.



Rochon's Prism.
a, incident ray; *b,* ordinary ray; *c,* extraordinary ray.
(From Preston's "Theory of Light.")



Wollaston's Prism.
a, incident ray; *b,* ordinary ray; *c,* extraordinary ray.
(From Preston's "Theory of Light.")

prismatic, *a.* 3. In *anat.,* noting muscles whose fibers run direct and parallel with one another from the point of origin to the point of insertion: correlative with ★*pyramidal,* 3, and ★*rhomboidal,* 2.

> Muscles of the former group are called *prismatic* or bandlike; those of the latter, triangular or pyramidal.
>
> *Encyc. Brit.,* XXV. 395.

Prismatic binocular, camera, eyepiece. See ★*binocular,* etc.—**Prismatic fabric,** in *petrog.,* a texture in rocks produced by crystals mostly prismatic in shape.—**Prismatic spectrum,** a spectrum produced by the passage of light through a prism or train of prisms. In prismatic spectra the distribution of wave-lengths is not uniform, the law of dispersion depending upon the material of the prism. When a glass prism is used, the dispersion within the visible spectrum is greatest in the violet and decreases continuously toward the red.

prismatine (priz′mạ̈-tin), *n.* [Gr. *πρίσμα(τ-),* a prism, + *-ine*2.] A mineral near ★kornerupine (which see).

prismatoid, *n.* 2. A term used by N. Story Maskelyne for a crystal form whose faces are parallel to one of the crystallographic axes while meeting the other two axes.

prismoid, *n.* 2. A prismatoid whose base and top have the same number of sides, and every corresponding pair parallel. See *prismatoid,* 1.

prism-spherometer (prizm′sfẹ̄-rom″e-tėr), *n.* A prism designed for use in ascertaining the curvature of surfaces.

prism-stereoscope (prizm′ster″ẹ̄-ọ̄-skōp), *n.* In *exper. psychol.,* Dove's name for the *total-reflection* ★*pseudoscope. E. B. Titchener,* Exper. Psychol., I. ii. 295.

prisometer (pri-zom′e-tėr), *n.* [Gr. *πρῖσις,* a severing, + *μέτρον,* measure.] An apparatus devised by Riverchon for measuring the time required for a cement to set.

prisoner, *n.* 6. In *mech.,* a piece of metal used to connect two adjacent parts of the rim of a fly-wheel. The prisoner is usually put in place in recesses in the rim while hot, so that its contraction during cooling will draw the two parts of the rim together very tightly. *F. R. Hutton*, Power Plants, p. 346.—**Prisoner at large**, a prisoner who is allowed the freedom of a ship when it is unnecessary to keep him in close confinement in order to prevent his escape, as when the vessel is at sea.—**Prisoner of war**, a person who, in time of war, is taken and held by the enemy. The fact that a state of war exists may alone justify the act.

Pristacanthus (pris-ta-kan′thus), *n.* [NL., < Gr. *πρίστης*, sawfish, + *ἄκανθα*, a spine.] An extinct genus of fishes based on fin-spines (ichthyodorulites). The type of spine to which the generic name *Pristacanthus* has been applied is elongated and greatly compressed laterally, so that the inner canal is reduced to a narrow cleft. The anterior margin is sharp and cutting, the posterior margin saw-like, with a row of teeth. From the Bathonian of Oxfordshire and the Upper Devonian of New York.

Pristigaster (pris-ti-gas′tėr), *n.* [NL., < Gr. *πρίστης*, sawfish, + *γαστήρ*, belly.] A genus of clupeoid fishes found on the coast of Guiana and Brazil.

pristin, *a.* A simplified spelling of *pristine*.

pristoid (pris′toid), *n.* and *a.* **I.** *n.* One of the *Pristidæ*; a sawfish.

II. *a.* Of or pertaining to the *Pristidæ*.

privet-moth (priv′et-môth), *n.* Any one of several moths whose larvæ feed on privet, as the privet hawk-moth of Europe, *Sphinx ligustri*, or the adult of the privet web-worm.

privilege, *n.* **5.** In the High Peak, Derbyshire, the land on which a house stands, including the garden, even if the garden is on the other side of the road.

> The village of Little Hucklow, where I have a *privilege* . . . is about two miles from Tideswell.
> *L. O. Addy*, in N. and Q., Sept. 10, 1904, p. 201.

Attachment of privilege, in *Eng. law*: (*a*) A process by which a man, by virtue of his privilege, calls another to litigate in that court to which he himself belongs, and who has the privilege to answer there. (*b*) A writ issued to apprehend a person in a privileged place. *Bouvier*, Law Dict.—**Testimonial privilege.** See ★*testimonial*.—**Viatorial privilege**, the exemption of a witness from attendance at court until duly summoned and indemnified in advance for his expenses. For sufficient reason the court may excuse him from attending at all, and may issue a commission to take his testimony. *Wigmore*, Evidence, § 2197.

prize^1, *n.*—**Booby prize**, in games, a prize, generally more or less ludicrous, given to the player who has made the lowest score.—**Scotch prize** (*naut.*), a capture that is illegal, and which must be given up.

prize^3, *n.* **3.** In *tobacco-manuf.*: (*a*) A press operated by a lever. Compare ★*prize-beam*.

> The packer gets into a hogshead, placed under a *prize*, fixed in a post like a cider *prize*, and a person outside hands him the tobacco. *W. Tatham*, Cult. and Com. of Tobacco, p. 116.

(*b*) The pressure exerted by a lever or press.

> The cake or stratum which is under *prize*.
> *W. Tatham*, Cult. and Com. of Tobacco, p. 52.

prize-beam (prīz′bēm), *n.* [*prize*^{3} + *beam*.] A lever consisting of a long timber, often with a platform to receive weights, used in prizing tobacco.

> So must the *prize-beam* retain its depressed position until two distinct ends are attained. *W. Tatham*, Cult. and Com. of Tobacco, p. 52.

prize-crew (prīz′krö), *n.* *Naval*, a body of seamen (and firemen) put on board a captured vessel to work her into port.

proambient (prō-am′bi-ent), *a.* [L. *pro*, before, + *ambiens*, going about: see *ambient*.] Moving or circulating in front of something else. [Rare.]

> To the light given forth by the glowing melted surface, with that of the stream of ignited particles flowing away behind the flying mass, must be added the enormously greater light of *proambient* air, itself heated by the compression mentioned.
> *Sci. Amer. Sup.*, July 9, 1904, p. 23840.

proanaphora (prō-an-af′ọ-ra̤), *n.*; pl. *proanaphoræ* (-rē). [NL., < Gr. *πρό*, before, + *ἀναφορά*, offering. See *anaphora*.] The introductory part of the Eastern liturgies, including all that preceded the Sursum Corda or anaphora.

proanaphoral (prō-an-af′ọ-ral), *a.* Of or pertaining to the proanaphora.—**Proanaphoral service**, in the Eastern liturgies, that part of the mass which is preparatory to the anaphora or offering of the eucharist.

proanthropos (prō-an-thrō′pos), *n.*; pl. *proanthropoi* (-poi). [NL., < Gr. *πρό*, before, + *ἄνθρωπος*, man.] A very primitive type of man, regarded as a precursor of the actual or existing type. Such a type is considered by many to have existed in *Pithecanthropos erectus* (of which the remains have been discovered in Java), taken to be a primitive species of man differing from all known human races in traits which those races have in common, and in them resembling the apes.

> We may postulate a Tertiary "precursor," a "*proanthropos*," but exhibit one of his bones in the broad light of day we cannot. *Buck*, Med. Handbook, IV. 40.

Proarthropoda (prō-är-throp′ọ-da̤), *n. pl.* [NL., < Gr. *πρό*, before, + NL. *Arthropoda*.] The hypothetical stock from which the *Arthropoda* have been supposed to be descended.

> The Arthropoda appear to me to form such a natural group. Their ancestral stock, the *Pro-Arthropoda*, joins with the ancestral stocks of the Chætopoda and Rotifera, forming the large natural group of the Appendiculata.
> *E. R. Lankester*, in Nat. Sci., April, 1897, p. 264.

proasma (prō-as′ma̤), *n.*; pl. *proasmata* (-ma̤-ta̤). [Gr. *προάσμα*, < *πρό*, before, + *ᾆσμα*, a song.] In *music*, a prelude or overture.

proatlantoatlantic (prō-at-lan″tọ-at-lan′tik), *a.* Relating to the proatlas and atlas. *Proc. Zool. Soc. London*, 1891, p. 113. [Rare.]

probabilize (prob′a̤-bl-īz), *v. t.*; pret. and pp. *probabilized*, ppr. *probabilizing*. [L. *probabilis*, probable, + *-ize*.] To make probable or to seem probable.

> Some, again, are now seeking to vindicate or *probabilize* the fact of inspiration and some of the other functions of the Holy Spirit by a new scrutiny of not only genius but of ecstatic and hypnoid states.
> *Amer. Jour. Relig. Psychol. and Education*, May, 1904, p. 2.

probang, *n.*—**Sponge probang**, in physical laboratory apparatus, a bit of sponge fastened to a stick or probe with which to clean the interior of a tube.

probe, *n.*—**Electric** or **telephonic probe**, a probe so constructed that when it touches a metallic body (such as a bullet) in a wound an electric circuit is established and a sound is made.

Probeloceras (prō-bē-los′ẹ-ras), *n.* [NL., < Gr. *πρό*, before, + NL. *Beloceras*.] A genus of phyllocampylous ammonoids or goniatites, of the family *Prolecanitidæ*, found in the Upper Devonian formation of New York.

probion (prọ-bī′on), *n.* [Gr. *πρό*, before, + *βίος*, living thing.] The term used by C. Nägeli to designate the hypothetical organism which forms the connecting link between inorganic matter and the lowest known form of organic life.

> Such a *Probion* resulting from spontaneous generation would be "merely a drop of homogeneous structureless plasma, devoid of any definite form and composed of albuminates, associated only with the compounds necessary for nutrition."
> *Salter*, tr. of Lafar, Tech. Mycol., I. 11.

problem, *n.*—**Dirichlet's problem**, a problem to find a real function satisfying Laplace's equation and taking assigned values at the boundary of the region; or to find a real function continuous within a closed surface, satisfying Laplace's equation and taking given values on that surface.—**Halley's problem**, a problem to determine the orbit of a planet from three heliocentric positions.—**Latin square problem**, the problem of placing n letters, $a, b, c, \ldots n$, one in every one of the n^2 compartments of a square lattice of order n in such a way that every row and every column contains every letter, no compartment is empty, and no letter occurs twice either in the same row or in the same column.—**Problem novel, play.** See ★*novel*, ★*play*^{1}.—**Problem of derangements**, a problem to find the number of permutations such that exactly n of the letters are in the places they originally occupied.—**Problem of the Virgins**, the designation by which Euler and his contemporaries knew the bipartite case in the analytical theory of multipartite denumeration, or the enumeration of the partitions of multipartite numbers in combinatory analysis.

proboscis-fish (prọ-bos′is-fish), *n.* Any fish of the genus *Mormyrus* of the order *Scyphophori*, found in fresh waters of tropical Africa. Species found in the Nile were objects of veneration to the ancient Egyptians. The Egyptians did not eat them, since they thought them to be one of the three different kinds of fishes which devoured a member of the body of Osiris.

> An extremely interesting feature in the report is the notes on the habits of the numerous species of Nile fishes kept in the aquarium. From these it appears that the *proboscis-fish* (Mormyrus kannume) is chiefly nocturnal, and employs its long snout in probing about among stones for animal food. *Nature*, June 9, 1904, p. 130.

proboscis-pore (prọ-bos′is-pōr), *n.* **1.** In nemertines, the external opening of the proboscis.—**2.** In *Balanoglossus*, a pore by which the cavity of the proboscis communicates with the exterior. *Parker and Haswell*, Zool., II. p. 2.

proboscis-sheath (prọ-bos′is-shēth), *n.* In nemertines, the canal or pouch lying dorsal to the alimentary canal and containing the proboscis when the latter is retracted.

Procaviidæ (prō-ka-vī′i-dē), *n. pl.* [NL., < *Procavia*, type genus, + *-idæ*.] A family of ungulate mammals including the hyraces. The name replaces *Hyracidæ*, this being antedated. *Thomas*, 1892.

procede, *v.* An amended and former spelling of *proceed*.

procedure, *n.*—**Oat-field procedure**, an extra-legal procedure against evil-doers or other socially objectionable persons: essentially a mild form of lynch-law, and practically the same as the 'whitecapping' once frequent in Indiana.

> Similar societies exist among the Yoruba Negroes of Guinea, and the traces of like institutions are found in Europe, as, for example, the famous *oat-field procedure* (Haberfeld treiben), an ancient custom which is kept up in the region of upper Bavaria situated between the Inn and the Isar. It is a sort of trial by a secret tribunal of misdemeanours which are not reached by the ordinary penal law. The court of Munich had in 1896 to deal with one of these procedures, which have now become very rare. *Deniker*, Races of Man, p. 254.

proceeding, *n.*—**John Doe proceedings**, in *law*, an inquisition directed against a fictitious person having for its object the discovery of the real person or persons guilty of some offense.

procellariine (pros-e-lā′ri-in), *a.* [NL. *Procellariinæ*.] Relating to, or characteristic of, the petrels.

Procerebral lobes. See ★*lobe*.

process, *n.*—**Acheson process.** See ★*Egyptianized clay*.—**Acid process**, in *iron metallurgy*, a process in which the furnace-lining is made of acid material, usually silica. Thus in the Bessemer and in the open-hearth processes the furnace may be lined either with an acid material (silica) or with a basic material (for example, calcined dolomite). In the former case the slag produced should be acid in character; in the latter it should be basic. An acid slag is irretentive of phosphorus, and therefore phosphorus cannot be eliminated from iron during its purification and manufacture into steel by the acid process. It is, then, necessary to use pig-iron low in phosphorus, since this element has a deleterious effect on the quality of the steel.—**Addie's process**, a process for recovering ammonia from the gases of blast-furnaces, coke-ovens, and fuel-gas generators by the action of gaseous sulphur dioxid, forming ammonium sulphite, which is absorbed by water in scrubbers. *Groves and Thorp*, Chem. Technol., I. 277.—**Alberini's process**, in *photog.*, an asphalt process in which by the use of crude bitumen the exposed portion of the film becomes disintegrated and is removed by flooding with alcohol and gentle friction with cotton wool. The exposed bitumen is thereby broken up into small scales or grains, without, as is usually the case, becoming insoluble. *Wall*, Dict. of Photog., p. 12.—**Aluminium processes**, processes for the extraction of aluminium. The following are the most important: (*a*) *Bradley's process*, a process in which an electric current is made to perform the double function of keeping the ore and the other substances melted, by converting a part of its electrical energy into heat, and of producing the electrolytic decomposition. This process can be carried out without the use of a crucible, a body of the ore itself being used as a vessel in which the reduction takes place. (*b*) *Cowles's process*, a process for making aluminium and other alloys, by placing a mixture of alumina, carbon, and the metal to be alloyed between two large carbon rods, the terminals of an interrupted current of high power. The intense heat melts the metal and converts the alumina into aluminium, while the oxygen escapes as carbonic oxid. (*c*) *Deville's process*, a process in which aluminium sodium chlorid is reduced by sodium, with cryolite or fluor-spar as a flux. Deville was the first to produce aluminium in an almost pure state (1854) and to determine its properties *en masse*. He also discovered simultaneously with Bunsen a method of decomposing alum sodium chlorid by an electric battery. (*d*) *Grabau's process*, a process based on the electrolysis of a bath composed of aluminium fluoride and caustic soda of potash, or their carbonates. The substitution of aluminium fluoride for cryolite greatly increases the purity of the metal. (*e*) *Hall's process*, an electrolytic process by which most of the aluminium in the United States is produced. In this process the alumina is dissolved in a fused bath composed of the fluorides of aluminium and sodium, and then electrolyzed by a current with a carbonaceous anode. The positive electrode may be of carbon, copper, platinum, or any other suitable material, copper being preferred on account of the copper oxid which protects the electrode from further oxidation. In the production of aluminium alloys the metal to be alloyed is used as a negative electrode and the alloy formed sinks to the bottom of the crucible. In the Hall process, as used by some of the larger manufacturers, the electrolytic tanks are iron troughs lined with carbon and connected up in series, each trough being connected by a stout copper bar with the anodes of the adjoining trough or with the negative conductor of the generator, according to its position in the series. Thus the tank itself acts as the cathode. The anodes are carbon rods suspended from a copper bar, which are placed above the vat and are partly immersed in the fused electrolyte. (*f*) *Héroult's process*, a process similar to that of Hall but discovered independently by Héroult in 1886. It is the only process which is used for the production of aluminium on a large scale outside of the United States. (*g*) *Minet's process*, a process consisting in the electrolysis of a mixture of sodium chlorid with either aluminium fluoride or the separate or double fluorides of aluminium and sodium. The mixture is melted in a non-metallic crucible, or in a metallic crucible inclosed in a thin refractory jacket to avoid filtration, and the aluminium fluoride decomposed is regenerated by causing the fluorin vapors evolved to act on bauxite or alumina placed somewhere about the anode. *Phillips and Bauerman*, Elements of Metallurgy, p. 579. (*h*) *Rose's process* (1855), a modification of Deville's method, cryolite being substituted for aluminium chlorid. *Phillips and Bauerman*, Elements of Metallurgy, p. 575. (*i*) *Wöhler's process.* Wöhler is regarded as the first to succeed in isolating aluminium. In his experiments of 1845 he reduced aluminium chlorid by means of pure potassium. The metal was obtained in the shape of small globules and contained some platinum from the tube in which it had been prepared. He was also the first to give a more or less accurate description of the chemical properties of aluminium and to determine its specific gravity. —**Ammonia nitrate process**, in *photog.*, a process of keeping an emulsion, at a moderate temperature, in a state of strong alkalinity with ammonia. *Woodbury*, Encyclopedic Dict. of Photog., p. 30.—**Ammonia-soda process.** See ★*ammonia.*—**Anderson process**, a process for the purification of drinking-water. The water is carried through revolving cylinders in which it is brought into contact with metallic iron, in borings, turnings, etc., continually agitated, is then exposed to the air to precipitate dissolved iron as ferric hydroxid, and is finally led to settling-tanks and sand-filters. The method has been applied on a working scale at Boulogne, Choisy-le-Roi, Antwerp, and other places.—**Andreoli process**, an electrolytic process for the extraction of gold from its ores. It is a modification of the Siemens-Halske process, and is based on the use of lead peroxid anodes and iron cathodes. The gold collects in the cathodes and is removed from time to time by a brief immersion in molten lead.—**Aniline process**, in *photog.*, a process based on the oxidation of aniline by chromic acid and used for copying tracings, maps, etc. *Woodbury*, Encyc. Dict. of Photog., p. 37.—**Arnold utilization process**, a trade-name for a method of dealing with waste and spoiled food-materials in large cities by treatment with steam, furnishing grease for soap-making, etc., and nitrogenous matter for the manufacture of fertilizers.—**Artique's process**, in *photog.*, a method of carbon-printing without transfer. A special paper coated with pigmented gelatin is sensitized by ammonium bichromate. After exposure behind a negative the picture is developed by soaking the paper in a mixture of sawdust and water. *Wall*, Dict. of Photog., p. 49.—**Asphalt process**, in *photog.*, the first process employed for producing a fixed photograph, in the usual sense of the term. It was devised by Niepce. Asphalt dissolved in benzol is used to coat a metal plate. When the dry surface is exposed behind a negative or a positive, the light which passes through renders the asphalt insoluble. When the soluble portions are washed away the exposed metal is etched. The plate then serves for printing. *Wall*, Dict. of Photog., p. 53.—**Balbach process.** (*a*) An electrolytic process for parting gold and silver. The operation is carried on in a stoneware tank with carbon bottom which forms the cathode. The bottom is covered with small silver plates on which the crystals of silver are deposited and which are connected with a negative overhead feeder. The anode plates, consisting of the gold-silver alloy, are placed in wooden boxes with slatted bottoms, the plates resting on canvas covers and connected with the positive overhead feed. The silver is shoveled out at intervals. The copper accumulates in the solution, while gold remains in the anode mud, from which it is subsequently removed. (*b*) A process for desilverizing lead by treating it with zinc and subjecting the mixture to a temperature sufficiently high to melt the lead but leave the zinc-silver alloy merely softened. During the operation air is excluded in order to prevent the formation of metallic oxids.—**Beaujard process**, a patented process for the manufacture of glycerin by heating fats with water and a little finely divided zinc. —**Becker's sodium process.** The apparatus used in this process is a modification of that employed in the Castner ★process (which see). The cathode passes through a tube inserted in the bottom of the vessel and closed at the lower end with a ring made of lava, porcelain, or some similar material. The tube is also surrounded by a double-walled water-jacket, or other cooling device, put there for the purpose of keeping the electrolyte within in a pasty or, if possible, solid state, so as to prevent any of it from escaping through the joint between the tube and the closing ring. The cathode is of metal or of retort carbon, and is generally somewhat conical in shape. The anode, which must not reach the bottom of the vessel nor exceed in height the cathode, is ring-shaped and completely surrounds the cathode. It is suspended by one or more rods, which serve also as conductors. Above the cathode is a metal cone insulated from the apparatus and intended to collect the globules of metal from the surface of the electrolyte. The diameter of this metal cone must be somewhat greater than that of the cathode and less than that of the anode, so that the metallic globules detached from the cathode pass into the conical receiver, while the gases generated at the anode escape around the outside. In the middle of the cone there is a rising-tube, covered at the top and provided with an exit-pipe passing in a downward direction through the walls of the vessel. The cone is surrounded by a rim which protects it from the electrolyte and is connected to the negative conductor by a resistance-coil through which only a small portion of the main current passes, making the cone a supplementary cathode, so that the metal liberated at the principal cathode becomes negative again as it comes in contact with the inner surface of the cone and passes through the tube which carries it out of the apparatus.—**Belgian process** for the extraction of zinc. The furnace employed in this process consists of a vertical arched chamber in which are generally placed from 60 to 80 circular or elliptical retorts arranged in four or more rows. The fireplace is sometimes placed underneath the chamber, and gas recuperative or regenerative firing is now largely employed. The retorts are somewhat inclined toward the mouth, so that the corrosive slag flows down to the coolest part. The distilled zinc passes into condensers attached to the retorts, where the fumes are condensed to liquid zinc. In some Belgian furnaces used in the United States the number of retorts exceeds 300, even reaching 900 in some cases.—**Bell-Krupp process.** Same as *Krupp* ★*process* (*a*).—**Bell process**, a process for the removal of excessive phosphorus from pig-iron, invented by Sir Lowthian Bell in 1875. Pig-iron rich in phosphorus is run into a reverberatory furnace lined with iron ore or some other substance rich in oxidized iron, and a powerful action of the peroxid of iron on the pig is produced either by stirring or by the arrangement of the furnace, the temperature being merely sufficient to keep the pig fluid. The Bell process was displaced, before it had come into general use, by the basic process.—**Berthier's process**, a process for determining the heat of combustion of a fuel, in which the oxygen for complete combustion is derived from an oxid of lead and its amount is computed from the mass of the metal reduced in the course of the reaction.—**Bessemer copper process**, a process for desulphurizing copper matte by blowing air through it. The sulphur furnishes heat enough, by its oxidization, to keep the bath molten. The sulphids of other metals in the matte lose their sulphur first and sink to the bottom of the bath as alloys, and being thence drawn off are separated by electrolysis. The remaining matte is then blown again until it is 99 per cent. copper, which is then cast, remelted, and poled for final purification.—**Betts's process**, an electrolytic process for the refining of lead. In this process the impure lead is used as the anode, being recovered in refined form on the cathode with a purity of 99.99 + per cent. The electrolyte is lead fluosilicate ($PbSiF_6$) or else a lead fluorin acid to which has been added a small amount of an organic agent such as glue, gelatin, etc. The current used is 10–20 amperes at a potential of 0.15–0.35 volt.—**Blair's process**, a process for the direct production of wrought-iron, introduced by Blair in 1873. The apparatus used in this process consists of a vertical reduction-chamber 40–50 feet high and 4 feet 6 inches in diameter, surrounded by and communicating with an outer heating-chamber. The mixture of ore, charcoal, and a little lime is introduced into the top of the reduction-chamber and heated by the hot gas passed into the heating-chamber from a gas-producer. The output of the furnace is about two tons of sponge a day. The Blair, like all other direct processes, is very little used.—**Bleiberg** or **Carinthian process**, a process of lead-smelting in reverberatory furnaces used at Bleiberg, Carinthia. The furnace has a long hearth sloping toward the door, so that the lead flows down into a receptacle placed at the door outside the furnace. The ore is first roasted at a low temperature and turned over at short intervals with a rake. After three or three and a half hours of roasting, the temperature is raised so as to effect the production of metallic lead by the mutual decomposition of its sulphid and the oxidized products of calcination. The slag from two successive charges is later reduced by the addition of charcoal and yields an inferior grade of lead. The fuel used in the Bleiberg process is mostly wood, but brown coal is sometimes employed instead. This process was abandoned in 1893.—**Boulton and Worthington process**, in *tile-manuf.*, a modification of Prosser's process for inlaying tiles with colored designs. See *Prosser's* ★*process.*—**Bower-Barff process**, a method of finishing metals to give them a permanent surface, named after its inventors, Bower and Barff. In this process the metal is treated by oxidizing gases at a high temperature, thus forming an oxid on the surface which is the same as the permanent surface of the mineral magnetite. The surface is first oxidized to a high oxid and then reduced till the desired stage is reached. See *Barff's process*, under *process.*—**Bradley's process.** See *aluminium* ★*processes.* —**Brin's process**, a process for manufacturing oxygen gas from atmospheric air by passing purified and compressed air over heated baryta, converting this into barium dioxid, from which oxygen is given off again on reduction of pressure.—**Carbonizing process.** See ★*carbonizing.* —**Carinthian process.** (*b*) See *Bleiberg* ★*process.*—**Castner process.** (*a*) A process, invented by Castner, for making at the same time caustic soda and chlorin by the electrolysis of common salt in solution in water. The apparatus consists of an iron melting-pot about a foot and a half wide and two feet high. The cathode is inserted through the bottom and is held in position by the solidified caustic alkali, which is put into the lower part of the melting-pot before the electrolysis is started. The anodes are suspended from the cover and immersed in the bath of caustic alkali, which is kept in fused condition by a gas-flame. The anodes are separated from the cathodes by a cylindrical diaphragm of wire mesh above which is placed the collecting-tube, which collects the metal and the hydrogen, while the oxygen escapes through an opening in the cover. The hydrogen also escapes from the collecting-tube, the lid of which is loose, and the liquid sodium is removed by a perforated ladle which, by reason of its high surface tension, retains the metal, while the caustic soda drains away through the perforations. (*b*) A method, also invented by Castner, of making metallic sodium by the electrolysis of fused caustic soda. Sodium hydroxid (caustic soda) is reduced by heating it with carbon, the carbon being in small grains which are loaded with iron so as not to float in the fused mass but to remain covered by it. The process does not require a very high temperature. By means of it sodium was produced at a small fraction of its previous cost, and metallic aluminium (which later was further cheapened by electric reduction) was reduced in price.—**Chloroplatinite process.** See ★*chloroplatinite.*—**Civil process**, a writ, order, or other direction issued in a civil action out of the court having jurisdiction thereof.—**Clark process**, a method of softening water, or diminishing its hardness, by adding enough lime-water or milk of lime to combine with and precipitate all carbonic acid present, thereby throwing down also calcium and magnesium carbonates previously held in solution by such carbonic acid. Calcium and magnesium present in the condition of sulphate or chlorid are not removed. In other words, the process gets rid of the so-called 'temporary hardness,' but does not affect the 'permanent hardness.' The precipitate may be allowed to settle, or may be removed by filtration. With certain improvements as to filtration introduced by Porter, the method is sometimes referred to as the *Porter-Clark process.*—**Claudet's process**, a process for the extraction of silver, which is found in the liquors resulting from the treatment of cuprous pyrites by the wet method of extraction. The liquor to be treated is first run into a vat where it is allowed to settle. It is then run into a vat of somewhat larger capacity than the first, into which at the same time an amount of some soluble iodide, sufficient to precipitate the silver, is run from a graduated tank, together with a quantity of water equal to about one tenth of the volume of the copper solution. While flowing into the second vat the liquor is constantly stirred and then allowed to settle during forty-eight hours. The supernatant liquor, after being assayed, is run off, and the tank is filled again. The precipitate, which is washed into a vessel about once a fortnight, consists chiefly of a mixture of lead sulphate, lead chlorid, silver iodide, and subsalts of copper. After the latter have been removed by washing with water acidulated with hydrochloric acid, the precipitate is decomposed by metallic zinc, which completely reduces the silver iodide and the lead chlorid. From this decomposition there is obtained a precipitate rich in silver and containing some gold, and zinc iodide, which latter is employed for further precipitation of silver.—**Combined process**, a process of manufacturing steel in which the Bessemer and the open-hearth processes are combined. The gray pig-iron is first treated in a converter and from there transferred to an open-hearth melting-furnace. In the Ural district the order is reversed, that is, the metal passes from the blast-furnace into the open-hearth furnace and when strongly heated is transferred to the converter.—**Contact process.** See ★*contact*1.—**Continuous process**, the Talbot process. See *calotype.*—**Cowles's process.** See *aluminium* ★*processes.*—**Cyanide process.** See ★*cyanide.*—**Damp-clay process.** Same as *Prosser's* ★*process.*—**Darby's recarburizing process**, a process of adding carbon to steel by introducing the carbon into the molten metal as it leaves the furnace. The carbon is placed in a perforated vessel suspended over the casting-ladle. The molten metal in passing through the perforated vessel on its way to the casting-ladle absorbs about 80 per cent. of the carbon and about 20 per cent. is consumed by combustion with air. The carbon must be dense and free from sulphur.—**Darwin's process.** Same as *Darwin's tubercle* (which see, under *tubercle*).—**Deacon's process**, a process patented by H. Deacon in England, and worked to some extent on an industrial scale, for producing chlorin by passing a mixture of hydrochloric-acid gas with air over a heated porous material, usually brick, impregnated with cupric sulphate.—**Deiters's process**, that one of several processes from a nerve-cell which forms the axis-cylinder.—**Dental processes.** Same as *alveolar processes* (which see, under *alveolar*).—**Deville and Caron's magnesium process**, a process founded on the reaction of sodium upon chlorid of magnesium at a red heat. It consists in mixing 150 parts of the anhydrous chlorid of magnesium, 120 parts of purified fluor-spar, and 56 parts of sodium, and placing the mixture in a red-hot clay crucible covered on the top and surrounded by incandescent coke. After the reaction the crucible contains a liquid mass through which are disseminated globules of magnesium. The liquid is stirred until the magnesium is collected in one large button, which, when the mass is cooled, is found in the upper portion of the saline scoriæ. —**Deville's aluminium process.** See *aluminium* ★*processes.*—**Deville's potassium process**, a process in which potassium is prepared from a mixture of charcoal and potassium carbonate, or from a mixture of 100 parts of potassium carbonate, 20 of carbon, and 14 of chalk. —**Diaphragm, diffusion process.** See ★*diaphragm*, ★*diffusion.*—**Direct process.** (*b*) Originally, line etching as distinguished from the half-tone process; now, half-tone work made directly from the object, without the intervention of a drawing or photograph.—**Dongola process**, a method of manufacturing leather by first subjecting the skins to the process of alum-tanning and afterward treating them with tannic acid in a solution of catechu or sumac.—**Dubrunfaut process.** See *Wilson* ★*process.*—**Dust process.** See *Prosser's* ★*process.*—**Eames's process**, a direct process of producing wrought-iron. The ground ore is mixed with a quarter of its weight of coke which has previously been washed with fire-clay and lime to render it less combustible and thereby to protect the metal from oxidation. This mixture is exposed to the flame of burning natural gas on the bed of a reverberatory furnace for about an hour and a half, when the iron may be balled up in the same manner as in the puddling-furnace.—**Electric steel process**, a process in the metallurgy of steel whereby the necessary heat for fusion and the required chemical action are secured by the intense heat of the electric arc passing between electrodes in a suitable crucible or furnace. The heating can be done without oxidizing effect under a cover of slag, and necessary fluxes can be added to purify or wash the metal bath completely, much less expensive material being used to start with and the final results being of a high grade.—**Extraction process.** Same as ★*carbonizing process.*—**Falciform process.** (*b*) A scythe-shaped process of the fascia lata entering into the formation of the femoral ring. (*c*) Fibers of the sacrosciatic ligament reflected on to the ramus of the ischium.—**Ferrier's albumin process**, in *photog.*, a process in which a clean glass plate of stereoscopic size is coated with iodized albumin which, when dry, is excited by immersion in a bath of silver aceto-nitrate, washed, and dried. The plate is exposed in a monocular camera, the right picture being taken on the left end of the plate and the left picture from a different station on the right end. The prints thus come right in the stereoscope. The development is accomplished by gallic acid and a few drops of silver aceto-nitrate applied hot (180° F.), any stains being rubbed off with cotton-wool. The picture is then fixed. *E. L. Wilson*, Cyclopædic Photog., p. 151.—**Fleitmann's process** for refining nickel, a process which consists in adding from 1/10 to 1/20 per cent. of magnesium to the coarse metal melted in a crucible. Magnesium acts as a deoxidizer and renders the metal ductile and capable of being welded to itself or to iron and steel.—**Flintshire process**, an English process of smelting galena in reverberatory furnaces. The furnace has a low inclined roof, and the hearth is separated from the grate by a fire-bridge. The bed slopes toward the well in front of the tap-hole. The galena is first roasted, so that it is partly converted into oxid of lead. When the charge is melted the separated metallic lead collects in the well, while the slag and undecomposed ore, stiffened with lime, is roasted for an hour and smelted. The lead is finally conducted into the outer basin, where it is stirred with a paddle to extract the metal from the rich scum on the surface of the molten lead. The whole operation lasts from five to six hours. —**Folian process**, the long process (processus gracilis) of the malleus in the middle ear.—**Gin process**, an electrothermic process for the production of steel. The furnace is of the resistance type, the hearth consisting of a long sinuous trough into which the fused cast-iron is introduced. The terminal connections through which the current is conveyed to the molten mass consist of large blocks of steel cooled by an internal current of water. When in operation the hearth, placed in a movable carriage-body, is put into an arched furnace in order to avoid the loss of heat by radiation. The current passed through the charge is sufficient to keep the mass in a fused state. In the 'dilution' method, or scrap process, a calculated amount of scrap-steel is added to the fused mass to assist the conversion process. In the 'ore' process some iron oxid is introduced to assist in the elimination of the impurities. The two processes may be used in combination. —**Goldschmidt process.** See ★*aluminothermics.*—**Grabau's process.** See *aluminium* ★*processes.*—**Grätzel's electrolytic magnesium process.** See ★*magnesium.*—**Gum-bichromate process,** in *photog.*, a method of printing in which paper coated with color (India ink, sienna, etc.) rubbed up with gum arabic and potassium bichromate is exposed under a negative, developed by washing with cold or warm water, and finally soaked in an alum bath and dried. *Wall*, Dict. of Photog., p. 366.—**Hall's process.** See *aluminium* ★*processes.*—**Hemal process.** See ★*hemal.*—**Hermite process,** a modern process for bleaching paper-pulp and cloth of vegetable origin by means of a 2.5 – 5.0 per cent. solution of magnesium, calcium, or aluminium chlorid submitted to electrolysis so as to produce a hypochlorite of the metal present.—**Héroult process.** (*a*) See *aluminium* ★*processes.* (*b*) An electrothermic process for the production of steel. The furnace used in this process is of the tilting open-hearth pattern, consisting of an iron casing lined with dolomite brick and magnesite brick around the openings. The electrodes are square prisms and are made of retort-coke containing some sulphur. They are introduced through the roof and are water-jacketed for a short distance above and below their passage through the roof. The charge consists of miscellaneous scrap and some iron ore and lime. The electrodes are suspended just above the slag line and the electric current passes from one electrode through the slag and the molten metal to the other electrode, its intensity being regulated by adjusting the width of the air-gap between the electrodes and the slag.—**Holland process,** a process, invented by Mr. Holland of Cincinnati, for uniting the smaller grains of the native alloy of iridium and osmium, producing practically fused iridium. The native alloy, or iridosmine, is brought to a high temperature in a Hessian crucible, and phosphorus is then added, which causes the material to fuse; after pouring it out so as to form flat sheets of small size, the phosphorus is removed from these by reheating them embedded in lime. The product is used for the points of gold writing-pens, fountain-pens, and drawing-pens, as also for the contact-points of telegraph-keys, the knife-edges of chemical balances, etc.—**Hübl process,** a method for distinguishing fats of the three types, stearin, olein, and linolein, by determining the amount of iodine absorbed under certain special conditions.—**Ives process.** See *color* ★*photography.*—**Jebb process,** a process for making starch from Indian corn, in which the germ as well as the husk of the seed is mechanically separated before grinding the remainder, thus avoiding the necessity for using an alkaline solution and saving the germ and husk in a condition which allows their use in feeding cattle.—**Joly-MacDonough process.** See *color* ★*photography.*—**Joubert's process,** in *photog.*, a process by which a print made on a suitable base, as glass, by the use of bichromated albumin is rubbed with an enamel color and the picture made permanent by firing.—**Jugal process.** (*a*) See *jugal.* (*b*) One of the two processes which by fusion form the jugum of the *Brachiopoda.*—**Kassner's process,** a method proposed for making oxygen gas on a commercial scale by heating calcium plumbate (Ca_2PbO_4) at a low temperature in an atmosphere of carbon dioxid, thus giving rise to calcium carbonate and lead dioxid; the mixture of these, on being more strongly heated, gives off oxygen and afterward carbon dioxid, and leaves a mixture of lime and a lower oxid of lead, from which calcium plumbate may be regenerated by heating in a current of air.—**Kjellin's process,** an electrothermic process for the production of steel. The furnace used in the process is of the induction type (see *electric* ★*furnace*), the contents in the hearth or crucible forming the secondary circuit of a transformer, while the first circuit is formed by a coil of thin insulated copper wire with a laminated core. The furnace is charged with white pig-iron, steel-scrap, and bar-scrap. The purity of the product depends on the composition of the charge, but as the molten metal is at no time during the operation exposed to gases, and as there are no electrodes to add any impurities, the Kjellin process yields a purer product than the crucible process.—**Krupp process,** in *metal.*: (*a*) A process for making pig-iron, practised at the Krupp works at Essen, Germany, which is carried on in a Pernot furnace and uses manganese and iron oxid. Also called *Bell-Krupp process.* (*b*) A cementation process for hardening the surface of steel plates similar to the Harvey process but with certain secret variations or additions.—**Krupp's dephosphorizing refinery process,** a process for reducing the phosphorus in pig-iron by running the molten metal from a cupola into an open-hearth furnace whose revolving hearth is lined with red ore. When the ore is raised to white heat, the molten iron is run from the cupola, and the hearth is rotated at a rate of about 10 revolutions a minute. The operation lasts from 5 to 10 minutes (according to the amount of phosphorus to be eliminated), after which the dephosphorized metal is transferred to an ordinary open-hearth furnace. The phosphorus is oxidized and some carbon is lost during the operation.—**Kurlbaum's process,** a method for producing an adherent deposit of platinum-black on the surface of the platinum foil of a bolometer strip. It consists in electrolyzing under definite conditions of current a solution of platinum chlorid to which has been added a minute quantity of lead acetate.—**Landore process.** See *ore* ★*process.*—**Lateral process.** Same as *parapophysis.*—**Lead-chamber process,** the process by which for more than a century sulphuric acid has been made on a great scale by the interaction of sulphur-dioxid gas, vapor of water, and atmospheric oxygen, aided by the presence of nitrogen dioxid and tetroxid, in large chambers of sheet-lead. See *sulphuric acid.* This process still remains the source of the greater part of the sulphuric acid of commerce, but its supremacy is threatened by the contact process which has been developed within the last few years.—**Le Sueur process,** one of several methods for electrolytically decomposing common salt in solution, so as to obtain from it on an industrial scale chlorin and caustic soda. A tank containing the brine is divided by a nearly horizontal diaphragm of asbestos, above which are the anodes of an iridium-platinum alloy, while below the cathode consists of a sheet of iron wire gauze.—**Lippmann process.** See *color* ★*photography.*—**Lister's process,** a process of preparing and spinning defective silk-cocoons and waste reeled silk, consisting in scouring the silk with soda and soap and then combing (or carding) and spinning it.—**Lost-wax process.** See *cire perdue.*—**Low-milling process,** the method of grinding wheat between millstones set very close together and afterward bolting the flour. In this way more of the bran is finely ground up and remains mixed with the flour than in the more modern high-milling or roller process.—**Lumière process.** See *color* ★*photography.*—**Lunge's process,** a modification of the common process for bleaching by means of chlorid of lime. A small quantity of acetic acid or some other weak organic acid is added to the bleach-liquor and serves to evolve free hypochlorous acid.—**MacArthur and Forrest's process.** Same as ★*cyanide process.*—**Maceration process,** a method formerly in use to some extent for obtaining a solution of sugar from beets. The roots, either in the fresh state rasped to a pulp, or cut into slices, dried, and ground to meal, were macerated in water, cold or warm, with or without the addition of a little milk of lime, and the sugar solution or 'juice' thus produced was separated from the residual solid fiber by expression. This method has been almost entirely abandoned in favor of the diffusion process.—**Mactear process,** one of several methods of recovering sulphur from the tank-waste of the Leblanc process for making carbonate of soda. It involves the blowing of air through the drainage-liquor from tank-waste heaps until enough calcium sulphid has been converted into calcium thiosulphate to react completely with the remaining sulphid, when hydrochloric acid is added, so that practically the whole of the sulphur is precipitated.—**Malignani's process,** a process of removing the air from the bulbs of glow-lamps in which the last traces of gas are brought into solid chemical combination with phosphorus and certain other substances.—**Malkin's process.** Same as *Boulton and Worthington* ★*process.*—**Manhes process,** a process for the desulphurization of copper matte in which a blast of air is passed through the metal as is done for iron in the Bessemer process: so called from its inventor, Pierre Manhes.—**Marginal process, sensation,** in *psychol.*, a mental process, sensation or other, which runs its course obscurely in the background of consciousness, that is, in the field of inattention: opposed to ★*focal idea* or *sensation.* *Amer. Jour. Psychol.*, XII. 252.—**Marsh-Berzelius process,** a modification of the original Marsh's test which was first proposed by Berzelius, consisting in carrying the arseniureted hydrogen gas through a hard glass tube of small diameter and heating this tube from without. The gas is decomposed by passing over the hot glass, and a deposit of metallic arsenic is formed inside the tube instead of being produced by burning the gas and placing over the flame a piece of porcelain. There are several advantages involved in this improved form of the process, especially for forensic purposes.—**Martin process.** (*b*) A method of making starch from wheat flour without fermentation, the flour being made into a dough with water and simply washed in a fine sieve under a stream of water, the starch depositing from the wash-water on standing.—**Martin's albumin negative process,** in *photog.*, a process in which plates are covered with a film of albumin containing ammonium iodide, milk-sugar, dextrine, and grape-sugar. When sensitized and exposed, gallic acid (with a few drops of a 4 per cent. nitrate solution) is used as a developer. *E. L. Wilson*, Cyclopædic Photog., p. 226.—**Massenez process,** a process preliminary to the manufacture of Bessemer steel, cast-iron from different blast-furnaces being mixed in the melted state and treated with ferromanganese in sufficient quantity to remove the sulphur present, so that a more uniform and purer material thus produced may be supplied to the converter.—**Mather-Thompson process,** a modern method of bleaching cotton cloth by means of chlorid of lime, from which hypochlorous acid is set free by exposure to an atmosphere of carbon-dioxid gas.—**Mayall's albumin-negative process,** in *photog.*, a process in which a plate for a negative is covered with a film of albumin to which potassium iodide, potassium bromide, and potassium hydrate are added. The dry plate is exposed to the vapor of iodine, as is done with a daguerreotype plate, sensitized in a bath of silver aceto-nitrate, and washed. Just before going to the camera it is again iodized. Gallic acid is used as a developer and hyposulphite of soda for fixing. For positive plates sodium chlorid is substituted for potassium bromide.—**Mège-Mouries process,** the original process, named from the inventor, for making artificial butter from the solid fat of domestic animals, as of the ox or horse. See *butterin*, *oleomargarin*, etc.—**Meinecke process,** a method of making common yellow soap in which crude turpentine is added to the contents of the boiler and, a still-head being placed over the latter, the spirits of turpentine given off in the boiling are collected and saved.—**Mercuric chlorid and ammonia process,** a method of intensifying photographic negatives, consisting in first bleaching the thoroughly washed negative with a solution of mercuric chlorid acidified with hydrochloric acid, and then blackening the image by the use of ammonium hydrate.—**Miller's process,** a process of refining gold by means of chlorin gas, introduced by F. B. Miller in 1876, and still used extensively in Australia. The gold is melted in an ordinary crucible-furnace, the chlorin gas being conveyed by a clay pipe entering the crucible through a hole in the bottom. The current of chlorin gas is started after the gold has been melted, and is kept up for about an hour and a half, when the gold is allowed to solidify, the silver chlorid floating on the top is poured off, and the small proportion of gold which it contains is subsequently recovered by remelting with sodium carbonate. The Miller process is especially adapted for gold containing small quantities of silver.—**Milly process,** in the manufacture of fatty acids for candle-making, a modified process of decomposition of the original fat by means of sulphuric acid. A very small quantity of sulphuric acid is used, and this acts for only a few minutes at 150° C., being followed by boiling with water. The greater part of the fatty acid product is thus obtained sufficiently white to be used for candles without being distilled.—**Minet's process.** See *aluminium* ★*processes.*—**Mond's process,** a method of recovering sulphur from the tank-waste of the Leblanc process for making carbonate of soda from common salt. It consists essentially in oxidizing the waste in tanks by means of a current of air supplied by a fan, leaching the oxidized material with water in the same tanks and precipitating sulphur from the solution by means of hydrochloric acid. These steps require to be repeated, and with special precautions as to details, to render the process commercially successful.—**Neural process,** an arch above the centrum of each vertebra through which the spinal cord runs.—**Niepce's process,** in *photog.*, a process which depends on the action of light on a thin layer of bitumen covering a metallic plate. The portions not rendered insoluble by the light are dissolved away, exposing the metal surface in part and obscuring it more or less at other portions. The metal can then be etched. It was devised by J. N. Niepce in 1829.—**Obuchow's steel process,** a process of producing steel by introducing molten white charcoal pig-iron of good quality into a crucible containing wrought-iron or steel-scrap together with magnetic iron ore, titaniferous black sand, and clay. When the contents have become perfectly liquid, niter and arsenious oxid are added, and the whole is well stirred.—**Oil process,** in *mining*, a method of ore concentration depending on the adhesion of certain oils to native metals and metallic sulphids. The adhering oil causes such grains to float in water, while the grains of gangue sink because the oil, unless added in excess, does not attach itself to non-metallic minerals.—**Ore process,** a method of conducting the open-hearth process for making steel from melted pig-iron, in which iron ore in the form of the oxids is introduced into the molten metal high in carbon resulting from the fusing of the pig-iron. The oxygen reacts upon the carbon of the bath, the carbon going off as CO_2: the reduced iron ore raises the weight of iron in the charge and therefore still further reduces the carbon percentage. The ore must be free from elements which would deteriorate the quality of the product. The method is known also as the *Landore process*, from the district in Wales where it was first successful.—**Orleans process,** the process of making vinegar from wine by fermentation in oaken casks to which air has free access, the wine being from time to time introduced in separate portions and the vinegar in like manner fractionally withdrawn.—**Orloff process,** a method of printing in colors introduced about 1900. Each color requires a separately engraved plate. The plates, arranged on separate cylinders, are successively impressed in proper position upon a transfer-sheet fastened to the impression-cylinder. This transfer-sheet, which contains all the colors, is then reimpressed upon the paper intended for the print. The advantages claimed for this process are accuracy of register and increased production.—**Osmose process,** a method of partly separating the mineral salts from beet-root molasses by osmosis, allowing of the recovery of more sugar from the molasses thus purified. See *osmogene.*—**Otto process,** a process for artificially purifying water for potable purposes, in which it is sterilized by treatment with ozone, which is an antiseptic.—**Otto-Stas process,** a general method of examination for alkaloidal poisons of mixed organic materials, such as the contents of the stomach, human tissues, etc., involving extraction with alcohol acidified with tartaric or oxalic acid, followed by other methods of purification.—**Oxland's process,** a process for the separation of tungsten from black tin. A charge of ore mixed with soda-ash is introduced into a reverberatory furnace with a cast-iron bed and remains there about three hours. It is then taken to lixiviation-vats where a part of the wolfram, now converted into tungstate of sodium, is dissolved. The oxids of iron and manganese are subsequently removed by washing on the dressing-floor.—**Papyrotint process,** in *photog.*, a photolithographic process in which a sensitized gelatin-coated paper, after exposure behind a negative, possesses the property, when developed, of causing a greasy ink to adhere to the parts affected by the light. The ink may be transferred to stone or zinc.—**Pasteur's process,** in *vinegar-making*, a method, devised by Pasteur, of cultivating, with the necessary conditions for growth, the acetic-ferment organism, *Mycoderma aceti*, and applying it to the fermentation of an alcoholic liquid.—**Pettenkofer's process,** in *chem.*, a method, frequently resorted to for determining the amount of carbon dioxid in air, consisting in agitation of a measured volume of the air to be examined with a determined and sufficient volume of an aqueous solution of barium hydroxid (so-called baryta-water), followed by a determination by means of a standard solution of oxalic acid of the amount of the surplus barium hydroxid left in solution. The quantity of barium hydroxid which had been precipitated as barium carbonate bears a constant relation to the quantity of carbon dioxid which precipitated it.—**Pig-and-ore process,** a process for making steel by melting together pig-iron and iron ore in such proportion as to give the correct amount of carbon. See *scrap* ★*process.*—**Porter-Clark process.** See *Clark* ★*process.*—**Powrie-Waner process.** See *color* ★*photography.*—**Processes of adjustment.** See ★*adjustment.* —**Prosser's process,** in *ceram.*, a process by which tiles, buttons, etc., are made with clay-dust subjected to great pressure. It was invented by Richard Prosser of England.—**Pseudomesial process.** Same as ★*pseudomesial.*—**Respiratory process,** in *entom.*, any one of various outgrowths, especially in aquatic larvæ, which function in respiration.—**Rhodin process,** one of the patented forms of the electrolytic process for making chlorin and caustic soda from a solution of common salt.—**Roller process,** a method of crushing rather than grinding wheat, which with special bolting machinery furnishes a whiter flour, freer from the material of the outer coats of the grain, than was produced by the older method of grinding between millstones.—**Rollet's refinery process,** a method of dephosphorizing pig-iron by melting it in a cupola with an addition of limestone and fluor-spar. It yields a very pure product, which is used for the production of the higher grades of steel in some works of France.—**Rose's process.** See *aluminium* ★*processes.*—**Running-down process,** a term applied to the process of refining cast-iron in an open-hearth furnace. *Phillips and Bauerman,* Elements of Metallurgy, p. 298.—**Sanger-Shepherd process,** in *photog.*, a process analogous to the Ives process in which three positives stained with the colors complementary to the taking screens are superimposed and viewed in transmitted light, producing an approximation to the natural colors.—**Scheibler's process,** in the manufacture of beet-root sugar, a method of obtaining crystallizable sugar from the molasses by treatment with strontium hydroxid. The details of the process were devised and worked out by Scheibler.—**Scrap process,** a form of the Siemens-Martin or open-hearth process for making steel in which a bath of pig-iron or other fusible iron high in carbon is first brought to fusion in an open-hearth furnace, and then scrap-steel or wrought-iron or other form of iron low in carbon is charged in. The melted bath fuses the scrap, and the percentage of carbon is lowered both by the increase of the element iron and the reactions with the melting flame and gases. Samples are taken at intervals, and more scrap is added until the desired properties are secured. Chromium, nickel, tungsten, or other alloying elements can also be added to the bath.—**Shoe-lifter process,** in certain extinct genera of brachiopods, a curved internal plate extending from the beak for half the length of the valve, attached by its edges to the bottom of the valve, but free at its outer extremity. This plate may occur only in the ventral valve (*Merista*) or in both valves (*Dicamara*).—**Soda process,** a process for making wood-pulp for paper in which caustic soda is used to disintegrate the bundles of fibers of the wood.—**Stas-Otto process.** See *Otto-Stas* ★*process.*—**Stassano process,** an electrothermic process of iron-smelting. The electric furnace used is of the arc type and consists of a cylindrical outer casing of iron surmounted by a conical roof and lined with magnesite brick. The cylindrical electrodes nearly meet in the center of the interior of the furnace, their number being determined by the capacity of the furnace. In Italy, where the furnace is in practical operation, it is used for the production of wrought-iron from ore of great purity.—**Strontia, strontium process.** Same as *Scheibler's* ★*process.*—**Sulphite process,** a process for making paper-pulp by the disintegration of wood, such as spruce or poplar, in the form of chips by heating in large digesters with an aqueous solution of calcium acid-sulphite.—**Surface combustion process,** a process for the manufacture of sulphuric acid. This new method of making sulphuric acid is based upon the fact, first observed by Phillips in 1831, that sulphur dioxid and oxygen gases carried in a state of mixture over a heated surface of platinum combine to form sulphur trioxid, which, on addition of water, is at once converted into sulphuric acid. The two reactions are represented by the formulæ $SO_2 + O = SO_3$ and $SO_3 + H_2O = H_2SO_4$. Numerous practical difficulties presented themselves in the way of utilizing these reactions on an industrial scale, but these have gradually been overcome, chiefly by researches carried on for years under the auspices of the Baden Aniline and Soda Works in Germany, and the conditions necessary to success have been determined, especially the freeing of the sulphur dioxid and air used from all suspended or gaseous impurities, the careful regulation of the temperature of the cylinders containing platinized asbestos, and the maintenance of the proper strength in sulphuric acid of the water used to absorb the sulphur trioxid. The process is now established on a commercial basis and many thousand tons of acid have been made by it. One great advantage which is presented by it is the production at the outset of acid of full strength, which can be transported at minimum freight rates and diluted, if necessary, by the consumer. In the manufacture by the lead-chamber process, hitherto in general use, the acid as it comes from the chambers contains only 62–70 per cent. of real H_2SO_4; this has to be concentrated by boiling off the remaining water, and if a product of full commercial strength is required the final concentration is commonly effected in costly platinum stills. The need for this disappears in the new process.—**Swansea process,** a method of copper-smelting long practised at Swansea in South Wales and now extensively used elsewhere. It is applied to various mixtures of ores, in which, however, copper pyrites, consisting of sulphur, copper, and iron, usually predominates. The main features of the process consist in partially roasting the ore with exposure to the air, so as to burn off a part of the sulphur, converting the iron to oxid, and strongly heating the residue with silica, so that two fused layers are formed, consisting of ferrous silicate and cuprous sulphid respectively. The cuprous sulphid is detached, re-roasted to such an extent as to convert a part of the copper to oxid, and again strongly heated in a melting-furnace, the oxygen being thus taken up and the remaining sulphur combining to form sulphur-dioxid gas, which escapes, while the copper melts down to form crude ingot-metal, afterward to be refined.—**Sweating process.** (*a*) A process for making joints with solder, brass, or other fusible metal or alloy, whereby the temperature of the two parts to be joined is raised to the fusing-point of the solder or metal or alloy, and the latter runs into the joint and solidifies in the spaces when cooled. (*b*) A process for making joints by bringing the two elements just to fusion at their contact-edges, so that they become one where they touch, without a solder or alloy.—**Sweeping process,** in *thermodynam.*, an irreversible process. A homogeneous substance not in a state of thermal equilibrium undergoes a sweeping process as the substance settles down to a state of thermal equilibrium. *Nichols and Franklin,* Elements of Physics, I. 217.—**Swell process,** a process in which a plate covered with a solution of bichromate of potash, or its equivalent in gelatin, is exposed under a photographic negative. Where the bichromatized gelatin has not been affected by light it absorbs water and swells up; a plaster cast of this surface is taken, and the operator is enabled to produce a relief printing-plate.—**Talbot process,** a continuous process for the manufacture of steel, in which a tilting open-hearth furnace with a basic lining is used. The furnace is charged either entirely with molten pig-iron or partly with scrap and partly with liquid pig-iron, and additions of oxids and limestone are made from time to time to hasten the operation. When the charge has been worked down, a portion of the metal is poured off, oxid of iron and lime are added to the slag, and molten pig-iron, equivalent in quantity to the steel tapped out, is run in. In the reaction which takes place between the impurities of the new charge and the oxidizing slag, the carbon, silicon, phosphorus, and manganese are oxidized, and equivalent amounts of iron are reduced from the oxid in the slag and pass into the metal bath. The slag, now almost deprived of its iron oxid, is partly run off, and the charge is worked down by fresh additions of oxid of iron and lime. About one third of the finished product is again poured off, and the operation is so repeated till the end of the week, when the furnace is emptied. As the hearth is never emptied during the operation it wears very slowly and the slag can be tapped off before it can seriously attack the lining. The rapidity of working depends on the composition of the pig-metal and the proportion of metal removed each time. A 200-ton furnace working on hematite iron yields a weekly output of about 1,400 tons.—**Taylor-White process,** a patented process for making a self-hardening tool-steel. The steel made by this process will continue to cut even after the edge of the tool is red-hot.—**Three-color process.** See ★*three-color.*—**Tortiniolite process,** a method of treatment applied to pig-iron in which the molten metal is run into chills heavily coated with a wash of impure graphite, it being assumed that some additional carbon is taken up by a kind of superficial cementation.—**Turkey-red process,** a process, of great antiquity in India and other parts of the East, for dyeing cotton cloth or yarn a brilliant and remarkably permanent red color by means of madder. A number of steps are required (some of which are repeated two or three times) which are varied in detail by different dyers; but the essential features of the process are the impregnation of the cloth with an alkaline emulsion of oil (Gallipoli oil and castor-oil which has been treated with sulphuric acid are commonly used), oxidation of the absorbed oil by exposure to heated and moist air, washing out unoxidized oil by means of alkaline solutions, mordanting with tannin (generally sumac or galls) and aluminium acetate, and finally dyeing in a bath prepared with madder, garancin, or artificial alizarin. Also known as *Adrianopla-red process.*—**Vandyke process,** a process of producing a zinc plate for printing, prepared by exposure under the actual drawing.—**Vat process,** in *dyeing* with indigo, any one of several methods of rendering indigo soluble by reducing it to hydrindigotin or indigo white, the cloth or yarn being then steeped in this solution and afterward exposed to atmospheric oxygen, by which the hydrindigotin is converted again into indigotin or indigo blue, which is insoluble and remains fixed upon the fiber. A vat process is distinguished from a process in which the indigo blue is, without reduction, rendered soluble as indigo-sulphonic acid.—**Volhard process,** in *anal. chem.*, a valuable method for the determination of silver in a solution of one of its salts, usually the nitrate. A few drops of a solution of ferric sulphate are added to the liquid, and then, from a graduated burette, a standardized solution of potassium thiocyanate. As long as any silver remains in solution a white precipitate of silver thiocyanate is produced, but as soon as the whole of the silver has been thrown down the next drop of the standardized reagent solution produces a red color in the liquid, due to the formation of ferric thiocyanate. The quantity of the reagent used is the measure of the quantity of silver present. The method can be applied in an acid solution, and in the presence of sundry other metals than silver, and can be indirectly used for the determination of chlorin, bromine, and iodine.—**Walloon forge** or **process,** a charcoal hearth (process) for refining cast-iron, used largely in Sweden (Swedish *Walloon*) and in Lancashire and South Wales (English *Walloon*). The charcoal hearths are usually low rectangular chambers with one or more twyers. The fuel is charcoal, and the wrought-iron produced by this process is superior to that produced by puddling, on account of its freedom from phosphorus. In Sweden the Walloon process is applied chiefly to the manufacturing of Dannemora iron.—**Water-reel process,** a process of softening the filaments of silk-cocoons for reeling.—**Wedgwood's process,** in *photog.*, a process, devised by Thomas Wedgwood and Sir Humphry Davy in 1802, whereby photographic pictures were made on glass, leather, or paper by the use of silver nitrate or chlorid. The pictures were not permanent.

> The very first scientific application of *Wedgwood's process* was made here by the illustrious Thomas Young, when he impressed Newton's rings on paper moistened with silver nitrate, as described in his Bakerian lecture to the Royal Society on November 24, 1803.
>
> *Smithsonian Rep.*, 1890, p. 380.

Weldon-Pechiney process, a process for obtaining chlorin from the waste-liquor of the recovery of ammonia in the Solvay process for making carbonate of soda from common salt. The liquor in question in its original form contains calcium chlorid, from which it is difficult to isolate chlorin economically. The Weldon-Pechiney process substitutes magnesia for lime as the means of recovering ammonia, so that the waste-liquor contains magnesium instead of calcium chlorid. This liquor, with the further addition of magnesium to form an oxychlorid, is evaporated to dryness, and the residue strongly heated, ultimately in a current of air. Hydrochloric acid and free chlorin are given off, saving altogether about 85 per cent. of the chlorin in the liquor.—**Weldon process,** a process for the recovery of manganese. It is an important improvement in the production of chlorin for making bleaching-powder, consisting in the treatment of the (previously waste) still-liquor with excess of slaked lime and a current of air forced through the liquid, with the result that oxygen is taken up from the air by the manganese in the liquid as hydroxid, and a black mud is produced, consisting largely of calcium acid-manganite, which can be used in place of fresh manganese dioxid to decompose more hydrochloric acid and furnish more chlorin.—**Welsh process of copper-smelting.** See *Welsh* ★*method of copper-smelting.*—**Wetherill process,** a process for manufacturing zinc white. Finely crushed zinc mixed with silicates, calamine, or roasted blende, is heated upon the bed of a muffle-furnace. The reduced zinc rises, together with the furnace-gases, and when these have somewhat cooled down, is re-oxidized. The zinc oxid, in the form of a fine white powder, is then filtered through coarse cotton cloth, through which the gaseous products of combustion escape.—**Wilson process,** a method of manufacturing fatty acids for candle-makers' use, by heating the original fat, especially palm-oil, with a small quantity of sulphuric acid, washing away any excess of this acid or other soluble matter, and distilling the residue with superheated steam. Also known as the *Wilson-Gwynne process* and the *Dubrunfaut process.*—**Wöhler's process.** See *aluminium* ★*processes.*—**Wohlwill process,** an electrolytic process of refining gold. The cathode-plates consist of electrodeposited fine gold rolled into thin sheets, and the electrolyte is a gold chlorid strongly impregnated with free hydrochloric acid. When the gold treated contains some lead, a mixture of hydrochloric and sulphuric acids is added to the gold chlorid solution. The process is used in several works in Germany and the United States.—**Woodbury's process.** Same as *woodburytype*, 1.

process, *v. t.* 3. In *leather-making*, to treat or soak in liquor. *Flemming,* Practical Tanning, p. 9.

process-block (pros′es-blok), *n.* A block having upon its face a metallic plate for printing obtained by a photomechanical process.

processing (pros′es-ing), *n.* The act or operation of putting something through a prescribed process.

> A three-filler cannery should have a width of at least 50 feet, and the length should correspond to the machines used in *processing*, giving ample room, so that the cans may go uninterruptedly throughout the whole length of the building.
>
> *Sci. Amer. Sup.*, March 21, 1903, p. 22751.

Processionary caterpillar, moth. See ★*caterpillar,* ★*moth*[1].

process-plate (pros′es-plāt), *n.* Same as ★*process-block.*

Processus vermiformis, a slender, hollow projection from the intestine opening near the cæcum, present in a typical form in the wombat. It differs from the vermiform appendage in being an independent structure, considered as representing the entire cæcum, while the appendix is a part of the cæcum. *Proc. Zool. Soc. London*, 1902, p. 19.

prochoresis (prō-kọ-rē′sis), *n.* [Gr. προχώρησις, a going forth, < προχωρεῖν, go forth.] Movement of the stomach in passing the chyme forward into the intestine.

prochromatin (prọ-krō′ma̤-tin), *n.* [Gr. πρό, before, + χρῶμα(τ-), color, + *-in*[2].] In *cytol.*, the substance of which the plasmosomes or true nucleoli consist; the 'paranuclein' of O. Hertwig. *Pfitzner*, 1883.

prochronize (prō′krọ-nīz), *v. t.*; pret. and pp. *prochronized*, ppr. *prochronizing*. [Gr. πρό, before, + χρόνος, time, + *-ize*.] To assign too early a date to; antedate.

Proclamation of rebellion, in *old Eng. law*, a writ, issued after a man had failed to appear on a subpœna or an attachment in chancery, declaring him a rebel unless he surrendered himself by a day named. The commission or writ of rebellion was a process of contempt.

proclinate (prọ-klī′nāt), *a.* [Gr. πρό, forward, + κλίνειν, bend, + *-ate*[1].] Inclined forward.

> Laterad the transfrontals are two *proclinate* orbitals in the usual position.
>
> *Kansas Univ. Quarterly*, July, 1900, p. 205.

proclivitous (prọ-kliv′i-tus), *a.* [L. *proclivitas*, declivity, + *-ous*.] Having a steep, precipitous slope; proclivous.

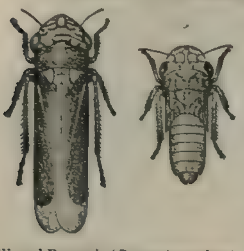
procnemial (prok-nē′mi-a̤l), *a.* and *n.* [Gr. πρό, in front of, + κνήμη, tibia.] **I.** *a.* Noting a crest or prominent ridge on the anterior surface of the tibia below the knee-joint. Oftener called the *cnemial crest.* See ★*crest.* *Smithsonian Rep.*, 1893, p. 465.—**Procnemial process,** a projection from the upper anterior part of the tibia remarkably developed in grebes and loons.

II. *n.* The procnemial crest.

Procniatidæ (prok-ni-at′i-dē), *n. pl.* [NL., < *Procnias*, generic name, + *-idæ*.] A family of birds comprising South American species of the genus *Procnias*. They have usually been placed with the tanagers, in spite of the swallow-like skull, but were made a distinct family by Lucas (1895) on account of structural peculiarities.

Procolophonia (prō″kọ-lo-fō′ni-ạ̈), *n. pl.* [NL.] An order of reptiles, established by Seeley, which contains extinct species of primitive structure, intermediate in this respect between the anomodonts and higher forms. Paired prevomers and ectopterygoids are present, as well as free epiotics. The vertebræ are amphicœlous and perforated by the notochord. The only known genus is *Procolophon*, from the Trias of South Africa.

Proconia (prọ-kō′ni-ạ̈), *n.* [NL. (Serville, 1832), < Gr. πρό, before, + κῶνος (?), cone.] 1. A genus of leaf-hoppers of the family *Jassidæ*, containing a number of wide-spread species.—2. [*l. c.*] An insect of this genus.—**Waved proconia**, an American tree-hopper, *Proconia undata*, which feeds on the leaves of the grape, cotton, and many trees and plants. Also called *sharp-shooter* by cotton-planters.



Waved Proconia (*Proconia undata*). Adult at left; nymph at right. (Sanderson, U. S. D. A.)

procoracoid (prọ̄-kor′ạ̈-koid), *n.* [Gr. πρό, forward, + E. *coracoid.*] A small bone, or center of ossification, which lies anterior to the coracoid and in contact with it and the scapula: present in monotremes, plesiosaurs, etc. In birds the procoracoid is represented by a process on the shaft of the coracoid just below the glenoid cavity. Same as the *precoracoid* of Huxley and others. *Amer. Nat.*, Feb., 1904, p. 105.

procoracoidal (prọ̄-kor-ạ̈-koi′dạ̈l), *a.* [*procoracoid* + *-al*¹.] Of or pertaining to the procoracoid; precoracoidal. *Trans. Zool. Soc. London*, Oct., 1899, p. 69.

procribrum (prọ̄-krib′rum), *n.*; pl. *procribra* (-rạ̈). [NL., < *pro-* + *cribrum.*] A sac-like development of the embryonic cribrum. It later gives rise to the sinus maxillaris. *Jour. Roy. Micros. Soc.*, Feb., 1905, p. 42.

procryptic (prọ̄-krip′tik), *a.* [Irreg. < L. *pro*, for, + E. *cryptic.*] Relating to resemblances in form and color between an animal and its surroundings by which it is concealed from its enemies.

> No doubt, however, it is an equally important *procryptic* factor, serving to protect the spider from various enemies. *Proc. Zool. Soc. London*, 1903, p. 48.

> The resemblance of a mollusc to the coral on which it lives, or an external parasite to the hair or skin of its host, would be *Procryptic*. *Encyc. Brit.*, XXVII. 149.

Procryptic coloring. See ★*coloring.*

procryptically (prọ̄-krip′ti-kạ̈l-i), *adv.* By means of or with reference to procryptic characters.

procteurynter (prok-tū-rin′tėr), *n.* [Gr. πρωκτός, anus, + *εὐρυντήρ, < εὐρύνειν, widen.] An instrument used in stretching the sphincter muscle of the anus.

proctocneme (prok′tok-nēm), *n.* [Gr. πρωκτός, the anus, + κνήμη, the tibia.] In anthozoans, one of the twelve primary mesenteries: contrasted with ★*metacneme.*

proctocnemic (prok-tok-nē′mik), *a.* [*proctocneme* + *-ic.*] Of or pertaining to a proctocneme; characterized by the presence of proctocnemes.

proctodæum, *n.* 2. The posterior division of the cloaca in such animals as birds, opening externally by the anus: correlated with ★*coprodæum* and ★*urodæum.*

proctologic, proctological (prok-tọ̄-loj′ik, -i-kạ̈l), *a.* [*proctolog(y)* + *-ic-al*¹.] Of or pertaining to proctology: as, the American *Proctologic* Society.

proctologist (prok-tol′ọ̄-jist), *n.* [*proctolog(y)* + *-ist.*] A medical practitioner who makes a specialty of diseases of the rectum and anus.

proctology (prok-tol′ọ̄-ji), *n.* [Gr. πρωκτός, anus, + *-ology.*] That medical specialty which deals with diseases of the anus and rectum.

proctoplegia (prok-tọ̄-plē′ji-ạ̈), *n.* [NL., < Gr. πρωκτός, anus, + πληγή, stroke.] Same as *proctoparalysis.*

proctoptosis (prok-top′tọ̄-sis), *n.* [NL., < Gr. πρωκτός, anus, + πτῶσις, falling.] Same as *proctocele.*

proctorrhaphy (prok-tor′ạ̈-fi), *n.* [Gr. πρωκτός, anus, + ῥαφή, sewing.] In *surg.*, operation for uniting the edges of the torn rectum and anus after rupture of the perineum.

proctoscirrhus (prok-tō-sir′, or skir′us), *n.*; pl. *proctoscirrhi* (-ī). [NL., < Gr. πρωκτός, anus, + σκίρρος, σκῖρος, a tumor. See *scirrhus.*] Cancer of the rectum and anus.

proctoscope (prok′tọ̄-skōp), *n.* [Gr. πρωκτός, anus, + σκοπεῖν, view.] An instrument used in the examination of the rectum; a rectal speculum.

> An examination with the *proctoscope* showed a large ulcerated area about two inches above the rectum. *Med. Record*, Aug. 1, 1903, p. 194.

proctostenosis (prok″tọ̄-stē-nō′sis), *n.* [NL., < Gr. πρωκτός, anus, + στένωσις, narrowing.] Stricture of the rectum.

proctotome (prok′tọ̄-tōm), *n.* [Gr. πρωκτός, anus, + -τομος, < ταμεῖν, cut.] A surgical knife used to incise the rectum, as for the relief of stricture.

proctotrypid (prok-tọ̄-trip′id), *n.* and *a.* I. *n.* One of the *Proctotrypidæ.*

II. *a.* Having the characters of or belonging to the hymenopterous family *Proctotrypidæ.*

procumbent, *a.* 3. In *anat.* and *zoöl.*, directed forward and slightly upward: contrasted with *decumbent.*

> In the lower jaw there is a single pair of *procumbent* incisors, followed by several small teeth. *Encyc. Brit.*, XXX. 506.

Procuratory of resignation, in *Scots law*, a process by which a vassal surrendered his fee or feud to his superior. The surrender of copyholds in England is by a kindred process.

procurrent (prọ̄-kur′ẹnt), *a.* [L. *procurrens*, ppr. of *procurrere*, run forward. See *procursive.*] Inserted progressively farther forward: said of the rays of a fish's fin. *Jordan and Evermann*, Amer. Food and Game Fishes, p. 538.

procurvature (prọ̄-kėr′vạ̈-tụ̄r), *n.* [*pro-* + *curvature.*] Forward curvature. *Annals and Mag. Nat. Hist.*, Jan., 1903, p. 114.

> . . . I am disposed to think that they [Aganippæ] have had an origin independent of the Cystauchenii in Australia from the Nemesiæ, from which they differ practically only in the *procurvature* of the fovea—a feature which is known to have arisen more than once within the limits of the Mygalomorphæ. *Proc. Zool. Soc. London*, 1903, p. 349.

procurved (prọ̄-kėrvd′), *p. a.* [*pro-* + *curved.*] Bent forward: the opposite of *recurved* or *decurved.*

> The male . . . is a very fine specimen . . . but with a recurved instead of *procurved* thoracic fovea. *Proc. Zool. Soc. London*, 1902, p. 122.

prod, *n.* 5. A pyramidal or conical point which protrudes from the face of a loam-plate or a core-plate for the purpose of holding or retaining the loam. *Lockwood*, Dict. Mech. Eng. Terms.

prodeltidium (prō-del-tid′i-um), *n.*; pl. *prodeltidia* (-ạ̈). [NL., < Gr. πρό, before, in place of, + NL. *deltidium.*] A plate developed on the dorsal side of the pedicle-lobe in the cephalula stage of brachiopod embryos and which later becomes attached to the posterior margins of the ventral valve to form the deltidium of postembryonic stages. *J. M. Clarke.*

prodiæne (prō-dī′ēn), *n.* [Gr. πρό, forward, + δι-, two, + (τρί)αινα, trident.] A four-rayed sponge-spicule with two of the arms close together as if forked and the fourth atrophied. *Proc. Zool. Soc. London*, 1902, p. 219.

prodidomid (prọ̄-did′ọ̄-mid), *n.* and *a.* I. *n.* A member of the araneid family *Prodidomidæ.*

II. *a.* Having the characteristics of or belonging to the araneid family *Prodidomidæ.*

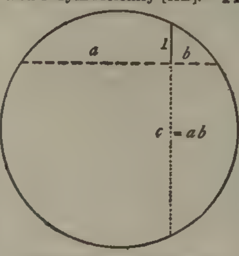
prodigal, *n.* 2. In *civil law*, a person of full age for whom, by judicial authority, a curator is appointed, by reason of his inability to attend to his obligations and estate.

prodissoconch (prọ̄-dis′ọ̄-kongk), *n.* [Gr. πρό, before, + δισσός, double, + κόγχη, shell.] The bivalve embryonic shell of a pelecypod, generally of a rounded form, equivalve, with straight, rather long hinge-line and smooth surface. It can often be distinguished at the apex of the beaks of young shells.

> It might perhaps be thought desirable to dignify this specialized type of protoconch by a distinct name, as has been done by Jackson in the case of the pelecypod protoconch ("*prodissoconch*"). If so, the name "prototeconch," suggested to me by the late Professor Hyatt, would be most applicable. *Amer. Nat.*, Dec., 1902, p. 918.

produce-car (prod′ūs-kär), *n.* In *car-building*, a refrigerator-car (which see) used to transport vegetables, fruit, etc.

product, *n.*—**Adaptation-product.** See ★*immunity*, 5.—**Geometric product.** Same as *outer* ★*product. B. de Saint-Venant.*—**Inner product,** in *geom.*, the combination $A_x B_x + A_y B_y + A_z B_z$ of the components of two vectors A, B on rectangular axes. It represents geometrically the product of the lengths of the two vectors and the cosine of their included angle. Grassmann, to whom the phrase is due, writes this symbolically [A | B].—**Inner product** of two coinitial sects *a*, *b*, making an angle *α*, the product *ab* cos *α* of one *a* and the projection *b* cos *α* of the other upon it.—**Intermediary product.** Same as ★*mid-product.*—**Outer product** of two vectors or directed sects, the parallelogram they determine considered as having area, posture (confinement to a particular parallel-axial pencil), and tour-sense. Grassmann, to whom the phrase is due, writes the outer product of A and B symbolically [AB].—**Product of two sects.** In *geom.*: (*a*) Their rectangle. (*b*) Set off from their intersection-point the unit sect on one of two perpendicular straights. On the other set off on one ray *a*, on the other *b*. The circle through the free end-points of 1, *a*, *b* determines on the fourth ray a sect, *c*, which is the product of the sect *a* by the sect *b*. Thus $c = ab$. (*c*) If the sects are taken as coplanar and confined to two straights, their product is the area of the parallelogram determined.—**Radical product** (*geom.*), the product of the sects from the radical center of three circles to two points on one of them.—**Relative product** of two relations, R S, the relation which holds between *x* and *z* whenever there is a term *y* to which *x* has the relation R and which has to *z* the relation S.—**Residual products,** those materials which, in the cultivation or manufacture of any given commodity, remain over either as waste-products, which have no value, or as by-products, which have some value of their own and thus insure a supplementary return to the industry that incidentally creates them.—**Solubility product,** in *phys. chem.*, a certain value of the product of the concentration of one of the ions of a salt by the concentration of the other ion, which determines how much of this salt can be held dissolved in a given solution. If, in a given solution, the product of the actual concentrations of the two ions exceeds this limiting value, solid salt will be precipitated; if the product of actual concentrations is less than this value, salt will be dissolved. Calcium sulphate is somewhat soluble in water, and the solubility product, which is the product of the concentration of calcium ions by the concentration of SO_4 ions, has a sensible value. If to this solution we add sulphuric acid, and so multiply the concentration of SO_4 ions by 10, the solubility product can be kept at its proper value only by reducing the concentration of calcium ions to one tenth the previous value, and calcium sulphate is precipitated. *Van Hise*, in U. S. Geol. Surv., Monographs, XLVII. iii. 117.—**Stereometric product** of two sects taken as fixed in tridimensional point-space is the volume of the tetrahedron they determine.—**Vectorial product.** Same as *outer* ★*product.*

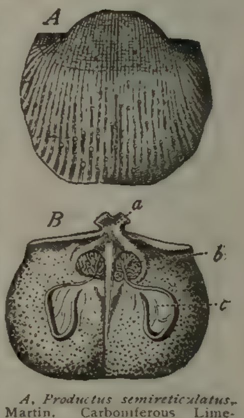


Product *ab* of sect *a* by sect *b*.

Productella (prō-duk-tel′ạ̈), *n.* [NL., < *Productus* + dim. *-ella.*] A genus of telotrematous straight-hinged brachiopods found in the Devonian formation. The shells resemble those of the allied genus *Productus* in general form, but differ in having the hinge characters normally developed.

product-theorem (prod′ukt-thē″ọ̄-rem), *n.* In the representation of complex numbers, the theorem that the absolute value of a product *ab* is the product of the absolute values of *a* and *b*, while the amplitude of *ab* is the sum of the amplitudes of *a* and *b*. $|ab| = |a|\,|b|$, while $\text{am}\,(ab) = \text{am}\,a + \text{am}\,b$.

Productus (prọ̄-duk′tus), *n.* [NL., < L. *productus*, produced. See *product.*] A genus of protrematous straight-hinged brachiopods found in Devonian, Carboniferous, and Permian formations, and especially abundant in and characteristic of the last two. The genus is represented by numerous species, many of which have world-wide distribution and all of which have convexo-concave shells of semicircular outline with thick prominent overarching beaks and spinose surfaces. The hinge-organs, with the exception of the strong cardinal process, are absent or vestigial.



A, *Productus semireticulatus*, Martin. Carboniferous Limestone; Visé, Belgium. Two thirds natural size; *B*, *Productus horridus*, Sow. Permian; Prussia and England, two thirds natural size, interior of dorsal valve; *a*, cardinal process; *b*, muscle-scars; *c*, brachial impressions. (From Zittel's "Palaeontology.")

proectoprocton (prọ̄-ek-tọ̄-prok′ton), *n.*; pl. *proectoprocta* (-tạ̈). [Gr. πρό, before, + ἐκτός, outside, + πρωκτός, anus.] Lankester's hypothetical ancestor of the ectoproctous polyzoans.

proedria (prō-ed′ri-ạ̈), *n.*; pl. *proedriæ* (-ē). [NL., < Gr. προεδρία, the privilege of the front seats.] In *Gr. antiq.*, the right to sit in front seats at the theater, the public games, etc.: granted by Greek cities as an honor to distinguished strangers.

> With strangers whom the city wished to honour with crowns or immunities or *proedriae*. *P. Gardner*, in Jour. Hellenic Studies, IX. 53.

proëmial, *a.* 2. In *paleon.*, pertaining to the vanguard of a migrating fossil fauna which gradually invades a new province, but is replaced after its first appearance by the previous tenant.

proencephalus (prō-en-sef′a̤-lus), *n.*; pl. *proencephali* (-lī). [NL., < Gr. *πρό*, before + *ἐγκέφαλος*, within the head. See *encephalon.*] A monster having a defect in the frontal region through which the brain projects.

proenzym (prọ̄-en′zim), *n.* [*pro-* + *enzym.*] The inactive form of a ferment in which it exists within the mother cell. Also *proferment* and *zymogen.*

Proëtidæ (prọ̄-et′i-dē), *n. pl.* [NL., < *Proëtus* + *-idæ.*] A family of medium-sized opisthoparian trilobites characterized by an oval, compact carapace, tumid cephalon, oval or ovate, tumid glabella with two basal lobes, thorax with 8–22 segments, and pygidium rounded and multisegmented. The family is represented by the genera *Proëtus, Phillipsia,* and *Arethusina,* which range from the Upper Silurian to the Permian system.

Proëtus (prọ̄-ē′tus), *n.* [NL.] A genus of opisthoparian trilobites of the family *Proëtidæ.* It is characterized by semicircular head-shields having thickened margin, rounded glabella usually with basal lobes, large crescentic, holochroal proximal eyes, 10 thoracic segments, semicircular marginate pygidium, and aspinous, smooth, or striated surface. Numerous small or medium-sized species range from the Lower Silurian to the Carboniferous and are specially abundant in the Silurian and Devonian formations.

profecy, *n.* An amended spelling of *prophecy.*

proferment (prọ̄-fėr′ment), *n.* [*pro-* + *ferment.*] Same as ★*proenzym.*

professor, *n.* **5.** The name of an artificial fly used in angling.

profest, *p. a.* An amended spelling of *professed.*

profesy, profet, profetic. Amended spellings of *prophesy,* etc.

profile, *n.* **2.** (*h*) In *theat.,* a wing having the outline of a tree. See *profile, v. t.,* 3.

> What is technically known as a "*profile,*" or tree form wing, was propped against the row of gas jets and left there for twenty minutes, with no other consequence than that the wood had been charred through, and broke on being handled. *Sci. Amer.,* July 2, 1904, p. 8.

Inboard profile, in *ship-building,* a plan which shows the internal arrangements of a vessel by a longitudinal vertical section at the centerline.—**Outboard profile,** in *naval arch.,* a plan which shows the general arrangement of the exterior of a vessel in longitudinal profile. See cut under ★*battle-ship.*

profiler (prō′fēl-ėr), *n.* A profiling-machine; a machine for cutting a profile on an edge by passing a rotating cutter along the edge while a former or guide compels the cutter to reproduce a predetermined outline on the work. *Elect. World and Engin.,* March 19, 1904, p. 58.

profilometer (prō-fi-lom′e-tėr), *n.* [*profile* + Gr. *μέτρον,* measure.] A craniometrical device for determining profiles. It has sliding rods which are adjustable to the contour of the head, and thus enable a tracing of the profile to be made.

profit, *n.*—**Rents and profits.** See ★*rent*^{2}.

profluvium (prọ̄-flū′vi-um), *n.*; *profluvia* (-ạ̈). [L., a flowing forth, < *profluere,* flow forth.] A morbid discharge or flux.

profylactic, *a.* and *n.* An amended spelling of *prophylactic.*

progamete (prọ̄-gam′ēt), *n.* [Gr. *πρό,* before, + *γαμέτης, γαμετή,* a spouse (see *gamete*).] A common name for the primary oöcytes of the female and the primary spermatocytes of the male animal.

> The cells of the reproductive glands are the germ cells (oögonia spermatogonia). They undergo division and give rise to the *progametes,* which in the case of the female are sometimes called oöcytes, in the case of the male spermatocytes. *Encyc. Brit.,* XXVIII. 139.

progamic (prọ̄-gam′ik), *a.* [Gr. *πρό,* before, + *γάμος,* marriage, + *-ic.*] Of or pertaining to a period in the development of the reproductive cells which antedates the phenomena of maturation (see ★*maturation,* 3) and fertilization: as, the *progamic* determination of sex; the *progamic* cell-divisions in oögenesis and spermatogenesis.

> *Progamic* divisions and reducing divisions, though sometimes coincident (as in Metazoa), are not necessarily associated, but may be widely divided in the life-cycle where there is "antithetic alternation of generations."
> *Jour. Roy. Micros. Soc.,* Oct., 1904, p. 508.

progamous (prog′a̤-mus), *a.* [Gr. *πρό,* before, +, *γάμος,* marriage, + *-ous.*] In *embryol.,* prior to fertilization of the ovum. *Buck,* Med. Handbook, VII. 146.

proganoid (prọ̄-gan′oid), *a.* and *n.* [Gr. *πρό,* before, + E. *ganoid.*] **1.** Noting a series or division of the order *Ganoidei,* of the class *Pisces,* proposed by Nicholson and Lydekker to include the suborders *Cephalaspidea, Placodermata,* and *Acanthodea.* It is no longer used. Some of these suborders have since been elevated to the rank of orders and others removed entirely from the class *Pisces* into the class *Agnatha.*—**2.** Any individual belonging to the proganoid series or subdivision of the order *Ganoidei,* as defined by Nicholson and Lydekker.

proganosaur (prọ̄-gan′ọ̄-sâr), *n.* [Gr. *πρό,* before, + *γάνος,* brightness (see *ganoid*), + *σαῦρος,* lizard.] A member of the *Proganosauria,* one of the suborders of the *Rhynchocephalia,* now called the *Proterosauria.* The members of this suborder are all extinct and comprise some of the most ancient and most primitive reptiles known. The *Proterosauria* Seeley (*Proganosauria* Baur) are characterized by the possession of small abdominal ribs arranged in several longitudinal series. The pubis and ischium are imperfectly fused. The fifth metatarsal is not dissimilar from the rest of the metatarsals. Marginal teeth are present in single uniform series. They are found in the Permian and Trias.

Proganosauria (prō-gan-ọ̄-sâ′ri-ạ̈), *n. pl.* [NL. See ★*proganosaur.*] A group of extinct reptiles, of small or moderate size and aquatic habits, distantly related to the existing *Hatteria.* The skull is long, the teeth are slender, the vertebræ are expanded above and perforated for the notochord, and the pectoral and pelvic girdles are plate-like. The known genera are *Mesosaurus* and *Stereosternum,* from the Permian.

progaster (prọ̄-gas′tėr), *n.* [NL., < Gr. *πρό,* before, + *γαστήρ,* belly.] **1.** The archenteron, or gastrocœle of an embryo in the gastrula stage.—**2.** In *entom.,* the anterior edge of the abdomen: a term used by acarologists. *Proc. Zool. Soc. London,* 1893, p. 266.

progeria (prọ̄-jē′ri-ạ̈), *n.* [NL., < Gr. *πρό,* before, + *γῆρας,* old age.] A state in which several of the characteristic physical marks both of infantilism and of senility exist in the same individual.

proglottidization (prọ̄-glot″ti-di-zā′shọn), *n.* [*proglottis* (*tid-*) + *-ization.*] The condition of being composed of proglottides; the arrangement of proglottides in a cestoid. See *proglottis.*

> The typical "*proglottidisation*" is not expressed externally. *E. R. Lankester,* Treatise on Zoology, IV. 118.

prognathi (prog′nạ̄-thī), *n. pl.* [NL., pl. of *prognathus*: see *prognathous.*] Prognathous individuals or types.

prognathite (prog′nạ̄-thīt), *n.* [*pro-* + *gnathite.*] In crustaceans, the sixth joint of a gnathite.

Prognathodes (prog-nath′ọ̄-dēz), *n.* [NL., < Gr. *πρό,* before, + *γνάθος,* jaw, + *εἶδος,* form.] A genus of chætodontoid fishes known from the West Indies.

prognose (prog′nōz), *v. t.* and *i.*; pret. and pp. *prognosed,* ppr. *prognosing.* [A back-formation from *prognosis.*] Same as *prognosticate.*

Prognurus (prog-nū′rus), *n.* [NL., < Gr. *Πρόγνη,* daughter of Pandion, transformed into a swallow, + *οὐρά,* tail.] A genus of deep-sea fishes, of the family *Liparididæ,* found off the Pacific coast of the United States.

progoneate (prọ̄-gō′nẹ̄-ạ̄t), *a.* [Gr. *πρό,* before, + *γονή,* generative organs, + *-ate*^{1}.] Having the genital opening at the base of the abdomen, as in pauropod and diplopod *Myriapoda.*

> It seems most probable that the Symphyla, though *progoneate,* are more recent forms than the *progoneate* myriopods, which have retained the primitive feature of double sexual outlets.
> *A. S. Packard,* Text-book of Entom., p. 22.

program, *n.* **5.** Same as *program music,* or the chain of thoughts or images that suggests and characterizes such music.

> In the realms of absolute music Goldmark is often dull. A "*programme*" seems essential to him. In opera he is most certainly at his best, and as an orchestral colourist he ranks among the very highest.
> *Encyc. Brit.,* XXIX. 22.

program (prō′gram), *v. t.*; pret. and pp. *programmed,* ppr. *programming.* [*program, n.*] To make a program of; enter consecutively in or as in a program.

progress, *n.* **5.** *pl.* In *astrol.,* the positions the moon forms in her advance, by allowing one synodical lunation for one year of the native's life.—**Dynamic progress,** adjustment to a new environment in distinction from static progress, or adjustment to a familiar environment. *Patten,* Theory of Social Forces, p. 15.—**Genetic progress,** progress due to unconscious evolutionary processes unaided by man's intention or conscious effort. *L. F. Ward,* Dynamic Sociol., I. 28.—**Static progress,** adjustment to one given environment in distinction from dynamic progress, or adjustment successively to different environments. *Patten,* Theory of Social Forces, p. 14.—**Teleological progress,** progress toward a given end, intelligently planned and achieved through the artificial adaptation of means to ends. *L. F. Ward,* Dynamic Sociol., I. 28.

progression, *n.* **3.** In *math.*: (*b*) A discrete series which has a first element but no last. *B. A. W. Russell.*—**4.** (*b*) The forward change of mutes from one order (surd, sonant, or aspirate) to another, according to Grimm's law.—**6.** In Stumpf's *psychol.,* one of the four immanent relations of sensation, the other three being number, similarity, and fusion. It is most clearly illustrated in the facts of sensation intensity. *E. B. Titchener,* Exper. Psychol., II. ii. cxxiii.—**7.** In *gambling,* any method of advancing the amount of a lost bet and reducing a bet won: a form of martingale, sometimes called "progress and pinch." Starting with 5 chips, if the first bet is lost 6 are wagered; if it is won, 4 only.—**8.** A mode of evolution of organisms by increase in size or number of differential additions. It is characteristic of the epacmic phylogeny of most races and is succeeded by retrogression in their acmic or paracmic history.—**Law of progression,** in *psychophys.,* the principle, laid down by Delbœuf, that $S = k \log \frac{R_e}{R_i}$, where S stands for intensity of sensation, R_e for the movement-process of external stimulation, R_i for the movement-process of internal stimulation, and k is a constant. *E. B. Titchener,* Exper. Psychol., II. ii. cxx.

Progressive games, manifold, multiplication, variation. See ★*game*^{1} etc.—**Progressive tenses,** tenses, or tense forms of a verb, used to indicate progressive action, or action that is going on at the time indicated, present, past, or future.

Proicene (prō′i-sēn), *n.* [Gr. *πρωί,* adv., early, + *καινός,* recent.] In *geol.,* a name proposed by Sir W. Dawson (1889) for the Upper Eocene or Vicksburg beds of the North American Tertiary: not generally accepted.

proil (proil), *n.* In *cribbage,* a corruption of *pair royal.* Also *prial.*

proiogony (prō-i-og′ọ̄-ni), *n.* [Gr. *πρώιος,* adj., early (< *πρωί,* adv., early), + *-γονια,* generation. The proper form would be **proigony.*] Reproduction by larvæ or immature animals, whether parthenogetically or sexually. [Rare.]

> Taschenberg . . . suggests the term *Proiogony* for all cases of sexually mature larvæ, so that the word Pædogenesis can be used in its original and proper meaning [*i.e.,* the parthenogenetic reproduction of larvæ or immature animals].
> *E. F. Phillips,* in Proc. Amer. Philos. Soc., Oct. 16, [1903, p. 292.

projaculate (prọ̄-jak′ụ̄-lāt), *v. t.*; pret. and pp. *projaculated,* ppr. *projaculating.* [L. *pro,* before, + *jaculari,* throw, dart.] To dart or throw forward; project. [Rare.]

> Perhaps no individual or race passes through all these stages in the phenomenology of love. . . . But long before this viaticum is open, the mind modulates over into the field of transcendence and *projaculates* gods, heavens, hells, and ideals, or, if more philosophical, hypostatizes ideas of goodness, truth, and beauty.
> *G. S. Hall,* Adolescence, II. 136.

project, *v. i.* **4.** To move about busily or curiously; pry. [Slang.]

> As we comes up, I observes the old Magdalena *projectin'* about the main door of the casa, stirrin' up some lazy peonies to their daily toil.
> *A. H. Lewis,* Wolfville Days, xiii.

project, *n.* **II**†. *a.* Projecting; sticking out.

> Had he encounter'd me with such proud slight,
> I would have put that *project* face of his
> To a more test than did her duchessship.
> *Chapman,* Bussy D'Ambois, ii. 1.

projectil, *a.* and *n.* A simplified spelling of *projectile.*

projectile, *n.*—**Armor-piercing projectile,** a projectile adapted, by its material and by special methods of hardening its point, to pierce modern armor-plate. A great advance in power of penetration has been secured by placing upon the point of the shell a soft metal cap which protects it from being broken by the hardened surface of the plate.

projection, *n.* **5.** (*d*) The foot of the perpendicular from a point to a straight line is the *projection* of the point upon the line.—**Axial projection,** projection from a fixed straight line, *m* (the projection-axis). Thus is obtained a new figure composed of planes all on the axis *m,* and called an axial eject of the original.—**Center of projection.** (*b*) See ★*center*^{1}.—**Eccentric projection,** in *psychol.*: (*a*) The localization of a sensation, aroused by stimulation of a nerve-tract, in the peripheral sense-organ: thus, a blow upon the ‘funny-bone’ arouses the sensation-complex of ‘pins and needles’ in the finger-tips; pain may be referred to the ‘foot’ after amputation of the leg; etc.

> By “*eccentric projection*” we understand the fact that a sensation produced by the stimulation of the nerve-trunk instead of the nerve-ends is regularly attributed to irritation of the peripheral ramifications of the nerve.
> *T. Ziehen* (trans.), Introd. to Physiol. Psychol., p. 77.

(*b*) The localization of pressure sensation at the extremity of a pencil, cane, etc., held in the hand, rather than in the hand itself.

> The *eccentric projection* of touches is only a special case of their location, and follows the same general laws.
> *E. C. Sanford*, Exper. Psychol., p. 2.

Equidistant projection, a way of mapping a sphere in which the projection-vertex is half a chord of a quadrant of the sphere outside it.—**Equivalent projection,** an equal-surface projection; a projection which represents the whole of the earth's surface on a scale that is uniform throughout as regards areas and is therefore specially appropriate in certain meteorological researches. The principal equal-surface projections are those of Lambert and Mollweide.—**Linear projection,** the projecting from a fixed point M (the projection-vertex) a figure, the original, composed of points, B, C, D, etc., by constructing the projecting straights $\overline{MB}$, $\overline{MC}$, $\overline{MD}$, etc. Thus is obtained a new figure composed of straights all through M, and called an ‘eject’ of the original.—**Meridional projection,** a projection of a sphere, the plane of projection being parallel to the meridian.

projectional (prọ-jek′sho̤n-a̤l), *a.* [*projection* + *-al*¹.] 1. Of, pertaining to, or making use of, projection.—2. Pertaining to the act of throwing forth or projecting; relating to a projection center or system. *Philos. Trans. Roy. Soc.* (London), 1899, ser. B, p. 298.—**Projectional demonstration.** See ★*demonstration.*

projection-axis (prọ-jek′sho̤n-ak″sis), *n.* In *geom.*, the fixed straight line in axial projection.

projection-center (prọ-jek′sho̤n-sen″tėr), *n.* A center, as a nerve-center, from which impulses are thrown or projected outward. See ★*center of projection. G. Elliot Smith*, in Trans. Linn. Soc., Zool., 1899, p. 378.

projection-eyepiece (prọ-jek′sho̤n-ī″pēs), *n.* See ★*eyepiece.*

projection-vertex (prọ-jek′sho̤n-vėr″teks), *n.* Same as *center of projection.* See *projection*, 5 (*a*).

Projective coördinate of the point D, the cross-ratio [ȦBCD], where A, B, C are points costraight with D, whose coördinates are ∞, 0, 1.—**Projective metrics.** See ★*metrics*¹.—**Projective transformation.** See ★*transformation.*

projectively (prọ-jek′tiv-li), *adv.* In accordance with the principles of projective geometry; non-metrically.

projector, *n.* 5. In *projective geom.*: (*a*) A projecting straight. (*b*) A projecting plane. (*c*) An eject.—**Chronographic projector,** an apparatus which projects on a screen a series of photographs in rapid succession, giving the effect of motion; a cinematograph; a biograph.

projectoscope (prọ-jek′tọ-skōp), *n.* [L. *projectus*, pp. of *projicere*, project, + Gr. σκοπεῖν, view.] An apparatus similar to the magic lantern.

projicient (prọ-jish′i-e̤nt), *a.* [L. *projiciens*, ppr. of *projicere*, project. See *project.*] Projecting.

> In presence of the arcs of the great *projicient* receptors and the brain there can be few receptive points in the body the activities of which are totally indifferent one to another.
> *Nature*, Sept. 8, 1904, p. 465.

prolamin (prō-lam′in), *n.* [*proline* + *am*(*ide*) + *-in*².] See the extract.

> *Prolamins* form a unique and sharply differentiated group of proteins which occur in quantity in the seeds of cereals, but not in those of any other plant yet examined. These are soluble in all proportions in alcohol of 70–80 per cent., and are not affected by boiling their alcoholic solutions, even for a long time. They are practically insoluble in water and saline solutions, but are soluble in dilute solutions of acids and alkalies.
> *Science*, Oct. 2, 1908, p. 422.

Prolapsus ani. Same as *proctocele.*—**Prolapsus uteri,** falling of the womb.

prolatum (prọ-lā′tum), *n.*; pl. *prolata* (-tạ̈). [NL.] A prolate spheroid.

Prolecanites (prō-lē-ka-nī′tēz), *n.* [NL., ‹ Gr. πρό, before, + NL. *Lecanites.*] A genus of fossil ammonoid cephalopods, type of the family *Prolecanitidæ*, with smooth or costate, compressed, discoidal, and involute shells and broadly hastate or rounded lobes and saddles on the suture-lines. The species ranges from Middle Devonian to Lower Carboniferous in North America, Europe, and Asia.

prolectite (prọ-lek′tīt), *n.* [Gr. προλέγειν, foretell, + *-ite*².] A mineral which occurs very sparingly at Nordmark, Sweden. It belongs to the humite group and from its crystallization is inferred to be a member whose existence had been predicted, having the composition $Mg[Mg(F,OH)]SiO_4$. See ★*humite.*

proliferation, *n.* 3. Increase in size by reproduction of the primary elements.

> There is, however, another phenomenon associated with extensive invasion of the kidneys. These organs show over the entire surface a large number of minute grayish spots, already referred to. These minute spots represent foci of necrobiotic changes in the cortex, followed by marked cell *proliferation* in the same areas. The less advanced foci are largely made up of the tubular epithelium of the area which has become, as it were, fused into a mass on account of the obliteration of the lumina of the tubules.
> *Jour. Exper. Med.*, March 17, 1902, p. 313.

Band of proliferation, in sea-anemones, a band of cells from which the septa are developed. *Van Beneden*, 1897.

prolification, *n.* 3. Reproduction by division. *N. E. D.*

proline (prō′lin), *n.* Pyrrolidine carboxylic acid, $C_4H_8N.CO_2H$, a compound formed by the hydrolysis of the glycylanhydrid obtained by the tryptic digestion of gelatin. The active *a*-proline melts at 205° C. *Nature*, Oct. 24, 1907, p. 653.

prolixious, *a.* 2†. Elastic; easily stretched; apt to yield.

> Bil. Nay, the Leather is affable and apt to bee drawn to any generous disposition.
> Kin. Pray (faire Lady) does it not come on too stiffe?
> Tor. No sir very gently.
> Bil. Stiffe, as *prolixious* as you please.
> *Dekker*, Match mee in London, ii.

proloculum (prọ-lok′ụ̄-lum), *n.*; pl. *prolocula* (-lạ̈). [NL., ‹ L. *pro*, before, for, + *loculum* for *loculus.* See *loculus.*] In foraminifers, the initial chamber of the cell.

> A dissertation by Mr. J. A. Cushman on the developmental history of the shelled foraminifera of the group Lagenidæ. For the initial chamber of these lagenoids the author proposes the name “*proloculum*,” on the analogy of “protoconch” in the case of the gastropod shell.
> *Nature*, Sept. 21, 1905, p. 516.

prolocution (prō-lọ-kū′sho̤n), *n.* [LL. *prolocutio*(*n-*), ‹ L. *proloqui*, speak out, forth, speak before. See *prolocutor.*] A preamble; a preliminary remark.

> “Sir,” said I, “if I tell you my story, I must commit a friend's life to your discretion. Pass me your word it shall be sacred.” . . . He passed me his word very seriously. “But,” said he, “these are rather alarming *prolocutions*; and if there are in your story any little jostles to the law, I would beg you to bear in mind that I am a lawyer, and pass lightly.”
> *R. L. Stevenson*, Kidnapped, xxvii.

prolog, *n.* and *v.* A simplified spelling of *prologue.* See *prologue.*

prologist (prō′log-ist), *n.* [Gr. πρόλογος, prologue, + *-ist.*] The writer of a prologue; also, one who speaks a prologue.

prolong (prọ-lông′), *n.* [*prolong*, *v.*] A prolongation: used specifically of an extension or elongated mouthpiece or chamber on retorts for the manufacture of zinc products or for the handling of other oxids which are volatile at high temperatures.

> This product which is mainly formed in the first period of distillation is a by-product with the European smelters, who use sheet-iron “*prolongs*” on the condensers to collect it. *Electrochem. and Metal. Industry*, Jan., 1905, p. 9.

prom (prom), *n.* A colloquial shortening of *promenade.*

prom. An abbreviation of *promontory.*

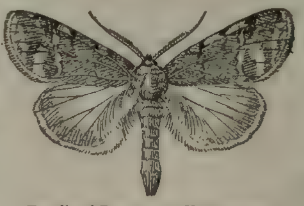
promenade-deck (prom-e-näd′dek), *n.* See ★*deck*, 2.

prometallide (prọ-met′a̤l-id), *n.* [Gr. πρό, before, + NL. *metallum*, metal, + *-ide*¹.] A name devised by Laurent, in connection with his nucleus theory, signifying a compound of a nucleus with an atom of hydrogen, as in the case of what is now called the radical ethyl, acting like an electropositive metal in the formation of salts.

Promicrops (prom′i-krops), *n.* [NL., so called in allusion to the shortness of the anterior part of the cranium; ‹ Gr. πρό, before, + μικρός, small, + ὤψ, face.] A genus of serranoid fishes found on both coasts of tropical America north to Florida and the Gulf of California. See *jewfish* (*a*), with cut.

prominence, *n.*—**Eruptive prominences,** solar prominences due to eruptions actually in progress below the chromosphere. They occur especially near active sun-spots, are characterized by rapid and violent changes of brightness and form, and usually show in their spectra the bright lines of invading metallic vapors in addition to those of hydrogen and helium; hence also called *metallic prominences.*—**Metallic prominences.** Same as *eruptive* ★*prominences.*

prominent, *n.*—**Two-lined prominent,** an American notodontid moth, *Heterocampa bilineata*, which occurs in the eastern United States. Its green or red yellow-striped larva feeds on the leaves of the elm, the oak, and the basswood.—**Unicorn prominent.** Same as *unicorn-moth.*



Two-lined Prominent (*Heterocampa bilineata*).
Natural size.

promis, *n.* and *v.* A simplified spelling of *promise.*

promittor (prọ-mit′o̤r), *n.* [NL., irreg. (for *promissor*) ‹ L. *promittere*, promise.] In *astrol.*, the planet which promises to produce a particular event upon forming a conjunction, or aspect, with the sun, moon, mid-heaven, or ascendant.

promnesia (prom-nē′zi̤ạ̈), *n.* [NL., ‹ Gr. πρό, before, + μιμνήσκειν, remember.] The illusory consciousness that an event, now happening for the first time, has been experienced before; paramnesia.

promonæne (prọ-mon′ēn), *n.* [Gr. πρό, forward, + μόνος, only, + (τρί)αινα, trident.] A sponge-spicule having the form of a bent rod, supposed to be of tetraxial type with two arms atrophied.

promote, *v. i.* 2. In *eccles. law*, to appeal to an ecclesiastical court, acting therein as informant and receiving compensation or fines exacted from the defendant. Such an informant is called a promoter and the court is said to be promoted. *Sir R. Phillimore*, Ecclesiastical Judgments.

promotion, *n.*—**Lineal promotion,** promotion of an officer by seniority in his branch of the service, as distinguished from regimental promotion.

Promyliobates (prọ-mil-i-ob′a̤-tēz), *n.* [NL., ‹ L. *pro*, for, + NL. *Myliobates*, a genus of fishes.] A genus of selachian fishes from the Upper Eocene of Monte Bolca, belonging to the family *Myliobatidæ*, the eagle-rays. They differ from the recent genus *Myliobates* in “apparently showing [the] pectoral fin less completely interrupted at [the] side of [the] head.” *Zittel* (trans.), Text-book of Palaeon., II. 44. In other respects it resembles *Myliobates.*

pronatoflexor (prọ-nā-tọ-flek′so̤r), *a.* Both pronator and flexor; including the pronator and the flexor muscles. *Buck*, Med. Handbook, III. 736.

pronephric (prō-nef′rik), *a.* [*pronephr*(*on*) + *-ic.*] Of or relating to the pronephros or head-kidney.

> The epiblastic origin of the *pronephric* duct is treated as an established fact, and the vertebrate kidney tubule compared to the nephridium of the annelids.
> *Nature*, Oct. 16, 1902, p. 604.

pronephridian (prō-nef-rid′i-a̤n), *a.* Same as ★*pronephric.*

pronephridiostome (prō-nef-rid′i-ọ-stōm), *n.* A flame-cell.

pronephridium (prō-nef-rid′i-um), *n.*; pl. *pronephridia* (-ạ̈). [NL., ‹ Gr. προ, before, + νεφρίδιον, dim. of νεφρός, kidney.] In annelids, one of the embryonic structures from which nephridia are developed. They consist of small cellular aggregations attached to the septa, one pair in each segment, except in front.

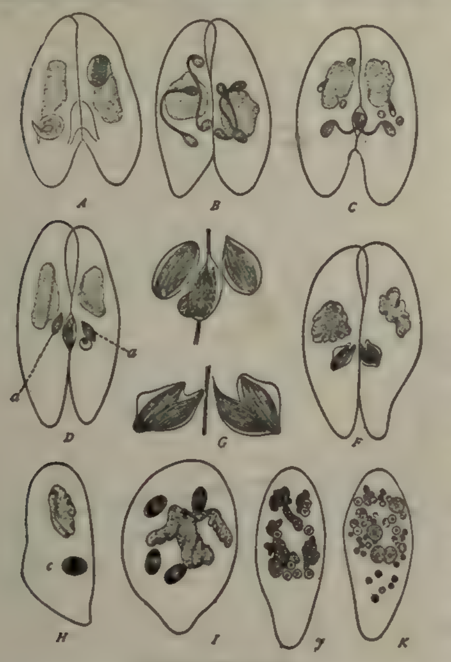
pronic (prō′nik), *a.* [? *prone* + *-ic.*] Consisting of a base or root or first power plus a higher power.—**Pronic number,** a number of the form $x + x^n$, where $n = 2$ or 3 or any greater integer, and x is called the *pronic root* or *basal number.*—**Pronic root.** See ★*pronic number* and ★*root*¹.

pronograde (prō′nọ-grād), *a.* [L. *pronus*, bent, leaning forward, + *gradi*, walk.] Carrying the body in a horizontal position, as do the majority of quadrupeds: opposed to ★*orthograde.*

> When discussing the extent to which the posterior vertebral segments of the body have been suppressed and transmuted during the evolution of man and the higher apes, Dr. A. Keith (Journal of Anatomy and Physiology, vol. xxx. p. 18) calls attention to the fact that naturalists are wrong in describing the larger apes as quadrupedal. They are so only when on the ground, which is not their proper habitat. When at home among the trees they carry the body upright, and may thus be called orthograde, in contradistinction to the lower Primates, which are *pronograde.*
> *Nature*, Oct. 30, 1902, p. 661.

Pronotogrammus (prọ-nō-tọ-gram′us), *n.* [NL., ‹ Gr. πρό, before, + νῶτος, back, + γραμμή, line.] A genus of serranoid fishes found on the Pacific coast of tropical America.

pronucleus, *n.*—**Stationary pronucleus**, the micronucleus which, in a conjugating infusorium, remains in the mother organism and unites with the active pronucleus or micronucleus coming from the other conjugating individual.



a, Stationary Pronucleus.

Conjugation of *Paramœcium caudatum*. (*A–C*, after R. Hertwig: *D K*, after Maupas.) (The macronuclei dotted in all the figures.)

A, micronuclei preparing for their first division; *B*, second division; *C*, third division; three polar bodies or "corpuscules de rebut," and one dividing germ-nucleus in each animal; *D*, exchange of the germ-nuclei (*a*, stationary pronucleus); *E*, the same enlarged; *F*, fusion of germ-nuclei; *G*, the same enlarged; *H*, cleavage-nucleus (*c*) preparing for the first division; *I*, the cleavage-nucleus has divided twice; *J*, after three divisions of the cleavage-nucleus; macronucleus breaking up; *K*, four of the nuclei enlarging to form new macronuclei; the first fission soon takes place.

(From Wilson's "The Cell.")

pronymph (prō′nimf), *n.* [Gr. *πρό*, before, + *νύμφη*, nymph (of insects).] A stage in the development of certain dipterous insects which immediately precedes the formation of the true nymph or pupa. In this pronymphal stage the insect consists simply of an envelop containing a formless creamy mass containing the results of histolysis and the centers for the regeneration of new organs. *Cambridge Nat. Hist.*, VI. 453.

pronymphal (prọ-nim′fa̤l), *a.* [*pronymph* + *-al*¹.] Of or pertaining to a pronymph.

prœstrous (prọ-es′trus), *a.* [*pro-* + *œstrous.*] Relating to the prœstrum or the period before the coming in heat of mammals.

> Ovulation can occur spontaneously at any œstrous (or *pro-œstrous*) period with Scottish black-faced sheep.
> *Jour. Roy. Micros. Soc.*, Aug., 1903, p. 484.

prœstrum (prọ-es′trum), *n.* [NL., < *pro*, before, + *œstrum*. See *œstrum.*] The time just previous to the period of sexual desire, or the coming in heat, of mammals.

> The *prœstrum* is marked by a mucous or sanguineo-mucous flow. It is very rapidly succeeded by *œstrus* (the period of desire).
> *Jour. Roy. Micros. Soc.*, Aug., 1903, p. 484.

proof, *n.* **7.** In alcoholic liquors, beside the proof-spirit of the British excise authorities there is a proof-spirit recognized by the United States internal revenue officers which is defined as "that alcoholic liquor which contains one-half its volume of alcohol of a specific gravity of .7939 at 60° Fahrenheit." *A. H. Allen* (Com. Org. Anal., 2d ed., I. 57) remarks upon this: "the specific gravity of such spirit is stated to be .93353 at 60° F., water at its maximum density being taken as unity. (This will correspond to a density of about .9341, if water at 60° F. be taken as unity, and to a content of 42.7 per cent. by weight of absolute alcohol.) Absolute alcohol would contain 200 per cent. of proof-spirit according to the United States excise, instead of 175½ per cent. as in the English system."
13. An assay of a bullion of known composition placed in the muffle with the other assays in order to determine the difference in weight due to the loss of silver by volatilization and absorption by the cupel.—**14.** In *photog.*, a trial print from a negative.—**Author's proof**, a clean proof, without typographical errors, supposed and intended to be a true reproduction of the author's manuscript or 'copy,' and therefore ready to be sent to him; also, the same proof after revision, with added markings by the author.—**Cosmological proof.** See ★*cosmological.*—**Lettered proof**, a finished proof of an engraving which contains the title of the engraving and the names of its designer, printer, etc.—**Pounded** or **beaten proof**, proof from a form which is too large for the small proof-press, proved by beating it on the form. See the extract.

> Letterpress forms, too large for the small proof-press, have to be proved by beating with the proof-planer after this manner: A sheet of sized paper, dampened on a clean stone by sponging it evenly on one side, is carefully laid upon the previously inked form of type. Then the stoneman takes the proof-planer in his left hand and lays it down squarely but quickly upon the inked form. Beginning at the nearest corner, with the end of the handle (not with mallet head) he strikes a quick blow usually in the center of the planer. From that page he moves the planer to other pages, renewing the striking until he sees the print of the types faintly indenting the moist sheet. *De Vinne*, Mod. Book Composition, p. 320.

Teleological proof, that proof of theism which is based upon the principle of final causation. Caldecott mentions three varieties of this proof: the first is from the teleological nature of biological organisms; the second is drawn from the adaptations of independent organisms and circumstances to one another; the third is drawn from the teleological unity of the whole universe, as showing one order throughout. The last argument may be put as an analogy or as a direct inference.

proof-bar (pröf′bä̤r), *n.* A steel bar which is placed in an oven or furnace in which steel is undergoing the process of cementation, and which is withdrawn from time to time by the attendant so that he may judge of the progress of the operation. *Lockwood*, Dict. Mech. Engin. Terms.

proof-charge (pröf′chärj), *n.* A charge of gunpowder used in the proof of a gun of any caliber. Proof consists in firing a specified number of charges which shall produce the maximum pressure which the gun is intended to withstand in service.

proofing (pröf′ing), *n.* In *hat-making*, a process for stiffening felt hats by immersing them in a bath composed largely of shellac, with other ingredients.

proof-load (pröf′lōd), *n.* In *mech.*, the load which strains a girder or beam to its elastic limit.

proof-strain (pröf′strān), *n.* In *mech.*, the strain corresponding to the elastic limit of the substance strained.

proof-stress (pröf′stres), *n.* In *mech.*, the stress which strains a beam or girder to the elastic limit.

proof-vinegar (pröf′vin″ẹ-gä̤r), *n.* As understood in England, vinegar containing 6 per cent. of acetic acid.

proötic, *n.* **2.** Specifically, in *ichth.*, a lateral bone in the cranium, articulating below with the parasphenoid, behind with the exoccipital and opisthotic, above with the pterotic and sphenotic, and anteriorly with the alisphenoid. It is usually perforated by the trigeminal nerve. From its inner surface a wing is often developed, which, meeting that from the opposite proötic in a median suture, forms the tube for the rectus muscles of the eye.

proöticum (prō-ot′i-kum), *n.*; pl. *proötica* (-kä̤). [NL.] In *ichth.*, same as ★*proötic*, 2. *Starks*, Synonymy of the Fish Skeleton, p. 512.

prop¹, *n.* **4.** An unexpected stop, as of a horse. *E. E. Morris.* [Australia.]

> The touchy mare gave so sudden a *prop*, accompanied by a desperate plunge, that he was thrown almost at the feet of the "Injun."
> *Rolf Boldrewood*, Old Melbourne Memories, xvi.

propaganda, *n.* **3.** Systematic effort to propagate or win support for a theory or method of action.

> Brand is the author of this new method, for which the writer has earnestly, and he is glad to note successfully, made *propaganda*.
> *Therapeutic Gazette*, Feb. 15, 1903, p. 85.

propagandistic (prop″a̤-gan-dis′tik), *a.* [*propagandist* + *-ic.*] Of the nature of or characterized by propagandism; devoted or pledged to a propaganda.

> The ["League of the Just"] now called itself "League of the Communists," and gave up its leanings towards conspiracy and became an educational and *propagandistic* body.
> *Encyc. Brit.*, XXX. 564.

propagational (prop-a̤-gā′shọn-a̤l), *a.* [*propagation* + *-al*¹.] Relating to or of the nature of propagation; propagative.

propalanin (prọ-pal′a̤-nin), *n.* [L. *prope*, near (?), + E. *alanin.*] A little used name for alanin.

propane (prō′pān), *n.* [*prop*(*ionic*) + *-ane.*] A gaseous hydrocarbon, C_3H_8, of the paraffin series, found in crude petroleum: made by reducing isopropyl iodide with zinc and hydrochloric acid, or by the action of hydriodic acid on acetone, glycerol, etc. It is liquid below — 17° C.

propargyl (prọ-pär′jil), *n.* The radical, $HC\vdots C.CH_2$—, of allylene. Also called *propinyl.*—**Propargyl alcohol**, an alcohol, $C_3H_3(OH)$, derived from allylene. It is a liquid with a pleasant odor and boils at 114–115° C. Also called *propinyl alcohol.*

propargylic (prō-pär-jil′ik), *a.* Same as *propiolic.*

Proparia (prō-pạ-rī′ạ), *n. pl.* [NL., < Gr. *πρό*, in front, + *παρειά*, the cheek.] In Beecher's classification, an order of trilobites distinguished by the fact that the free cheeks of the cephalon do not carry the genal angles. It comprises the families *Encrinuridæ*, *Calymenidæ*, *Cheiruridæ*, and *Phacopidæ*.

proparian (prọ-pā′ri-a̤n), *a.* and *n.* **I.** *a.* Pertaining to or having the characters of the *Proparia*.

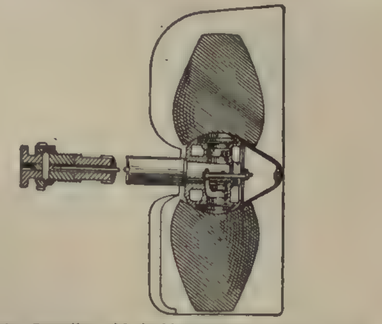
II. *n.* A trilobite of the order *Proparia*.

propatagium, *n.* **2.** In *zoöl.*, that part of the wing membrane of a bat which lies in advance of the arm; the præbrachium.

propathia (prọ-path′i-a̤), *n.* [Gr. *πρό*, before, + *πάθος*, disease.] Same as *prodrome*, 2. *Buck*, Med. Handbook, I. 573.

prop-cell (prop′sel), *n.* One of a number of cells arranged in five or six rows external to the outer hair-cells and cells of Deiter in the organ of Corti.

propeller, *n.* **4.** In *elect.*, in the tangential system of traction, the moving part of the system, corresponding to the rotor of an alternator, which is drawn along by the inductive action of the stator-coils between the track and thus affords motive power for the attached cars.—**Feathering propeller**, a form of screw-propeller for vessels in which the blades are not rigidly fastened to the hub of the wheel but are capable of being adjusted mechanically so as to have a varying angle of inclination to the plane through the axis of the shaft: used in vessels in which the mechanical propulsion is auxiliary to sails, that the blades may be turned into the plane of the shaft when sailing so as not to act as a drag when the shaft is not turning. When the blades are to drive they are given the desired pitch or angle with the shaft axis by levers and adjusting screws.—**Guide-blade propeller**, a type of screw-propeller, having broad blades and comparatively small diameter, placed in the axis of a fixed hollow cylinder at the stern of a shallow-draft vessel. Fixed in the interior of the cylinder abaft the propeller are a number of radial blades so arranged as to guide the streams of water thrown aft by the propeller and increase its propulsive efficiency. Also called a *screw-turbine.*—**Hydraulic propeller**, the combination used in jet-propulsion of vessels, in which a jet of water from a pump sent forcibly outward at the stern is intended to propel the vessel by reaction in the direction opposite to the motion of the jet.



Feathering Propeller, with the blades thrown parallel with the keel for sailing.

> The water-jet or *hydraulic propeller* cannot be regarded as a serious competitor with the screw or paddle-wheel, but it has attracted so much attention and been so strongly recommended that it cannot be left unnoticed.
> *White*, Manual of Naval Arch., p. 574.

Left-handed propeller, a screw-propeller which revolves from the starboard toward the port side of the ship during the upper part of its revolution while the engines are working ahead.

propeller-boom (prō-pel′ėr-böm), *n.* A small boom which can be rigged out on each side over the twin screws of a large steamer when in port to prevent small craft, coming alongside, from striking the propeller-blades.

propeller-bracket (prọ-pel′ėr-brak″et), *n.* Same as ★*shaft-bracket.*

propeller-frame (prọ-pel′ėr-frām), *n.* See ★*stern-frame.*

propeller-port (prọ-pel′ėr-pōrt), *n.* *Naut.*, an aperture in the after end of the quarter-deck, immediately over the propeller, covered with a small hatch, and found on vessels fitted with a hoisting propeller, the latter being lifted and lowered by means of a tackle after being disconnected from the shaft.

propene (prō′pēn), *n.* [*prop*(*yl*)*ene.*] Same as *propylene.*

propenylic (prop-e-nil′ik), *a.* [*propenyl* + *-ic.*] Of or pertaining to propenyl.

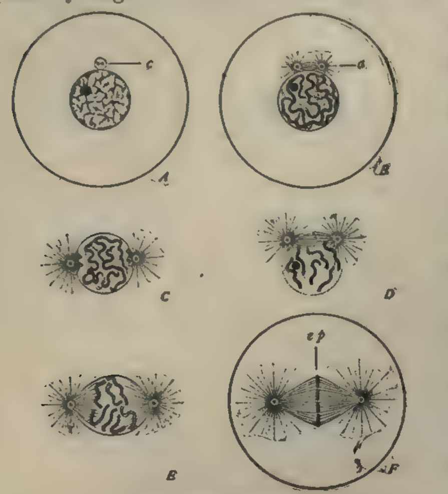
propepsin (prọ-pep′sin), *n.* [*pro*(*enzym*) + *pepsin.*] The proenzym of pepsin. Same as ★*pepsinogen.*

proper, *a.* **12.** In *geom.*, not figurative; not at infinity: as, *proper* points.

properitoneal (prọ-per″i-tọ-nē′ạl), *a.* [Gr. *πρό*, before, + *περιτόναιον*, peritoneum, + *-al*¹.] Situated in front of the peritoneum. *Buck*, Med. Handbook, I. 4.

property, *n.* **4.** Specifically, in *old Eng. law*, chattels as distinguished from 'estate' (lands).—**Dotal property**, in the civil law of Louisiana, the property brought upon marriage by a wife to her husband to assist in the expenses of the marriage establishment.—**Metric property.** See ★*metric*¹.

prophase (prō′fāz), *n.* [NL. *prophasis*, < Gr. *πρό*, before, + *φάσις*, phase.] In *cytol.*, a preparatory stage in mitotic cell-division. The prophase is characterized by a more intense staining of the chromatin, the resolution of the reticulum into a skein or spireme, the breaking up of the latter into chromosomes, the appearance of the achromatic spindle, and the disappearance of the nuclear wall. The prophase is succeeded by the metaphase.



Prophases of Mitosis.

A, resting-cell with reticular nucleus and true nucleolus; at *c* the attraction-sphere containing two centrosomes; *B*, early prophase, the chromatin forming a continuous spireme, nucleolus still present, above the amphiaster *a*; *C*, *D*, two different types of later prophases; *C*, disappearance of the primary spindle, divergence of the centrosomes to opposite poles of the nucleus (examples, some plant-cells, cleavage-stages of many eggs); *D*, persistence of the primary spindle (to form in some cases the "central spindle"), fading of the nuclear membrane, ingrowth of the astral rays, segmentation of the spireme-thread to form the chromosomes (examples, epidermal cells of salamander, formation of the polar bodies); *E*, later prophase of type *C*, fading of the nuclear membrane at the poles, formation of a new spindle inside the nucleus, precocious splitting of the chromosomes (the latter not characteristic of this type alone); *F*, the mitotic figure established, *ep* the equatorial plate of chromosomes.

(From Wilson's "The Cell.")

The first division in Salamandra is characterized by a long period of growth of the cell and nucleus during the *prophase*, the appearance of the reduced number of chromosomes and their double longitudinal splitting; the first longitudinal fission taking place during the *prophase* and the second during the metaphase or anaphase.
Bot. Gazette, April, 1903, p. 250.

prophasis, *n.* **2.** Same as ★*prophase.*

prophatnic (prọ-fat′nik), *a.* [Gr. *πρό*, before, + *φάτνιον*, socket of a tooth.] Characterized by alveolar prognathism. *Sergi.*

prophet, *n.*—**Evangelical Prophet**, an epithet of Isaiah, whose writings are supposed by many to be prophetic descriptions of the life and teachings of Christ.

prophetin (prof′e-tin), *n.* [*Prophet*(*arum*) (see def.) + *-in*².] A resinous glucoside, $C_{23}H_{36}O_7$, found in *Cucumis Prophetarum.*

prophylactic. **I.** *a.*—**Prophylactic rules**, in *evidence*, those rules and customs of courts which tend to insure the truth of testimony. They are the oath, the penalty for perjury, the custom of publicity, and the possible detention of witnesses. *Wigmore*, Evidence, § 1813.

II. *n.*—**Haffkine's prophylactic**, a preparation made by heating a culture of plague bacilli, used as a preventive of this disease; also, a similar preparation used as a preventive of cholera.

prophyll (prō′fil), *n.* Same as *prophyllum.*

First of all the '*prophylls*' occur right and left on the lateral bud.
K. E. Goebel (trans.), Organography of Plants, I. 95.

prophyllum, *n.* **2.** Same as *bracteole.*

The leaf-like structures upon the pedicels being spoken of as bracteoles or *prophylla.*
J. Percival, Agr. Bot., p. 89.

propine² (prō′pin), *n.* [*prop*(*ionic*) + *-ine*².] Same as ★*allylene.*

propinyl (prō′pi-nil), *n.* [*prop*(*ionic*) + *-in-* + *-yl.*] Same as ★*propargyl.*

propionamide (prō″pi-on-am′id), *n.* [*propi*(*one*) + *amide.*] The white crystalline amide of propionic acid, $C_2H_5.CONH_2$, made by distilling ammonium propionate. It melts at 79° C.

propione (prō′pi-ōn), *n.* [*propi*(*onic*) + *-one.*] A liquid, $(C_2H_5)_2CO$, or diethylketone, made by distilling barium propionate; also in other ways. It boils at 102.7° C.

proplasma (prō-plaz′mạ̈), *n.*; pl. *proplasmata* (-mạ-tạ̈). [Gr. *πρόπλασμα*, a model.] In *Gr. antiq.*, a model; in Greek sculpture, a cast or model from which a statue was worked out by points.

There is no doubt that in Roman times, and possibly occasionally earlier, puntelli from a finished model or "*proplasma*" were used just as they are in modern times.
E. A. Gardner, in Jour. Hellenic Studies, XI. 138.

propleurum (prō-plö′rum), *n.* [NL.] Same as *propleuron.*

propodeon (prọ-pō′dẹ-on), *n.* Same as *propodeum.* *Cambridge Nat. Hist.*, V. 491.

propodial, *n.* **2.** A general name for a bone lying between the humerus and carpals, and femur and tarsals: thus, the radius and ulna and tibia and fibula are propodials. Correlated with *mesopodial* and *metapodial.*

Marsh has also referred to the genus Diplosaurus a fragment of a *propodial* bone.
Amer. Jour. Geol., XIV. I. 8.

Propontic (prọ-pon′tik), *a.* [*Propont*(*is*) + *-ic.*] Of or relating to the Propontis, or Sea of Marmora.

Proporidæ (prọ-pō′ri-dē), *n. pl.* [NL. *Proporus*, the type genus, + *-idæ.*] A family of turbellarians, of the order *Acœla*, having one generative opening and no accessory female generative apparatus. It includes the genera *Proporus*, *Monoporus*, and *Haplodiscus.*

proportion, *n.*—**Law of constant proportion.** See ★*law*¹.—**Ordinate proportion**, a proportion whose terms are in regular order.—**Terms of a proportion**, its two antecedents and two consequents.

proportional, *n.*—**Third proportional**, the third of any three quantities in continued proportion.

Proporus (prọ-pō′rus), *n.* [NL.] The typical genus of the family *Proporidæ.* *O. Schmidt*, 1848.

proposal, *n.* **4.** In *solo whist*, a bid to take eight tricks with the assistance of a partner.—**Proposal and acceptance**, in *solo whist*, the proposal by one player for a partner and the acceptance of the offer by another.

propose, *v.* **I.** *trans.* **6.** In *systematic biol.*, to use (a new name) without complying with the technical requirements of publication. See ★*publication*, 5.

II. *intrans.* **4.** In *solo whist*, to offer to take eight tricks with the assistance of a partner.

proposition, *n.* **7.** Something to be done, accomplished, etc.; especially, something difficult or puzzling. [Slang.]

He could call a coyote or a fox, or even so fitful an' nervous a *prop'sition* as a antelope.
A. H. Lewis, Wolfville Nights, vii.

proposta (prō-pōs′tạ̈), *n.* [It., a proposition, < L. *proposita*, fem. of *propositus*, proposed. See *proposition.*] In *music*, the subject of a fugue or canon: opposed to *risposta.*

Proprietary articles. See ★*article.*

proprietas (prọ-prī′e-tas), *n.* [ML.: see *propriety.*] In *medieval music*, the state or use of a ligature with a short instead of a long note at the beginning.

Propristis (prọ-pris′tis), *n.* [NL., < L. *pro*, for, + NL. *Pristis*, a genus of fishes.] A genus of selachian fishes of the family *Pristidæ* or the saw-fishes, differing from the genus *Pristis* (which see) in not having the rostral teeth implanted in cartilage: from the Upper Eocene of Egypt.

props², *n.* **2.** *pl.* The stage-wardrobe of an actor.

Propterus (prop′tẹ-rus), *n.* [NL., < Gr. *πρό*, in front of, + *πτερόν*, a wing (fin).] A genus of ganoid fishes of the family *Macrosemiidæ*, characterized by an elongated deep body, rhomboidal or almost six-sided scales deeper than long, a long dorsal fin subdivided into a high anterior and lower posterior portion, massive pectoral and pelvic fins, and a short pointed snout. The vertebræ are ring-like. From the Upper Jurassic.

proptoma (prop-tō′mạ̈), *n.*; pl. *proptomata* (-mạ-tạ̈). [Gr. *πρόπτ*(*ωσις*), a falling forward, + *-ōma.*] The tumor formed by a prolapsed organ.

propugnator (prō-pug-nā′tọr), *n.* [L., < *propugnare*, fight for, defend. See *propugn.*] A defender; one who contends for or advocates.

Great changes had occurred in the interval of thirteen years. No longer was Chalmers the *propugnator* of establishments on either side of the Tweed.
S. H. Cox, Interviews, Chalmers, p. 78.

Propulsive coefficient. See ★*coefficient.*

propulsor (prọ-pul′sọr), *n.* [See *propulse*, *v. t.*] The trade-name of a form of explosion-engine for boats.

propyl (prō′pil), *n.* [*prop*(*ionic*) + *-yl.*] The hypothetical radical, C_3H_7, of propane.—**Propyl alcohol**, an alcohol, $C_3H_7(OH)$, derived from propane. *Normal* or *primary propyl alcohol*, $CH_3.CH_2.CH_2(OH)$, is found in fusel-oil and is also made synthetically. It is a liquid which boils at 97.4° C. and yields propionic acid when oxidized. *Secondary* or *isopropyl alcohol*, $CH_3.CH(OH).CH_3$, is a liquid which boils at 82.8° C. and yields acetone when oxidized. It is made by reducing aqueous acetone with sodium; also in other ways. See ★*isopropyl.*

propylamine (prō-pi-lam′in), *n.* [*propyl* + *amine.*] A ptomaïne, $C_3H_7.NH_2$, isomeric with trimethylamine.

propyl-glucosamin (prō″pil-glö-kọ-sam′in), *n.* A ptomaïne, $C_6H_{13}O_3N_2$.

propylic (prọ-pil′ik), *a.* [*propyl* + *-ic.*] Containing the radical propyl: as, *propylic* alcohol.

propylitization (prop″i-lit-i-zā′shọn), *n.* [*propylite* + *-ize* + *-ation.*] In *geol.*, the process which yields propylite, a more or less altered andesite. *Geikie*, Text-book of Geol., p. 772.

prorachidial (prō-rā-kid′i-ạl), *a.* [*prorachis* (*chid-*) + *-i-al*¹.] Relating or pertaining to the prorachis.

The stem represents a greatly enlarged and elongated mother zooid. It is divided longitudinally by a partition separating a so-called "ventral" or *prorachidial* canal from a so-called "dorsal" or metarachidial canal.
Encyc. Brit., XXV. 457.

prorachis (prō-rā′kis), *n.*; pl. *prorachides* (-ki-dēz). [NL., < Gr. *πρό*, before, + *ῥάχις*, spine.] In pennatulaceans, that face of the rachis which is sterile and coincides with the asulcar aspect of the terminal zoöid: contrasted with ★*metarachis* and ★*pararachis.*

Prorastomidæ (prō-ra-stom′i-dē), *n. pl.* [NL., < *Prorastomus*, generic name, + *-idæ*, family ending.] A family of extinct *Sirenia*, known from a few specimens from the Eocene of Europe and Miocene of America. These remains indicate animals resembling the manatee, but with a more complete dentition, there being $i\frac{3}{3}c\frac{1}{1}pm\frac{5}{5}m\frac{3}{3}$. *Cope*, 1889.

prorean (prō′rẹ-ạn), *a.* Noting a fissure in the brain of *Carnivora*, considered by G. Elliot Smith to have some relation to the coronal fissure in the lemurs. *Trans. Linn. Soc.*, Zool., 1903, p. 359.

prorennin (prō-ren′in), *n.* [*pro*(*enzym*) + *rennin.*] The proenzym of rennin: same as ★*chymosinogen* or ★*renninogen.*

Proreptilia (prō-rep-til′i-ạ̈), *n. pl.* [NL., < *pro*, before, + *Reptilia.*] In a general sense, the *Stegocephalia* considered as a distinct class apart from Amphibia; in a more restricted sense, the genera *Eryops* and *Cricotus*, with their allies, considered as forming a subclass: practically the *Temnospondyli* of Zittel.

By grouping them and their nearest allies together as *Proreptilia* it is intended to indicate that they are the lowest known Reptiles and that they probably link this class to the Amphibia.
H. Gadow, Amphibia and Reptiles, p. 285.

prorhinal (prọ-rī′nạl), *a.* [*pro-* + *rhinal.*] Lying in front of the nasal cavity.

proroca (prō-rō′kä), *n.* [Properly *piroroco*; Tupi.] The bore of the Amazon.

For comparison it may be interesting to note the following description of the Amazon's bore, or *proroca*, by La Condamine. *Pop. Sci. Mo.*, Feb., 1908, p. 109.

prorogation, *n.* **3.** In *astrol.*, the exercise of the office of prorogator. *J. M. Ashmand*, tr. of Ptolemy's Tetrabiblos, iii. 13.

prorogator (prọ-rog′ạ-tọr), *n.* [See *prorogation.*] In *astrol.*, the hyleg; the giver of life.

By night the moon is to be elected as *prorogator.*
J. M. Ashmand, tr. of Ptolemy's Tetrabiblos, iii. 13.

prorogatory (prọ-rog′ạ-tọ-ri), *a.* In *astrol.*, relating to the office of prorogator.

prorostrum (prō-ros′trum), *n.*; pl. *prorostra* (-trạ̈). [NL., < L. *pro*, before, + *rostrum*, beak.] In *entom.*, the anterior portion of the rostrum of a rhyncophorous insect. *Proc. Zool. Soc. London*, May–Dec., 1902, p. 279.

prosarium (prọ-zā′ri-um), *n.*; pl. *prosaria* (-ạ̈). [NL., in ML. *prosarius* (sc. *liber*, book), < *prosa*, prose.] A service-book containing proses or sequences. See *prosar* and *prose*, 3.

pros. att'y. An abbreviation of *prosecuting attorney.*

prosbul (pros-böl′), *n.* [Gr. πρὸς Βουλῇ, 'before the council.'] A rabbinical legal document concerning loans, providing against the biblical law of limitation by the sabbatical year, shemitta. (Deut. xv. 1–4.) The terms of the prosbul provided that the loan about to be made should not be considered void at the entrance of the sabbatical year.

Proscorpius (prō-skôr′pi-us), *n.* [NL., < Gr. πρό, before, + σκορπίος, scorpion.] A genus of fossil scorpions found in Silurian rocks.

prosecretin (prō-sẹ-krē′tin), *n.* [*pro-* + *secretin.*] The inactive form of secretin; it is converted into secretin by means of dilute acids. The prosecretin is formed in the mucous membrane of the intestinal tract.

It was then found that the active substance, which we call secretin, was produced by the action of acid from a precursor in the mucous membrane, probably in the epithelial cells themselves. Once formed by the action of acid, it could be boiled, neutralised, or made alkaline, without undergoing destruction. The precursor of the substance (*pro-secretin*) cannot be extracted by any means that we have tried from the mucous membrane.
Nature, May 19, 1904, p. 65.

prosectorium (prō-sek-tō′ri-um), *n.*; pl. *prosectoria* (-ạ̈). [NL., < L. *prosecare*, cut off. See *prosection.*] The anatomical or dissection room, as in a laboratory of natural science.

Mr. F. E. Beddard, F.R.S., exhibited preserved and injected brains of mammals prepared in the Society's *prosectorium.* *Nature*, June 11, 1903, p. 141.

prosecute, *v.*—**Prosecuting attorney.** See ★*attorney.* **Prosecuting witness.** See ★*witness.*

prosecutor, *n.*—**Crown prosecutor,** the title of the prosecutor of criminal actions in some of the British Colonies.—**Speaking with prosecutor,** in *Eng. law*, the practice of allowing a defendant convicted of a misdemeanor to confer with the prosecuting officer before sentence, so that if the prosecutor, being satisfied, will so certify to the court, a trivial punishment or suspension of sentence may follow.

prosencephal (pros-en-sef′al), *n.* Same as *prosencephalon.* *Buck*, Med. Handbook, II. 142.

proseries (prō-sē′rẹ̄z), *n.* [Gr. πρό, before, + L. *series*, series.] The ancestors of an organism or of a group of organisms considered collectively.

I consider as progenitors or as *proseries* of the cephalopods, the conularias, in which the body form and shell secretion of the orthoceratites was inaugurated and the formation of four gills, which it would be difficult to derive from the body form of the cephalopods, was established. *O. Jaekel*, in Amer. Geol., April, 1903, p. 201.

Prosobranchia (pros-ọ̄-brang′ki-ạ̈), *n. pl.* [NL., < Gr. πρόσω, forward, + βράγχια, gills.] In Cuvier's classification, a division of the gastropod *Mollusca* characterized by having the lungs or gills placed in front of the heart. Same as *Streptoneura* of Spengel.

prosobranchialism (pros-ọ̄-brang′ki-ạl-izm), *n.* Same as *prosobranchism.*

prosocline (pros′ọ̄-klīn), *a.* [Gr. πρόσω, forward, + κλίνειν, incline.] Directed forward.

The posterior primary lamellæ remained simple throughout the whole life, and no case is known in which secondary teeth originated from them; but whether originally or only subsequently, they are always anteriorly inclined (*prosocline*).
Annals and Mag. Nat. Hist., July, 1902, p. 74.

prosocœle (pros′ọ̄-sēl), *n.* [Gr. πρόσω, forward, + κοῖλος, hollow.] The foremost cavity of the brain; the fore ventricle; the cavity or ventricle of the secondary fore-brain, or prosencephalon. *Buck*, Med. Handbook, II. 167.

prosodemic (pros-ọ̄-dem′ik), *a.* [Gr. πρόσω, forward, + δῆμος, people, + *-ic.*] Noting an epidemic disease in which the infection passes from one person to another in individual ways, instead of reaching a large number at once through one channel, such as the water-supply.

They lay stress upon a distinction, vital to epidemiologists, which must be drawn between infection which reaches a number of persons at once through a single medium, as water or milk, and the slower, more complex process by which a disease passes from person to person; the path of the contagious material being different in each individual instance. The term '*prosodemic*' has been used to describe this form of infection.
Science, April 24, 1903, p. 665.

prosodetic (pros-ọ̄-det′ik), *a.* [Gr. πρόσω, forward, + δετός, bound, + *-ic.*] Of or pertaining to pelecypod shells which have opisthodetic ligaments in which a remnant of the area persists, in front of the beaks, as the lunule. Compare ★*opisthodetic* and ★*amphidetic.*

prosogyrate (pros-ọ̄-jī′rāt), *a.* [NL., < Gr. πρόσω, forward, + γῦρος, a turn, + *-ate*¹.] In *zoöl.*, curved forward, as the beaks of certain pelecypods.

prosogyre (pros′ọ̄-jīr), *a.* [Gr. πρόσω, forward, + γῦρος, a turn.] Same as ★*prosogyrate.*

prosogyrous (pros-ọ̄-jī′rus), *a.* Same as ★*prosogyrate.*

prosopial (pro-sō′pi-ạl), *a.* [*prosopi(um)* + *-al*¹.] Of or pertaining to the bony beak, or prosopium, of parrots. *Proc. Zool. Soc. London*, 1895, p. 369.

prosopium (pro-sō′pi-um), *n.*; pl. *prosopia* (-ạ̈). [NL., < Gr. προσωπεῖον, a mask.] A term applied by Mivart to the united bones which form the bony beak of parrots.

By this term [*prosopium*] I intend to denote the whole ossified mass in front of the cranio-facial articulation and the articulations of the zygomata and palatines.
Proc. Zool. Soc. London, 1895, p. 365, note.

prosoplax (pros′ọ̄-plaks), *n.* [NL., < Gr. πρόσω, forward, + πλάξ, something flat.] In *Pholas* and some related mollusks, the anterior one of the accessory valves developed on the dorsal side. Compare ★*mesoplax* and ★*metaplax.*

prosopometer (pros-ọ̄-pom′e-tėr), *n.* [Gr. πρόσωπον, face, + μέτρον, measure.] In *craniom.*, an instrument with which the area of the face may be measured.

Prosopon (pro-sō′pon), *n.* [NL., < Gr. πρόσωπον, face.] A genus of small crabs, among the earliest of the *Brachyura*, having an elongate, pentagonal, deeply furrowed carapace with granulate surface. Several species from Jurassic and Cretaceous formations are known.

prospect, *n.* **12.** In *organ-building*, the external front or façade of the instrument, including the case and the display-pipes.

prospectant (prọ-spek′tạnt), *a.* [See *prospect*, *v.*] Looking forward.—**Prospectant evidence,** testimony as to motive, character, habit, capacity from which the inference is that one did or did not do a given thing, as that if one usually carried a revolver, he had it on a given day. *Wigmore*, Evidence, § 51.

prosporoid (prō-spō′roid), *n.* A term suggested by Petri for the small protuberance on the hyphæ of an endotropic mycorrhiza. See ★*mycorrhiza.*

prosquamosal (prō-skwā-mō′sạl), *n.* [L. *pro*, for, + E. *squamosal.*] A bone present in the crania of some anomodont reptiles lying upon the jugal and connected with the squamosal, with which it may be fused. Also termed *supratemporal.*

In further contrast with the Synapsida, the squamosal is a relatively small element, frequently separate from the *prosquamosal*, and never entering into articulation with the lower jaw. *Amer. Nat.*, Feb., 1904, p. 106.

prostalia (prō-stā′li-ạ̈), *n. pl.* [NL., < Gr. πρό, before, + √στα-, stand, + L. *-alis*, E. *-al*¹.] In the morphology of the sponge-skeleton, those spicules of the *Hexactinellidæ* which project from the surface of the sponge-body. They comprise, according to position, *prostalia basalia*, which form the root tufts; *prostalia marginalia*, which form a circlet about the osculum; and *prostalia pleuralia*, which project from the lateral walls of the body.

prostas (prō′stas), *n.* [L. *prostas*, < Gr. προστάς, < προΐστασθαι, stand in front.] In a Greek dwelling-house, a vestibule leading to the women's apartments: apparently, any open lobby, as between two piers or antæ.

prostate, *n.* **2.** In platyhelminths and earthworms, a glandular body connected with the sperm-duct.

Prostatic catheter. See ★*catheter.*

prostatocele (pros-tat′ọ̄-sēl), *n.* [*prostate* + Gr. κήλη, a tumor.] A tumor of the prostate gland.

prostatoncus (pros-tạ-ton′kus), *n.* [*prostate* + Gr. ὄγκος, a mass.] Enlargement of the prostate gland.

prostatoscirrhus (pros″tạ-tọ-sir′us), *n.* [*prostate* + Gr. σκιρρος, a hard tumor.] The hardening of the prostate through increase of fibrous tissue.

prostatovesiculitis (pros″tạ-tọ-vẹ-sik″ụ-lī′tis), *n.* [NL., < *prostates*, prostate, + L. *vesicula*, vesicle, + *-itis.*] Inflammation of the prostate gland and seminal vesicles.

prostemmate (prō-stem′āt), *n.* [Gr. πρό, before, + στέμμα(τ-), a fillet.] One of the prostemmatic organs. See *prostemmate* ★*organ.*

prostemmatic (prō-ste-mat′ik), *a.* Pertaining to the prostemmate.

prosthesis, *n.*—**Dental prosthesis.** See ★*dental.*—**Paraffin prosthesis,** the subcutaneous injection of melted paraffin in order to restore the natural contour, as in cases of sunken bridge of the nose. *Science*, March 25, 1904, p. 502.

prosthetic, *a.* **2.** In *surg.*, relating to or concerned in the supplying of an artificial part in place of the natural one which is wanting.

The mechanical correction of palatal defects causing imperfection of deglutition and speech, which comes distinctly within the province of the *prosthetic* dentist.
Encyc. Brit., XXVII. 418.

prosthetics (pros-thet′iks), *n.* In *surg.*, the art of prosthesis or of the supplying of missing parts by artificial ones.

prosthetist (pros′the-tist), *n.* [*prosthesis* (*-thet-*) + *-ist.*] In *surg.*, one who practises prosthesis; one who supplies artificial substitutes for missing parts of the body; especially one who manufactures artificial limbs. *Buck*, Med. Handbook, V. 513.

prosthion (pros′thi-on), *n.*; pl. *prosthia* (-ạ̈). [NL., < Gr. πρόσθιον, neut. of πρόσθιος, foremost < πρόσθεν, before.] In *craniom.*, the point between the two upper middle incisors. Same as *alveolar point* (which see, under *alveolar*).

prosthionic (pros-thi-on′ik), *a.* [*prosthion* + *-ic.*] In *craniom.*, relating to the prosthion.—**Prosthionic index.** Same as *alveolar index.* See *craniometry.*

prostholytic (pros-thọ̄-lit′ik), *a.* [Gr. πρόσθεν, forward, + λυτός, < λύειν, loose, dissolve, + *-ic.*] Noting the evolutionary stage or condition of free interbreeding or symbasis, in which normal evolutionary progress is made, as in natural species. Compare ★*catalytic*, 2, ★*dialytic*, 4, and ★*hemilytic.* *O. F. Cook.*

The *prostholytic* or progressive stage of evolution is found in large species of wide distribution containing abundant individuals with free intercrossing of numerous lines of descent. There is unlimited diversity or inconstancy of individual characters, and variation is indefinite and continuous in the sense that endless fluctuations and intergradations are present. The requirements of symbasis are fully met; interbreeding is normal and reproductive fertility is high.
Pop. Sci. Mo., May, 1903, p. 20.

prostoma (pros′tọ̄-mạ̈), *n.*; pl. *prostomata* (pros-tō′ma-tạ̈). [Gr. πρό, before, + στόμα, mouth.] The blastopore or primitive mouth-opening of the embryo in the gastrula stage.

prostomal (pros′tọ̄-mạl), *a.* [*prostoma* + *-al*¹.] Of or pertaining to the prostoma.

prostomiad (prọ̄-stō′mi-ad), *adv.* [*prostomi(um)* + *-ad*³.] In a prostomial direction. [Rare.] *E. R. Lankester*, Nat. Sci., April, 1897, p. 265.

prostration, *n.*—**Electric prostration,** a condition marked by pigmentation of the skin, photophobia, and pains in the face and throat, caused by prolonged exposure to the light of a voltaic arc.

prosturgeon (prō-stėr′jọn), *n.* A term applied to ganoid fishes of extinct type, presumably ancestors of the sturgeons. [Rare.]

There are papers systematic on the fossil fishes of California, on new sticklebacks, sturgeon fishes, *prosturgeons*, conodonts. *Science*, Feb. 7, 1908, p. 201.

protagon, *n.* **2.** Same as *lecithin.*

protalbic (prō-tal′bik), *a.* [*protalb(umose)* + *-ic.*] Noting an acid, a cleavage product of egg-albumin which results on heating with dilute caustic alkali.

protalbumose (prō-tal′bụ-mōs), *n.* Same as ★*proto-albumose.*

Protalcyonacea (prọ̄-tal″si-ọ̄-nā′sẹ̄-ạ̈), *n. pl.* [NL., < Gr. πρῶτος, first, + NL. *Alcconacea.*] A group of alcyonarians in which the zoöids are solitary and do not form colonies by gemmation. It includes the single family *Haimeidæ.*

protalcyonacean (prọ̄-tal″si-ọ̄-nā′sẹ̄-ạn), *a.* and *n.* **I.** *a.* Relating to, or having the characters of, the *Protalcyonacea.*

II. *n.* Any member of the *Protalcyonacea.*

protamine (prō-tam′in), *n.* [Gr. πρῶτος, first, + E. *amine.*] A member of a group which comprises the simplest albumins known to occur in the animal body. According to Kossel, a protamine group also forms the essential nucleus of all the more complex albumins. This view is not generally held, however, and as a matter of fact a protamine radical has thus far been demonstrated in relatively few instances. Without exception the few members of the group have been met with in the mature testicles of certain animals; for example, salmine in the salmon, sturine in the sturgeon, clupein in the herring, etc.

Protamniota (prọ̄-tam-ni-ō′tạ̈), *n. pl.* [NL., < Gr. πρῶτος, first, + NL. *Amniota.*] The earliest forms of *Amniota*, as seen in the *Sauropsida.* See *protamnion.* *Buck*, Med. Handbook, I. 221.

protan (prō′tan), *n.* [Gr. πρῶτος, first, + *-an.*] The trade-name of a tannin nucleoproteid used in medicine as an intestinal astringent.

protandric, *a.* **2.** In *zoöl.*, of or pertaining to protandry, or the ripening of the spermatozoa before the ova in hermaphroditic organisms.

protandry, *n.* 2. In *zoöl.*, the condition of the reproductive organs in hermaphroditic animals, characterized by the production of ripe spermatozoa before the ova are mature or capable of being fertilized: an arrangement which insures cross-fertilization between different individuals, as in certain hermaphroditic worms, crustaceans, etc.

protanope (prō′ta̤-nōp), *n.* [*protanopia.*] In *physiol.* and *psychophys.*, one who is afflicted with the form of partial color-blindness known as protanopia.

protanopia (prō-ta-nō′pi-ạ̈), *n.* [NL., < Gr. πρῶτος, first, + NL. *anopia.*] In *physiol.* and *psychophys.*, a word introduced by von Kries to designate the form of red-green color-blindness termed by the Helmholtzian school 'red-blindness.' *Baldwin*, Dict. of Philos. and Psychol., II. 370.

protanthocyan (prọ-tan-thọ-sī′ạn), *n.* [Gr. πρῶτος, first, + E. *anthocyan.*] A yellowish coloring matter found in the petaloid calyxes of certain unopened flowers. It passes later into anthocyan. It appears to be a derivative of tannin.

protar (prō′tär), *a.* [Gr. πρῶτος, first, + *-ar* (?).] In *photog.*, an anastigmatic photographic objective, first computed by P. Rudolph in 1889. *Stand. Dict.*

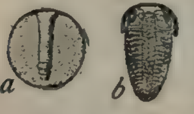
protargol (prō-tär′gol), *n.* [Gr. πρῶτος, first, + E. *argol.*] A trade-name for a salt of silver with proteid material, soluble in water, not coagulating albumen, less irritant than silver nitrate, and actively germicidal: used by surgeons in the treatment of gonorrhea.

protarsal (prō-tär′sa̤l), *a.* [*protars*(*us*) + *-al*¹.] In *entom.*, of or relating to the protarsus. *Proc. Zool. Soc. London*, 1902, p. 391.

protarsus, *n.* 2. The next to the last joint of a spider's leg, between the tibia and the tarsus.

> Tibiæ and *protarsi* mostly jet-black.
> *Proc. Zool. Soc. London*, 1903, p. 49.

protaspis (prō-tas′pis), *n.*; pl. *protaspides* (-pi-dēz). [NL., < Gr. πρῶτος, first, + ἀσπίς, shield.] The minute embryonic shell of the trilobites. It has a subcircular outline, large semicircular or crescentic cephalon with distinct axial furrows, no thorax, and a segmented abdominal lobe. The stage of development characterized by the growth of the protaspis has been divided into an early (*anaprotaspis*) substage, with minute pygidium; a middle (*metaprotaspis*), in which the anterior margin of the pygidium begins to show traces of annulations; and a late (*paraprotaspis*), with the pygidium large, well annulated, and provided with its full complement of appendages. Subsequent growth proceeds by successive molts during which the thoracic segments are introduced by repeated separation of the anterior segment of the pygidium.



Sao hirsuta, Barr. Cambrian.

a, protaspis, enlarged; *b*, adult, reduced. (From Zittel's "Paleontology.")

protaxis (prọ-tak′sis), *n.*; pl. *protaxes* (-sēz). [NL., < Gr. πρῶτος, first, + L. *axis*, axis.] In *geol.*, the belt of earliest deformation and uplift in a mountain system. *Dana*, Manual of Geol. (4th ed.), p. 24.

> Professor Darwin quotes the western coast of North America as inconsistent with his theory; but that coast is parallel to a line of primitive wrinkling, for there is an Archean *protaxis* to the coast ranges and Rocky Mountains. *J. W. Gregory*, in Smithsonian Rep., 1898, p. 269.

Proteales (prō-tẹ-ā′lēz), *n. pl.* [NL. (Lindley, 1833), < *Protea* + *-ales.*] An order of dicotyledonous, apetalous plants containing the single family *Proteaceæ* (which see).

Protean, *a.* 3. In the geology of New York, a name applied by the geologists of the first State Survey to the rocks now termed the Clinton beds of the Silurian system: in allusion to the variable character of the component stratigraphic elements.

proteane (prō′tẹ-ān), *n.* [*prote*(*in*) + *-ane.*] A term suggested by Osborne to designate certain insoluble modifications of albumins which result on prolonged exposure to water.

protease (prō′tẹ-ās), *n.* [*prote*(*in*) + *-ase.*] A generic term for proteolytic ferments.

proteate (prō′tẹ-āt), *n.* [*prote*(*in*) + *-ate*¹.] Same as *acid albumin.* See *albumin.*

protective, *a.*—**American Protective Association**, a secret order in the United States, founded in 1887. Its main aims are to preserve the non-sectarian character of the public schools, and to discourage the election of Catholics to office. Abbreviated *A. P. A.*—**Protective character.** See ★*character.*—**Protective coloring.** See *procryptic* ★*coloring.*

protegulum (prọ-teg′ụ̄-lum), *n.*; pl. *protegula* (-lạ̈). [NL., < L. *pro*, for, + *tegula*, a tile.] The minute bivalved shell characteristic of the phylembryonic stage of *Brachiopoda*, having a semicircular outline, straight or arcuate hinge-line, no articulation between the valves, no cardinal area, and a smooth or concentrically striated surface. This protegulum has been observed in genera representative of nearly all the principal families of brachiopods.

> The *protegulum* of this species is nearly circular, biconvex, with arcuate hinge.
> *Amer. Jour. Sci.*, April, 1904, p. 283.

proteic (prō′tẹ-ik), *a.* [*prote*(*in*) + *-ic.*] Same as *proteinaceous.*

proteid¹, *n.*—**Coagulated proteid**, a proteid (albumin) which has been rendered insoluble in the usual solvents, by heat, mineral acids, alcohol, etc., and in some instances also by certain ferments (for example, chymosin, and the fibrin ferment).—**Defensive proteid**, an albuminous proteid, formed through cellular activity, which has antitoxic properties in the widest sense of the term.—**Proteid cell.** See ★*cell.*—**Serum proteid**, any albumin found in the blood-serum.

protein, *n.* 2. Collectively, the nitrogenous components of food, sometimes excluding and sometimes including certain gelatinoid and amidic substances which are without nutritive value or possess it in an inferior degree.—3. A trade-name for a dried preparation which consists essentially of the casein of milk: sold as a food material.—**Bacterial proteins**, albuminous substances obtained from bacteria.—**Coagulated protein**, a protein rendered insoluble through the action of heat or alcohol.—**Protein-crystals**, crystals of certain proteins (albumins), such as serum albumin, ovalbumin, edestin, etc.

proteinochrome (prō′tẹ̄-in-ọ̄-krōm″), *n.* [*protein* + Gr. χρῶμα, color.] The colored product which results from proteinochromogen (tryptophan) on treating with chlorin or bromine. Several such substances apparently exist.

proteinochromogen (prō″tẹ-in-ọ-krō′mọ-jen), *n.* [*protein* + *chromogen.*] A substance formed during proteolytic (notably tryptic) digestion. It is characterized by the readiness with which it combines with chlorin and bromine to form variously colored products. Of these, a bluish violet substance which contains 35 per cent. of bromine is especially characteristic. Chemically considered proteinochromogen is skatolaminoacetic acid,

$$C_6H_4\begin{matrix}\diagup C(CH\;)\\ \diagdown NH\end{matrix}\!\!=\!C.CH(NH_2).COOH.$$

proteinoid (prō′tẹ-in-oid), *a.* [*protein* + *-oid.*] Having the character of a protein (albumin).

protembryo, *n.* 2. A term applied to the ovum and its cleavage stages in the development of a polyzoan. *Cumings*, 1904.

proteolite (prō′tē-ọ-līt), *n.* [Gr. Πρωτεύς, *Proteus*, + λίθος, stone.] In *petrog.*, a name originally given by Boase to schist metamorphosed, by contact with granite, into a variety of cornubianite. Recently it has been applied by Bonney to a hornfels containing andalusite, an andalusite-hornfels.

proteolyze (prō′tẹ̄-ọ-līz), *v. t.*; pret. and pp. *proteolyzed*, ppr. *proteolyzing.* [*proteoly*(*sis*) + -(*i*)*ze.*] To cause the hydrolytic decomposition of albumins in (a substance), notably by means of ferments and mineral acids.

> In fresh milk, 2 or 3 cc. of a saturated solution of alum may be used in place of acetic acid, usually with little higher results. But when the milk-casein has been *proteolyzed* to any extent the use of alum is not permissible, since it precipitates caseoses in addition to casein.
> *Amer. Chem. Jour.*, Feb., 1903, p. 169.

proteose (prō′tẹ-ōs), *n.* [*prote*(*in*) + *-ose.*] An albumose which is derived from the albumins proper. See ★*albumose.*

Proteosoma (prō-tẹ̄-ọ-sō′mạ̈), *n.* [NL., < Gr. Πρωτεύς, Proteus, + σῶμα, body.] A genus of sporozoans, of the order *Hæmosporidia. P. grassii* is parasitic in the blood of many common birds, the intermediate host being a mosquito of the genus *Culex.*

proteosome (prō′tẹ-ọ-sōm), *n.* A sporozoan of the genus *Proteosoma.*

> The only bodies in the diseased cells that might be mistaken for bacteria were small proteid granules, resembling *proteosomes*, which stained with difficulty, swelled up, and lost their shape in 5 per cent potash.
> *U. S. Dep. Agr.*, Div. Veg. Physiol. and Pathol., Bulle-[tin 19, 1900, p. 14.

proteranope (prot′ẹ-ran-ōp), *n.* Same as ★*protanope. Baldwin*, Dict. Philos. Psychol., II. 787.

protergum (prọ-tėr′gum), *n.*; pl. *proterga* (-gạ̈). [NL., < Gr. πρό, before, + L. *tergum*, back.] In *entom.*, same as *pronotum.*

proterical (prọ-ter′i-ka̤l), *a.* [Gr. πρωτερική, precocious (sc. συκῆ, fig), < πρωί, early.] Denoting or characterizing an early-bearing or precocious fig-tree.

proteroglyphous (prot-ẹ̈-rog′li-fus), *a.* [NL. *Proteroglypha* + *-ous.*] 1. Having teeth in the front portion of the upper jaw grooved on the anterior face, as in *Elaps* and similar poisonous snakes.—2. Resembling or having the characteristics of the poisonous snakes known as *Proteroglypha.*

Proterotheriidæ (prot″ẹ̈-rọ-thẹ̄-rī′i-dē), *n. pl.* [NL., < *Proterotherium*, type genus, + *-idæ.*] A family of extinct ungulate mammals, belonging to the order *Litopterna* and typified by the genus *Proterotherium*, comprising animals resembling llamas in their general proportions. All known species are from the Miocene of South America.

proterotome (prot′ẹ̈-rọ-tōm), *a.* [Gr. πρότερος, fore, + -τομος, < ταμεῖν, cut.] Cutting by moving forward: said of the molar teeth of the lower jaw of certain mammals in mastication. *Cope.* [Rare.]

proterotype (prot′ẹ̈-rọ-tīp), *n.* [Gr. πρότερος, fore, + τύπος, type.] In the nomenclature of types in natural history, the material on which the original description is based.

Proterozoic (prot″ẹ-rọ-zō′ik), *a.* and *n.* [Gr. πρότερος, fore, + ζωή, life, + *-ic.*] I. *a.* Of or pertaining to the life existing before the time of the Cambrian or first fossils: a term originally proposed as a substitute for *Azoic*, *Eozoic*, *Archæan*, etc., in order to avoid the assertions contained in these words if taken literally. *Geikie*, Text-book of Geol., p. 861.

II. *n.* The time during which the simplest life-forms were developed: applied to the interval between the Archeozoic and Paleozoic as used by Chamberlin and Salisbury. It is assumed that life existed, but no determinable forms have yet been found. The subdivisions of the Proterozoic are Keweenawan, Animikean, and Huronian. *Chamberlin and Salisbury*, Geol., I. 17.

protest, *n.*—**Extension of protest**, in *marine law*, a statement giving the particulars of the voyage, the storms met with, as recorded in the log-book, and asserting that any damage that may have happened to ship or cargo was caused by the elements beyond the control of master and crew.

protestant, *n.*—**German Protestant**, a member of the German Evangelical Protestant Church, a body of scattered congregations in the United States having no synodical organization. The theology of the church is liberal and rationalistic. The German language is spoken in the church.

protetrad (prō-tet′rad), *a.* [Gr. πρό, before, + E. *tetrad.*] In *cytol.*, noting a stage in the formation of the chromosome preceding that of the tetrad (which see), or quadripartite chromosome.

> A. Labbe observes that in the state of synapsis the chromosomes unite two and two, and fuse their chromatin into a single or *protetrad* body.
> *Jour. Roy. Micros. Soc.*, Oct., 1904, p. 529.

Proteus, *n.* 5. In *bacteriol.*, an untenable generic name applied by some authors to certain bacteria, especially *Bacillus vulgaris* and other closely related putrefactive species.

protevangel (prōt-ẹ̄-van′jel), *n.* [See *protevangelium.*] A first or prior evangel or gospel; a protevangelium.

> *Protevangel* of James.—This title was first given in the 16th century to a writing which is referred to as The Book of James . . . by Origen (tom. xi. in Matt.).
> *Encyc. Brit.*, XXV. 497.

prothomo (prōt-hō′mō), *n.*; pl. *prothomines* (-hom′i-nēz). [NL., < Gr. πρῶτος, first, + L. *homo*, man.] The type of man which in the evolutionary scale first developed true human characteristics. *A. F. Chamberlain*, in Amer. Anthropologist, July–Sept., 1902, p. 527. [Rare.]

prothrombin (prō-throm′bin), *n.* [*pro*(*enzyme*) + *thrombin.*] The proenzym or inactive form of thrombin (the fibrin ferment, in the sense of A. Schmidt).

prothyalosome (prōt′hī-ạ̈-lọ-sōm), *n.* Same as *prothyalosoma.*

prothyrum (proth′i-rum), *n.*; pl. *prothyra* (-rạ̈). [L. *prothyrum* (used in the pl. *prothyra*), < Gr. πρόθυρον, < πρό, before, + θύρα, door.] In *Greco-Rom. archæol.*, the front door or the vestibule or porch of entrance to any building.

protic (prō′tik), *a.* [*prot*(*ein*) + *-ic.*] Noting an acid of doubtful composition, obtained from the albuminous constituents of fish muscle. *W. D. Halliburton*, Chemical Physiol. and Pathol., p. 422.

proto-albumose (prō″tō-al′bụ̄-mōs), *n.* [Gr. πρῶτος, first, + E. *albumose.*] One of the primary albumoses which are formed during peptic digestion. In its physical characteristics this is further removed from the original albumin from which it is derived than heteroalbumose. It is readily soluble in water and to a certain extent diffusible through animal membrane. It is essentially a hemibody in the sense of Kühne. See ★*albumin.*

proto-Aryan (prō-tō-är′yạn), *a.* Primitive Aryan: applied to the supposed Aryan race in its very first stage of existence. *G. S. Hall,* Adolescence, II. 657.

Protoascineæ (prō″tọ-as-sin′ẹ-ē), *n. pl.* [NL., < Gr. πρῶτος, first, + ἀσκός, a sac, + *-ineæ.*] A suborder of ascomycetous fungi including the family *Endomycetaceæ.*

Protobasidiomycetes (prō″tọ-bā-sid″i-ọ-mī-sē′tēz), *n. pl.* [NL., < Gr. πρῶτος, first, + NL. *Basidiomycetes.*] A subclass of the lower basidiomycetous fungi characterized by having protobasidia and including the three orders *Uredinales, Auriculariales,* and *Tremellales.*

protobasidium (prō″tō-bạ-sid′i-um), *n.*; pl. *protobasidia* (-ạ̈). [NL., < Gr. πρῶτος, first, + NL. *basidium.*] A form of basidium which is divided into four cells either transversely or longitudinally, each cell bearing either laterally or apically a basidiospore, as in *Auricularia, Tremella,* and other genera of the lower basidiomycetous fungi.

The union of the groups into one sub-class is based on the long recognised resemblances between the promycelium of Uredineæ and the *protobasidium* of Auricularieæ.
Encyc. Brit., XXVIII. 562.

protoblast (prō′tō-blȧst), *n.* [Gr. πρῶτος, first, + βλαστός, germ.] A primitive or embryonic cell, consisting of succulent granular cytoplasm and a nucleus.

The architecture of the embryo is fully outlined in the arrangement of the parent blastomeres, or *protoblasts.*
E. B. Wilson, Biol. Lectures, 1893, p. 10.

Protobranchiata (prō″tọ-brang-ki-ā′tạ̈), *n. pl.* [Gr. πρῶτος, first, + βράγχια, gills, + *-ata.*] An order of *Pelecypoda.* They have simple plate-like gill-filaments which are not reflected and the mantle-cavity is not divided into two parts. It includes the families *Nuculidæ* and *Solenomyidæ.*

protobranchiate (prō-tọ-brang′ki-āt), *a.* [Gr. πρῶτος, first, + βράγχια, gills, + *-ate*1.] Of, pertaining to, or resembling the foliate gills seen in *Nucula* and other archaic types of pelecypods in which the gill elements are plate-like and organically united only by their common stem; of or pertaining to the *Protobranchiata.*

protocarbohydrate (prō-tọ-kär-bọ-hī′drāt), *n.* [Gr. πρῶτος, first, + E. *carbohydrate.*] The unknown carbohydrate from which, it is believed, sugar, starch, cellulose, and other complex carbohydrates are built up in the plant-cell.

protocarinate (prō-tọ-kar′i-nāt), *a.* [Gr. πρῶτος, first, + E. *carinate.*] In *ornith.,* possessing a keeled breast-bone at an early period of time.

It is now generally admitted that the Palæognathæ must be the descendants of an Avian *proto-carinate* form capable of flight.
W. P. Pycraft, in Trans. Zool. Soc. London, Dec., 1900, [p. 260.

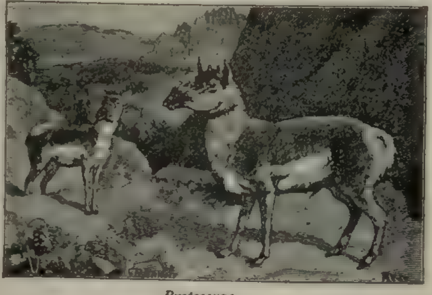
Protocaris (prọ-tok′ạ-ris), *n.* [NL., < Gr. πρῶτος, first, + καρίς, shrimp.] An obscure phyllopod crustacean supposed to be related to the modern genus *Apus* which it closely resembles, found in the Lower Cambrian rocks of Vermont.

protocaseose (prō-tọ-kā′sẹ-ōs), *n.* [Gr. πρῶτος, first, + E. *case(in)* + *-ose.*] The proto-albumose derived from casein.

protocatechuic (prō-tọ-kat-e-chö′ik), *a.* [Gr. πρῶτος, first, + E. *catechu* + *-ic.*] Derived from catechol.—**Protocatechuic acid,** a crystalline acid, $C_6H_3(OH)_2(COOH)$, or 3,4-dihydroxybenzoic acid, found in the fruit of *Illicium religiosum.* It is made by fusing piperic acid, clove oil, catechol, gum guaiacum, vanillin, and many other gums and resins with caustic potash.—**Protocatechuic aldehyde,** a crystalline compound, $C_6H_3(OH)_2.CHO$, or 3,4-dihydroxybenzoic aldehyde. It is made by heating piperonal, vanillin, or opianic acid with dilute hydrochloric acid, and in other ways.

protocephalopod (prō-tọ-sef′a-lō-pod), *n.* [Gr. πρῶτος, first, + E. *cephalopod.*] The hypothetical primitive ancestor of the *Cephalopoda.*

Protoceras (prọ-tos′e̤-ras), *n.* [NL., < Gr. πρῶτος, first, + κέρας, horn.] An extinct ruminant mammal belonging to the even-toed or artiodactyl division of the *Ungulata.* It is characterized by the presence of greatly developed bony protuberances from various parts of the skull in the male. The most prominent of these arise from the maxillæ, frontals, and parietals. All are faintly indicated in the skull of the female. The forefeet are tetradactyl and the hind feet functionally didactyl. Remains of these animals occur in the upper levels of the White River Oligocene (the so-called *Protoceras beds*) of North America.



Protoceras.
(From a skeleton in the Princeton Museum.)

Protoceratidæ (prō″tọ-sẹ-rat′i-dē), *n. pl.* [NL., < *Protoceras* (*-rat-*) + *-idæ.*] A family of ungulate mammals containing extinct forms from the Oligocene of North America, about the size of sheep and distantly related to existing chevrotains. The skull was long and narrow and in the males bore two pairs of horns, possibly three. The forefoot has four toes, the outer ones very slender; and the hind foot has also four toes, but the metatarsals of the second and fifth ones are reduced to vestiges at the upper end. *Marsh,* 1891.

protocerebron (prō-tō-ser′ẹ-bron), *n.*; pl. *protocerebra* (-brạ̈). [NL., < Gr. πρῶτος, first, + L. *cerebrum,* brain.] In Viallanes's system, the first of the three divisions of an insect's brain. *Cambridge Nat. Hist.,* V. 118.

protochlorophyll (prō-tọ-klō′rọ-fil), *n.* [Gr. πρῶτος, first, + E. *chlorophyll.*] A green coloring matter found in the leaves of plants which are kept in the dark. Under the influence of light it changes into chlorophyll. *Jour. Roy. Micros. Soc.,* Oct., 1903, p. 662.

Protochorda (prō-tọ-kôr′dạ̈), *n. pl.* [NL., < Gr. πρῶτος, first, + χορδή, chord.] The lancelets, tunicates, and hemichordates, considered together as forming a class of *Vertebrata.*

Protochordata (prō″tō-kôr-dā′tạ̈), *n. pl.* [*Protochorda.*] Same as ★*Protochorda.*

protochordate (prō-tọ-kôr′dāt), *a.* and *n.* [*Protochordata.*] **I.** *a.* Pertaining to, or having the characters of, the *Protochorda.* *Proc. Zool. Soc. London,* 1898, p. 346.

II. *n.* A member of the *Protochordata,* a group of animals closely related to the vertebrates, whose limits are variously defined by different authorities.

protochromosome (prō-tọ-krō′mọ-sōm), *n.* [Gr. πρῶτος, first, + E. *chromosome.*] A piece of the chromatin network or skein of the cell-nucleus which has not yet assumed the definite shape of a chromosome.

The number of chromosomes in the nucleus is invariably two, though in the basidium the first phases of division show a number of *protochromosomes* which later resolve themselves also into two chromosomes; the basidium in any species can give rise to two generations of spores on the same sterigma.
Jour. Roy. Micros. Soc., April, 1903, p. 211.

Protocimex (prō-tọ-sī′meks), *n.* [NL., < Gr. πρῶτος, first, + L. *cimex,* bed-bug (see *Cimex*).] The oldest known hemipterous insect, represented by a fragmentary wing from the graptolitic shales of the Lower Silurian of Sweden.

protocladus (prō-tọ-klā′dus), *n.*; pl. *protocladi* (-dī). [Gr. πρῶτος, first, + NL. *cladus.*] In sponge-spicules, one of the branches of the first order in a cladome. *Proc. Zool. Soc. London,* 1902, p. 218.

protoclastic (prō-tọ-klas′tik), *a.* [Gr. πρῶτος, first, + κλαστός, broken, + *-ic.*] In *petrog.,* a term applied by Brögger to a texture due to granulation or fragmentation of crystals in igneous rocks during the molten condition of the magma or matrix, previous to final solidification.

protocneme (prō′tok-nēm), *n.* [Gr. πρῶτος, first, + κνήμη, tibia.] In zoantharians, one of the twelve primary mesenteries. Compare ★*metacneme.* *Duerden.*

Protococcales (prō″tọ-ko-kā′lēz), *n. pl.* [NL., < *Protococcus* + *-ales.*] An order of the *Chlorophyceæ* or green algæ.

protocœlom (prō-tọ-sē′lom), *n.* Same as ★*protocœloma.*

It is probably multiple. Each *protocoelom* is in its nature a gonocoel, that is to say a coelomic pouch, the epithelial walls of which produce ova or sperm or both.
E. R. Lankester, Zoology, II. 35.

protocœloma (prō″tọ-sē-lō′mạ̈), *n.*; pl. *protocœlomata* (-mạ-tạ̈). [NL., < Gr. πρῶτος, first, + NL. *Cœloma.*] The primitive cœloma. Also *protocœlom.*

protocolar (prō′tō-kol-ạ̈r), *a.* [For **protocollar*; < *protocol* + *-ar*3.] Pertaining to or of the nature of a protocol or diplomatic agreement; hence, pertaining to diplomatic forms.

You may have noticed how the Japanese marine minister, in answering Admiral Togo's bulletin of victory, seizes the opportunity to remind him of the virtues of the Mikado. . . . To some extent it is *protocolar,* but one must not for that think it an empty form.
N. Y. Evening Post, July 15, 1905.

protoconch, *n.* **2.** The apical whorl of a gastropod shell.

The apical whorl of a gastropod shell has come to be generally known as the *protoconch,* though this term had been preoccupied for the corresponding apex of cephalopod shells. *Amer. Nat.,* Dec., 1902, p. 918.

protoconchial (prō-tọ-kong′ki-ạl), *a.* Same as *protoconchal.* *Amer. Nat.,* Oct., 1907, p. 624.

protocone (prō′tọ-kōn), *n.* [Gr. πρῶτος, first, + κῶνος, cone.] The anterior inner cusp in an upper molar, and the anterior outer cusp in an upper premolar, of many mammals, homologous to the single cusp assumed by the tritubercular theory of dental complication to be the primitive reptilian ancestral type from which by progressive complication the teeth of mammalians have been derived. The antero-external cusp in the lower molars and premolars has similar homologies, according to the tritubercular theory, and is termed, for distinction from the upper series, the *protoconid.*

According to the original theory of Cope as developed by Osborn, the homologue of the main reptilian cone or *protocone* is invariably situated on the antero-internal, or lingual side in the upper teeth.
H. F. Osborn, in Amer. Jour. Sci., April, 1904, p. 321.

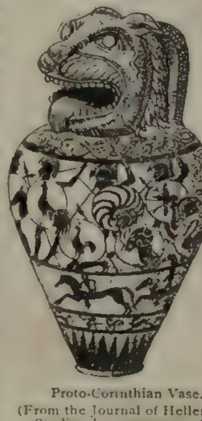
protoconid (prō-tọ-kon′id), *n.* [*protocone* + *-id*2.] That cusp in the lower premolars and molars which is homologous with the protocone in the corresponding teeth of the upper jaw. See ★*protocone.*

Again summing up this combined evidence, we find in the Jurassic period the superior molars of the only mammals known (excepting the Triconodonta and Multituberculata) to consist of a large conical internal cusp or protocone, which we have every reason to believe is homologous with the large external cusp or *protoconid* in the lower jaw.
H. F. Osborn, in Amer. Jour. Sci., April, 1904, p. 323.

protoconule (prō-tọ-kon′ūl), *n.* [Gr. πρῶτος, first, + κῶνος, cone, + L. dim. *-ulus,* E. *-ule.*] The anterior intermediate cusp in sextuberculate molars situated between the protocone and paracone. *Amer. Mus. Jour. Sup.,* Jan., 1903, Guide Leaflet No. 9, p. 20.

proto-Corinthian (prō″tọ-kọ-rin′thi-ạn), *a.* [Gr. πρῶτος, first, + E. *Corinthian.*] In the history of Greek pottery, a term applied to vases which resemble the so-called Corinthian, but appear to be older and more primitive.

The term *Protokorinthian* was invented for the class by Furtwaengler, as a provisional title, not because it is proved that the vases were made in Korinth, but because the class is, in general, older than the Korinthian ware and is closely bound up with it by numerous transitional stages.
Cecil Smith, in Jour. Hellenic Studies, XI. 173.



Proto-Corinthian Vase.
(From the Journal of Hellenic Studies, by permission of the Council.)

protocorm (prō′tọ-kôrm), *n.* [Gr. πρῶτος, first, + κορμός, trunk.] A tuber-like body provided with rhizoids produced in the place of a hypocotyl with roots, in the germination of some species of *Lycopodium.* This is regarded by Treub (the author of the term) as the rudiment of a leafy shoot, but by Goebel as an arrested hypocotylous segment. Analogous formations are found in the related genus *Phylloglossum* and in some orchids and dicotyledons.

protocoteine (prō-tọ-kō′tẹ-in), *n.* [Gr. πρῶτος, first, + (*para*)*coto* + *-e-* + *-ine*2.] A compound found in small quantity in paracoto bark.

protocranium (prō-tọ-krā'ni-um), *n.*; *pl. protocrania* (-a̤). [NL., < Gr. πρῶτος, first, + κρανίον, skull, cranium.] The posterior portion of the epicranium of an insect's head. It is sometimes separated from the epicranium proper by a transverse line. *Cambridge Nat. Hist.*, V. 92, 93.

Protodiscineæ (prō"tọ-di-sin'ẹ-ē), *n. pl.* [NL., < Gr. πρῶτος, first, + δίσκος, a disk, + *-ineæ.*] A suborder of ascomycetous fungi which includes the family *Exoascaceæ*.

protodont (prō'tọ-dont), *a.* [Gr. πρῶτος, first, + ὀδούς (ὀδοντ-), tooth.] 1. Noting a type of tooth which is rather high and conical, with two small tubercles developed on the anterior and the posterior face.—2. Pertaining to, or characteristic of, the group of mammals named *Protodonta*.

Protodonta (prō-tọ-don'ta̤), *n. pl.* [NL., < Gr. πρῶτος, first, + ὀδούς (ὀδοντ-), tooth.] Cope's term for a group of primitive mammals, largely hypothetical, which have the incisors reduced and molars with compressed, cutting crowns and simple roots. The *Dromatheriidæ* are assigned to this order.

protodynastic (prō"tọ-dī-nas'tik), *a.* [Gr. πρῶτος, first, + E. *dynast(y)* + *-ic.*] Existing or occurring during the first or earliest known dynasties (of Egypt).

> In a memoir, which will be published in a short time, he [Prof. Elliot Smith] intends to give a full account of the structure of the brain in the predynastic and *protodynastic* Egyptians. *Nature*, Nov. 6, 1902, p. 14.

protœcium (prō-tē'si-um), *n.*; pl. *protœcia* (-a̤). [NL., < Gr. πρῶτος, first, + NL. *œcium.* See *œcium.*] In bryozoans, the basal disk of the primary individual of the colony.

> It follows, therefore, that before the colony has reached a stage in which its genus or even its family is recognizable, the first zoœcium, which the author here proposes to designate as the *protœcium*, has become mature (ephebic).
> *E. R. Cumings*, in Amer. Jour. Sci., Jan., 1904, p. 50.

proto-Egyptian (prō"tọ-ẹ-jip'shạn), *a.* [Gr. πρῶτος, first, + E. *Egyptian.*] Noting the autochthonous race in Egypt which preceded the known historical race. Remains of such a people have been found in the Nile valley.

> We may provisionally apply the term 'Egypto-Libyan' or '*Proto-Egyptian*' to this early indigenous population of the Nile valley.
> *A. J. Evans*, in Jour. Hellenic Studies, XVII. 379.

proto-elastose (prō"tọ-ẹ-lȧs'tōs), *n.* [Gr. πρῶτος, first, + E. *elast(in)* + *-ose.*] The proto-albumose derived from elastin. *Simon*, Physiological Chem., p. 179.

proto-ephippium (prō-tọ-e-fip'i-um), *n.*; pl. *proto-ephippia* (-a̤). [NL., < Gr. πρῶτος, first, + NL. *ephippium.*] In some entomostracans, a sort of egg-case.

> The latter [resting eggs] in the Daphniidæ are enclosed in a modified part of the mother's shell, called the ephippium from its resemblance to a saddle in shape and position. In other families a less elaborate case has been observed, for which Mr. Scourfield has proposed the term *protoephippium*. *Encyc. Brit.*, XXVIII. 270.

proto-epiphyte (prō-tọ-ep'i-fīt), *n.* See ★*epiphyte*, 1.

proto-Etruscan (prō"tō-ẹ-trus'kạn), *a.* and *n.* [Gr. πρῶτος, first, + E. *Etruscan.*] Primitive Etruscan.

protogala (prō-tog'ạ-la̤), *n.* [Gr. πρῶτος, first, + γάλα, milk.] The colostrum or first milk secreted by the mother after childbirth.

protogasteropod (prō-tọ-gas'tẹ-rọ-pod), *n.* [Gr. πρῶτος, first, + E. *gasteropod.*] The hypothetical primitive gasteropod.

protogelatose (prō-tọ-jel'ạ-tōs), *n.* [Gr. πρῶτος, first, + E. *gelat(in)* + *-ose.*] The proto-albumose derived from gelatin.

protogenide (prọ-toj'e-nid), *n.* [*protogen(ic)* + *-ide*¹.] In *chem.*, a name used by Laurent, in connection with his nucleus theory, to denote a compound of a nucleus with two atoms of hydrogen or oxygen, or with 2, 4, or 6 atoms of a salt-radical, as of chlorin.

protogenist (prọ-toj'e-nist), *n.* [Gr. πρωτογενής, first-born, + *-ist.*] The 'first-born' of the race: used in the extract as 'first-born' (that is, one of the earliest) of those who indulge in (concetti). See *concetto.*

> Lucan came fairly by his style (a sort of Roman Cowley he), and I am glad I took up the book, since I bethought me for the first time that Lucan was the true *protogenist* of the concettisti. *Lowell*, Letters, II. 333.

protoglobulose (prō-tọ-glob'ū-lōs), *n.* [Gr. πρῶτος, first, + E. *globul(in)* + *-ose.*] The proto-albumose derived from globulin.

protogod (prō'tọ-god), *n.* [Gr. πρῶτος, first, + E. *god.*] The original god from which, by deification of qualities or of special manifestations, a number of other gods are derived.

protogonocyte (prō-tọ-gon'ọ-sīt), *n.* [Gr. πρῶτος, first, + E. *gonocyte.*] One of the two cells resulting from the division of the impregnated ovum, the first of the series terminating in the archigonocyte or primary germ-cell. *Buck*, Med. Handbook, VI. 864.

protogonoplasm (prō-tọ-gon'ọ-plazm), *n.* [Gr. πρῶτος, first, + E. *gonoplasm.*] A differentiated area in the substance of a protozoan from which later the gemmules develop.

> An early cytoplasmic stage.—This agrees in the main with that first described by Councilman, Magrath, and Brinckerhoff for human variola, but is more detailed. The smallest form (seven-tenths of a micron in diameter) is a minute homogeneous sphere which is all nucleus. One of the first indications of differentiation is central vacuolization, with the occasional appearance of a minute central dot, which stains with methylene blue. Differentiation in the peripheral portion is first shown by minute unstained spots, which, with growth, increase in size and stain green in Borrel preparations, while comparatively large masses stain red. This red material forms the substance of the later developing gemmules, and is called *protogonoplasm* by Calkins.
> *Jour. Med. Research*, Oct., 1904, p. 363.

protograph, *n.* 2. In the nomenclature of natural history, the original pictorial description of a species, genus, or higher group.

proto-Hellenic (prō"tọ-he-len'ik), *a.* [Gr. πρῶτος, first, + E. *Hellenic.*] Pertaining or belonging to that (hypothetical) people from which all the Greek or Hellenic tribes originated.

protohematoblast (prō-tọ-hem'ạ-tọ-blȧst), *n.* [Gr. πρῶτος, first, + E. *hematoblast.*] A nucleated spherical cell, derived from a bone-marrow cell, which later becomes a nucleated red blood-corpuscle.

> Malassez states that the nucleated red blood corpuscles are derived from the proper marrow cells by these giving rise first to spherical cells of large size which do not readily stain, contain little or no hæmoglobin, and possess a very diffuse nucleus. These cells are termed *protohæmatoblasts* by Malassez. *Buck*, Med. Handbook, II. 20.

protokosin (prō-tọ-kō'sin), *n.* A colorless, crystalline, physiologically inactive compound, $C_{29}H_{38}O_9$, obtained from cusso.

protolemur (prō-tọ-lē'mėr), *n.* [Gr. πρῶτος, first, + E. *lemur.*] Any one of a group of insectivorous mammals ancestral to the lemurs.

Protolenus (prō-tol'e-nus), *n.* [NL., < Gr. πρῶτος, first, + NL. *Olenus*, a genus of trilobites.] A genus of opisthoparian trilobites found in Lower Cambrian rocks of the Province of New Brunswick, Canada.

Protolepidoptera (prō-tō-lep-i-dop'tẹ-ra̤), *n. pl.* [NL., < Gr. πρῶτος, first, + NL. *Lepidoptera.*] A suborder of lepidopterous insects, erected by Packard, containing only the family *Eriocephalidæ*: distinguished from the ★*Palæolepidoptera* (the *Micropterygidæ* only) and the *Lepidoptera Haustellata* (all the other families).

Protolimulus (prō-tọ-lim'ụ-lus), *n.* [NL., < Gr. πρῶτος, first, + NL. *Limulus*, a genus of *Crustacea.*] A limuloid arthropod found in the Upper Devonian rocks of Pennsylvania.

protolithic (prō-tọ-lith'ik), *a.* [Gr. πρῶτος, first, + λίθος, stone, + *-ic.*] In *anthrop.*, denoting stone implements without designed modification in form, but selected according to fitness of form and gradually shaped by wear, without definite recognition of the shaping on the part of the operator. See ★*technolithic.* *W. J. McGee*, in 17th Rep. Bur. Amer. Ethnol. I, p. LXVI.

> The use of objects without the designed modification of them has been applied to Seri stone implements by Mr. McGee, when he calls such modified implements *protolithic*, while the modified stone implements he calls technolithic. The two phases are widely distinct, not only in type of object, but even more in the mental operations exemplified by the objects; for the *protolithic* objects represent undesigned adaptation and modification of cobbles picked up at random, while the others represent designed shaping in accordance with preconceived ideals. The coexistence of the incongruous types seemed puzzling at the outset. *Smithsonian Rep.*, 1898, p. 43.

protolithionite (prō-tọ-lith'i-ō-nīt), *n.* [Gr. πρῶτος, first, + NL. *lithium* (*lithion) + *-ite*².] An iron-lithium mica from the tourmalin-granite of Eibenstock, Saxony: it is closely related to zinnwaldite.

protolithoplasm (prō-tọ-lith'ọ-plȧzm), *n.* [Gr. πρῶτος, first, + λίθος, stone, + πλάσμα, thing formed or molded.] A word coined on the analogy of 'protoplasm' to describe the earliest beginnings of crystals which some observers believe they have seen with the highest powers of the microscope.

> Then are seen appearing in the network small obscure points called 'petroblasts,' which, when observed under high magnifying power, seem to be at the centre of a dark substance called 'deuterolithoplasm,' and on the periphery of another clearer substance named by Von Schrön '*protolithoplasm.*' The formation of the crystal results from these two substances.
> *Knowledge and Scientific News*, Aug., 1904, p. 183.

protolog (prō'tọ-log), *n.* [Gr. πρῶτος, first, + λόγος, account.] In the nomenclature of natural history, the original verbal description of a species, genus, or higher group. Also *protologue.*

protologic (prō-tọ-loj'ik), *a.* [*protolog(y)* + *-ic.*] Of or pertaining to protology.

protologue (prō'tọ-log), *n.* Same as ★*protolog.* *Science*, June 9, 1905, p. 889.

protology (prọ-tol'ọ-ji), *n.* [Gr. πρῶτος, first, + -λογια, < λέγειν, speak.] The science of the beginnings of things: used in reference to the mythology of primitive tribes. *J. N. B. Hewitt*, in An. Rep. Bur. Amer. Ethnol. 1899–1900, p. 138.

protoloph (prō'tọ-lof), *n.* [Gr. πρῶτος, first, + λόφος, crest.] The anterior cross-crest in such a tooth as that of a tapir or rhinoceros: correlated with ★*ectoloph* and ★*metaloph.* See cut under ★*tooth*, 1. *Amer. Mus. Jour. Sup.*, Jan., 1903, Guide Leaflet No. 9, p. 20.

protome (prō'tọ-mẹ), *n.* [Gr. προτομή, the foremost or upper part.] In *Gr. antiq.*, the front of anything, as the head of a horse or the prow of a ship.

> The horse's head, or *protomé*, as is well known, is introduced generally in a sunken square.
> *A. J. Evans*, in Jour. Hellenic Studies, VII. 14.

Protomorphic races. See ★*race*³.

protomycelium (prō"tọ-mī-sē'li-um), *n.* [NL., < Gr. πρῶτος, first, + NL. *mycelium.*] The transition stage of Eriksson's mycoplasma to the hyphal condition. See ★*mycoplasma.*

proto-Mycenæan (prō"to-mī-sẹ-nē'ạn), *a.* [Gr. πρῶτος, first, + E. *Mycenæan.*] Of or pertaining to the earliest or oldest portion of the Mycenæan age. See ★*Mycenæan.*

> Mr. Hogarth appends a description by Dr. Boyd-Dawkins of *proto-Mycenæan* dolichocephalic skulls found by him, which the distinguished craniologist pronounces to possess characters which "point unmistakably to the fact that the possessors of the skulls . . . led the artificial life of highly civilised peoples." . . .
> *Nature*, Aug. 21, 1902, p. 394.

protomyosinose (prō-tọ-mī'ọ-si-nōs), *n.* [Gr. πρῶτος, first, + E. *myosin* + *-ose.*] The proto-albumose derived from myosin.

proton (prō'ton), *n.*; pl. *prota* (-ta̤), *protons* (-tonz). [Gr. πρῶτον, neut. of πρῶτος, first, first state of a thing; a thing in its first state.] 1. The first inception or rudiment of a structure or organ in the embryo: a term suggested as an equivalent of the German *anlage.*

> The nematode embryo is elongate, or vermiform, and possesses a firm outer cuticular layer which is highly refractive and appears under the microscope as a clear structureless boundary. . . . A clear area near the center of the worm, consisting of one or a few large cells is the *proton* of the reproductive system.
> *Trans. Amer. Micros. Soc.*, June, 1902, p. 113.

2. A term designating certain products of tryptic digestion which are obtained from the protamins and which, supposedly, are intermediary between these and the end-products.

protonauplius (prō-tō-nâ'pli-us), *n.*; pl. *protonauplii* (-ī). [NL., < Gr. πρῶτος, first, + NL. *nauplius.*] The hypothetical embryonic nauplius stage of the hypothetical crustacean prototype, as yet unobserved but, by virtue of Beecher's researches on trilobite larvæ, supposed to have been similar to the protaspis stage of primitive trilobites. *Amer. Jour. Sci.*, June, 1904, p. 419.

protonegro (prō-tọ-nē'grō), *n.* [Gr. πρῶτος, first, + E. *negro.*] A negro of the primitive negro stock.

> These steatopygous Bushmen were perhaps *Protonegroes*, who may have branched off from the Nigritic stock when first that species reached the Mediterranean regions. *Sir Harry Johnston*, The Nile Quest, p. 2.

Protonemertini (prō"tọ-nē-mėr-tī'nī), *n. pl.* [Gr. πρῶτος, first, + NL. *Nemertes* + *-ini.*] An order of nemerteans. They have the cerebral ganglia and lateral nerves outside the dermal muscles, either in the ectoderm or beneath the dermis; the body-wall consisting of an ectoderm, a dermis, and an external circular and an internal longitudinal layer of muscles, usually with a diagonal layer between; the mouth behind the brain; no cæcum; and a proboscis without stylets. The order includes the families *Carinellidæ* and *Hubrechtidæ*. Compare ★*Mesonemertini*, ★*Metanemertini*, and ★*Heteronemertini.*

protonephridium (prō-tǫ-nef-rid′i-um), *n.*; pl. *protonephridia* (-ạ̈). [NL., ‹ Gr. πρῶτος, first, + NL. *nephridium.*] A nephridium that is devoid of an internal opening.

protonephrium (prō-tǫ-nef′ri-um), *n.*; pl. *protonephria* (-ạ̈). Same as *protonephron.*

protonic^2 (prǫ-ton′ik), *a.* [*proton* + *-ic.*] Of or pertaining to a proton or anlage. See ★*proton*, 1.

> And the second is the differentiation of this intestinal increment into hepatic structure. The differentiation has gradually extended posteriad from the *protonic* inception. *Trans. Amer. Micros. Soc.*, June, 1902, p. 59.

protonuclein (prō-tǫ-nū′klẹ-in), *n.* [Gr. πρῶτος, first, + E. *nuclein.*] A trade-name of a substance prepared from the lymphoid tissues of animals, with the addition of gum and milk-sugar: employed as a healing application to wounded and ulcerated surfaces. *Buck*, Med. Handbook, III. 541.

Protopauropus (prō-tǫ-pâ′rǫ-pus), *n.* [NL., ‹ Gr. πρῶτος, first, + NL. *Pauropus.*] A name proposed by Packard for the theoretical ancestral myriapod, since that form probably resembled the larva of the modern *Pauropus.*

protopelecypod (prō″tǫ-pe-les′i-pod), *n.* [Gr. πρῶτος, first, + E. *pelecypod.*] The hypothetical original ancestor of the *Pelecypoda*, supposed to have had small, thin, symmetrical, subcircular or oval shells, with edentulate hinge-line and smooth surface.

Protoperlidæ (prō-tǫ-pėr′li-dē), *n. pl.* [NL., ‹ Gr. πρῶτος, first, + NL. *Perlidæ.*] A family name proposed by Brongniart for certain fossil insects, related to the *Perlidæ*, found in the Carboniferous strata of Commentry, France.

protophyllin (prō-tǫ-fil′in), *n.* [Gr. πρῶτος, first, + φύλλον, leaf, + *-in*^{2}.] A hydrid of chlorophyl described by Gautier and Timirjazev. Colorless under ordinary conditions, it turns green on exposure to light.

protopine (prō′tǫ-pin), *n.* [Gr. πρῶτος, first, + ὀπ(ιον), opium, + *-ine*^{2}.] A crystalline alkaloid, $C_{20}H_{17}O_5N$, found in opium and in the roots of the celandine, *Chelidonium majus*, the bloodroot, *Sanguinaria Canadensis*, and *Macleya cordata.* It melts at 204° C. Also called *macleyine.*

protoplasm, *n.* 2. The invisible basis of living substance; the ultimate and true protoplasm as free from all non-living objects. See the extract.

> *Protoplasm* . . . is a morphological term but . . . the same word *protoplasm* is also frequently used to denote . . . "the real living substance." The word then embodies a physiological idea.
>
> *M. Foster*, Textbook of Physiol., p. 5.

Nervous protoplasm. Same as ★*neuroplasm.*—**Protoplasm derivate**, the intracellular substance of certain tissues supposed to be the product of the activity of cells that lie embedded in the ground substance.—**Structure of protoplasm.** (*a*) *Visible structure.* With the best optical aids living protoplasm is rarely found to be homogeneous, but contains droplets, granules, striations, fibrillæ, or plates that differ in different cells and in the same cell at different periods. In preserved protoplasm dyes or stains may make certain parts conspicuous, and upon this basis many important hypotheses of protoplasmic structure have been built up. Most of these assume some one or other universal structure in all protoplasm. Thus, the *granular hypothesis*, carried to extremes by Altmann, made granules the essential structure in all cells. The *filar hypothesis* of Flemming claimed separate threads as the essential structure. This gave place to the *network hypothesis* which recognized a framework or meshwork as the fundamental structure of protoplasm. Bütschli's *alveolar hypothesis* interprets most of the visible appearances in protoplasm as the expression of a universal honeycomb or froth structure. Strengthened by the experiments of Rhumbler and others this hypothesis has risen to the dignity of a theory explaining some of the fundamental activities of protoplasm in the lower animals. More recent views make protoplasm polymorphic, and of different structure at different times and places. A. Fischer claims that many of the above appearances are artificial products and thinks that similar structures in living protoplasm may be temporary precipitations of proteids. G. F. Andrews finds the above basic and many other kinds of structures in living protoplasm to be built up on a basis of relatively inert inclusions embedded in a plasma or continuous substance. A clear distinction is to be drawn between the diverse structural arrangements seen in most masses of protoplasm and the background of ultimate protoplasm the structure of which has not been seen. (*b*) *Chemical structure.* To chemical examination protoplasm yields large amounts of proteids and of water, as well as some fats, carbohydrates, and mineral substances. Of these the proteids are preëminent in some fundamental phenomena of protoplasm. Whether the ultimate protoplasm is one chemical substance or a mixture of substances is not known. Visible portions of protoplasm are complex and non-homogeneous in most cases and minute contiguous areas give different chemical reactions. (*c*) *Physical structure.* Protoplasm is essentially liquid in many of its active phases, with great differences of viscosity in different areas and in the same area at different times. It often looks like an emulsion and some of its properties are comparable with those of colloidal solutions. Assuming electrical charges in protoplasm, such fundamental activities as contraction of muscle and transmission by nerves have found formal explanations. (*d*) *Deduced biological structure.* To explain heredity and some other phenomena of living things, protoplasm has frequently been regarded as made up of units which are generally thought of as ultramicroscopic. Among such units of ultimate protoplasm are the 'physiological units' of Herbert Spencer, the 'gemmules' of Darwin, the 'pangens' of De Vries, the 'plastidules' of Haeckel, the 'biophores' of Weismann, the 'micellæ' of Nägeli, and the 'plasomes' of Wiesner. In some cases these units are held to have some of the fundamental attributes of living things. These conceptions afford only formal explanations of certain protoplasmic phenomena.

Protoplasmic continuity, segmentation. See ★*continuity*, ★*segmentation.*

protoproteose (prō-tǫ-prō′tē-ōs), *n.* [Gr. πρῶτος, first, + E. *proteose.*] Any proto-albumose derived from a native albumin.

protopsychic (prō-tǭ-sī′kik), *a.* [Gr. πρῶτος, first, + E. *psychic.*] In *psychol.*, pertaining to or characteristic of the first beginnings of mind; mentally rudimentary or ultimate.

> It is one thing to build up the identical consciousness that has just been dissected, and quite another to take the dissected bits of, say, the normal, adult consciousness and entrust them, as *protopsychic* units, to time for the creation of a mental phylogeny.
>
> *Amer. Jour. Psychol.*, XI. 406.

protopterygian (prō″top-tẹ-rij′i-ạn), *a.* [Gr. πρῶτος, first, + πτέρυξ, wing, fin, + *-ian.*] In *ichth.*, noting that stage of embryonic development in which the fin-rays first appear. *J. A. Ryder.*

proto-Renaissance (prō-tǫ-rė-nā-soṅs′), *n.* [Gr. πρῶτος, first, + F. *Renaissance.*] A revival movement in art and literature preceding the Renaissance proper, especially that which began in the reign of the Emperor Frederick II. (1194–1250), when a definite attempt was made to revive interest in ancient art. The finest monuments of this movement are certain medals of the emperor and the sculpture of Niccola Pisano.

Protorohippus (prō″tor-ǫ-hip′us), *n.* [NL., ‹ Gr. πρῶτος, first, + NL. *Orohippus.*] A primitive equine animal, from the Middle Eocene Wind River beds, characterized by the presence of four complete toes in the fore foot and three in the hind foot. *Protorohippus* stood 16 inches high at the withers.

Protorosauria (prō″tor-ǫ-sâ′ri-ạ̈), *n. pl.* [NL.] An order of reptiles established by Seeley to contain rather large reptiles from the Permian of Germany. The vertebræ are mostly biconcave; hypocentra are present; and the strong attachment of the pelvis indicates terrestrial habits. *Palæohatteria* also belong to this order.

proto-Semitic (prō″tǫ-sẹ-mit′ik), *a.* [Gr. πρῶτος, first, + E. *Semitic.*] Primitively Semitic: applied to a supposed primitive race from which all Semitic peoples were descended.

protosocial (prō-tǫ-sō′shạl), *a.* [Gr. πρῶτος, first, + E. *social.*] Containing possibilities of social evolution; especially, pertaining to the primitive horde and its undeveloped social capacities. *L. F. Ward*, Pure Sociol., p. 274.

Protospondyli (prō-tǭ-spon′di-lī), *n. pl.* [Gr. πρῶτος, first, + σπόνδυλος, a vertebra.] A suborder of fishes characterized by having a semiheterocercal tail, the bony supports of the dorsal and anal fins equal in number to the fin-rays, and more than five actinosts in the pectoral and none in the ventral fins. They are the characteristic forms of the Jurassic. The only living species is the North American *Amia.*

Protospongidæ (prō-tǫ-spon′ji-dē), *n. pl.* [NL., ‹ Gr. πρῶτος, first, + NL. *Spongidæ.*] A family of hexactinellid sponges represented by fragmentary, quadrately reticulate, spicular skeletons in Cambrian and Lower Silurian rocks.

Protostegidæ (prō-tǫ-stē′ji-dē), *n. pl.* [NL. *Protostega*, type genus, + *-idæ.*] A family of turtles, comprising species of large size and marine habits, characterized by having the carapace imperfectly developed, the plastron well developed, and the limbs modified for swimming. The type species is *Protostega gigas*, from the Cretaceous of Kansas.

protostomal (prǫ-tos′tǫ-mạl), *a.* [*protostoma* + *-al*^{1}.] Of or pertaining to a protostoma or blastopore. *Philos. Trans. Roy. Soc.* (London), 1900, ser. B, p. 323.—**Protostomal seam**, in *embryol.*, the suture or seam formed by the closure of the lips of the protostoma or blastopore at the close of the gastrulation of certain animals.

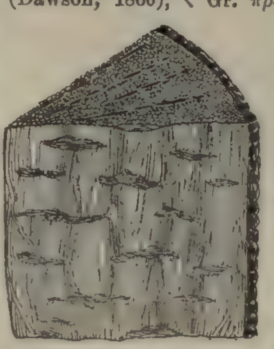
protostyle (prō′tǫ-stīl), *n.* [Gr. πρῶτος, first, + στῦλος, style.] A small cusp present in the upper premolars of many mammals and situated in front of the protocone on the margin of the tooth-crown.

protosulphate (prō-tǫ-sul′fāt), *n.* [Gr. πρῶτος, first, + E. *sulphate.*] A compound of a metal or an electropositive radical with one combining unit of the radical of sulphuric acid, or that member of a series of sulphates which contains the smallest proportion of the sulphuric acid radical: as, *protosulphate* of iron or ferrous sulphate ($FeSO_4$), commercially known as *green vitriol.*

protosulphid (prō-tō-sul′fid), *n.* [Gr. πρῶτος, first, + E. *sulphid.*] A compound of a metal or an electropositive radical with one atom of sulphur, or that member of a series of sulphids which contains the smallest proportion of sulphur.

protosulphuret (prō-tǫ-sul′fụ̄-ret), *n.* Same as ★*protosulphid.*

Prototaxites (prō″tǭ-tak-sī′tēz), *n.* [NL. (Dawson, 1860), ‹ Gr. πρῶτος, first, + NL. *Taxites.* See *Taxites.*] A genus of fossil algæ, occurring in Silurian and Devonian rocks, the trunks of which attained the dimensions of tree-trunks. It may have been a gigantic seaweed or kelp, but Dawson regarded it as a land plant and a true tree. It was subsequently renamed *Nematophycus* by Carruthers and *Nematophyton* by Dawson, but the original name must be adhered to although implying a relationship to the *Pinales.* See *Nematophycus.*



Prototaxites logani, reduced.
Section of trunk.

prototheca (prō-tǫ-thē′kạ̈), *n.*; pl. *prototheeæ* (-sē). [NL., ‹ Gr. πρῶτος, first, + θήκη, receptacle.] The cup, or calicle, of the first, or parent, polyp of a coral colony. See the extract under ★*protothecal.*

protothecal (prō-tǫ-thē′kạl), *a.* [*prototheca* + *-al*^{1}.] Of or pertaining to a prototheca.

> These conspicuous radial folds of the prototheca make it difficult to discern the exact character of the concentric foldings of the *protothecal* wall.
>
> *Annals and Mag. Nat. Hist.*, Jan., 1904, p. 29.

prototheme (prō′tǫ-thēm), *n.* [Gr. πρῶτος, first, + θέμα, theme.] The first constituent of a word or name.

> These *protothemes* in familiar intercourse, or even on more serious occasions, often received the termination -a, Seax, for instance, becoming Seaxa.
>
> *N. and Q.*, 10th ser., III. 176.

prototoxin (prō-tǫ-tok′sin), *n.* [Gr. πρῶτος, first, + E. *toxin.*] A derivative of a toxin which has a marked affinity for the corresponding antitoxin.

prototoxoid (prō-tǫ-tok′soid), *n.* [Gr. πρῶτος, first, + E. *toxoid.*] A toxoid which has a greater affinity for the corresponding antitoxin than the toxin proper.

prototroch (prō′tǭ-trōk), *n.* [Gr. πρῶτος, first, + τροχός, a wheel, a disk.] A locomotor organ in the trochophore larvæ of many marine annelids. It consists of a band of thickened cells encircling the body of the larva in front of the mouth and bearing strong motile cilia. See ★*preoral circlet.*

> The adult Sipunculid retains the retractor muscles and nephridia of the trochophore. The loss of the *prototroch*, the development of the cœlome, and the enormous elongation of the trunk, are the only fundamental changes which the trochophore undergoes in passing into the adult condition.
>
> *Jour. Roy. Micros. Soc.*, Feb., 1904, p. 64.

prototrochal (prō′tǫ-trō-kạl), *a.* [*prototroch* + *-al*^{1}.] Of or pertaining to a prototroch.

prototrophic (prō-tǫ-trof′ik), *a.* [Gr. πρῶτος, first, + τροφή, nourishment, + *-ic.*] Requiring for growth only simple inorganic substances, as carbon dioxid and ammonia or nitrous acid and a few mineral salts: a term used by A. Fischer to designate a group of nitrifying bacteria characterized by a very primitive metabolism. Compare ★*metatrophic* and ★*paratrophic.* *Encyc. Brit.*, XXVI. 55.

prototype, *n.*— **National prototypes**, one of two meters and one of two kilograms kept in the custody of the United States Bureau of Standards, by comparison with which weights and measures used in the United States are ultimately determined. The two kilograms are those designated as 4 and 20 by the International Commission of Weights and Measures, and consist of an alloy of 90 per cent. of platinum and 10 per cent. of iridium. They have been compared with great precision, both with the international prototype kilogram and with the kilograms issued by the Commission to the contributing governments. The two meters are those designated as 21 and 27. They consist of the same alloy, and have likewise been compared with the international prototype meter, and with the meters furnished to the other governments by the Commission. Kilogram 4 and meter 21 are used for actual comparisons with other weights or measures, while kilogram 20 and meter 27 are kept under seal for occasional use in verifying working kilogram 4 and working meter 21. In reference to the *mètre des Archives*, and the international prototype meter, and to the corresponding kilograms, these national standards are copies; but their formal adoption as the authoritative standards to which other standards in the United States are to be conformed has caused them to be called, perhaps with justice, the national prototype kilogram and the national prototype meter.

prototypic (prō-tọ-tip'ik), *a.* Same as *prototypal. Dana*, Manual of Geol. (4th ed.), p. 903.

protoveratridine (prō"tọ-vẹ-rā'tri-din), *n.* [*protoveratr*(*ine*) + *-id* + *-ine*^{2}.] A bitter non-poisonous alkaloid produced by decomposition of the protoveratrine of *Veratrum album.*

protoveratrine (prō"tọ-vẹ-rā'trin), *n.* [Gr. *πρῶτος*, first, + NL. *Veratr*(*um*) + *-ine*^{2}.] An intensely poisonous alkaloid obtained from the rhizomes of white hellebore, *Veratrum album.* It probably occurs also in *Veratrum viride.*

protoxidize (prọ-tok'si-dīz), *v. t.*; pret. and pp. *protoxidized*, ppr. *protoxidizing.* [Gr. *πρῶτος*, first, + E. *oxid* + *-ize.*] In *chem.*, to convert into a protoxid by union with a proper amount of oxygen.

protozoëa (prō"tọ-zọ-ē'ạ̈), *n.* pl.; *protozoëas* (-ạ̈z), *protozoëæ* (-ē). [NL., < Gr. *πρῶτος*, first, + NL. *zoëa.*] A copepod-like larval type which is found in a few of the higher *Crustacea.* It has a long, jointed abdomen without appendages, and it swims by means of the antennæ. *Euphausia*, *Penæus*, *Lucifer*, and *Sergestes* are known to pass through a free protozoëan stage, and *Porcellana* and *Pinnixa* hatch as protozoëas, but they escape from the protozoëan skin and become zoëas a few minutes after hatching.

protozoëan (prō"tọ-zọ-ē'ạn), *a.* [*protozoë*(*a*) + *-an.*] Of or pertaining to a protozoëa.

protozoölogist (prō"tọ-zọ-ol'ọ-jist), *n.* [*protozoölog*(*y*) + *-ist.*] A student of the *Protozoa*, especially of the parasitic forms. *Nature*, Nov. 29, 1906, p. 117.

protozoölogy (prō"tọ-zọ-ol'ọ-ji), *n.* [*protozo*(*on*) + *-ology.*] That branch of zoölogy which treats of the *Protozoa.*

Protozoology, a science that has only in most recent times attracted general attention, is nothing more or less than the study of a group of organisms which zoologists term protozoa. *Nature*, Nov. 29, 1906, p. 115.

protractor, *n.*— **Stereographic protractor**, in map projection, a plotting instrument or chart comprising graduated circular arcs and lines, used for the purpose of measuring geographical distances from maps plotted by stereographic projection. See *map-projection*, under *projection.*

The use of the *stereographic protractor* for measuring distances along great circles, of measuring spherical angles at a given point, together with various applications in navigation. *Nature*, April 24, 1902, p. 599.

Protremata (prō-trē'mạ-tạ̈), *n. pl.* [NL.] In Beecher's classification of the *Brachiopoda*, an order of articulated genera having the pedicle-opening restricted to the ventral valve throughout life and the prodeltidium originating on the dorsal side of the body-wall in the *Cephalata* stage and later ankylosed to the ventral shell, thus initiating the deltidium, which persists in all later growth stages. The brachia are unsupported by a calcareous ribbon. A few genera (*Thecidea*, *Lacazella*) still exist, but most of the genera of the order are extinct.

protreptic (prọ-trep'tik), *a.* Same as *protreptical.*

protrochal (prō-trō'kạl), *a.* [*pro-* + *trochal.*] Noting a larval stage in some mollusks, as *Dentalium* and *Nucula*, which is antecedent to the trochophore and characterized by the possession of recurrently ciliated zones. The term is applied also to a larva of certain polychætous worms.

This 'test' has also been seen in two species of Nucula, and pending fuller inquiry into the Myzomenian and a reinvestigation of Dentalium, I would suggest that this recurrently ciliated sac is representative of a larval stage antecedent to the trochophore, for which the term *protrochal* may suffice. This term has indeed been already applied to a larva of certain Polychæta, which might well represent a modification of that for which I am arguing; and quite recently it appears to have been observed near Ceylon for a species of the genus Marphysa. *Rep Brit. Ass'n Advancement of Sci.*, 1902, p. 630.

protrochula (prō-trō'kụ-lạ̈), *n.* [*pro-* + L. *trochus*, + dim. *-ula.*] A hypothetical organism represented by the stage in the development of the trochophore before the formation of the anus. *Hatschek.*

The *pro-trochula* — is, Hatschek holds, to be considered as the point of meeting of flat-worms and all higher invertebrates. If we go farther, and inquire what this *pro-trochula* may be and how it arose, Hatschek's reply would be that it is a hypothetical organism represented by the stage in the development of the trochophore before the formation of the anus. How it arose is not clear. *Encyc. Brit.*, XXXI. 794.

protrudent (prọ-trö'dẹnt), *a.* Projecting or protruding.

The mandibles are short but rather more *protrudent.* *Proc. Zool. Soc. London*, 1902, p. 128.

protrypsin (prọ-trip'sin), *n.* Same as *trypsinogen.*

protuberance, *n.*— **Red protuberance.** Same as *solar prominence* (which see, under *prominence*).

protuberance-spectroscope (prọ-tū'bẹ-rạns-spek"trọ-skōp), *n.* A spectroscopic attachment to an astronomical telescope especially designed with a view to the convenient observation of the spectra of solar protuberances.

protungulate (prọ-tung'gū-lāt), *n.* [Gr. *πρῶτος*, first, + E. *ungulate.*] The primitive ungulate or common ancestor of all ungulates or hoofed mammals.

protyle, *n.* 2. A hypothetical form of primal, undifferentiated matter from which, it has been imagined, by granulation or segregation of minute but definite masses may have been produced the atoms of the various chemical elements.

Prout's hypothesis. See ★*hypothesis.*

prov. An abbreviation (*f*) [*cap.*] of *Provence*; (*g*) [*cap.*] of *Proverbs*, a book of the Old Testament; (*h*) of *province.*

prove, *v. t.* 7. In homeopathic practice, to test the therapeutic action of (a drug) by observing the symptoms following its administration in appreciable amounts to persons in health.

proveliger (prō-vel'i-jėr), *n.* [L. *pro*, before, + NL. *veliger.*] In mollusks, a stage preceding the veliger or before the formation of the shell; also a hypothetical form of similar structure regarded by Verrill as the molluscan archetype.

Proventricular valvule, a circular fold in the wall of the proventriculus of certain insects. *A. S. Packard*, Text-book of Entom., p. 313.

prover, *n.* 3. In homeopathic medicine, one who submits himself to experimentation in order to determine the therapeutic indications for a drug. See ★*prove, v. t.*, 7.

The manifestations of drug action thus produced are carefully recorded, and this record of "drug-diseases," after being verified by repetition of many "*provers*," constitutes the distinguishing feature of the homœopathic materia medica. *Encyc. Brit.*, XXIX. 312.

4. In *old Eng. law*, one who gives state's evidence; an approver or probator.

provide, *v. t.*— **To cast loose and provide**, to get (a gun) ready for action, and to furnish (it) with ammunition.

province, *n.*— **Juvavian province.** See ★*Juvavian.* — **Mediterranean province**, a geographic designation applied by Austrian geologists to a marine basin which, during Triassic time, covered the eastern Alps, Tyrol, Lombardy, Carinthia, and extended eastward. Another contemporaneous Triassic basin extending over the Austrian Alps has been termed the *Juvavian province.*— **Petrographical province**, a term applied by Judd (1886) to a region in which the igneous rocks of a definite period possess characters which distinguish them from the igneous rocks of another region. The characters are chiefly chemical and mineralogical.

Provincial constitutions. See ★*constitution.*

provinculum (prō-ving'kụ-lum), *n.*; pl. *provincula* (-lạ̈). [L. *pro*, for, in place of, + *vinculum*, a bond.] The primitive hinge of certain young pelecypod shells, consisting of minute teeth on both sides of or behind the ligament, which are apparently independent of the permanent dentition of later stages.

proving, *n.* 3. The homeopathic test of the therapeutic value of a drug. See ★*prove, v. t.*, 7.

proving-box (prö'ving-boks), *n.* In *bread-making*, a large sheet-metal box having sliding doors and sheet-metal shelves, used to prove the rolls and loaves of dough before baking. It is sometimes mounted on wheels for convenience in moving the load to the oven, and is usually fitted with an inlet for live steam. The steam fills the box and condenses on the rolls, causing them to bake with a smooth hard crust.

proving-hole (prö'ving-hōl), *n.* In *mining*, an air-conduit in a mine.

Proviverridæ (prō-vī-ver'i-dē), *n. pl.* [NL., < *Proviverra*, the type genus, + *-idæ.*] A family of *Creodonta*, which contains species of rather small size, having the upper molars resembling those of the living marsupials of the genus *Dasyurus*, while the lower molars approach those of the true carnivore *Viverra*: from the Eocene of Europe and North America. *Schlosser*, 1886.

Provost cell. See ★*cell.*

proxene (prok'sēn), *n.* Same as *proxenus.*

proxeneta (prok-se-nē'tạ̈), *n.* [L. *proxeneta.* See *proxenet.*] A broker or agent, specifically, a marriage broker. A contract with such an agent is void under the common law, though the civil law tolerated them.

proxeny (prok'se-ni), *n.* [Gr. *προξενία*, < *πρόξενος*, a public guest or friend. See *proxenus.*] The office or duty of a proxenus.

The Delphian decree . . . conferring *proxeny* on the Athenian priestess Chrysis. . . . We have fullest information concerning the Athenian *proxeny.* *W. Smith*, Dict. Greek and Roman Antiquities, I. 979.

prozone (prō'zōn), *n.* [Gr. *πρό*, before, + *ζώνη*, a belt, zone.] The anterior of the three regions into which the pronotum of *Acrididæ*, *Locustidæ*, and *Gryllidæ* is divided.

Disk of pronotum tectiform, distinctly convex in longisection, the mid-carina very pronounced, the lateral carinae faintly indicated on the "*prozone*," obsolete on metazone. *Psyche* (Boston), Feb., 1904, p. 7.

prozymogen (prọ-zī'mọ-jen), *n.* [Gr. *πρό*, before, + E. *zymogen.*] A cytoplasmic substance in the gastric cells of *Amphibia.* It is supposed to arise from the chromatin of the nucleus and to pass into the cytoplasm where it becomes zymogen which is eventually discharged from the cell after the chromatin of the nucleus has been restored. *Science*, May 17, 1901, p. 769.

P. R. S. An abbreviation of *President of the Royal Society.*

P. R. S. A. An abbreviation of *President of the Royal Scottish Academy.*

prudentialism (prọ-den'shạl-izm), *n.* [*prudential* + *-ism.*] Prudential character; action or conduct governed by prudential motives.

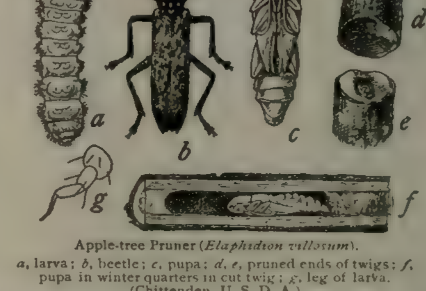
Prudhomme's black. See ★*black.*

prune-granite (prön'gran"it), *n.* See ★*granite.*

Prune-juice expectoration. See ★*expectoration.*

Prunella twill. See ★*twill*^{1}.

pruner, *n.* 2. Any one of many cerambycid beetles whose larvæ bore into the twigs of various trees, weakening them and causing them to fall off as if pruned.— **Apple-tree pruner**, a longicorn beetle, *Elaphidion villosum*, which lays its eggs in young twigs or small branches, whence the issuing larva burrows into the center of the twig or branch. On reaching full growth the larva nearly severs the branch, so that it is readily broken off by the wind. It affects, besides apple, other fruit-trees and shade and forest growth.



Apple-tree Pruner (*Elaphidion villosum*).
a, larva; *b*, beetle; *c*, pupa; *d*, *e*, pruned ends of twigs; *f*, pupa in winter quarters in cut twig; *g*, leg of larva.
(Chittenden, U. S. D. A.)

pruning, *n.* 1. The clearing of the stem of a tree through the death and fall of branches for want of light is known as *natural pruning*; when living branches are removed by cutting them close to the stem the operation is known as *green pruning*; when it is confined to dead branches it is known as *dry pruning.*

pruritic (prọ-rit'ik), *a.* [*prurit*(*us*) + *-ic.*] Affected with pruritus; itching.

Prus. An abbreviation (*a*) of *Prussia;* (*b*) of *Prussian.*

Prussak's fibers. See ★*fiber*1.

Prussian defense. See ★*defense.*

Prymnodesmia (prim-nọ̄-des′mi-ạ̈), *n. pl.* [NL., < Gr. πρυμνόν, lower part, + δέσμα, a bond.] A group of spatangoid echinoids or sea-urchins, founded by Lovén to contain genera with subanal fascioles.

Przibram schists. See ★*schist.*

P. S. An abbreviation (*c*) [*l. c.*] of *passed School of Instruction* (*of Officers*); (*d*) [*cap.*] of *Permanent Secretary;* (*e*) [*cap.*] of *Privy Seal.*

psalidodect (sạ̄-lid′ọ̄-dekt), *a.* [Gr. ψαλίς (ψαλιδ-), a pair of scissors, + δήκτης, a biter, < δάκνειν, bite.] Cutting by movement over the inner surface of another cutting-edge of the molar teeth of the lower jaw of certain mammals in mastication. *Cope.* [Rare.]

psalistoma (sa-lis′tọ̄-mạ̈), *n.*; pl. *psalistomata* (sal-is-tō′mạ-tạ̈). [Gr. ψαλίς, scissors, + στόμα, mouth.] In decapod crustaceans, the cutting-tooth or sharp margin of the mandible.

> Mandible with shortened cutting-tooth (*psalistoma*) and a three-jointed palp (synaphipod).
> *Trans. Linn. Soc.*, Zool., 1903, p. 440.

psallette (sä-let′), *n.* [F., irreg. < Gr. ψάλλειν, play on the harp, sing to the harp, + *-ette.*] Same as *maîtrise*, 1.

psaltery. 1. The term is loosely applied to a variety of stringed instruments, some of them lyres or harps, rather than zithers.

psammite, *n.*—**Condroz psammites,** in *geol.*, the sandy facies of the Famennian (Upper Devonian) in Belgium. It carries an abundant fauna. See ★*Condrusian.*

Psammobia (sa-mō′bi-ä), *n.* [NL., < Gr. ψάμμος, sand, + βίος, life.] The typical genus of the *Psammobiidæ.* *Lamarck.*

Psammobiidæ (sam-ọ̄-bī′i-dē), *n. pl.* [NL., < *Psammobia* + *-idæ.*] A family of bivalve mollusks, of the order *Eulamellibranchiata*, which have elongated separate siphons and a large tongue-shaped foot. It includes the genera *Psammobia* and *Sanguinolaria.*

Psammodus (sam′ọ̄-dus), *n.* [NL., < Gr. ψαμμος, sand, + ὀδούς, tooth.] A Lower Carboniferous genus of selachian fishes of the family *Psammodontidæ*, known only from the teeth, which are large and more or less quadrangular, with thick, smooth roots almost as large as the crown. The crown surface is porous and punctate or finely striated. The genus occurs in the Carboniferous of Europe and North America.

psammogenous (sa-moj′e-nus), *a.* [Gr. ψάμμος, sand, + γίγνεσθαι, become, + *-ous.*] In *phytogeog.*, of a more or less coarse-grained sandy consistency: said of soils. Thurmann, the author of the term (1849), further distinguished psammogenous soils into *perpsammic*, *hemipsammic*, and *oligopsammic*, and named transitional states *pelopsammic.* Compare ★*pelogenous.*

psammology (sa-mol′ọ̄-ji), *n.* [Gr. ψάμμος, sand, + -λογια, < λέγειν, speak.] The science which deals with the different forms assumed by sand.

> The study of *psammology.*
> *Geog. Jour.* (R. G. S.), IX. 570.

Psammoperca (sam-ọ̄-pėr′kạ̈), *n.* [NL., < Gr. ψάμμος, sand, + πέρκη, perch.] A genus of serranoid fishes, found from the Bay of Bengal and the China Sea to the north coast of Australia.

psammophile (sam′ọ̄-fil), *a.* [Gr. ψάμμος, sand, + φίλος, loving.] Same as ★*psammophilous.*

> The slender, wiry culms of this grass . . . render the species one of the most striking types of *psammophile* plants.
> *C. Mohr*, Plant Life of Alabama, p. 131.

psammophilous (sa-mof′i-lus), *a.* [Gr. ψάμμος, sand, + φίλος, loving, + *-ous.*] Living in or frequenting sandy places: said of plants or animals. Also *psammophile* and *ammophilous.* *Smithsonian Rep.* (Nat. Mus.), 1892, p. 508.

psammophyte (sam′ọ̄-fīt), *n.* [Gr. ψάμμος, sand, + φυτόν, plant.] In *phytogeog.*, a plant adapted to grow and habitually growing in sand, as on the seashore, on dunes, etc.

psammophytic (sam-ọ̄-fit′ik), *a.* [*psammophyte* + *-ic.*] Having the character of or pertaining to psammophytes; psammophilous.

psammosarcoma (sam″ọ̄-sär-kō′mạ̈), *n.*; pl. *psammosarcomata* (-mạ-tạ̈). [NL., < Gr. ψάμμος, sand, + σάρκωμα, sarcoma.] A sarcoma with calcareous deposit.

psammotherapy (sam-ọ̄-ther′ạ-pi), *n.* [Gr. ψάμμος, sand, + θεραπεία, medical treatment.] The employment of sand-baths in the treatment of disease.

psammous (sam′us), *a.* [Gr. ψάμμος, sand, + *-ous.*] Containing sand; sandy; gritty.

psaturose (sat′ụ̄-rōs), *n.* [F. *psaturose* (Beudant, 1832), prop. **psathyrose*, < Gr. ψαθυρός, friable, crumbling, + *-ose.*] Stephanite or brittle silver ore, an ore containing about 68.5 per cent. of silver.

P. S. C. An abbreviation of *Passed Staff College.*

pschutt (pshöt), *n.* [See the def.] The élite; the 'upper ten'; the highest of high life. The word is said to have originated in an expression of Daudet's in "Le nabab," where he represents the Marquis de Monpavon, a haughty and disdainful old beau, as expressing his profound scorn for the act of explaining himself or even making the slightest effort to help others to understand him. In his conversation with the Duke de Mora (Morny), a man of the same characteristics, he substituted "*ps*—" "*ps*—" for every word he was too indolent to say; and this "*ps*" is supposed to have given birth to *pschutt* as expressing the very cream of the aristocratic set. Afterward used attributively, in the sense of ultra-extravagant and -fashionable. *Larousse.* [Slang.]

Psednoblennius (sed-nọ̄-blen′i-us), *n.* [NL., < Gr. ψεδνός, thin, spare, scanty, + NL. *blennius*, blenny.] A genus of blennioid fishes found in the Gulf of California.

pselaphesia (sel-ạ-fē′shiạ̈), *n.* [NL., < Gr. ψηλάφησις, a feeling.] In *psychol.*, a term proposed by M. Dessoir in 1892 to include active touch and the 'muscle sense': opposed to *contact-sense.* *E. C. Sanford*, Exper. Psychol., p. 1.

pselaphesis (sẹ̄-laf′e-sis), *n.* [See ★*pselaphesia.*] 1. Same as a ★*pselaphesia.*—2. Same as *carphologia.*

Psenes (sē′nēz), *n.* [NL. (Cuvier and Valenciennes, 1833), origin uncertain. It is appar. a F. plural, and is given as from a Gr. "ψήνη, the osprey."] A genus of fishes of the family *Nomeidæ*, inhabiting warm seas and known chiefly from very young specimens found in the open ocean.

psephite (sē′fīt), *n.* [Gr. ψῆφος, a pebble, + *-ite*2.] In *petrog.*, a coarse conglomerate with argillaceous cement: extended by Naumann to all coarse fragmental rocks, conglomerates, and breccias. Distinguished from *psammite* and *pelite.* *Brongniart*, 1813.

psephitic (sẹ̄-fit′ik), *a.* [*psephite* + *-ic.*] In *petrog.*, resembling or composed of coarse sand or coarse fragments of rock or crystal.

Psephodus (sef′ọ̄-dus), *n.* [NL., < Gr. ψῆφος, a pebble, a counter, + ὀδούς (ὀδοντ-), tooth.] A selachian fish of the family *Cochliodontidæ*, known only from teeth which are rhombic or rhomboidal in shape, four- or five-cornered, slightly convex or more strongly arched with finely punctate crown surface and crenulated borders. It occurs in the Carboniferous of Europe, India, and North America.

Psettichthys (se-tik′this), *n.* [NL., < Gr. ψῆττα, flounder, + ἰχθύς, fish.] A genus of flounders found on the coast of California.

pseud. An abbreviation of *pseudonym.*

pseudaconin (sūd-ak′ọ̄-nin), *n.* [*pseudacon(it)in.*] A feebly poisonous, light yellow, amorphous alkaloid, $C_{25}H_{39}O_8N$, formed by hydrolyzing pseudaconitin with dilute mineral acids or alcoholic soda. It melts below 100° C.

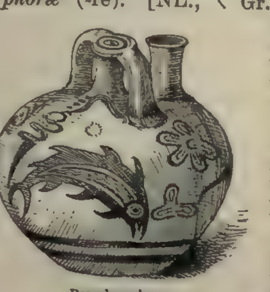
pseudacousma (sūd-a-kös′mạ̈), *n.* [NL., < Gr. ψευδής, false, + ἄκουσμα, thing heard.] Same as *pseudacusis.*

pseudallosematic (sūd″al-ọ̄-sẹ̄-mat′ik), *a.* [Gr. ψευδής, false, + E. *allosematic.*] Noting resemblances of an animal in form and color to some object associated with another species. *Poulton.*

pseudambulacra (sūd-am-bụ̄-lā′krä), *n. pl.* [NL., < Gr. ψευδής, false, + NL. *ambulacrum.*] A name given by Roemer to the ambulacral fields of blastoids.

pseudamnesia (sūd-am-nē′shiạ̈), *n.* [NL., < Gr. ψευδής, false, + μιμνήσκειν, remind.] A general term for the illusions of memory in which the subject appears to remember events that he has never experienced, including simple paramnesia (confusion of imagination with memory), identifying paramnesia (false familiarity or double memory), and suggestive or associative paramnesia (false recollections aroused by present impressions). *Baldwin*, Dict. of Philos. and Psychol., II. 374.

pseudamphora (sūd-am′fọ̄-rạ̈), *n.*; pl. *pseudamphoræ* (-rē). [NL., < Gr. ψευδής, false, + ἀμφορεύς, a jar.] A peculiar form of vase often found in the older classes of Greek pottery. It has two handles connected with a false neck, the actual opening being placed on one side.



Pseudamphora.

> The next style to consider is that of the false-necked vases, otherwise called bügelkannen, or '*pseudamphoræ.*'
> *W. M. Flinders Petrie*, in Jour. Hellenic Studies, XI. 274.

pseudamygdaloid (sūd-ạ-mig′dạ-loid), *n.* [Gr. ψευδής, false, + E. *amygdaloid.*] In *petrog.*, an igneous rock containing pseudamygdules.

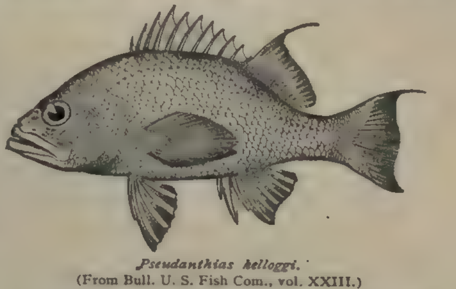
pseudamygdule (sūd-ạ-mig′dūl), *n.* [Gr. ψευδής, false, + E. *amygdule.*] In *petrog.*, a mineral aggregate or crystal replacing a primary mineral of an igneous rock in such a manner as to appear like a true amygdaloidal filling of a vesicular cavity.

pseudangina (sūd-an-jī′nạ̈), *n.* [NL., < Gr. ψευδής, false, + NL. *angina.*] An attack of pain resembling that of *angina pectoris*, but not due to disease of the heart or coronary arteries. Also written *pseudo-angina.* *Phil. Med. Jour.*, Jan. 31, 1903, p. 207.

pseud-annual (sūd′an″ụ̄-ạl), *n.* See ★*annual*, 3.

> When the plant reduces itself to a bulb at the approach of the dry or cold season, it thereby becomes a *pseud-annual*, but when it reduces itself to a seed it is strictly annual.
> *L. H. Bailey*, Survival of the Unlike, p. 294.

Pseudanthias (sū-dan′thi-as), *n.* [NL., < Gr. ψευδής, false, + NL. *Anthias.*] A genus of serranoid fishes, closely allied to *Anthias.* The species are numerous in the Pacific, *P. kelloggi* in Hawaii, *P. japonicus* in Japan.



Pseudanthias kelloggi.
(From Bull. U. S. Fish Com., vol. XXIII.)

pseudaposematic (sūd″ap-ọ̄-sẹ̄-mat′ik), *a.* [Gr. ψευδής, false, + E. *aposematic.*] Relating to the phenomenon of protective mimicry, as distinguished from protective resemblance, or cryptic defense. *E. B. Poulton.*—**Pseudaposematic character,** a character which, in one species, serves to warn away enemies, copied in another species. See ★*pseudepisematic character.*

pseudatoll (sūd-a-tol′), *n.* [Gr. ψευδής, false, + E. *atoll.*] 1. A nearly circular island simulating an atoll in form.—2. A small reef, simulating an atoll in form, but resulting from the growth of a single community of organisms.

pseudatropine (sūd-at′rọ̄-pin), *n.* Same as ★*oscine*2.

Pseudechis (sū-dek′is), *n.* [NL., < Gr. ψευδής, false, + ἔχις, a viper.] A genus of elapine snakes, comprising very deadly species. A typical member of the genus is *P. porphyriaceus*, the black snake of Australia, which reaches a length of five or six feet. The outer row of scales is red at the base and the ventral scales are red. The species feeds on small mammals, birds, and reptiles.

pseudencephalic (sūd-en-se-fal′ik), *a.* [*pseudencephal*(*us*) + *-ic.*] Relating to a pseudencephalus. *Buck*, Med. Handbook, II. 229.

pseudentoptic (sūd-en-top′tik), *a.* [Gr. ψευδής, false, + E. *entoptic.*] In *physiol.* and *psychophys.*, apparently but not really entoptic. See the extract.

> Notice . . . the horizontal bands that follow a slow dropping and raising of the upper lid. Such appearances as these, since their cause is not really in the eye but outside of it, have been called *pseudentoptic* by Laqueur.
> *E. C. Sanford*, Exper. Psychol., p. 98.

pseudepigraph (sūd-ep′i-gråf), *n.* A spurious writing. See *pseudepigrapha.*

> Wisdom of Solomon.—This *pseudepigraph* claims to have been written by King Solomon.
> *Encyc. Brit.*, XXV. 496.

pseudepigraphal (sūd-e-pig'rạ-fạl), *a.* [*pseudepigraph* + *-al*^{1}.] Having the character of a pseudepigraph or of the pseudepigrapha.

pseudepisematic (sūd″ep-i-sẹ̄-mat'ik), *a.* [Gr. ψευδής, false, + E. *episematic.*] In *biol.*, noting the mimicry or copying, in one species, of an episematic character of another species.

> It is commonly assumed that the purpose of this imitation is purely alluring or *pseudepisematic.*
> *Proc. Zool. Soc. London*, Jan.–April, 1903, p. 48.

Pseudepisematic character, an episematic character or recognition-mark of one species copied in another for the purpose of deception. *Encyc. Brit.*, XXVII. 149.

pseudholoptic (sūd-ho-lop'tik), *a.* See ★*pseudoholoptic.*

pseudidea (sūd-ī-dē'ạ̈), *n.* [Gr. ψευδής, false, + E. *idea.*] A false idea, notion, or theory; an idea which may be framed in words, but is intrinsically unthinkable; or, an idea perverted by automorphic interpretation.

> The proposition with which Kant's philosophy sets out, verbally intelligible though it is, cannot by any effort be rendered into thought—cannot be interpreted into an idea properly so called, but stands merely for a *pseudidea.* *H. Spencer*, First Principles, iii.

> It may be questioned whether this fundamental dictum of Herbert Spencer's philosophy is not itself a good example of those very "*pseud-ideas*" whose nature and frequency in human reasoning he has so clearly described.
> *L. F. Ward*, Dynamic Sociol., I. 160.

pseudinoma (sū-di-nō'mạ̈), *n.*; pl. *pseudinomata* (-mạ-tạ̈). [NL., < Gr. ψευδής, false, + (?) ἴς (ἰν-), muscle, + *-oma.*] 1. A scirrhous cancer.—2. A phantom tumor.

pseudisochromatic (sūd-ī″sọ̄-krọ̄-mat'ik), *a.* [Gr. ψευδής, false, + E. *isochromatic.*] In *psychophys.*, pretendedly or illusorily same-colored: said of certain test-cards, used for the diagnosis of color-blindness, in which patches of one color are variously distributed among patches of another color, with which the former may, by color-blind persons, be confused.

pseudisodomum, *n.* See *pseudisodomon.*

pseudo-acid (sū-dọ̄-as'id), *n.* An organic compound which, in the free state, has not the structure of an acid: in the presence of bases it gradually undergoes molecular rearrangement and forms salts. *Amer. Chem. Jour.*, Sept., 1903, p. 187.

pseudo-amœboid (sū″dọ̄-ạ-mē'boid), *a.* Simulating the amœboid form. *Buck*, Med. Handbook, I. 280.

pseudo-angina (sū″dọ̄-an-jī'nạ̈), *n.* Same as ★*pseudangina.*

pseudo-apoplectic (sū-dọ̄-ap-ọ̄-plek'tik), *a.* Simulating apoplexy. *Buck*, Med. Handbook, IV. 589.

pseudobacillus (sū″dọ̄-ba-sil'us), *n.*; pl. *pseudobacilli* (-ī). [NL.] One of the minute bodies found in sputum, which react to stains in the same manner as the tubercle bacillus, but are not living organisms. They are readily dissolved in ether or chloroform, and are probably fine particles of fat.

pseudobase (sū'dọ̄-bās), *n.* An organic compound which, in the free state, has not the structure of a base: in the presence of acids it gradually undergoes molecular rearrangement and forms salts.

pseudobeat (sū'dọ̄-bēt), *n.* In *phonet.*, a fluctuation of intensity occurring in the phonautographic curves of the letter *r.* See the extract.

> The curve of *r* was found to consist of small vibrations with rather regular fluctuations of amplitude having long periods; the resemblance to the familiar curves of two tones forming beats suggested the term '*pseudobeats*' for the fluctuations of intensity observed in the *r*-curves.
> *Scripture*, Exper. Phonetics, p. 19.

pseudocapitulum (sū″dọ̄-ka-pit'ụ̄-lum), *n.*; pl. *pseudocapitula* (-lạ̈). [NL., < Gr. ψευδής, false, + NL. *capitulum.*] In certain mites, a sclerite resembling the capitulum, but morphologically distinct. *Jour. Roy. Micros. Soc.*, Dec., 1904, p. 650.

pseudocardinal (sū-dọ̄-kär'di-nạl), *a.* [Gr. ψευδής, false, + E. *cardinal.*] Of or pertaining to those teeth in a schizodont pelecypod shell which are situated below the beaks. Same as *subumbonal.*

pseudocenter (sū-dọ̄-sen'tėr), *n.* [Gr. ψευδής, false, + κέντρον, center.] An organism or an organ which, while unspecialized or primitive, is actually the degenerate or simplified descendant of a more complicated ancestor.

pseudocentric (sū-dọ̄-sen'trik), *a.* [*pseudocenter* (*centr-*) + *-ic.*] Of or pertaining to a pseudocenter.

> A form of apocentricity extremely common and often perplexing may be termed *pseudocentric*; in such a condition there is an apparent simplicity that reveals its secondary nature by some small and apparently meaningless complexity. *Encyc. Brit.*, XXVIII. 343.

pseudocentricity (sū″dọ̄-sen-tris'ị-ti), *n.* [*pseudocentric* + *-ity.*] The character of being pseudocentric; the state or condition of being or of pertaining to a pseudocenter. *Trans. Linnean Soc.*, Zool., 1901, p. 265.

pseudocentrous (sū-dọ̄-sen'trus), *a.* [*pseudocenter* + *-ous.*] Having vertebræ without centra, but composed of a shell of bone surrounding the notochord, and consisting of two pairs of arcualia. The condition is found in some extinct amphibians.

> Order Urodela, Dumeril. *Pseudocentrous*, with the tail remaining throughout life.
> *H. Gadow*, Classification of Vertebrata, p. 12.

pseudocentrum (sū-dọ̄-sen'trum), *n.*; pl. *pseudocentra* (-trạ̈). [NL., < Gr. ψευδής, false, + κέντρον, center.] The body of a vertebra which is formed by the meeting and fusion of the two principal pairs of dorsal and ventral arcualia, or entirely by the chief dorsal arcualia. This condition obtains in the tailed amphibians. *Philos. Trans. Roy. Soc.* (London), 1896, ser. B, p. 21.

pseudocephalocele (sū-dọ̄-sef'ạ-lọ̄-sēl), *n.* [Gr. ψευδής, false, + E. *cephalocele.*] A non-congenital hernia of the brain, due to disease or subcutaneous fracture of the skull. *Buck*, Med. Handbook, II. 237.

Pseudoceratites (sū″dọ̄-ser-ạ-tī'tēz), *n. pl.* [NL., < Gr. ψευδής, false, + NL. *Ceratites.*] An artificial group of ammonoid cephalopod genera with ceratitoid sutures found in Cretaceous rocks, comprising the retrogressive descendants of earlier, more complex Jurassic and Cretaceous types. Among the American genera included in this group may be mentioned *Placenticeras, Sphenodiscus, Engonoceras*, and *Metengonoceras.*

pseudoceratophorous (sū″dọ̄-ser-ạ-tof'ọ̄-rus), *a.* [Gr. ψευδής, false, + κέρας (κερατ-), horn, + -φορος, < φέρειν, bear.] Having horns that are not outgrowths of the frontal bones, but, as in the giraffe, are developed from separate centers of ossification.

> The existence [in the Giraffe] of *pseudoceratophorous* epiphyses permanently invested by a hairy integument
> *Proc. Zool. Soc. London*, 1860, p. 105.

Pseudoceridæ (sū-dọ̄-ser'i-dē), *n. pl.* [NL., < *Pseudoceros* + *-idæ.*] A family of polyclads having an oval or elliptical body with fold-like marginal tentacles, the mouth in the middle of the anterior half of the body, and the eyes on the brain-areas and the tentacles. It includes the genera *Pseudoceros, Thysanozoon*, and *Yungia.*

Pseudoceros (sụ̄-dos'ẹ̄-ros), *n.* [NL., < Gr. ψευδής, false, + κηρός (?), bees-wax.] The typical genus of the *Pseudoceridæ. Lang*, 1884.

pseudochromæsthesia (sū-dọ̄-krōm-es-thē'shiạ̈), *n.* [NL., < Gr. ψευδής, false, + NL. *chromæsthesia.*]. In *psychol.*, the constant and uniform association of colors with uncolored visual impressions or with sensations of other modalities; especially, colored hearing, or the association of colors with sounds: the commonest form of synæsthesia.

> *Pseudo-chromesthesia* is that peculiar faculty of association of the sensorial perceptions, by means of which any primary sensation or even a purely psychical process can evoke, in the case of certain persons, a false visual sensation of color, constant in the case of the same stimulus with the same person. *Amer. Jour. Psychol.*, V. 20.

pseudochromatin (sū-dọ̄-krō'mạ-tin), *n.* [Gr. ψευδής, false, + E. *chromatin.*] Same as ★*prochromatin. Pfitzner*, 1886.

pseudochrome (sū'dọ̄-krōm), *n.* [Gr. ψευδής, false, + χρῶμα, color.] A large, spherical, extranuclear body composed of coiled filaments in the cell cytoplasm of the ovarian follicles of birds. It seems to be equivalent to the 'ergastoplasm' of Garnier and the 'mitochondria' of Benda. *Jour. Roy. Micros. Soc.*, Oct., 1903, p. 594.

pseudochrysolite (sū-dọ̄-kris'ọ̄-līt), *n.* [Gr. ψευδής, false, + E. *chrysolite.*] Same as ★*bottle-stone.*

pseudoclassic (sū-dọ̄-klȧs'ik), *a.* [Gr. ψευδής, false, + E. *classic.*] In the *fine arts*, having the form but not the spirit of classic art; sometimes, simply imitated from classic art.

pseudoclistogamous (sū″dọ̄-klīs-tog'ạ̈-mus), *a.* [See ★*pseudoclistogamy.*] Presenting the character of pseudoclistogamy. *Pound* and *Clements*, Plant Life of Nebraska.

pseudoclistogamy (sū″dọ̄-klīs-tog'ạ̈-mi), *n.* [Gr. ψευδής, false, + E. *clistogamy.*] The phenomenon of being clistogamous only as affected by special causes. For cases of pseudoclistogamy see ★*hydroclistogamy* and ★*photoclistogamy*, 2.

pseudocœle, *n.* **2.** A cavity of the brain, lying between the hemispheres and below the corpus callosum. The name is given because the cavity is not in the brain substance, but between the hemispheres. Same as *fifth ventricle. Science*, Feb. 17, 1905, p. 268.

pseudocœlian (sū-dọ̄-sē'li-ạ̈n), *a.* Same as *pseudocœlic.*

pseudocoloboma (sū″dọ̄-kol-ọ̄-bō'mạ̈), *n.*; pl. *pseudocolobomata* (-mạ-tạ̈). [NL., < Gr. ψευδής, false, + NL. *coloboma.*] A strongly pigmented or non-pigmented line on the iris, giving the appearance of a coloboma.

pseudocone (sū'dọ̄-kōn), *n.* [Gr. ψευδής, false, + κῶνος, cone.] A false or modified crystalline lens or cone occurring in the eyes of muscid flies. The cone is replaced by four cells filled with a transparent fluid, and a protoplasmic nucleated portion.—**Pseudocone eye.** See ★*eye*^{1}.

pseudoconglomerate (sū″dọ̄-kọn-glom'ẹ-rạ̄t), *n.* [Gr. ψευδής, false, + E. *conglomerate.*] In *petrog.*, a rock, resembling a conglomerate, formed by the crushing of a compact rock into larger and smaller fragments which have become more or less rounded in the process of crushing. *Geikie*, Text-book of Geol., p. 683.

pseudoconhydrine (sū″dọ̄-kọn-hī'drin), *n.* [Gr. ψευδής, false, + E. *conhydrine.*] An alkaloid extracted in small quantity from the less volatile portion of crude conine from *Conium maculatum.* It is isomeric with conhydrine, and differs from conine in containing in addition to the elements of this latter an atom of oxygen.

pseudocrystalline (sū-dọ̄-kris'ta-lin), *a.* [Gr. ψευδής, false, + E. *crystalline.*] In *petrog.*, noting a texture or rock which resembles one that is truly crystalline, being made up of detrital crystals or fragments little worn and cemented together by any kind of mineral cement.

pseudocubic (sū-dọ̄-kū'bik), *a.* [Gr. ψευδής, false, + E. *cubic.*] Cubic in outer form, but not isometric in internal structure or distribution of properties. *Geikie*, Text-book of Geol., p. 105.

pseudocumene (sū-dọ̄-kum'ēn), *n.* [Gr. ψευδής, false, + E. *cumene.*] A colorless oily hydrocarbon, 1,2,4-trimethylbenzene, $C_6H_3(CH_3)_3$, found in coal-tar and petroleum, and also made synthetically. It boils at 169.8° C.

pseudocumidine (sū″dọ̄-kum'i-din), *n.* [Gr. ψευδής, false, + E. *cumidine.*] Aminotrimethylbenzene, $C_6H_2(CH_3)_3NH_2$, a raw material of the color industry. Also called *ψ-cumidine.*

pseudocyphella (sū″dọ̄-sī-fel'ạ̈), *n.*; pl. *pseudocyphellæ* (-ē). [NL., < Gr. ψευδής, false, + NL. *cyphella.*] A small depression in the under surface of a lichen thallus, differing from a cyphella in being pulverulent or bearing soredia.

> They [Cyphellæ] are generally naked, but are often also pulverulent or sorediiferous, in which latter case they are called *pseudo-cyphellæ. Encyc. Brit.*, XIV. 554.

pseudocyst, *n.* 1. In *bot.*: (*b*) The vegetative cell of any of the blue-green algæ.—**2.** In some sporozoans, a structure which is formed from the residual protoplasm left after the sporoblasts are separated off and which by swelling causes the true cyst-wall to burst asunder, thus setting free the spores.

pseudodeltidium, *n.* It is a triangular cover over the delthyrium or pedicle-slit, developed by the union of the deltidial plates in telotrematous brachiopods.

pseudoderm (sū'dọ̄-dėrm), *n.* [Gr. ψευδής, false, + δέρμα, skin.] In sponges, a sort of outer covering or skin formed by outgrowths from the ascon tubes situated most peripherally.

pseudodiabase (sū-dọ̄-dī'ạ-bās), *n.* [Gr. ψευδής, false, + E. *diabase.*] In *petrog.*, a name given by Becker to certain altered diabases in California which were supposed to have been formed by metamorphism from sediments.

pseudodiorite (sū-dọ̄-dī'ọ̄-rīt), *n.* [Gr. ψευδής, false, + E. *diorite.*] In *petrog.*, same as ★*metadiorite.*

pseudodiphtheria (sū″dǭ-dif-thē′ri-ạ̈), *n.* [NL., < Gr. ψευδής, false, + NL. *diphtheria.*] An affection resembling diphtheria, but not marked by the presence of the bacillus of diphtheria. See *pseudodiphtheria* ★*bacilli. Buck*, Med. Handbook, III. 486.

pseudodiphtheritic (sū″dǭ-dif-thẹ-rit′ik), *a.* Relating to or of the nature of pseudodiphtheria.

pseudodoxy (sū′dǭ-dok-si), *n.* [Gr. ψευδοδοξία, < ψευδόδοξος, having a false opinion. See *pseudodox.*] The holding of erroneous opinions; incorrectness of opinion, especially in matters of theology: opposed to *orthodoxy.*

pseudo-emphysema (sū″dǭ-em-fi-sē′mạ̈), *n.* [NL., < Gr. ψευδής, false, + NL. *emphysema.*] A condition of the lungs, due to temporary blocking of the smaller bronchial tubes, which resembles in its symptoms and post-mortem appearances true emphysema. *Buck*, Med. Handbook, II. 493.

pseudo-encephalitis (sū″dǭ-en-sef-ạ-lī′tis), *n.* [NL., < Gr. ψευδής, false, + NL. *encephalitis.*] A condition in infants which resembles acute hydrocephalus: due to colliquative diarrhea.

pseudo-ephedrine (sū″dǭ-ef′ẹ-drin), *n.* [Gr. ψευδής, false, + E. *ephedrine.*] A colorless crystalline alkaloid, $C_{10}H_{15}ON$, isomeric with ephedrine, contained in *Ephedra vulgaris, E. helvetica*, and other species of *Ephedra*: similar to atropin.

pseudo-equality (sū″dǭ-ẹ-kwâl′i-ti), *n.* An apparent or false equivalence which disappears when subjected to adequate tests. *Nature*, Sept. 18, 1902, p. 497.

pseudo-erysipelas (sū″dǭ-er-i-sip′e-lạs), *n.* [Gr. ψευδής, false, + NL. *erysipelas.*] A diffuse inflammation of the skin that does not have all the characteristic features of erysipelas.

pseudofluctuation (sū″dǭ-fluk-tụ̄-ā′shọn), *n.* [Gr. ψευδής, false, + E. *fluctuation.*] In *pathol.*, an impulse transmitted through solid but soft tissue, such as muscle, giving the impression of a fluid sac. *Buck*, Med. Handbook, VI. 571.

pseudoform (sū′dǭ-fôrm), *n.* [Gr. ψευδής, false, + L. *forma*, form.] A false or simulating form; specifically, the labile form of a substance which undergoes tautomeric changes. See ★*pseudomerism.*

> The notion of the shifting hydrogen radical is but the hypothetical way of viewing the intervention of the intramolecular change by which the substance becomes its "*pseudoform.*" *Nature*, Sept. 18, 1902, p. 503.

pseudoganglion (sū-dǭ-gang′gli-ọn), *n.*; pl. *pseudoganglia* (-ạ̈). [NL., < Gr. ψευδής, false, + NL. *ganglion.*] A circumscribed thickening of the sheath of a nerve, resembling externally a ganglion.

pseudogaster (sū-dǭ-gas′tėr), *n.* [NL., < Gr. ψευδής, false, + γαστήρ, belly.] The cavity formed by the folding of a flabellate sponge into a cup-shaped or tubular form.

pseudoglacial (sū-dǭ-glā′shiạl), *a.* [Gr. ψευδής, false, + E. *glacial.*] Simulating glacial deposits or action. *J. Geikie*, The Great Ice Age, p. 697.

pseudoglioma (sū″dǭ-glī-ō′mạ̈), *n.*; pl. *pseudogliomata* (-mạ-tạ̈). [NL., < Gr. ψευδής, false, + NL. *glioma.*] A suppurative affection of the choroid resembling a glioma of the retina. *Med. Record*, July 11, 1903, p. 50.

pseudoglobulin (sū-dǭ-glob′ụ̄-lin), *n.* [Gr. ψευδής, false, + E. *globulin.*] One of two fractions (*pseudoglobulin* and *euglobulin*) of serum globulin. Of these the euglobulin is thrown down from its saline solution on dialysis, while the pseudoglobulin remains in solution.

pseudoglottis (sū-dǭ-glot′is), *n.* [NL., < Gr. ψευδής, false, + γλωττίς, glottis.] The aperture in the larynx formed by the ventricular bands or false vocal chords.

pseudogyne, *n.* **2.** A curious caste or form of ant occurring in the colonies of certain species, as *Formica sanguinea*, in which is combined the thorax of a female with the abdomen and size of a worker.

> In 1895 E. Wasmann, S. J., advanced the hypothesis that the so-called "*pseudogynes*" in the colonies of Formica sanguinea owe their existence and development to the rearing of the beetle Lomechusa strumosa F. *Entomological News*, XV. 339.

pseudogyny (sū-doj′i-ni), *n.* [*pseudogyne* + *-y*³.] The condition of being a pseudogyne.

> E. Wasmann returns with fresh light to a discussion of "*pseudogyny*" in Formica sanguinea, etc. A pseudogynous form exhibits a somewhat deformed combination of the thorax-structure of a female with the abdominal development and body size of a worker. *Jour. Roy. Micros. Soc.*, April, 1903, p. 172.

pseudohallucination (sū″dǭ-ha-lū-si-nā′shọn), *n.* In *mental pathol.*, an apperceptive or psychic hallucination; a hallucination which results from the exercise of memory and imagination without the interposition of a sensory stimulus.

> *Pseudohallucinations* . . . occur, as a rule, in chronic cases. The imagination plays an important part in their etiology. *S. Paton*, Psychiatry, p. 59.

pseudohalter (sū-dǭ-hal′tėr), *n.*; pl. *pseudohalteres* (-tẹ-rēz). [NL., < Gr. ψευδής, false, + NL. *halter.* See *halter*³.] One of the greatly reduced elytra of a stylopid beetle.

pseudohemoglobin (sū″dǭ-hem-ǭ-glō′bin), *n.* [Gr. ψευδής, false, + E. *hemoglobin.*] A reduction-product intermediate between oxyhemoglobin and hemoglobin, derived from the former on treating it with sodium hydrosulphite.

pseudoholoptic (sū″dǭ-ho-lop′tik), *a.* [Also *pseudholoptic*; < Gr. ψευδής, false, + E. *holoptic.*] Nearly holoptic. Pseudoholoptic eyes in the *Diptera* are intermediate between holoptic and dichoptic eyes, that is, they are not entirely separated, nor do they meet in a coadapted line of union.

Pseudohypertrophic dystrophy. Same as *pseudohypertrophic paralysis* (which see, under *paralysis*).

pseudo-ion (sū-dǭ-ī′ọn), *n.* A molecule whose motion, in a liquid undergoing electrolysis, somewhat resembles that of a true ion, but is produced by a different cause. *Jour. Phys. Chem.*, June, 1907, p. 446.

pseudoism (sū′dǭ-izm), *n.* [*pseudo-* + *-ism.*] The state or character of being inclined to falsehood; habitual disposition to be false in words and acts.

pseudo-isochromatic (sū″dǭ-ī″sǭ-krǭ-mat′ik), *a.* Same as *pseudisochromatic.*

pseudo-isometric (sū-dō-ī-sǭ-met′rik), *a.* See ★*pseudosymmetry.*

pseudojervine (sū-dǭ-jėr′vin), *n.* One of the alkaloids extracted from the rhizomes of white hellebore, *Veratrum album.*

Pseudojulis (sū-dǭ-jö′lis), *n.* [NL., < Gr. ψευδής, false, + NL. *Julis.*] A genus of labroid fishes, found about rocky islands of the Pacific.

pseudolaminated (sū-dǭ-lam′i-nā-ted), *a.* [Gr. ψευδής, false, + E. *laminated.*] In *geol.*, noting a bedded appearance not due to ordinary sedimentation. The term is applied by Geikie to a structure produced by shearing movement accompanying glacial deposition. *J. Geikie*, The Great Ice Age, p. 340.

pseudolatry (sū-dol′ạ-tri), *n.* [Gr. ψευδολατρεία, < ψευδής, false, + λατρεία, service, worship.] False worship: a term used by Cyril and other Christian writers to designate the polytheistic worship of the pagans. Also applied to false worship, idolatry, etc., within the Christian church.

Pseudoleucemia infantum, a form of anemia occurring in young children. Also called *Von Jaksch's disease.*

pseudoleucemic (sū″dō-lụ̄-sē′mik), *a.* [*pseudoleucemia* + *-ic.*] Relating to or affected with pseudoleucemia.

pseudolipoma (sū″dō-li-pō′mạ̈), *n.*; pl. *pseudolipomata* (-mạ-tạ̈). [NL., < Gr. ψευδής, false, + NL. *lipoma.*] A tumor or localized edema resembling a fatty tumor.

pseudolunule (sū-dǭ-lū′nūl), *n.* [Gr. ψευδής, false, + E. *lunule.*] A small area on each of the lateral slopes of the beaks in brachiopod shells of the genus *Porambonites.*

pseudo-lupus (sū-dǭ-lū′pus), *n.* An affection of the skin resembling lupus in appearance, but due to an infection with blastomycetes, or saccharomycetes. *Med. Record*, Oct. 5, 1907, p. 583.

pseudoluxation (sū″dǭ-luk-sā′shọn), *n.* [Gr. ψευδής, false, + E. *luxation.*] Partial dislocation of a bone: as *pseudoluxation* of the patella. *U. S. Dept. Agr., Rep. on Diseases of the Horse*, 1903, p. 338.

pseudomania (sū-dǭ-mā′ni-ạ̈), *n.* [NL., < Gr. ψευδής, false, + μανία, madness.] 1. A condition resembling mania. *G. S. Hall*, Adolescence, I. 352.—**2.** A mental disease characterized by self-accusation of crimes never committed.—**3.** An uncontrollable impulse to practise deceit.

pseudomartyr (sū-dǭ-mär′tėr), *n.* [Gr. ψευδής, false, + μάρτυρ, martyr.] A false or pretended martyr.

pseudomelanin (sū-dǭ-mel′ạ-nin), *n.* [Gr. ψευδής, false, + E. *melanin.*] A black pigment resulting, in cases of hemochromatosis, from the absorption of hydrogen sulphid from the intestinal tract, by organs in which hemosiderin has been deposited.

pseudomelanosis (sū-dǭ-mel-ạ-nō′sis), *n.* [NL., < Gr. ψευδής, false, + NL. *melanosis.*] The presence of dark or black patches in the tissues after death, due to the action of hydrogen sulphid from the intestine upon hemosiderin deposits. See ★*pseudomelanin. Buck*, Med. Handbook, III. 397.

pseudomeningocele (sū″dǭ-mẹ-ning′gǭ-sēl), *n.* [Gr. ψευδής, false, + E. *meningocele.*] A tumor beneath the scalp, caused by the extrusion of a portion of the cerebral membranes, filled with cerebrospinal fluid, through an opening in the skull caused by a fracture or by disease.

pseudomer (sū′dǭ-mėr), *n.* [Gr. ψευδής, false, + μέρος, part.] One of the pseudomeric compounds.

pseudomeric (sū-dǭ-mer′ik), *a.* [*pseudomer* + *-ic.*] Exhibiting or capable of pseudomerism.

pseudomerism (sū-dom′ẹ-rizm), *n.* [*pseudomer* + *-ism.*] The property by virtue of which a compound reacts as if its structure changed according to the reagent used. The variety of unstable structure, which does not exist ordinarily by itself, is known as the labile form or pseudoform.

pseudomery (sū-dom′ẹ-ri), *n.* Same as ★*pseudomerism.*

pseudomesial (sū-dǭ-mes′i-ạl), *a.* [Gr. ψευδής, false, + E. *mesial.*] Noting a process in the cranium of the sole, formed by the union of the sphenotic and the prefrontal. *Proc. Zool. Soc. London*, May 1, 1894, p. 443.

pseudomesoderm (sū-dǭ-mes′ǭ-dėrm), *n.* [Gr. ψευδής, false, + E. *mesoderm.*] A false mesoderm, as the layer between the ectoderm and the axial cell in *Orthonectida.*

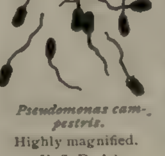
pseudometameric (sū-dǭ-met-ạ-mer′ik), *a.* [Gr. ψευδής, false, + E. *metameric.*] An apparent but not a real metamerism or division into segments; false metamerism. *Philos. Trans. Roy. Soc.* (London), 1890, ser. B, p. 163.

pseudometamerism (sū″dǭ-me-tam′ẹ-rizm), *n.* [Gr. ψευδής, false, + E. *metamerism.*] In *zoöl.*, the metameric arrangement of internal organs without external metamerism, as in *Gunda segmentata.*

pseudomitotic (sū″dǭ-mi-tot′ik), *a.* [Gr. ψευδής, false, + E. *mitotic.*] Noting that form of karyokinetic, or mitotic, division in which the chromosomes of the cell-nucleus are divided transversely, instead of longitudinally, as in true mitosis.

> For that method in which one of the chromosome divisions is transverse and the other longitudinal the term *pseudomitotic* is suggested, and this method is subdivided into a method of postreduction division in which the so-called reduction division succeeds the equation division and a method of præreduction division in which the reduction division is the first to occur. *Science*, June 5, 1903, p. 906.

Pseudomonas (sū-dǭ-mon′as), *n.* [NL. (Migula, 1896). < ψευδής, false, + E. *Monas* (see *Monas*, 2).] A genus of motile bacteria. The cells are short or long, sometimes forming filaments; the flagella polar, varying from 1 to 10. The species are numerous, occurring mostly in soil and water. A few are pathogenic. *P. campestris* is the cause of the black rot of cabbage and other closely related plants. *P. Hyacinthi* causes a rot of hyacinth bulbs.



Pseudomonas campestris.
Highly magnified.
(U. S. D. A.)

pseudomonoclinic (sū-dǭ-mon-ǭ-klin′ik), *a.* [Gr. ψευδής, false, + E. *monoclinic.*] Resembling the monoclinic forms, but not having monoclinic structure. See ★*pseudosymmetry. Van Hise*, in U. S. Geol. Surv., Monographs, XLVII. v. 253.

pseudomonocyclic (sū-dǭ-mon-ǭ-sik′lik), *a.* [Gr. ψευδής, false, + E. *monocyclic.*] Presenting the false appearance of having a monocyclic arrangement of the basal plates, as *Apiocrinus*, a Jurassic crinoid.

pseudomonogonic (sū-dọ-mon-ọ-gon'ik), *a.* [Gr. ψευδής, false, + E. *monogonic.*] Apparently confined to one parent only: used with reference to the transmission of the characteristics of one parent only to the offspring in sexual reproduction.

> It is . . . not improbable that '*pseudo-monogonic*' heredity is sometimes due to this fact.
> *Weismann* (trans.), Germ-Plasm, p. 269.

pseudomorphose (sū-dọ-môr'fōz), *v. t.*; pret. and pp. *pseudomorphosed*, ppr. *pseudomorphosing.* [*pseudomorph*(*ism*) + *-ose*, as in *metamorphose.*] To change by pseudomorphism.

pseudomucin (sū-dọ-mū'sin), *n.* [Gr. ψευδής, false, + E. *mucin.*] An albuminous substance which belongs to the class of glucoproteids (gluco-albumins) and is found in the contents of ovarian cysts. It is identical with the metalbumin of Scherer.

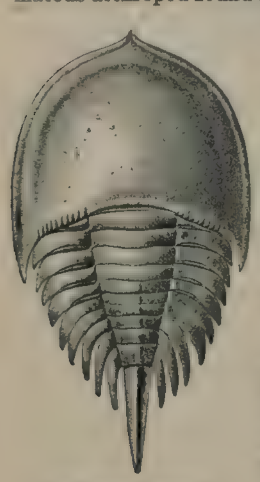
pseudomyxoma (sū″dọ-mik-sō'ma̤), *n.*; pl. *pseudomyxomata* (-mạ-ta̤). [NL., < Gr. ψευδής, false, + NL. *myxoma.*] The presence of mucoid substance due to the rupture of a colloid cyst, giving the appearance of a myxoma: found especially in the peritoneal cavity after escape of the colloid contents of an ovarian cyst.

pseudoneoplasm (sū-dọ-nē'ọ-plazm), *n.* [Gr. ψευδής, false, + E. *neoplasm.*] 1. A tumor-like formation of temporary character, due to inflammatory action.

> Ordinarily localized in the ileocæcal region, but likewise affecting other regions less frequently, the process effects a disease of long duration, the most conspicuous feature being the more or less extensive formation of fibrous and tuberculous granulation tissue in the implicated parts. This is often of such a character that the inflammatory hyperplasia or "*pseudo-neoplasm*" (Benoit) may easily be mistaken clinically for tumor-formation of the locality resembling carcinoma.
> *Jour. Exper. Med.*, Nov. 29, 1901, p. 24.

2. A phantom tumor.

Pseudoniscus, *n.* 2. A small fossil merostomatous arthropod found in the Silurian rocks of the Island of Ösel, Sweden, and in the Salina beds of New York State. The animal has a large horseshoe-shaped smooth head-shield, with genal spines and without eyes, a trilobitic abdomen of 10 segments, and a short, straight, terminal spine.



Pseudoniscus roosevelti.

pseudonuclein (sū-dọ-nū'klẹ-in), *n.* Same as ★*paranuclein.*

pseudo-orthorhombic (sū″dọ-ôr-thọ-rom'bik), *a.* See ★*pseudosymmetry.*

pseudopallium (sū-dọ-pal'i-um), *n.*; pl. *pseudopallia* (-a̤). [NL., < Gr. ψευδής, false, + NL. *pallium.*] In gastropods, a process of the cephalic integument which projects backward over the shell. *Jour. Roy. Micros. Soc.*, Aug., 1903, p. 491.

pseudoparasitism (sū-dọ-par'ạ-sī-tizm), *n.* [Gr. ψευδής, false, + E. *parasitism.*] The temporary presence in the alimentary canal, tissues, or cavities of the body, of worms or worm-like organisms which are not normally parasites.

> Among the Myriopods about forty recorded cases of *pseudoparasitism* have been brought together and discussed by Blanchard. In the large majority the animal was taken from the nasal fossae, though in a smaller number it was actually obtained living from the alimentary canal where it undoubtedly can exist for a brief time in spite of the untoward environment. The ingestion of such forms is purely accidental, the symptoms those of helminthiasis in general and their stay at most very limited. They never show any evidence of adaptation to the new environment.
> *Trans. Amer. Micros. Soc.*, June, 1902, p. 131.

pseudoparthenogenesis, *n.* 2. The fertilization of eggs from a seminal receptacle subsequent to sexual union.

> The word *Pseudoparthenogenesis* has been applied by some writers to cases in which the eggs are fertilized from a seminal receptacle . . ., and in which copulation does not take place for each egg.
> *E. F. Phillips*, Proc. Amer. Philos. Soc., 1903, p. 292.

pseudopedicellaria (sū″dọ-ped″i-se-lā'ri-a̤), *n.*; pl. *pseudopedicellariæ* (-ē). [NL., < Gr. ψευδής, false, + NL. *pedicellaria.*] In some starfishes, one of the pairs of small sessile opposable spines.

pseudopedogenesis (sū-dọ-pē-dọ-jen'e-sis), *n.* [Gr. ψευδής, false, + E. *pedogenesis.*] A mode of reproduction which closely resembles pedogenesis. The reproduction of the *Stylopidæ* was supposed by Von Siebold to be pseudopedogenetic, but this view is opposed by Meinert and Sharp. *Cambridge Nat. Hist.*, VI. 303.

pseudopedogenetic (sū″dọ-pē″dọ-jẹ-net'ik), *a.* Pertaining to or of the nature of pseudopedogenesis.

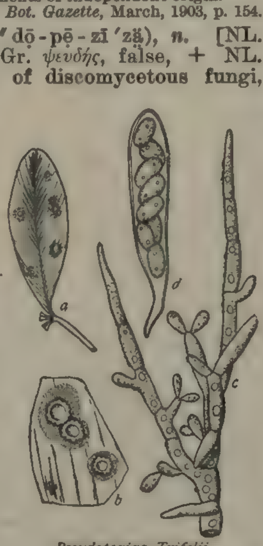
pseudopepsin (sū-dọ-pep'sin), *n.* [Gr. ψευδής, false, + E. *pepsin.*] A ferment similar to pepsin, supposedly secreted by the glands of the pyloric portion of the stomach, which is capable of acting not only in acid but also in feebly alkaline media, and yields tryptophan among the end-products of digestion to which it gives rise.

pseudopeptone (sū-dọ-pep'tōn), *n.* [Gr. ψευδής, false, + E. *peptone.*] An older term for ★*ovomucoid.*

pseudoperithecium (sū″dọ-per-i-thē'si-um), *n.*; pl. *pseudoperithecia* (-a̤). [NL., < Gr. ψευδής, false, + NL. *perithecium.*] A thin covering surrounding an ascocarp, such as occurs in some of the lower Ascomycetes.

> The head, which strongly suggests the *pseudoperithecium*, if it may so be termed, of the more highly differentiated species of Gymnoascus, is thus a remarkable combination of two elements of independent origin.
> *Bot. Gazette*, March, 1903, p. 154.

Pseudopeziza (sū″dọ-pẹ-zī'za̤), *n.* [NL. (Fückel, 1869), < Gr. ψευδής, false, + NL. *Peziza.*] A genus of discomycetous fungi, of the family *Mollisiaceæ*, having sessile, smooth, dark, waxy ascocarps and unicellular hyaline spores. Over 60 species have been described, some of which are parasitic. *P. Trifolii* is a common species which produces a leaf-spot disease of clover. *P. Medicaginis* causes leaf-spot of alfalfa.



Pseudopexiza Trifolii.

a, several ascocarps on a clover leaflet, natural size; *b*, three ascocarps, enlarged; *c*, a portion of a hypha, bearing conidia, slightly enlarged; *d*, an ascus with eight spores; enlarged.

(Drawn from Engler & Prantl's "Pflanzenfamilien.")

pseudophilosophical (sū″dọ-fil-ọ-sof'i-kạl), *a.* Pertaining to or characterized by pseudophilosophy.

pseudophilosophy (sū″dọ-fi-los'ọ-fi), *n.* [Gr. ψευδής, false, + E. *philosophy.*] False or pretended philosophy. *H. M. Cecil*, Pseudophilosophy at End of 19th Century, 1897.

pseudophotæsthesia (sū-dọ-fō-tes-thē'si-a̤), *n.* [NL., < Gr. ψευδής, false, + NL. *photæsthesia.*] In *psychol.*, false or illusory visual perception; especially, pseudochromæsthesia. *Amer. Jour. Psychol.*, V. 20.

pseudophototaxis (sū-dọ-fō-tọ-tak'sis), *n.* [NL., < Gr. ψευδής, false, + NL. *phototaxis.*] In *biol.*, the movement of organisms toward or away from a source of light when in relation to currents of water or to other factors and not in relation to the light; false phototaxis.

pseudophthisis (sū-dọ-thī'sis), *n.* [NL., < Gr. ψευδής, false, + E. *phthisis.*] Progressive emaciation without disease of the lungs.

pseudophysostigmine (sū-dọ-fī-sọ-stig'min), *n.* [Gr. ψευδής, false, + E. *physostigmine.*] An alkaloid extracted from the cali-nut or false Calabar bean.

pseudoplasm (sū'dọ-plazm), *n.* [Gr. ψευδής, false, + πλάσμα, anything formed.] 1. A cancer formed of heterologous tissue.—2. Same as ★*pseudoneoplasm.*

Pseudopleuronectes (sū-dọ-plö-rọ-nek'tēz), *n.* [NL., < Gr. ψευδής, false, + NL. *Pleuronectes.*] A genus of flounders found on both coasts of North America. See ★*mud-dab*, with cut.

pseudopod, *n.* 3. In *entom.*, any one of the structures which function as feet in many insect larvæ, as spines, thickenings, or other modifications of the integument.

pseudo-Pompeian (sū″dọ-pom-pē'an), *a.* [Gr. ψευδής, false, + E. *Pompeian.*] In the *fine arts*, imitated from Pompeian designs.

> In the beautiful *pseudo-pompeian* decoration which now belongs to the Duke de Rivoli.
> *Lady Dilke*, French Furniture and Decorations of [XVIII Cent., p. 67.

pseudopore (sū'dọ-pōr), *n.* [Gr. ψευδής, false, + E. *pore.*] In sponges, small orifices through the pseudoderm.

pseudoporphyritic (sū-dọ-pôr-fi-rit'ik), *a.* [Gr. ψευδής, false, + E. *porphyritic.*] In *petrog.*, noting a porphyritic rock in which the same minerals do not occur both as phenocrysts and as components of the ground-mass. *Harker*, 1897.

Pseudopriacanthus (sū-dọ-prī-ạ-kan'thus), *n.* [NL., < Gr. ψευδής, false, + NL. *Priacanthus.*] A genus of fishes of the family *Priacanthidæ*, rather widely distributed.

pseudoprimitive (sū-dọ-prim'i-tiv), *a.* [Gr. ψευδής, false, + E. *primitive.*] Having merely the appearance of being primitive: said of organs or structures which are secondary, but appear to be of a more generalized or primordial type. *Proc. Zool. Soc. London*, 1902, p. 219.

pseudopsychology (sū″dọ-sī-kol'ọ-ji), *n.* False or pretended psychology.

pseudoptics (sụ-dop'tiks), *n.* [Gr. ψευδής, false, + E. *optics.*] In *psychol.*: (*a*) The science of optical illusions. (*b*) A trade-name for a set of apparatus devised by H. Münsterberg for demonstrating, in simple form, some of the principal phenomena of visual sensation and perception. *E. B. Titchener*, Exper. Psychol., I. ii. 309.

pseudoreduction (sū'dọ-rẹ-duk'shọn), *n.* [Gr. ψευδής, false, + E. *reduction.*] In *cytol.*, a form of reduction in which the number of the chromosomes of the germ-nuclei is reduced without reducing the number of ids or chromatin granules: opposed to true reduction, in which the number of both chromosomes and granules is reduced to one half. Pseudoreduction occurs in the roundworm of the horse (*Ascaris megalocephala*). *Rückert.*

pseudoreversal (sū-dọ-rẹ-vėr'sạl), *n.* [Gr. ψευδής, false, + E. *reversal.*] In *spectroscopy*, an apparent reversal of a spectral line observed in photographs of the spectrum and due to solarization of the brightest portions of the image, and consequent conversion of a negative into a positive impression upon the plate.

pseudorganic (sūd-ôr-gan'ik), *a.* [Gr. ψευδής, false, + E. *organic.*] Noting the exhibition of a superficial or accidental resemblance to an organism or to the fossil remains of an organism.

pseudorhabdite (sū-dọ-rab'dīt), *n.* [Gr. ψευδής, false, + E. *rhabdite.*] In turbellarians, one of the finely granular block-like masses with uneven surface, found in certain cells of the integument; a false rhabdite.

pseudorheumatism (sū-dọ-rö'mạ-tizm), *n.* [Gr. ψευδής, false, + E. *rheumatism.*] A painful condition of the joints or muscles which simulates rheumatism, but is due to a different cause.

pseudorhombohedral (sū″dọ-rom-bọ-hē'drạl), *a.* See ★*pseudosymmetry.*

pseudoscience (sū-dọ-sī'ẹns), *n.* [Gr. ψευδής, false, + E. *science.*] False or pretended science; a pretended science.

> The march of progress let the muse explore
> In *pseudo-science*, and empiric lore.
> *J. G. Saxe*, Progress, A Satire, st. 8.

> We are but listening to the primitive emotionalism of earlier apologetics talking the cant of modern *pseudoscience.* *H. M. Cecil*, Pseudo-philosophy, p. 4.

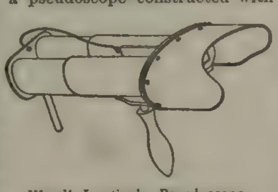
pseudoscientific (sū-dọ-sī-ẹn-tif'ik), *a.* Of the nature of pseudoscience; falsely scientific; quackish; charlatanical.

> Heterogeneous elements might be absorbed, but if they could not be reduced to the national type they should be eliminated. This was the *pseudo-scientific* note of the new anti-Semitism, the theory which differentiated it from the old religious Jew-hatred and sought to give it a rational place in modern thought.
> *Encyc. Brit.*, XXV. 472.

Pseudosciuridæ (sū″dọ-sī-ū'ri-dē), *n. pl.* [NL., < *Pseudosciurus*, type genus, + *-idæ.*] A family of extinct rodents, comprising species related to the squirrels. *Sciuridæ*, but having longer molar teeth. The type species, *Pseudosciurus*, is found in the Upper Eocene of Europe.

pseudoscolex (sū-dọ̄-skō′leks), *n.* [NL., < Gr. ψευδής, false, + NL. *scolex*.] In certain cestodes, as *Thysanocephalum crispum*, a growth formed by much-folded ridges of the neck of the scolex.

pseudoscope, *n.*—**Lenticular pseudoscope,** in *physiol.* and *psychophys.*, a pseudoscope constructed with lenses in place of prisms. R. W. Wood's lenticular pseudoscope consists of a Brewster stereoscope furnished with two extensible tubes closed at their farther ends by double convex lenses. The field is large and clear, but the pseudoscopic conversion implies inversion of the objects viewed.—**Total-reflection pseudoscope,** in *exper. psychol.*, the prism pseudoscope, devised independently by H. W. Dove in 1851 and by C. Wheatstone in 1852.



Wood's Lenticular Pseudoscope.

Pseudoscopelus (sū-dọ̄-skop′e-lus), *n.* [NL., < Gr. ψευδής, false, + NL. *Scopelus.*] A genus of deep-water fishes found in Old Bahama straits.

pseudosculum (sūd-os′kū-lum), *n.*; pl. *pseudoscula* (-lạ̈). [NL., < Gr. ψευδής, false, + L. *osculum.*] The terminal aperture of a pseudogaster.

pseudosematic (sū′dọ̄-sẹ̄-mat′ik), *a.* [Gr. ψευδής, false, + E. *sematic.*] Noting color-markings that either suggest something unpleasant to enemies, or are attractive to an animal's prey. They are usually accompanied by similarly useful modifications of form. *Poulton.*

> Mimicry, or *Pseudo-sematic* Colours.
> *Encyc. Brit.*, XXVII. 148.

pseudosensation (sū′dọ̄-sen-sā′shọn), *n.* [Gr. ψευδής, false, + E. *sensation.*] In *psychol.*, an illusory sensation, especially a sensation that is synesthetically aroused. *Amer. Jour. Psychol.*, V. 20.

pseudosessile (sū-dọ̄-ses′il), *a.* [Gr. ψευδής, false, + E. *sessile.*] Appearing sessile, although not really so, as the bees in which the non-sessile condition appears only when the abdomen is deflexed. *Annals and Mag. Nat. Hist.*, April, 1903, p. 399.

Pseudosirex (sū-dọ̄-sī′reks), *n.* [NL., < Gr. ψευδής, false, + NL. *Sirex.*] A supposed sphingoid moth found in the Jurassic lithographic shales of Solenhofen, Bavaria, and thought by some authors to be a wood-wasp, one of the *Uroceridæ.*

pseudoskeleton (sū-dọ̄-skel′e-tọn), *n.* [Gr. ψευδής, false, + E. *skeleton.*] A skeleton composed entirely of foreign bodies without any element secreted by the organism itself, found in certain forms, mostly from the deep sea, considered by Haeckel to be sponges. Compare ★*autoskeleton.*

pseudosocial (sū-dọ̄-sō′shal), *a.* [Gr. ψευδής, false, + E. *social.*] Pertaining to a social class, chiefly paupers, whose apparent social instincts and habits are not really social, in the technical sense. *Giddings*, Prin. of Sociol., p. 72.

pseudosolution (sū′dọ̄-sọ̄-lū′shọn), *n.* [Gr. ψευδής, false, + E. *solution.*] 1. A mixture which does not appear heterogeneous under the microscope, but which scatters and polarizes a beam of light that is passed through it.—2. The condition presented by certain colloid substances, as the casein of milk, when forming with water a permanent but not perfectly transparent mixture.

pseudosphere, *n.* **3.** The surface generated by the revolution of the tractrix about its asymptote.

pseudospherulite (sū-dọ̄-sfer′ọ̈-līt), *n.* [Gr. ψευδής, false, + E. *spherulite.*] In *petrog.*, a name given by Rosenbusch (1876) to a spherulite composed of more than one kind of mineral. Same as *spherulite*, 1.

pseudostereoscope (sū-dọ̄-ster′ẹ̄-ọ̄-skōp), *n.* [Gr. ψευδής, false, + E. *stereoscope.*] A binocular microscope which shows the object in an inverted or a transposed position.

pseudostereoscopic (sū-dọ̄-ster″ẹ̄-ọ̄-skop′ik), *a.* [*pseudostereoscope* + *-ic.*] Pertaining to or shown by a pseudostereoscope.

pseudostereoscopism (sū-dọ̄-ster-ẹ̄-os′kọ̄-pizm), *n.* [*pseudostereoscope* + *-ism.*] Pseudostereoscopic vision; the appearance of an object viewed through a pseudostereoscope.

pseudostromatism (sū-dọ̄-strō′mạ-tizm), *n.* [Gr. ψευδής, false, + στρῶμα(τ-), covering, layer, + *-ism.*] In *petrog.*, a rock-structure which resembles false bedding; a schistosity developed parallel to stratification by numerous minor thrust-fault planes. *Bonney*, 1886.

pseudostrophanthin (sū″dọ̄-strọ-fan′thin), *n.* [Gr. ψευδής, false, + E. *strophanthin.*] A very poisonous glucoside, $C_{40}H_{60}O_{16}.H_2O$, found in *Strophanthus hispidus.* It acts upon the heart, and has about twice the effect of strophanthin. Also written *pseudostrophantin.*

Pseudosuchia (sū-dọ̄-sū′ki-ạ̈), *n. pl.* [NL., < Gr. ψευδής, false, + σοῦχος, a crocodile.] An extinct suborder of the *Crocodilia*, characterized by reduced premaxillæ, large nasals, external nares paired and placed far forward, internal nares separate in about the middle of the palate, orbits large and laterally directed, paired parietals and frontals, conical teeth deeply socketed and confined to anterior half of jaws, and dorsal armor a paired series of oblong scutes. Its representatives occur in the Keuper of Europe and the Trias of New Mexico.

pseudosulphocyanogen (sū′dọ̄-sul″fọ̄-sī-an′ọ̄-jen), *n.* Same as ★*persulphocyanogen.*

pseudosylvian (sū-dō-sil′vi-ạn), *a.* [Gr. ψευδής, false, + E. *Sylvian.*] Used only in the following phrase.—**Pseudosylvian sulcus,** a fissure covered by the cerebral cortex which proceeds, from the posterior limb of the rhinal, vertically upward into the Sylvian fossa: noted by G. Elliot Smith in certain lemurs. *G. Elliot Smith*, in Trans. Linn. Soc., Zool., 1903, p. 333.

pseudosymmetric (sū″dọ̄-si-met′rik), *a.* [Gr. ψευδής, false, + E. *symmetric.*] Having the appearance of a higher degree of symmetry than is actually the case; deceptively symmetric; exhibiting pseudosymmetry.

pseudosymmetrical (sū-dọ̄-si-met′ri-kạl), *a.* Same as ★*pseudosymmetric.*

pseudosymmetry, *n.* A crystal exhibiting pseudosymmetry is often named according to the system of symmetry which it imitates (through twinning, distortion, etc.) as follows: *pseudisometric, pseudotetragonal, pseudohexagonal, pseudorhombohedral* or *pseudotrigonal, pseudo-orthorhombic, pseudomonoclinic*, etc.; for example, complex twins of phillipsite sometimes resemble isometric dodecahedrons and are hence said to be *pseudisometric*; also, isometric crystals (as of gold, silver, and copper) by symmetrical distortion, that is, by flattening or elongation in the direction of an octahedral (trigonal) axis, are often strikingly *pseudorhombohedral.*

pseudosynapticula (sū″dọ̄-sin-ap-tik′ū-lạ̈), *n.*; pl. *pseudosynapticulæ* (-lē). [NL., < Gr. ψευδής, false, + NL. *synapticula.*] In madreporarian corals, a false synapticula, that is, one formed by the joining together of contiguous granules and devoid of a center of calcification. *Philos. Trans. Roy. Soc.* (London), 1896, ser. B, p. 145.

pseudosynapticular (sū″dọ̄-sin-ap-tik′ụ-lạ̈r), *a.* [*pseudosynapticul(a)* + *-ar*³.] Of or pertaining to a pseudosynapticula.

pseudosyphilis (sū-dọ̄-sif′i-lis), *n.* [NL., < Gr. ψευδής, false, + NL. *syphilis.*] A condition marked by the formation of ulcers or by an eruption on the skin resembling a syphilide, which subsides spontaneously or yields readily to simple non-specific treatment.

pseudotabes (sū-dọ̄-tā′bēz), *n.* [NL., < Gr. ψευδής, false, + L. *tabes*, wasting, tabes.] 1. Any disease which simulates, especially in the ataxia, tabes dorsalis.—2. Any wasting disease of infancy and childhood which simulates tabes mesenterica. *Med. Record*, April 11, 1903, p. 587.

pseudotetanus (sū-dọ̄-tet′ạ-nus), *n.* [NL., < Gr. ψευδής, false, + τέτανος, tetanus.] Persistent muscular contractions, simulating tetanus, but not associated with the presence of the tetanus bacillus and never fatal.

pseudotetragonal (sū″dō-te-trag′ọ̄-nạl), *a.* [Gr. ψευδής, false, + E. *tetragonal.*] See ★*pseudosymmetry.*

pseudotetrameral (sū″dọ̄-te-tram′e-ral), *a.* [Gr. ψευδής, false, + E. *tetrameral.*] Having the characters of the *Pseudotetramera.*

pseudotheca (sū-dọ̄-thē′kạ̈), *n.*; pl. *pseudothecæ* (-sē). [NL., < Gr. ψευδής, false, + θήκη, a case.] In some corals, as in the family *Astræidæ*, a false wall formed in the absence of the eutheca by the union of projections developed on the septa, the projections being devoid of true centers of calcification.

pseudothecal (sū-dọ̄-thē′kạl), *a.* [*pseudothec(a)* + *-al*¹.] Of or pertaining to a pseudotheca. *Philos. Trans. Roy. Soc.* (London), 1896, ser. B, p. 163.

pseudothecalia (sū″dọ̄-thē-kā′li-ạ̈), *n. pl.* [NL., < Gr. ψευδής, false, + NL. *thecalis* (neut. pl. *thecalia*), thecal.] Apparent thecal walls formed by the fusion of laterally thickened peripheral edges of septa in certain *Anthozoa.*

pseudothyrum (sū-dọ̄-thī′rum), *n.*; pl. *pseudothyra* (-rạ̈). [L., < Roman Gr. ψευδόθυρον, < ψευδής, false, + θύρα, door.] In *class. archæol.*, a secret or private door, as distinguished from a main entrance.

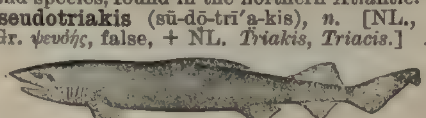
pseudotoxin (sū-dọ̄-tok′sin), *n.* [Gr. ψευδής, false, + E. *toxin.*] The poisonous extract of belladonna-leaves.

pseudotrachea (sū″dọ̄-trā′kẹ̄-ạ̈), *n.*; pl. *pseudotracheæ* (-ē). [NL., < Gr. ψευδής, false, + τραχεῖα, trachea.] One of the incomplete chitinous tubes which support the labella of many flies. They are cylindrical channels which open on the surface in zigzag slits, and their ends form the scraping teeth. *A. S. Packard*, Text-book of Entom., p. 446.

pseudotracheal (sū-dọ̄-trā′kẹ̄-ạl), *a.* Of or pertaining to a pseudotrachea; resembling tracheæ in structure, as the salivary ducts of certain nemocerous *Diptera.*

Pseudotriakidæ (sū″dọ̄-trī-ak′i-dē), *n. pl.* [NL., < *Pseudotriakis* + *-idæ.*] A family of sharks which contains a single known genus and species, found in the northern Atlantic.

Pseudotriakis (sū-dọ̄-trī′a-kis), *n.* [NL., < Gr. ψευδής, false, + NL. *Triakis, Triacis.*] A genus of sharks of the family *Pseudotriakidæ*, of the northern Atlantic.



Pseudotriakis microdon.
(From Bulletin 47, U. S. Nat. Museum.)

pseudotrichinosis (sū″dọ̄-trik-i-nō′sis), *n.* [NL., < Gr. ψευδής, false, + NL. *trichinosis.*] An acute inflammation of the general muscular system, which simulates an invasion of *Trichina spiralis*, but is not due to the presence of this parasite.

pseudotrigonal (sū-dọ̄-trig′ọ̄-nạl), *a.* [Gr. ψευδής, false, + E. *trigonal.*] See ★*pseudosymmetry. Nature*, Dec. 3, 1903, p. 100.

pseudotrimeral (sū-dọ̄-trim′ẹ-rạl), *a.* [*Pseudotrimer(a)* + *-al*¹.] Having the characters of the *Pseudotrimera*; pseudotrimerous.

pseudotropine (sū-dọ̄-trō′pin), *n.* [Gr. ψευδής, false, + E. *tropine.*] An alkaloid, isomeric with tropine, both being derived by decomposition from atropin, hyoscyamine, and belladonnine of deadly nightshade, *Atropa Belladonna.*

pseudotubercle (sū-dọ̄-tū′bėr-kl), *n.* [Gr. ψευδής, false, + E. *tubercle.*] A pathological lesion which simulates those of tuberculosis, but is not associated with the presence of the tubercle bacillus. *Buck*, Med. Handbook, III. 416.—**Pseudotubercle bacilli.** See ★*bacillus.*

pseudotuberculosis (sū″dọ̄-tụ̄-bėr″kụ̄-lō′sis), *n.* [NL., < Gr. ψευδής, false, + NL. *tuberculosis.*] A disease characterized by the presence of pseudotubercles.

pseudotumor (sū-dọ̄-tū′mọr), *n.* [Gr. ψευδής, false, + E. *tumor.*] A circumscribed swelling of uncertain character and duration; a phantom tumor. *Buck*, Med. Handbook, VI. 778.

pseudoturbinal (sū-dọ̄-tėr′bi-nạl), *n.* [Gr. ψευδής, false, + E. *turbinal.*] An incurved part of the bony nasal wall, such as is found in birds and reptiles.

pseudovarial (sūd-ọ̄-vā′ri-ạl), *a.* Same as *pseudovarian.*

pseudovariola (sū″dọ̄-vạ̄-rī′ọ̄-lạ̈), *n.* [NL., < Gr. ψευδής, false, + NL. *variola.*] Any affection which presents the symptoms of smallpox, such as the eruptive form of vaccinia, or chicken-pox with an unusually profuse eruption.

pseudovermicule (sū-dọ̄-vėr′mi-kūl), *n.* Same as ★*pseudovermiculus.*

pseudovermiculus (sū″dọ̄-vėr-mik′ụ̄-lus), *n.*; pl. *pseudovermiculi* (-lī). [NL., < Gr. ψευδής, false, + L. *vermiculus*, a little worm.] A stage in the development of the parasite, *Laverania malariæ*, of pernicious malaria. It is a gregarine-like body resulting from the union of a microgamete with a macrogamete and is actively motile, making its way into the wall of the intestine of its host, the mosquito (*Anopheles*), where it becomes encysted and later divides into a large number of minute sporozoites. Also *pseudovermicule*.

pseudovitellus (sū″dō-vi-tel′us), *n.*; pl. *pseudovitelli* (-ī). [NL., < Gr. ψευδής, false, + E. *vitellus*.] A peculiar internal structure of the *Aphididæ* which consists of a cellular double string, and may possibly replace the Malpighian tubes which are absent in these insects. *Cambridge Nat. Hist.*, VI. 588.

pseudoxanthin, *n.* **2.** A powdery compound, $C_5H_4N_4O_2$, made by heating uric acid with sulphuric acid.

Pseudoxiphophorus (sū″dọk-zi-fof′ọ-rus), *n.* [NL., < Gr. ψευδής, false, + NL. *Xiphophorus*.] A genus of fishes of the family *Pœciliidæ*, found in mountain streams of Mexico.

P. S. H. An abbreviation of *Petersburg*, or *St. Petersburg, standard hundred:* used in the lumber trade.

psilanthropia (sī-lan-thrō′pi-ạ̈), *n.* [NL.] Same as *psilanthropism*.

psiloceran (sī-los′ẹ-ran), *a.* Of or pertaining to the ammonoid genus *Psiloceras*.

psiloma (sī-lō′mạ̈), *n.* [NL., < Gr. ψιλός, smooth, + *-oma*.] Same as ★*psilosis*, 2.

psilosis (sī-lō′sis), *n.* [NL., < Gr. ψίλωσις, a making smooth or bare, < ψιλός, smooth, bare.] **1.** A disease, which occurs chiefly in the tropics, marked by fullness and pain in the abdomen, diarrhea, vomiting, a red tongue covered with whitish points, and emaciation. Also called *sprew* and *aphthæ tropicæ*.—**2.** Same as *alopecia*.

Psithyrus (sith′i-rus), *n.* [NL. (St. Fargeau, 1832), < Gr. ψίθυρος, whispering.] An important genus of guest-bees synonymous with *Apathus*, over which it has precedence. Its species live in the nests of bumblebees.

psittacism (sit′a-sizm), *n.* [Gr. ψιττακός, a parrot, + *-ism*.] A mechanical state of the mind in which reflective consciousness plays little or no part: alluding to the parrot which remembers and repeats words of which it does not know the sense.

> Then followed monographs on *psittacism* and symbolic thought, heredity, and laughter.
> *Amer. Jour. Relig. Psychol. and Education*, May, 1904, [p. 107.

psittacofulvin (sit″a-kō-ful′vin), *n.* [Gr. ψιττακός, a parrot, + L. *fulvus*, yellow, + *-in*².] A yellow pigment contained in the feathers of certain parrots and other birds.

psittacosis (sit-a-kō′sis), *n.* [NL., < Gr. ψιττακός, parrot, + *-osis*.] An infectious influenza-like disease of parrots, which may be transmitted to man in the form of disease of the lungs.

psocid (sos′id), *n.* and *a.* **I.** *n.* A member of the corrodentian family *Psocidæ*.

II. *a.* Having the characters of or belonging to the family *Psocidæ*. *Science*, Dec. 13, 1901, p. 941.

psomophagy (sọ-mof′ạ-ji), *n.* [Gr. ψωμός, a bit, morsel, + -φαγια, < φαγεῖν, eat.] The practice of simply breaking up the food with the teeth without thorough mastication.

psorenteria (sō-ren-tē′ri-ạ̈), *n.* [NL., < Gr. ψωρός, scabby, + ἐντερον, intestine.] A disease of the solitary glands of the intestine which causes them to appear, post-mortem, as small yellowish prominences on the mucous membrane.

psorenteritis (sō-ren-tẹ-rī′tis), *n.* Same as ★*psorenteria*.

psoriatic (sō-ri-at′ik), *a.* [*psoriasis* (*-iat-*) + *-ic*.] Relating to or affected with psoriasis. *Buck*, Med. Handbook, I. 457.

psoromic (sọ-rom′ik), *a.* [*Psoroma* + *-ic*.] Derived from *Psoroma*.—**Psoromic acid.** (*a*) A crystalline acid, $C_{20}H_{14}O_9$ (or $C_{20}H_{16}O_{10}$ (?)), found in species of *Psoroma* and *Rhizocarpon*. It melts with decomposition at 203–204° C. Probably identical with *parellic acid*. (*b*) Same as ★*parellic acid*.

Psorophora (sọ-rof′ọ-rạ̈), *n.* See *fringe-legged* ★*mosquito*, with cut.

Psoroptes (sọ-rop′tēz), *n.* [NL., < Gr. ψωρός, scabby, + πτήσσειν, hide, crouch.] An important genus of parasitic mites having piercing mandibles and a jointed pedicel to the suckers. *P. communis*, var. *ovis*, causes sheep-scab. —**Psoroptes equi,** a mite which attacks horses and causes a cutaneous disease known as psoroptic acariasis. Also called *Psoroptes communis equi*.—**Psoroptes longirostris Mégnin,** the mite which causes psoroptic acariasis in domesticated animals. Also called *Psoroptes communis*.

psoroptic (sọ-rop′tik), *a.* [*Psoropt*(*es*) + *-ic*.] Of, pertaining to, or produced by, *Psoroptes*. —**Psoroptic acariasis.** See ★*acariasis*.

psorosis (sọ-rō′sis), *n.* [NL., < Gr. ψωρός, scabby, + *-osis*.] A disease which affects orange-trees, causing injury to the bark, accompanied by a flow of gum. Also called *gum disease*.

> *Psorosis*, a disease known in Florida as "tears" or "gum disease," is often confounded with foot rot, but is unquestionably quite distinct. In appearance it is similar to foot rot, but with it the diseased spots occur on the limbs and occasionally on the trunk, but never on the roots so far as known. *Psorosis* does not kill the bark entirely, but extends only to the middle layer, the inner bark and cambium layer remaining healthy.
> *U. S. Dep. Agr.*, Div. of Veg. Physiol. and Pathol., [Bulletin 8, 1896, p. 31.

psorospermiasis (sō-rọ-spėr-mī′ạ-sis), *n.* [NL., < *psorosperm* + *-iasis*.] Infection with psorospermiæ. *Bowhill*, Manual of Bacteriological Technique, p. 29.

psorospermosis (sō″rọ-spėr-mō′sis), *n.* [NL., < *psorosperm* + *-osis*.] Infection with psorospermiæ; psorospermiasis. *Buck*, Med. Handbook, II. 678.

psorozoa (sō-rọ-zō′ạ̈), *n. pl.* [NL., < Gr. ψωρός, scabby, + ζῷον, animal.] Same as *psorospermiæ*.

psovie (sō′vē), *n.* The Russian wolfhound or borzoi dog. See ★*dog*.

psych. An abbreviation of *psychology*.

psychagogic (sī-kạ-goj′ik), *a.* [Gr. ψυχαγωγός, leading departed souls to the nether world, also summoning the dead, < ψυχή, life, soul, + ἀγωγός, < ἄγειν, lead.] Leading the soul; persuading or inducing the mind to assent or follow.

psychagogus (sī-kạ-gō′gus), *n.*; pl. *psychagogi* (-jī). [L., < Gr. ψυχαγωγός. See ★*psychagogic*.] In *Gr. myth.*, a leader of souls: an epithet of Hermes. See *psychopomp*.

psychanopsia (sī-kạ-nop′si-ạ̈), *n.* [NL., < Gr. ψυχή, soul, + ἀν- priv., + ὄψις, sight.] Hysterical blindness. *Alien. and Neurol.*, Aug., 1907, p. 389.

psychasthenia (sī-kas-thē′ni-ạ̈), *n.* [NL., < Gr. ψυχή, mind, + ἀσθένεια, weakness.] Weakness, through exhaustion, of the mental faculties; mental exhaustion.

> And that [danger] awaiting the exalted seclusive, the development into neurasthenic, hypochondriacal, and dementia præcox types; while hysteria, *psychasthenia*, and epilepsy appear on somewhat more independent ground.
> *Amer. Jour. Psychol.*, XIV. 363.

psychasthenic (sī-kas-then′ik), *a.* and *n.* [*psychasthenia* + *-ic*.] **I.** *a.* Suffering from exhaustion of the mental faculties, indicated by various morbid impulses, superstitious observances, abnormal fears, causeless anxieties, etc.

> The *psychasthenic*. This is a term lately applied by Janet to a group of psychopathic and neurotic conditions which comprehends obsessions, impulsions, manias, phobias, scruples, tics, states of anxiety, etc.
> *Amer. Jour. Psychol.*, XIV. 363.

II. *n.* One who suffers from psychasthenia.

Psychic cells, tic. See ★*cell*, ★*tic*¹.

Psychical blindness, center. See ★*blindness*, ★*center*1. —**Psychical compound,** in *psychol.*, a complex psychosis or mental process. The term implies that the complex process has been designated by a special name, or at least evinces a functional unitariness.

> All *psychical compounds* may be resolved into psychical elements, that is, into pure sensations and simple feelings. *W. Wundt* (trans.), Outlines of Psychol., p. 101.

psychid (sī′kid), *n.* and *a.* **I.** *n.* A member of the lepidopterous family *Psychidæ*.

II. *a.* Having the characters of or belonging to the family *Psychidæ*.

psychism, *n.* **3.** The study or the theory of so-called psychic phenomena, that is, of telepathy, clairvoyance, spiritistic phenomena, mediumship, etc.

> For *psychism* must solve the question, "Do coming events cast their shadows before them?"
> *A. C. Halphide*, The Psychic and Psychism, p. 210.

psychobiological (sī″kọ-bī-ọ-loj′i-kạl), *a.* [*psychobiolog*(*y*) + *-ical*.] Pertaining to life and mind; relating both to psychology and to biology.

> The experiments must conform to the *psychobiological* character of an animal if sane results are to be obtained.
> *Amer. Jour. Psychol.*, XII. 206.

psychobiology (sī″kọ-bī-ol′ō-ji), *n.* [Gr. ψυχή, soul, mind, + E. *biology*.] That branch of biological science which treats of the interrelations or interactions between body and mind, or between states or changes in the body and states or changes in consciousness.

> No doubt this connexion of vegetal and animal functions remains one of the obscurest in all *psycho-biology*, though its teleological fitness is obvious enough.
> *Encyc. Brit.*, XXXII. 65.

psychochemistry (sī-kọ-kem″is-tri), *n.* [Gr. ψυχή, soul, mind, + E. *chemistry*.] **1.** In *psychophys.*, the chemistry of the mental life; the science of the chemical changes which accompany the appearance of definite types of consciousness in the psychophysical organism. *Amer. Jour. Psychol.*, XI. 600.—**2.** In *psychol.*, mental chemistry; the derivation of psychical resultants from elements which, considered alone, neither resemble nor give promise of these resultants, as the derivation of psychological space from non-spatial sensory elements.

psychocurative (sī-kọ-kū′rạ-tiv), *a.* [Gr. ψυχή, soul, mind, + E. *curative*.] Pertaining to or concerned with psychic or mental healing. See ★*psychotherapy*. *A. C. Halphide*, The Psychic and Psychism, p. 21. [Rare.]

psychodid (sī′kọ-did), *n.* and *a.* **I.** *n.* A member of the dipterous family *Psychodidæ*.

II. *a.* Having the characters of or belonging to the family *Psychodidæ*.

psychodyl (sī′kọ-dīl), *n.* [Also *psychodyle:* < Gr. ψυχή, soul, mind, + E. *odyl*.] The psychic force imagined to be operating in the physical phenomena of spiritistic séances.

psycho-educational (sī″kọ-ẹd-ụ-kā′shọn-ạl), *a.* Relating both to psychology and to education; concerned with the application of psychology to education.

> An evening session, held in the *psycho-educational* laboratory. *Science*, April 22, 1904, p. 659.

psychogenetic (sī″kọ-jẹ-net′ik), *a.* [Gr. ψυχή, soul, mind, + E. *genetic*.] Relating to the development of mind, or to the theory of this development; psychogenetical.

> Hume . . . had quite unwittingly furnished what from his own point of view should have been regarded as a logical deduction and justification—rather than the mere *psychogenetic* description, which it purported to be,—of the realistic belief.
> *Jour. Philos., Psychol. and Sci. Methods*, June 9, [1904, p. 328.

psychogeny, *n.*—**Biontic psychogeny,** individual psychogeny: same as *ontogenetic* ★*psychology*. *Haeckel* (trans.), Riddle of the Universe, p. 104.—**Phyletic psychogeny,** phylogenetic psychology; the science or the theory of the historical development of the human from the animal mind.

> It becomes one of the main tasks of the modern monistic psychology to trace the stages of the historical development of the soul of man from the soul of the brute. Our "phylogeny of the soul" seeks to attain this object; it may also . . . be called . . . in contradistinction to biontic (individual), *phyletic psychogeny*.
> *Haeckel* (trans.), Riddle of the Universe, p. 149.

psychogram (sī′kọ-gram), *n.* [Gr. ψυχή, soul, mind, + γράμμα, a writing.] A psychographic record; a tracing made by a psychograph, such as the planchette.

> He [Mr. W. Ingles Rogers] remained looking at the plate for forty-three minutes, and afterwards developed it, with the result that an outline of the coin was clearly shown upon it. The "*psychogram*" as the resulting picture is called, was sufficient to show that better results might confidently be expected.
> *Pop. Sci. News*, Feb., 1896, p. 42.

psychographist (sī-kog′rạ-fist), *n.* **1.** A 'spirit-writer'; one who is supposed to be able to transmit the thought of a disembodied spirit by means of automatic writing. See *psychography*, 2.

> It may also interest you to learn that of fifteen clairvoyants, palmists, . . . chromoscopists and "*psychographists*" whom I have called upon this week the majority have informed me that clergymen are their best customers among men. *Kansas City Daily Times*, July 12, 1904.

2. One who writes a descriptive psychology, or a natural history of the mind. [Rare.] See *psychography*, 1.

psychokinesia (sī″kọ-ki-nē′si-ạ̈), *n.* [NL., < Gr. ψυχή, soul, + κίνησις, movement.] A sudden explosive attack of temporary insanity.

> Even those otherwise unaccountable outbursts of *psychokinesia* or temporary insane displays, in some instances termed mania transitoria, kleptomania, emotional insanity, or epileptic unconscious automatisms or psychic epilepsias and morbid fulminations of passion and impulse, often require long antecedent or subsequent histories to prove or disprove their real morbid nature.
> *Alien. and Neurol.*, Aug., 1907, p. 358.

psychological, *a.*—**The psychological moment.** See ★*moment*.—**Psychological physics.** See ★*physics*.

psychology, *n.*—**Abnormal psychology,** or **psychology of the abnormal,** that branch of psychology which treats of the deviations or derangements, temporary or permanent, of mental functions. It covers, for example, the phenomena of dreaming; illusion and hallucination; hypnosis and related states; consciousness under the influence of drugs; mental defect (aphasia, etc.); epidemics of fright, religious excitement, etc.; and the various forms of insanity.—**Animal psychology,** the psychology of the lower animals. *W. Wundt* (trans.), Lectures on Human and *Animal Psychology* (title of book).—**Cellular psychology,** the psychology of the single cell, considered as the elementary organism of anatomy and physiology. *Haeckel* (trans.), Riddle of the Universe, p. 177.—**Differential psychology.** (*a*) Same as *individual* ★*psychology* (*a*). (*b*) The special psychology of any single group of living things: a common term for folk psychology, professional psychology, race psychology, ethnic psychology, psychology of peoples, etc.—**Dynamic psychology,** the psychology of mind in action: same as *functional* ★*psychology*. *E. L. Thorndike*, Elements of Psychol., p. 184.—**Elementary psychology.** Same as *cellular* ★*psychology*. *Haeckel* (trans.), Riddle of the Universe, p. 177.—**Ethnic psychology.** (*a*) The psychology of peoples; the differential psychology of national groups: same as *folk* ★*psychology* (2).

These mental traits, characteristics, differences between human groups are precisely the material which *ethnic psychology* takes as its material for investigation.
D. G. Brinton, Basis of Social Relations, p. x.

(*b*) The science of the products of the mental life in the human race at large; same as *folk* ★*psychology* (3). *W. Wundt* (trans.), Physiol. Psychol., I. 5.

Ethnic psychology is the psychology of a 'collective' mind, i.e., of the mental processes that are set up by the communion of individual minds; the psychology of a race or society or professional class, as distinguished from the psychology of the individual, child or man.
E. B. Titchener, Primer of Psychol., p. 292.

Experimental psychology. The phrase 'experimental psychology' was, apparently, first introduced by Wundt in 1862 to denote a psychology whose results, instead of being based upon speculation, philosophical prepossession, or casual self-observation, should be assured, like the results of physics or physiology, by the strict employment of an experimental method. At first, as was natural, the scope and contents of the discipline were ill-defined. Nevertheless its range was wider than is commonly recognized. Within a few years of the founding of the Leipzig laboratory in 1879, work was going on in several large departments. There was, naturally, a strong current of influence from Fechnerian psychophysics. There was great activity in the fields of sensation and perception, much of it continuing, as it had begun, in the physiological laboratories: even to-day the distinction between the physiology and the psychology of sense is far from clear in the minds of many investigators. There was especial interest in the study of the 'personal equation.' Wundt himself brought the problems of attention to the forefront of discussion. Time, no less than space, afforded material for experimental inquiry. Measurements were made of the rate of association of ideas, and the character of the ideas constituting a train of thought was also investigated. In a word, the five great departments of sensation, perception, association, attention, and action all fell, early in the eighties of the last century, under the domination of the experimental method. The later development of the science has proceeded along two principal lines: first, by the extension of experiment to processes and formations hitherto examined only by an unaided introspection, and secondly by the attainment of a clearer and more profound insight into the problem of psychology at large and its mode of solution. Under the former heading, it may be said that there is now no single type or form of conscious contents that is not, at any rate in principle, amenable to experimentation. Methods have been devised for the study of the affective processes, feeling and emotion, those most elusive of all our conscious experiences, as well as for that of memory, imagination, and the higher forms of intellectual life. Moreover, these methods exist in two variations, as qualitative and quantitative, the one supplementing and correcting the deficiencies of the other. If psychology as a system still presents a ragged and uneven front, and if there is still room for controversies about personal opinion, this is due simply to the youth of the science, to the inadequacy of material equipment (the psychological laboratory has hardly yet become a matter of course in collegiate institutions), to the great intrinsic difficulty of psychological analysis, and to the breadth and thoroughness of the preparation required for successful psychological work; the three latter causes all coöperating, of course, to keep down the numbers of those engaged in psychological research. Under the second heading, it may be said that the experimental method has not only brought to light a complexity in the mental life before undreamed of—has not only (that is) shown the significance and the necessity of psychological analysis—but has also set a standard to be followed in the fields of social and comparative psychology, and has thus materially assisted in the progress of these disciplines to their present status. It is often said that experimental psychology has not fulfilled the vast promises of its beginnings. Nothing, however, could be farther from the truth. Apart from the fact that psychologists themselves made no promises, large or small (these were made for them, by enthusiastic onlookers), the introduction of the experimental method has changed the whole face of psychology, from sensation to self-consciousness. Evidence may be found in Wundt's recent (1902) classification of the various divisions of psychology. Setting individual psychology, the study of the single mind, over against comparative psychology, he includes under the former the two departments of child psychology and of experimental psychology 'in the narrower sense,' and under the latter those of animal and of ethnic psychology. The whole psychology of the normal, adult human mind (the ordinary psychology of the textbooks) is thus made an experimental psychology, while the qualifying phrase indicates that the experimental method may be applied, though indirectly, to the study of children and of animals. It need hardly be explained that this indirectness of application results from the impossibility of introspective control. The experimental method came into psychology, not to oust introspection, but to fulfil it. See ★*psychophysics*.—**Faculty psychology,** a general name for those systems of psychology (characteristic of the eighteenth century) which sought to explain the phenomena of mind by referring them to one or more mental powers or faculties. These 'faculties' (reason, imagination, understanding, will, etc.) were in reality nothing more than classificatory concepts; but the faculty psychology looked upon them as actual forces or powers of the mind, by means of which the concrete ideas, impulses, etc., could be explained. C. von Wolff (1679–1754) is regarded as the typical faculty-psychologist; and the group includes men of such eminence as Bonnet, Tetens, and Kant. The fundamental error of the faculty theory was clearly exposed by Locke, in his discussion of the freedom of the will; but its principal and most successful opponent was Herbart. Even to-day the theory is current in popular psychology, while it has not wholly disappeared from certain academic systems.

The *faculty-psychology* considered these class-concepts as psychical forces or faculties, and referred psychical processes to their separate or united activity.
W. Wundt (trans.), Outlines of Psychol., p. 11.

Folk-psychology, a translation of the German term *Völkerpsychologie*. The word is variously employed, to denote (1) the science of the mental products of primitive peoples; (2) the differential psychology of national groups ('psychology of peoples'); (3) the science of the products of the mental life in the human race at large, and especially of language, mythology, religion, and custom.—**Functional psychology,** that division of psychology which treats of mind in action, or of mental dynamics; the psychology which looks upon mind as a system of organic functions: opposed to *structural* ★*psychology*, somewhat as physiology is opposed to anatomy.

There is, however, a *functional psychology*, over and above this psychology of structure. We may regard mind, on the one hand, as a complex of processes, shaped and moulded under the conditions of the physical organism. We may regard it, on the other hand, as the collective name for a system of functions of the psychophysical organism.
Philos. Rev., Sept., 1898, p. 451.

Generic psychology. Same as *comparative psychology*. *W. Wundt* (trans.), Physiol. Psychol., I. 16.—**Genetic psychology,** that division of psychology which deals with the development of mind in the individual and with its evolution in the race. The term is used broadly to cover the study of the development of the mind of the child (*infant* and *child psychology*) and of the adult (*adolescent* and *senile psychology*); that of the evolution of the human mind in the various forms of human society (*folk, social, comparative human psychology*); and that of the evolution of mind at large in the organic series (*race, animal, comparative psychology*). Theoretically, indeed, the genetic method is applicable wherever mind is found, just as it is applicable wherever life is found. Practically, the difficulty of application is very great; so that, in spite of continuous and fruitful work from the time of Spencer and Darwin, it is not as yet possible to systematize the results of genetic psychology with anything like the completeness attained in the sphere of normal human psychology.—**Individual psychology.** (*a*) The psychology of individual variations. Also *differential psychology*.

General Psychology studies the general properties of psychical processes, these, therefore, which are common to all individuals; *Individual Psychology*, on the contrary, studies those psychical processes which vary from one individual to another. *Amer. Jour. Psychol.*, X. 330.

(*b*) The psychology and psychogenesis of the human mind.

Child psychology and experimental psychology in the narrower sense may be bracketed together as *individual psychology*, while animal psychology and ethnic psychology form the two halves of a generic or comparative psychology. *W. Wundt* (trans.), Physiol. Psychol., I. 5.

Intellectualistic psychology, a psychology which regards ideation as the root-function of mind: opposed to *voluntaristic* ★*psychology*. See the quotation.

When the chief emphasis is laid on the objects of immediate experience, *intellectualistic psychology* results. This attempts to derive all psychical processes, especially the subjective feelings, impulses, and volitions, from ideas, or intellectual processes as they may be called on account of their importance for objective knowledge.
W. Wundt (trans.), Outlines of Psychol., p. 12.

Ontogenetic psychology, the genetic psychology of the individual. *Haeckel* (trans.), Riddle of the Universe, p. 389.—**Phylogenetic psychology.** Same as *phyletic* ★*psychogeny*.—**Physical psychology,** a phrase used by A. H. Lloyd for the branch of psychology "concerned with the substitutes or indirections for mind that appear in all the so-called physical sciences." *Science*, July 5, 1901, p. 18.—**Professional psychology,** the psychology of professional life; a form of individual or differential psychology.

The object of this memoir was to present the importance of those studies which had for their object a research into what the reporter called "*professional psychology*," or the psychology of professional life. He said the psychic functions of the individual were greatly influenced by the profession he chose to exercise among his fellows. *Smithsonian Rep.*, 1890, p. 683.

Race psychology. Same as *racial* ★*psychology* (*b*). *J. M. Baldwin*, Mental Development, p. 13.—**Racial psychology.** (*a*) The differential psychology of the races of mankind. The term is sometimes used as identical with *ethnic* ★*psychology*, sometimes (as in the accompanying extract) differentiated from it.

The unity not merely of present traits but of future aims, not merely of ideas but of ideals, is the true unity which constitutes the ethnic mind. This is the foundation fact which must be constantly present to the student, if his researches in ethnic psychology are to be profitable. In this it differs from *racial psychology*, for while doubtless each race has mental advantages and deficiencies which are its own and which largely decide the destiny of its members, these are not united in pursuit of one end. There is no unity of will and purpose.
D. A. Brinton, Basis of Social Relations, p. 35.

(*b*) Race psychology; the differential psychology of species and races, whether human or sub-human.—**Social psychology.** (*a*) Same as *folk*-★*psychology* (3).

Because of this dependence on the community, in particular the social community, this whole department of psychological investigation is designated as *social psychology*, and distinguished from individual or . . . experimental psychology.
W. Wundt (trans.), Outlines of Psychol., p. 23.

(*b*) The science of the individual mind as conditioned, in its functions and development, by other minds; the psychology of the social factor in its influence upon the individual mind. *Baldwin*, Dict. of Philos. and Psychol., II. 538.—**Structural psychology,** the psychology whose problem is the analysis and synthesis of mental processes for their own sake, and regarded merely as existent, without respect to their genesis or function.

It is unnecessary to pursue further our examination of *structural psychology*.
E. B. Titchener, in Philos. Rev., Sept., 1898, p. 462.

The new psychology, a name sometimes given, loosely, to the experimental psychology introduced by Wundt.

My aim in this book is to show just what *the new psychology* is. *Scripture*, New Psychol., p. ix.

Variational psychology, a term proposed by Baldwin and Stout for the psychology of mental variations, that is, for such psychological studies as are usually included under individual or differential psychology, professional psychology, the psychology of the criminal, etc., classes, and so on. *Baldwin*, Dict. of Philos. and Psychol., II. 759.—**Voluntaristic psychology,** a psychology in which the main emphasis is laid upon the subjective factor in immediate experience: opposed to *intellectualistic* ★*psychology*. See the extract.

If . . . the chief emphasis is laid on the way in which immediate experience arises in the subject, a variety of explanatory psychology results which attributes to those subjective activities not referred to external objects, a position as independent as that assigned to ideas. This variety has been called *voluntaristic psychology*, because of the importance that must be conceded to volitional processes in comparison with other subjective processes.
W. Wundt (trans.), Outlines of Psychol., p. 12.

psychomechanics (sī″kọ-mē-kan′iks), *n.* [Gr. ψυχή, mind, soul, + E. *mechanics*.] In *psychophys.*, a name given by C. Féré to his investigations into the interrelation of mental and physical work and fatigue; motor psychophysics. *Amer. Inventor*, July 15, 1904, p. 318.

psychometer (sī-kom′e-tėr), *n.* [Gr. ψυχή, soul, + μέτρον, measure.] In *exper. psychol.*, a recording device, invented in 1906 by C. G. Jung, for registering variations of the psychogalvanic reflex. A movable indicator slides upon the galvanometer scale, and is connected with a recording pen which writes upon a kymograph.

psychometrically (sī-kō-met′ri-kal-i), *adv.* 1. By way of the occult powers of psychometry; in the manner of a psychometrist. See *psychometry*, 1.—2. By way of quantitative psychological determination, especially by way of measurement of the time-relations of mental phenomena; chronoscopically or chronographically. See *psychometry*, 2.

psychometrist (sī-kom′e-trist), *n.* [*psychometr(y)* + *-ist*.] 1. One who is supposed to be endowed with the occult powers of psychometry. See *psychometry*, 1. *Kansas City Daily Times*, July 12, 1904.—2. A student of psychophysics or of quantitative psychology, especially a student of the time-relations of mental phenomena. See *psychometry*, 2. [Rare.]

psychomonism (sī-kọ-mon′izm), *n.* [Gr. ψυχή, soul, mind, + E. *monism*.] In *metaphys.*, Haeckel's term for the ultra-idealistic view that "one thing only exists, and that is my own mind." *Haeckel* (trans.), Riddle of the Universe, p. 226.

psychomoral (sī-kọ-mor′al), *a.* Pertaining both to mind and to conduct; pertaining to mind in its ethical features and aspects.

Dr. Semal advocated a *psycho-moral* examination of the delinquent in order to determine his condition, whether he was a confirmed criminal or only a criminal on occasion. *Smithsonian Rep.*, 1890, p. 663.

Psychomotor action. See ★*action*.

psychoneural (sī-kọ-nū′ral), *a.* [Gr. ψυχή, soul, mind, + νεῦρον, nerve, + *-al*[1].] Of or pertaining to the interaction between nervous organization and the organization of consciousness, or to the relation between psychology and neurology.

Psychoneural parallelism is no doubt a well-established generalization; nevertheless, concerning its exact range and its precise meaning there are differences of opinion. . . . In ascending any biological phylum, we find that the psychical and neural aspects differentiate and develop together. *Encyc. Brit.*, XXXII. 69.

psychoneurotic (sī″kō-nū-rot′ik), *a.* and *n.* [*psychoneurosis(-ot-)* + *-ic*.] I. *a.* Relating to or affected with a psychoneurosis. *Buck*, Med. Handbook, V. 28.

II. *n.* One who suffers from a psychoneurosis.

psychonomic (sī-kọ-nom′ik), *a.* [Gr. *ψυχή*, mind, soul, + *νόμος*, law, + *-ic.*] Regulative or directive of the mental life or of the development of mind.

> The flow of the psychic, we find, however, so soon as we go over to the objective or 'psychological' point of view, is conditioned upon physiological processes and functions — those of the brain and other organs. These latter condition — limit, further, direct, inhibit, in any way modify — the flow of the psychic changes. Such conditions are '*psychonomic.*' This term may be used to denote the entire sphere of phenomena which are in connection with the psychological, but which, nevertheless, are not intrinsic to the series of psychic changes as such.
> *J. M. Baldwin*, Development and Evolution, p. 8.

psychonomics (sī-kọ-nom′iks), *n.* [See ★*psychonomic.*] In *psychol.*, the science which deals with the relations of the individual mind, to its environment, more especially its social environment; in *sociol.*, the science which deals with the psychological factors and laws implied in social organization and development: suggested, in both uses, by Baldwin and Giddings, in *Baldwin*, Dict. of Philos. and Psychol., II. 391.

psychopathologic (sī″kọ-path-ọ-loj′ik), *a.* [Gr. *ψυχή*, soul, mind, + E. *pathologic.*] Pertaining to mental pathology, that is, to the graver forms of mental derangement.

> These researches should be made both upon the criminal and the insane, and one can thus see the links which form the *psycho-pathologic* chain of human life, at one end of which we may find insanity and at the other criminality.
> *Smithsonian Rep.*, 1890, p. 636.

psychopathological (sī″kọ-path-ọ-loj′i-ka̤l), *a.* Same as ★*psychopathologic.* *Amer. Anthropologist*, April–June, 1901, p. 366.

psychopathology (sī″kọ-pa̤-thol′ọ-ji), *n.* [Gr. *ψυχή*, mind, + E. *pathology.*] That branch of medical science which treats of diseases of the mind. *Amer. Anthropologist*, April–June, 1901, p. 366.— **Ethnic psychopathology**, the psychopathology of a nation, race, people, or analogous human group.

> In the history of the mental life of individuals and nations we find a striking parallelism to these physical processes, certain degenerations bringing with them compensations in the growth of higher faculties, others tending inevitably to the destruction of the individual or the group. The latter belongs to the domain of "*ethnic psycho-pathology.*"
> *D. G. Brinton*, Basis of Social Relations, p. 83.

psychopedagogic (sī″kọ-ped-a̤-goj′ik), *a.* [Gr. *ψυχή*, soul, mind, + E. *pedagogic.*] Relating to both psychology and pedagogy; concerned with the application of psychology to education; psycho-educational.

> As a *psycho-pedagogic* theory, a reversionary goal or term, . . . this conception [of nakedness and plainness of speech] is a precious element in man's spiritual idealization of his own life. *G. S. Hall*, Adolescence, II. 96.

psychopedagogical (sī″kọ-ped-a̤-goj′i-ka̤l), *a.* Same as ★*psychopedagogic.*

psychophore (sī′kọ-fōr), *n.* [Gr. *ψυχή*, soul, mind, + *-φορος*, < *φέρειν*, bear.] A term coined by G. S. Hall, on the analogy of Weismann's *biophore*, to denote the hypothetical vehicle of mental heredity.

> The feeling-instincts of whatever name are the *psychophores* or bearers of mental heredity in us, some of which persist below the threshold of consciousness throughout our lives, while others are made over as instincts or are transformed to habits into directions of the will more or less persistent. *G. S. Hall*, Adolescence, II. 61.

Psychophysical dualism, parallelism. See ★*dualism*, ★*parallelism.*

psychophysically (sī-kọ-fiz′i-ka̤l-i), *adv.* By psychophysical means; in a psychophysical manner.

psychophysics, *n.* Psychophysics was defined by Fechner in 1860 as "an exact science of the functional relations or relations of dependency between body and mind, or more generally between the bodily and mental, the physical and psychical world"; and Wundt, in 1902, declares in the same spirit that psychophysics is to be understood as "an investigation of the relations that may be shown empirically to obtain between the psychical and the physical aspects of vital processes." It may, however, be questioned whether a definition of this generality can be made useful for scientific purposes. It is, no doubt, implied in such phrases as 'the psychophysical organism,' by which we mean the correlated body-mind of actual experience, the ensouled body or the embodied mind, and 'psychophysical evolution,' by which we mean the evolution of this correlated body and mind. Nevertheless, a science cannot remain poised between two existing sciences; it must have a positive content of its own. In other words, psychophysics, viewed in this very general way, must soon show a tendency to fall either toward the side of psychology or toward that of biology, and to be subsumed under the one or the other of the sciences whose methods and results it is supposed to relate and combine. It was, perhaps, by an implicit recognition of this danger, reinforced by the desire to hold fast to all that might be tenable in the Fechnerian definition, that the meaning of psychophysics was, until quite recently, narrowed down to that special field of research in which Fechner had shown himself especially active—to the correlation of intensity of external stimulus with intensity of sensation. In this sense we speak of the four classical methods (least differences, right and wrong cases, average error, mean gradations) as 'the psychophysical methods,' and of Weber's Law as 'the psychophysical law.' It is needless to say that Fechner would never have assented to this restriction; that apart, however, the new definition is so obviously artificial, and the delimitation of subject-matter which it suggests is so obviously accidental, that it has neither logical standing nor prospect of survival. Indeed, it has at no time found acceptance among psychophysical workers: at the very least, the experiments made upon simple and compound reactions, and upon what is still known as the 'time sense,' have been also included under psychophysics. Of late years, the term has taken on a better and a broader meaning, a meaning which preserves the spirit if not the letter of Fechner's definition, and which promises to settle down into something like finality. Psychophysics may now be defined as that department of experimental psychology which aims, not at introspective analysis, but rather at the determination of the quantitative norms of the mental life. Thus, the reaction experiment is a psychological experiment if it is made with a view to the introspective analysis of the action-consciousness; it is a psychophysical experiment if its object is the determination of the time-values of certain typical organic reactions. In the former case, it can be performed only by trained students of psychology; in the latter, it may be made a means to the comparison of the capacities of children, the lower races of man, and even the higher animals. So the time-sense experiment is a psychological experiment, if our aim is the discovery of the conscious basis or vehicle of the time-consciousness; a psychophysical experiment, if we wish to establish the norms of temporal discrimination, or to institute comparative studies of the time-discrimination of different ages and races. Psychophysics has fallen to the one side —to the side of psychology: for the establishment of quantitative norms of the mental life must be intrusted to those who have made mind their special study. At the same time, when the norms have once been established, there is no further need of introspection; psychophysics becomes a matter of technique and of external observation; and, in so far, the Fechnerian view is retained. It may be added that the results of psychophysics, while they must be obtained by the experimental psychologist working, at any rate in the first instance, within the psychological laboratory, are of great importance both for anthropology and for medicine; and that the methods, once worked out, may be carried afield and thus applied under conditions widely remote from those of their first elaboration. See *experimental* ★*psychology.*— **Physical psychophysics**, a type of psychophysical doctrine which, so far as possible, assimilates psychophysical to physical work, making the limen, for instance, an error of observation, and rejecting the 'doubtful cases' of the method of right and wrong cases. *E. B. Titchener*, Exper. Psychol., II. ii. 185.

psychophysiologically (sī-kọ-fiz″i-ọ-loj′i-ka̤l-i), *adv.* In a psychophysiological manner; by psychophysiological means. *T. Ziehen* (trans.), Introd. to Physiol. Psychol., p. 133.

psychopompous (sī-kọ-pom′pus), *a.* [*psychopomp* + *-ous.*] Of or pertaining to a psychopomp; having the functions of a psychopomp.

> The god of *psychopompous* function, round
> Circling the sun with fourfold force.
> *Bailey*, The Mystic, l. 78.

psychorhythmia (sī-kọ-rith′mi-ä), *n.* [NL., < Gr. *ψυχή*, mind, + *ῥυθμός*, rhythm.] A pathological condition in which the various mental actions repeat themselves involuntarily.

psychorragy (sī′kọ-rā-ji), *n.* [See *psychorrhagia.*] 1. Same as ★*psychorragia*, 1.— 2. Mind-division or mind-cleavage: a supposed condition of the mind in which "some psychical element of man's complex personality can leave him, for example, in dreams, and produce a phantasm at a distance." The term was introduced by *Myers and MacCulloch*, Religion, its Origin and Forms, p. 71.

psychorrhagia (sī-kọ-rā′ji-ä), *n.* [NL., < Gr. *ψυχορραγία*, < *ψυχορραγής*, letting the soul break loose, < *ψυχή*, soul, + *ῥηγνύναι*, break.] 1. The breaking away of the soul; the death-agony.— 2. Same as ★*psychorragy*, 2.

psychotechnical (sī-kọ-tek′ni-ka̤l), *a.* [*psycho(logy)* + *technical.*] Relating to psychology considered in its applications as a guide to practice; or, relating to an art which is based upon psychology as its science.

> In the first case the science of pedagogy is a *psychotechnical* discipline which makes education mechanical and deprives the teacher of the teleological attitude of inner understanding.
> *H. Münsterberg*, in Harvard Psychol. Stud., I. 654.

psychotheism, *n.* 2. A form or stage of theism, the gods of which represent certain aspects of the human mind, or impersonate certain mental characteristics of their worshipers.

> Certain of the gods of barbarians gradually become representatives of certain psychic characteristics, and we have the stage of *psychotheism*, and there is a god of War, a god of Love, a god of Hate, a god of Commerce, and many other major deities.
> *J. W. Powell*, Truth and Error, p. 388.

psychotherapeutics, *n.* 2. Same as ★*psychotherapy*, 2.

psychotherapy, *n.* 2. Treatment of functional disease by mental suggestion. *Med. Times*, Jan., 1908, p. 19.

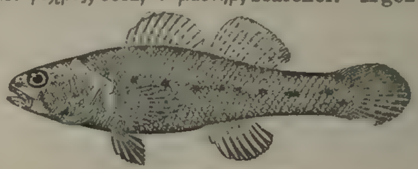
psychotic (sī-kot′ik), *a.* Of or relating to a psychosis.

psychozoic, *a.* 2. [*cap.*] A term used by some geologists to designate the later portion of Quaternary time marked by man's existence, which thus includes all of recent time and an indefinite portion of the Pleistocene period. See *Psychozoic* ★*era.*

II. *n.* The Psychozoic period.

Psychrolutes (sī-krọ-lū′tēz), *n.* [NL., < Gr. *ψυχρολούτης*, one who bathes in cold water, < *ψυχρός*, cold, + *λούειν*, bathe.] A genus of cottoid fishes found on the shores of the northern Pacific.

Psychromaster (sī-krọ-mȧs′tėr), *n.* [NL., < Gr. *ψυχρός*, cold, + *μαστήρ*, searcher.] A genus of fishes of the family *Percidæ*, found in spring brooks of the Tennessee River basin in northern Alabama.



Psychromaster tuscumbia.
(From Bulletin 47, U. S. Nat. Museum.)

psychrometer, *n.*—**Aspiration psychrometer**, an arrangement (devised by Belli in 1836 and improved later) for determining the true temperature and moisture of the air at any place and time. The bulbs of the psychrometer are inclosed in short tubes, and fresh air is drawn rapidly over them by a revolving fan without allowing it to cool by the expansion due to the suction.— **Assmann's aspiration psychrometer**, a modification of Belli's psychrometer: the standard to which all ordinary meteorological records should be referred. See *hygrometer.*— **Sling-psychrometer** or **whirled psychrometer**, a pair of thermometers, wet-bulb and dry-bulb respectively, suspended by a short chain from a short handle, and swung around rapidly like a sling. By the normal rate of revolution the thermometer-bulbs acquire a speed through the air of from six to ten yards per second, and are thereby quickly brought to the temperatures required for the determination of the humidity of the air. See *hygrometer.*

psychrophilic (sī-krọ-fil′ik), *a.* [Gr. *ψυχρός*, cold, + *φιλεῖν*, love, + *-ic.*] Having a liking for a low temperature: applied to a group of bacteria whose optimum temperature of growth lies between 15° and 20° C. See ★*bacterium.*

psychrotherapy (sī-krọ-ther′a̤-pi), *n.* [Gr. *ψυχρός*, cold, + *θεραπεία*, medical treatment.] The use of cold in the treatment of disease. *Lancet*, July 11, 1903, p. 104.

psyctic (sik′tik), *a.* [Gr. *ψυκτικός*, cooling, < *ψύχειν*, make cool or cold.] Cooling; refrigerant.

Psylla, *n.* 2. [*l. c.*] An insect of this genus. —**Pear psylla**, a homopterous insect of the family *Psyllidæ*, *Psylla pyri*, common to Europe and the United States. It frequently does great damage to the buds and leaves of the pear.

psyllid (sil′id), *n.* and *a.* I. *n.* A member of the homopterous family *Psyllidæ.*

II. *a.* Having the characters of or belonging to the family *Psyllidæ.*

pt. An abbreviation (*c*) of *payment;* (*d*) of *point;* (*e*) of *port.*

P. T. An abbreviation (*a*) [*l. c.* or *cap.*] of *post-town;* (*b*) of *pupil-teacher.*

ptarmic, *n.* II. *a.* Exciting sneezing.

ptarmigan, *n.*—**White-tailed ptarmigan**, *Lagopus leucurus*, an entirely white species, inhabiting the mountain ranges of western North America.

pteleiform (te-lē′i-fôrm), *a.* [Gr. *πτελέα*, elm, + L. *forma*, form.] In *anthrop.*, of the form of an elm-leaf: said of the apertura pyriformis of a skull. *Welcker; Allen.*

ptelein (tē′lẹ-in), *n.* [NL. *Ptelea* + *-in*^{2}.] A substance prepared from the root and bark of the wafer-ash, *Ptelea trifoliata.* It is sometimes used in medicine as a stimulant and tonic.

pteleorhine (te-lē′ọ-rin), *a.* [Gr. *πτελέα*, elm, + *ῥίς* (*ῥιν-*), nose.] Same as ★*pteleiform.*

Pteraclidæ (te-rak′li-dē), *n. pl.* [NL., < *Pteraclis* + *-idæ.*] A family of small pelagic fishes containing two genera and about five species.

Pteraclis (ter′a̤-klis), *n.* [NL., irreg. < Gr. *πτερόν*, wing (fin), + *κλείειν*, close (*κλείς*, a bolt, a key).] A genus of fishes of the family *Pteraclidæ*, pelagic and widely distributed.

Pteranodontes (te-ran-ọ-don′tēz), *n. pl.* [NL. See *Pteranodon.*] The large, toothless pterodactyls, considered as constituting a suborder of flying reptiles.

pterapophysial (te-rap-ọ̄-fiz'i-ạl), *a.* [Gr. *πτερόν*, feather, + E. *apophys(is)* + *-ial.*] Relating to or connected with the articulation of the pterygoid with some other bone. [Rare.]

> *Pterapophysial* facet on quadrate for articulation of pterygoid. *Proc. Zool. Soc. London*, 1899, p. 1027.

pteraspidian (ter-as-pid'i-ạn), *a.* [*Pteraspis* (*-aspid-*) + *-ian.*] Having the characters of or pertaining to the ostracoderm fishes of the genus *Pteraspis.*

ptereal (tē'rẹ̄-ạl), *n.* [Gr. *πτερόν*, wing, fin, + *-e-al*^{1}.] In fishes, a bone of the lateral inferior surface of the cranium just anterior to the exoccipital; the proötic. *Starks*, Synonymy of the Fish Skeleton, p. 512.

pterergate (ter-ėr'gāt), *n.* [Gr. *πτερόν*, wing, + *ἐργάτης*, worker.] A worker-ant with vestiges of wings. *Wheeler*, 1905.

Pteria^2 (tē'ri-ä̤), *n.* [NL., < Gr. *πτερόν*, feather.] A genus of schizodont prionodesmacean pelecypods characterized by aviculoid, bialate, inequivalve, oblique shells with alivincular ligament and radial ornamentation. Numerous species range from Devonian to recent formations.

Pteriacea (ter-i-ā'sẹ̄-ä̤), *n. pl.* [NL., < (?) Gr. *πτερίς*, a fern ? + *-acea.*] In Dall's classification, a superfamily of the prionodesmaceous pelecypod mollusks, with amphidetic area, filibranchiate or reticulate gills, free mantle-lobes without siphons, anterior adductor small or obsolete, and schizodont or edentulous hinge.

pterichthyoid (te-rik'thi-oid), *a.* and *n.* **I.** *a.* Having the characters of the genus *Pterichthys.*

II. *n.* A fish allied to the extinct genus *Pterichthys.*

pteridophytic (ter-i-dọ̄-fit'ik), *a.* [*pteridophyte* + *-ic.*] Having the character of a pteridophyte or representing such character.

> *Pteridophytic* types of embryogeny. *Bot. Gazette*, XXV. 305.

Pteridospermæ (ter″i-dọ̄-spėr'mē), *n. pl.* [NL. (Oliver and Scott, 1903), < Gr. *πτερίς* (*πτεριδ-*), a fern, + *σπέρμα*, a seed.] A class of fossil plants of the phylum *Pteridospermaphyta* (*Cycadofilices*), having the external aspect of ferns, but bearing true seeds. A considerable number of the most abundant Paleozoic plants formerly classed as ferns have already been found to be seed-bearing, including *Neuropteris, Odontopteris, Alethopteris*, and *Aneimites*; and others of this class are constantly being discovered.

Pteridospermaphyta (ter″i-dọ̄-spėr-ma-fī'tä̤), *n. pl.* [NL. (Ward, 1904), < Gr. *πτερίς* (*πτεριδ-*), a fern, + NL. *Spermaphyta.*] A great group or phylum of extinct plants, probably all Paleozoic, having the outward appearance of the *Pteridophyta*, but bearing seeds instead of macrospores, nearly equivalent to the *Cycadofilices*, but broader in its scope, including those resembling calamites and lepidophytes as well as ferns. It embraces three classes, the ★*Pteridospermæ*, the ★*Calamospermæ*, and the ★*Lepidospermæ* (which see).

pteridospermous (ter″i-dọ̄-spėr'mus), *a.* Belonging or relating to the class of plants *Pteridospermæ.*

Pterinea (te-rin'ẹ̄-ä̤), *n.* [NL., < Gr. *πτέρινος*, feathered, < *πτερόν*, feather.] A genus of primitive schizodont prionodesmacean pelecypods having two-winged, inequivalve, oblique shells, with obscure dentition, amphidetic external ligament, grooved area, and long straight hinge-line. The species range from Silurian to Carboniferous and are particularly abundant in Devonian formations.

pteritannic (ter-i-tan'ik), *a.* [Gr. *πτερίς*, fern, + E. *tannic.*] Noting a form of tannic acid supposed to exist in the male fern, *Dryopteris filix-mas.*

pterocarpin (ter-ọ̄-kär'pin), *n.* [*Pterocarp(us)* + *-in*^{2}.] A crystalline, neutral substance, $C_{20}H_{16}O_6$, found in red sandalwood, *Pterocarpus santalinus*, from which it is extracted with ether, after treatment with slaked lime.

Pterocarya (ter-ọ̄-kar'i-ä̤), *n.* [NL. (Kunth, 1824), < Gr. *πτερόν*, wing, + *καρύα*, walnut.] A genus of three or four species of ornamental deciduous trees of the family *Juglandaceæ.* They have large, alternate, odd-pinnate leaves, and small, greenish, monœcious flowers in pendulous catkins appearing with the leaves. They are trees of rapid growth and bear in summer and fall long drooping racemes of light-green fruits. Three species are known in cultivation, *P. fraxinifolia*, a native of Transcaucasia, *P. stenoptera* of China, and *P. rhoifolia* of Japan, an important forest tree.

Pterocera (te-ros'ẹ-rä̤), *n.* [NL., < Gr. *πτερόν*, wing, + *κέρας*, horn.] A genus of recent platypodous *Mollusca* with short spire, bent canal, and wing-like outer margin with tubular spinous processes.

Pterocerian (ter-ọ̄-sē'ri-ạn), *n.* [*Pterocera* + *-ian.*] In *geol.*, the basal substage of the Kimmeridgian stage of the Upper Jurassic system in France, characterized by the prevalent gastropod genus *Pterocera.*

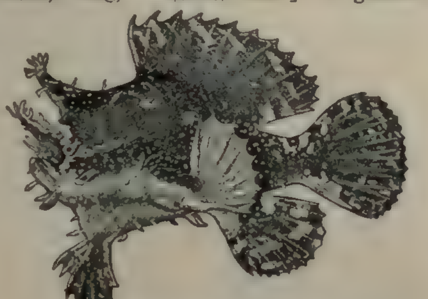
pteroglossal (ter-ọ̄-glos'ạl), *a.* [Gr. *πτερόν*, feather, + *γλῶσσα*, tongue, + *-al*^{1}.] Having a long, feathered tongue, as the toucans.

pteromorpha (ter-ọ̄-môr'fä̤), *n.*; pl. *pteromorphæ* (-fē). [NL., < Gr. *πτερόν*, wing, + *μορφή*, form.] One of the thin wing-like expansions of the skin in certain mites, as the *Oribatidæ.* *Nature*, Dec. 12, 1907, p. 142.

pterophorid (te-rof'ọ̄-rid), *n.* and *a.* **I.** *n.* A member of the lepidopterous family *Pterophoridæ.*

II. *a.* Having the characters of or belonging to the family *Pterophoridæ.*

Pterophryne (ter-ọ̄-frī'nē), *n.* [NL., < Gr. *πτερόν*, wing, + *φρύνη*, toad.] A genus of fishes of the family *Antennariidæ*, found about the West Indies and in the Gulf Stream.



Sargassum-fish (*Pterophryne tunida*).
(From Jordan's "Guide to the Study of Fishes.")

pteropodal (te-rop'ọ̄-dạl), *a.* [*pteropod* + *-al*^{1}.] Of or pertaining to the *Pteropoda*; made up of remains of pteropods: as, *pteropodal* limestone, which contains abundant shells of those animals.

pteropod-ooze (ter'ọ̄-pod-öz″), *n.* See ★*ooze.*

pterospore (ter'ọ̄-spōr), *n.* [Gr. *πτερόν*, wing, + *σπορά*, seed.] In *phytogeog.*, a term proposed by Clements for a plant the distribution of whose fruit or seeds is expedited by a wing, margin, or flattened shape.

pterothorax (ter-ō-thō'raks), *n.* [NL., < Gr. *πτερόν*, wing, + *θώραξ*, thorax.] The combined meso- and metathorax of a thysanopterous insect; that portion of the thorax that bears the wings.

> *Pterothorax* approximately as wide as abdomen, nearly cylindrical, narrowing abruptly in front, gradually behind. *Entomological News*, Nov., 1904, p. 293.

pterotic, *n.* **2.** Specifically, in fishes, a posterolateral ossification of the cranium. It forms (sometimes with the assistance of the opisthotic) the parotic process. It articulates with the parietal and epiotic at the side; the frontal and sphenotic anteriorly; the proötic and opisthotic below; and the exoccipital beneath the opisthotic. It assists the sphenotic in suspending the hyomandibular from the cranium.

pterygial, *a.* **II.** *n.* One of the small bones forming the basal support of the pectoral fins of bony fishes, lying between the fin-rays and the hypo- and hypercoracoid; an actinost.

> The feature of the *pterygials* being attached to the scapula and coracoid either directly or synchondrosially is worth notice. *Proc. Zool. Soc. London*, 1902, II. 291.

pterygiate (te-rij'i-āt), *a.* [*pterygium* + *-ate*^{1}.] Furnished with wings or wing-like flaps or appendages. *Annals and Mag. Nat. Hist.*, Aug., 1904, p. 108.

pterygion (te-rij'i-ọn), *n.*; pl. *pterygia* (-ä̤). [NL., < Gr. *πτερύγιον*, a little wing. See *pterygium.*] In *craniom.*, either of the extreme points of the pterygoid process, called *medial* and *lateral pterygion*, respectively. *Von Török.*

pterygiophore (te-rij'i-ọ̄-fōr), *n.* [Gr. *πτερύγιον*, wing, fin, + *-φορος*, < *φέρειν*, bear.] In fishes, one of the nodules of bone or cartilage between the dorsal and anal rays and their respective interspinous bones.

> I have not met with cartilages of this kind in any [other] fish which has come under my notice. . . . I regard them as representing a second or distal series of radials or *pterygiophores*, the interspinous bones forming the proximal series. *T. J. Parker*, in Trans. Zool. Soc. London, XII. 24.

pterygium, *n.* **4.** An instrument employed in the operation for the removal of a pterygium from the cornea.—**5.** A forward growth of the eponychium over the nail-plate.

Pterygogenea (ter″i-gọ̄-jē'nẹ̄-ä̤), *n. pl.* [NL., < Gr. *πτέρυξ* (*πτερυγ-*), wing, + *γένος*, kind.] In Brauer's system, one of the two main divisions of insects, including all the winged forms.

Pterygoid condyle. See ★*condyle.*

pterygoidal (ter-i-goi'dạl), *a.* and *n.* [*pterygoid* + *-al*^{1}.] **I.** *a.* Same as *pterygoid.*

II. *n.* A pterygoid muscle. *Scripture*, Exper. Phonetics, p. 230.

pterygoideum (ter-i-goi'dẹ̄-um), *n.*; pl. *pterygoidea* (-ä̤). [NL.] Same as *pterygoid.*—**Pterygoideum externum**, a bone in the skull of fishes which connects the palatine with the quadrate; the pterygoid.—**Pterygoideum internum**, a bone in front of the metapterygoid in the skull of fishes; the mesopterygoid.—**Pterygoideum posterius**, a bone in the skull of fishes usually connecting the hyomandibular with the mesopterygoid; the metapterygoid.

pterygophore (ter'i-gọ̄-fōr), *n.* [Gr. *πτέρυξ* (*πτερυγ-*), wing, + *-φορος* < *φέρειν*, bear.] See the quotation.

> It is held that the most primitive form of limb is simply a lateral skin fold extending along the whole body, and that into this certain cartilaginous processes, or rays (actinophores of Ryder, *pterygophores* of Parker), extend. *Buck*, Med. Handbook, IV. 480.

pterygopodium (ter″i-gọ̄-pō'di-um), *n.*; pl. *pterygopodia* (-ä̤). [NL., < Gr. *πτέρυξ* (*πτερυγ-*), wing, + *πόδιον*, dim. of *πούς*, foot.] In *ichth.*, a clasper-part of a ventral fin modified as an intromittent organ, as in sharks and their allies. [Rare.]

pterylium (te-ril'i-um), *n.*; pl. *pterylia* (-ä̤). [NL.] Same as *pteryla.*

pterylological (ter-i-lọ̄-loj'i-kạl), *a.* [**pterylolog(y)* + *-ic-al*^{1}. See *pteryla.*] Relating to or connected with the arrangement of the feather-tracts.

Ptg. An abbreviation (*a*) of *Portugal*; (*b*) of *Portuguese.*

ptilinum (ti-lī'num), *n.*; pl. *ptilina* (-nä̤). [NL., < Gr. *πτίλον*, a feather, a wing, a wing-like membrane.] A bladder-like expansion of the head of nearly half of the dipterous insects when just emerged from the puparium. It is capable of great dilation and is probably of service in helping to rupture the puparium. It disappears after emergence, and its position is represented by the lunula.

Ptilota, *n. pl.* **2.** *sing.* A genus of the red algæ, common on both the Atlantic and the Pacific coast. Popularly known as *featherweed.* *C. Agardh*, 1823.

ptinid (tin'id), *n.* and *a.* **I.** *n.* A member of the coleopterous family *Ptinidæ.*

II. *a.* Having the characters of or belonging to the family *Ptinidæ.*

ptomatin (tō'mạ-tin), *n.* [Gr. *πτῶμα(τ-)*, a corpse, + *-in*^{2}.] Same as *ptomaïne.*

ptomatropin (tō-mat'rọ̄-pin), *n.* [Gr. *πτῶμα*, corpse, + E. *atropin.*] A poisonous basic substance found in putrefying meat, resembling atropin in its effects upon the animal body. *Science*, Feb. 7, 1908, p. 222.

ptosic (tō'sik), *a.* Same as *ptotic.* *Med. Record*, Oct. 19, 1907, p. 640.

ptosis, *n.* **2.** A falling down or prolapse of any of the abdominal viscera. Also called *Glenard's disease* and *enteroptosis.* *Med. Record*, Oct. 10, 1903, p. 589.

ptyalinogen (tī-ạ-lin'ọ̄-jen), *n.* [*ptyal(in)* + *-o-* + *-gen.*] The proenzym of ptyalin.

ptyalose (tī'ạ-lōs), *n.* [*ptyal(in)* + *-ose.*] Maltose formed by the action of ptyalin on starch.

Ptychocheilus (tī-kọ̄-kī'lus), *n.* [NL., < Gr. *πτύξ* (*πτυχ-*), a fold, + *χεῖλος*, lip.] A genus of large fishes of the family *Cyprinidæ*, found in fresh waters of the western United States.

Ptycholepis (tī-kol'e-pis), *n.* [Gr. *πτύξ* (*πτυχ-*), a fold, + *λεπίς*, a scale.] An extinct genus of ganoid fishes of the family *Eugnathidæ*, having the head and opercular bones ornamented with ridges of ganoin, minute teeth, and thick scales, much longer than deep, grooved longitudinally on the outer side. It occurs in the Upper Lias of Europe and the Trias of Carinthia and of Connecticut.

Ptychoparia (tī-kọ̄-pā'ri-ä̤), *n.* [NL., < Gr. *πτύξ* (*πτυχ-*), a fold, + *παρειά*, cheek.] A genus of opisthoparian trilobites allied to *Olenus*, found in Cambrian formations.

ptychopterygial (tī″kop-te-rij'i-a̤l), *a.* [*ptychopterygi(um)* + *-al*^{1}.] Relating to or having the form of a ptychopterygium, or primitive type of fin. *Proc. Zool. Soc. London*, 1898, p. 347, note.

ptychopterygium (tī″kop-te-rij'i-um), *n.*; pl. *ptychopterygia* (-ä̤). [NL., ‹ Gr. *πτύξ* (*πτυχ-*), a fold, *πτερύγιον*, a little wing.] A primitive type of fin, formed by a fold of the skin, and having a triangular shape.

> In Cladoselache the fin is low, with a very long base, like a fold of skin (*ptychopterygium*), and composed of feeble rays.
> *D. S. Jordan*, Guide to Study of Fishes, I. 510.

ptychotis-seed (tī-kō'tis-sēd), *n.* The seed of *Ptychotis involucrata*, an umbelliferous plant, used in India by the natives as a condiment, and medicinally as a carminative.

Ptygmatis (tig'ma̤-tis), *n.* [NL., ‹ Gr. *πτύγμα(τ-)*, anything folded, ‹ *πτύσσειν*, fold.] A genus of fossil gastropods of the family *Nerineidæ*, having high, turreted, spiral shells with complicately ridged columellar and stomal surfaces: found in Jurassic and Cretaceous rocks.

ptyocrinous (tī-ok'ri-nus), *a.* [Gr. *πτύον*, a fan (for winnowing), + *κρίνειν*, separate, + *-ous.*] In *cytol.*, of or pertaining to gland-cells which accumulate their secretion in the cytoplasm in the form of droplets and then permit it to escape by breaking through the surface cytoplasm, as, for example, in the goblet-cells of the intestine: opposed to ⋆*diacrinous.*

puaiohi (pö″ī-ō'hē̤), *n.* [Hawaiian.] A thrush-like bird, *Phæornis palmeri*, of Kauai, Sandwich Islands.

puapua (pö″ä-pö'ä), *n.* [Native name.] In Samoa, *Guettarda speciosa*, a small littoral tree bearing axillary clusters of fragrant flowers. See ⋆*buabua, pigeonwood* (*c*), and *zebra-wood*, 2.

pub. An abbreviation (*d*) of *published*; (*e*) of *publication.*

pubertal (pū'bėr-ta̤l), *a.* [*pubert(y)* + *-al*^{1}.] Relating to, resulting from, or occurring simultaneously with puberty.

> There is perhaps a little increase at seven, and a certain and almost universal retardation, most marked about the tenth year, but extending over several years; this depression in the curve some have wrongly thought complemental to its elevation during the period of *pubertal* increase. *G. S. Hall*, Adolescence, I. 5.

puberulous (pu̇-ber'ọ̈-lus), *a.* [NL. **puberulus*, dim. of L. *puber*, downy.] Having very short, soft hairs; puberulent.

Pubic bones, pelvic bones; the bones which support the ventral fins of fishes.

publication, *n.* **5.** In *systematic biol.*, the distribution, in print, of the name of a species, genus, or other biological group, in accordance with certain technical requirements. To constitute publication of a species name, it is required that it shall be accompanied by a description or by a citation of a description. To constitute publication of a genus name, it is required in addition that it shall be associated with a species whose name is published at the same or at an earlier time. A writer who uses a new name without complying with the technical requirements of publication is said to *propose* the name. A subsequent writer may *adopt* such a name by citing it and completing its publication. In botany, by reason of the initial date for the application of the law of priority, genus and species names in works prior to 1753 are regarded as proposed but not published. See *law of priority*, under ⋆*law*^{1}.

publish, *v. t.* **6.** In *systematic biol.*, to give technical publication to. See ⋆*publication*, 5.

puca, *n.* [Ir. *pūca.* See *puck.*] Same as ⋆*pooka.*

Pucciniaceæ (puk-sin-i-ā'sē̤-ē), *n. pl.* [NL., ‹ *Puccinia* + *-aceæ.*] The largest family of the order *Uredinales*, commonly called rusts. The principal genera are *Gymnosporangium, Uromyces, Puccinia*, and *Phragmidium.* All its members are parasitic and many of the fungous diseases of cultivated plants are caused by them.

pucciniaceous (puk-sin-i-ā'shius), *a.* Belonging to the family *Pucciniaceæ*, or resembling fungi of that family.

puccoon, *n.*—**Indian puccoon**, the hoary puccoon, *Lithospermum canescens.* See *Indian* ⋆*paint.*

puce, *a.* **II.** *n.* A purple-brown or reddish-brown color.—**Alizarin puce**, a color obtained when alizarin is applied with a mixture of aluminium and iron mordants.

puce-lead (pūs'led), *n.* Lead dioxid or brown oxid of lead, PbO_2.

puceron (pös-roṅ'), *n.* [F.] A plant-louse; any member of the homopterous family *Aphididæ*: adopted into English to some extent.

puck, *n.* **4.** A disk of rubber used in place of a ball in hockey.

pucka, *a.* **II.** *n.* A coin: as, a *pucka* pice. It sometimes denotes a coin of double weight and sometimes one from the government mint.

pucker-struck (puk'ėr-struk), *a.* [*pucker*, a gather in a dress, a frill, + *struck.* Compare *stage-struck.*] Excessively fond of finery or adornment. *Sarah R. McL. Greene*, Flood-tide, xxxiii. [Coast of Maine.]

pudding, *n.* **4.** The joint of an electric cable inside a junction-box.—**Bird's-nest pudding**, a pudding consisting of apples oaked in milk to which eggs and flour have been added.—**Nesselrode pudding**, a rich frozen dessert containing chestnuts, sometimes almonds, and candied fruits finely divided: served with whipped cream or a wine sauce.

pudding (pu̇d'ing), *v. t.* To draw together and join inside in a junction-box, as an electric cable.

pudding-ball (pu̇d'ing-bâl), *n.* An Australian fish resembling a mullet. The name is a corruption of the aboriginal *puddinba*, by the law of hobson-jobson. *E. E. Morris*, Austral English.

pudding-granite (pu̇d'ing-gran″it), *n.* Same as *orbicular granite.* See ⋆*orbicular*, 5.

pudding-mat (pu̇d'ing-mat), *n.* *Naut.*, a round, bag-shaped fender of interwoven rope, filled with granulated cork, oakum, hemp or manila fiber, etc. It is used to protect a vessel's sides from a towboat or from the sides of a dock when entering a slip.

pudding-opium (pu̇d'ing-ō″pi-um), *n.* See ⋆*opium.*

puddle^1, *n.* **3.** A mixture of soil or mold and water forming thin mud, in which the roots of young trees are dipped to retard drying out during transplanting.

puddle^1, *v. t.* **4.** To dip (the roots of young trees) in puddle or thin mud.

puddler, *n.* **2.** A device or machine for stirring the fused metal in a puddling-furnace.

puddlers'-mine (pud'lėrz-mīn), *n.* A fettling mixture made by wetting up red hematite with water, which is used to smooth over the lining of puddling-furnaces.

puddle-wall (pud'l-wâl), *n.* See ⋆*hearting*, 2 (*b*).

puddling-train (pud'ling-trān), *n.* A set of two pairs of rolls in a rolling-mill. One pair, known as *puddling-rolls*, is used for consolidating the blooms after their removal from the hammer or the squeezer, and the second, known as *mill-rolls*, is used for rolling into bars the masses of iron as they come from the balling- or reheating-furnace, where they go from the puddling-rolls. See *forge-train. Phillips and Bauerman*, Elements of Metallurgy, p. 329.

Pudendal sac. See ⋆*sac*^{2}.

pudiano (pö-di-ä'nō), *n.* [Amer. Sp. *pudiano* (Marcgrave, 1648), a variant of *bodiano* = Pg. bodião (NL. *bodianus*), name of a fish; said to be connected with F. *boudin*, E. *pudding.* See *pudding.*] A name applied to certain fishes of the family *Labridæ*, as the ladyfish, *Bodianus rufus*, in Brazil, and the pudding-wife.

pueblan (pöeb'la̤n), *a.* [*puebl(o)* + *-an.*] Of or pertaining to a pueblo or the Pueblos: as *pueblan* architecture.

Pueblo pottery. See *American* ⋆*pottery.*

puebloan (pöeb'lọ̄-a̤n), *n.* [*pueblo* + *-an.*] Same as ⋆*pueblan.*

Puella (pu̇-el'ä̤), *n.* [NL., ‹ L. *puella*, a girl: a translation of the Bohem. *panenka*, by which the genus was designated by Barrande.] A genus of taxodont paleoconch pelecypods, found in the Devonian rocks.

pueo (pö-ā'ō), *n.* [Hawaiian.] A small owl, *Asio accipitrinus sandwichensis*, of the Sandwich Islands, a geographic race of the North American short-eared owl.

puer (pū'ėr), *n.* [Also *pure*: origin obscure.] **1.** The droppings of dogs. [Prov. Eng.]—**2.** In *tanning*, an infusion of the dung of dogs, fowls, or pigeons, used to soften the skins after liming and preparatory to tanning. Also known as *bate.* The soaking in such an infusion is called *puering* or *bating.*—**Puer run**, in *tanning*, an injury to the skin caused by the action of the puer. *C. T. Davis*, Manuf. of Leather, p. 155.

puer (pū'ėr), *v. t.* [*puer* , *n.*] In *tanning*, to cleanse with a bate of dog's dung.

Pueraria (pū-e̤-rā'ri-ä̤), *n.* [NL. (De Candolle, 1825), named in honor of Marc Nicolas *Puerari*, a correspondent of de Candolle.] A genus of climbing herbs or shrubs including about 15 species and belonging to the family *Fabaceæ.* They are characterized by the tumid nodes, 3-foliate leaves, and blue or purplish flowers with monadelphous stamens and beardless style, disposed in long, dense, sometimes compound racemes. The species are natives of tropical Asia, Japan, and New Guinea, and three have been introduced into cultivation for ornament. The roots of *P. Thunbergiana* are fleshy and yield a good quality of starch, and in Japan the tough fiber of the inner bark is manufactured into a fine and remarkably strong cloth. See *Ko* ⋆*hemp.*

Puerco group. See ⋆*group*^{1}.

pueril, *a.* A simplified spelling of *puerile.*

puering (pū'e̤-ring), *n.* [*puer* .] The process of treating skins by means of puer; bating. *Modern Amer. Tanning*, p. 45.

puerpera (pu̇-ėr'pe̤-rä̤), *n.* [L., ‹ *puer*, child, + *parere*, bring forth.] A lying-in woman.

puersman (pū'ėrz-ma̤n), *n.* [*puer* + *-s* + *man.*] One who attends to the puering or bating of skins. *Flemming*, Practical Tanning, p. 257.

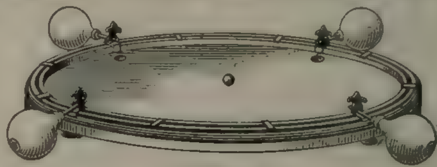
puf, *v.*, *n.*, and *interj.* A simplified spelling of *puff.*

puff, *v. i.* **5.** In *bot.*, to discharge suddenly a cloud of spores, as frequently occurs in certain fungi.

> Many of the Discomycetes have the peculiar habit of *puffing* if they are shaken or if the chamber in which they have been kept is opened.
> *De Bary* (trans.), Fungi, p. 89.

puff, *n.*—**Veiled puff**, a modification of cavernous respiration, heard on auscultation, in which one can imagine a sound as of a light cloth moving to and fro with the air in the lung-cavity.

puff-billiards (puf'bil″yä̤rdz), *n.* A game played on a circular board surrounded by a frame bearing metal brackets opposite the pockets. The players take positions at the brackets, and by means of rubber blowers seek to force a cork ball into their opponents' pockets. It is a game requiring considerable skill.



Puff-billiards.

> Mrs. . . . is said to have invented *puff-billiards*, but the great mind who is responsible for ping-pong has yet to be discovered. *Com. Advertiser*, May 11, 1901.

puffer, *n.*—**Sharp-nosed puffer**, a member of the family *Canthigasteridæ*, found in tropical seas.—**Southern puffer**, *Spheroides spengleri*, a fish common in the West Indies and on the coast of the southern United States.

puffin, *n.* **3.** A name wrongly applied to the Manx shearwater, *Puffinus anglorum.*—**Horned puffin**, *Fratercula corniculata*, a species having a small horny appendage on the upper eyelid, found on both sides of the northern Pacific.

puffinet (puf'i-net), *n.* [Dim. of *puffin.*] A local English name for the black guillemot, *Cepphus grylle.*

puffing-hole (puf'ing-hōl), *n.* Same as ⋆*blow-hole*, 5. *Geikie*, Text-book of Geol., p. 569.

puff-shark (puf'shärk), *n.* A shark, *Catulus uter*, belonging to the family *Scylliorhinidæ*, found on the coast of California.

> The curious *puff shark* uttered a deep grunt when it was taken from the water. I heard this sound one day while on the beach at Avalon, and although I recognized it, I could not see the fish. Finally after hearing it repeated a number of times I traced it to a hook near by where a fisherman had, with the usual indifference to the feelings of sharks, hung the fish by the gills.
> *Sci. Amer. Sup.*, Nov. 15, 1902, p. 20323.

Puget series. See ⋆*series.*

pugger (pug'ėr), *n.* [*pug*^{3}, *v.*, + *-er*^{1}.] A worker in a pug-mill; one who feeds a pug-mill with clay.

puggrie, *n.* See *pugree.*

puggy (pug'i), *a.* [*pug*^{1} + *-y*^{1}.] Like a monkey.

> Troth, . . . my affection for my king, God bless the *puggy* face of him, is under more control.
> *R. L. Stevenson*, Catriona, x.

pug-moth (pug'môth), *n.* Same as *pug*^{1}, 7.

pugua (pö'gwä), *n.* [Chamorro name.] In Guam, the betel-nut palm, *Areca Cathecu*, the nuts of which together with the leaves of the betel-pepper and a pinch of slaked lime, are used as a masticatory called *mamao*. See ★*bonga* and *areca-nut*.

Puiseux diagram. See ★*diagram*.

puja (pö'jä), *n.* [Also *pujah, pooja, poojah*; < Hind. *pūjā*, < Skt. *pūjā*, honor, respect, worship, < √ *pūj*, honor, respect.] A Hindu rite or ceremony of religion. *Yule and Burnell*, Hobson-Jobson.

pukeko (pö'kā-kō), *n.* [Maori.] The purple coot, or water-hen, *Porphyrio melanotus*, of New Zealand.

pukras, *n.* Same as *pucras*.

pul¹ (pöl), *n.* [F., < L. *pulsus*, a pushing.] In *phys.*, a proposed unit for the measurement, in the French system, of the time integral of forces; one dyne acting for one second.

pul², *v.* and *n.* A simplified spelling of *pull*.

Pulaski shales. See ★*shale*².

pulaskite (pū-las'kīt), *n.* [*Pulaski* county, Arkansas, + *-ite*².] In *petrog.*, a phaneric igneous rock composed of tabular soda-orthoclase (cryptoperthite) with subordinate amount of hornblende and biotite, and a little diopside, nephelite, sodalite, and accessory minerals. It is a syenite with trachytic texture, containing a little nephelite. *J. F. Williams*, 1890.

pulegone (pū'lẹ-gōn), *n.* [NL. *puleg*(*ium*) + *-one*.] An oily unsaturated ketone related to the terpenes, $(\mathrm{CH_3})_2\mathrm{C{:}C}\!<\!\begin{matrix}\mathrm{CO.CH_2}\\ \mathrm{CH_2.CH_2}\end{matrix}\!>\!\mathrm{CH.CH_3}$, found in the oils of Spanish and American pennyroyal (*Mentha Pulegium* and *Hedeoma pulegioides*), etc. It has an odor resembling peppermint.

pulgada (pöl-gä'dä), *n.* [Sp. *pulgada*, < *pulgar*, the thumb, < L. *pollicaris*, adj., < *pollex*, thumb.] A Spanish and Spanish-American measure of length, equal to the twelfth part of the pié, or to nearly one English inch.

pulicid (pụ-lis'id), *n.* and *a.* **I.** *n.* A member of the aphanipterous family *Pulicidæ*.

II. *a.* Having the characters of or belonging to the family *Pulicidæ*.

pull, *v. t.* **14.** In *cricket*, to hit (a short ball pitched on the wicket or on the off side), with a horizontal bat, so as to send (it) round to the on side. **To pull off**, to bring about or carry through; complete successfully. [Slang.]

> The national shoot will be conducted by the combined bodies, and it is believed that one of the most successful meets in the history of shooting can be *pulled off*.
> *Forest and Stream*, Jan. 24, 1903, p. 78.

To pull one's leg, to take in; fool; deceive by a plausible tale or statement. [Slang.]

> "B.-P." always says that the Polynesian traveller with the numerous wives and family to keep was the only man who ever really *pulled his leg!*
> *Julian Ralph*, in War's Brighter Side, xv.

To pull the ball, in *golf*, to play a ball with a curve toward the left with a right-handed player or toward the right with a left-handed player.

pull, *n.* **9.** In *cricket*, a stroke made with a horizontal bat, by which a short ball pitched on the wicket or to the off side is hit round to the on side. *Hutchinson*, Cricket, p. 53.—**10.** In *golf*, a stroke such that the ball describes a curve toward the left with a right-handed player, or toward the right with a left-handed player. See also ★*hook*, 10.—**Long pull**, in *printing*, the pull of the bar-handle of a hand-press against the side frame that develops the full power of the press. The pull that stops before the full power is developed is known as the *short pull*.

pull-boat (pu̇l'bōt), *n.* A flatboat used in logging cypress.

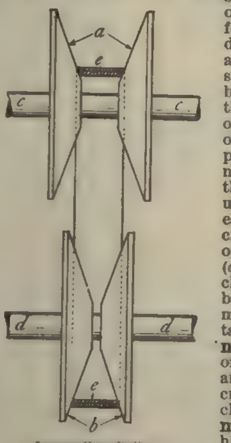
> In the cypress swamps of Louisiana there are employed what are known as *pull-boats*, an evolution from the plan of placing a hoisting engine upon a scow and snaking the logs out of the swamp. By this plan the logs, which are drawn in at the rate of 600 feet a minute, are capped with steel cones, which prevent them from imbedding in the soft ground or catching against obstructions. The endless-rope *pull-boat* engines have 44-inch winding drums, and each weighs 33,000 pounds.
> *Sci. Amer.*, Oct. 17, 1903, p. 276.

puller, *n.* **2.** In *turpentining*, a long-handled hack used for chipping faces too high to be reached with the ordinary hack.

puller-in (pu̇l'ėr-in″), *n.* One who is employed to induce passers-by to enter a shop and purchase.

pullery (pu̇l'ẹ-ri), *n.* [*pull* + *-ery*.] A room or factory where the hair or wool is removed from skins. *Flemming*, Practical Tanning, p. 1.

pulley, *n.*—**Antifriction pulley**, a pulley with an antifriction block (which see, under *antifriction*).—**Expanding pulley**, a mechanical device for varying the speed of a belt by running it on a larger or smaller circumference. There are many such devices, one of the best being a pair of steep cones on each shaft with the belt running between these, the edge of the belt touching each. As one pair of cones is closed the other pair is separated proportionately by a suitable mechanism. In other forms, the conical surfaces are made up of separate elements of each cone which interlace or cross each other between their opposing faces.—**Idle pulley.** (*a*) A pulley which merely changes the direction of the belt. (*b*) A pulley which merely tightens the belt but takes off no power.—**Magnetic pulley**, a chain-sheave or pulley inside of which is an electromagnet which increases the adhesion of the chain to the pulley.—**Segmental pulley.** (*a*) A pulley having an incomplete rim, or one which is only a segment of a circle, and which can make only a portion of a revolution. (*b*) A pulley built up of segments or sectors.—**Split pulley.** (*a*) A pulley made in two parts, which are bolted together for convenience in placing it on and removing it from the shaft. (*b*) A segmental pulley; a pulley made in two or more sectors for convenience in casting. **Spring pulley**, a pulley having a wrought-iron or steel rim which is cut through at one point, and a split hub, the openings being in line, to allow it to pass over enlarged portions of a shaft.—**Standing pulley**, the stationary pulley-block of a compound hoist; a fixed pulley.



Expanding Pulley.

a, pair of driving-cones; *b*, pair of driven cones; *c*, driving-shaft to which *a a* are keyed and on which they approach or separate; *d*, driven shaft on which *b b* are similarly attached; *e*, belt of lateral stiffness pressed sidewise as *a a* and *b b* are brought together reciprocally, so as to bear by frictional contact at surfaces nearer the axis of *c* or *d* or farther therefrom reciprocally.

pulley-cone (pu̇l'i-kōn), *n.* A grooved cone of wood or metal, constituting a series of pulleys of gradually increasing diameter. *Harvard Psychol. Studies*, I. 417.

pulley-lathe (pu̇l'i-lāᴛʜ), *n.* **1.** An engine-lathe having a large chuck for holding pulley castings while they are being bored and faced. —**2.** A lathe having a gap in the bed, used for turning and finishing pulleys; a wheel-lathe.

pulley-stile (pu̇l'i-stīl), *n.* In a window-frame or sliding sash, the upright member in which the pulley is fitted and upon which the sash slides up and down.

pull-foot (pu̇l'fu̇t), *v. i.* To run; hurry. [Slang.]

pulling-bar (pu̇l'ing-bär), *n.* A draw-bar; the bar to which the coupler is fastened. *J. G. A. Meyer*, Modern Locomotive Construction, p. 528.

pulling-hitch (pu̇l'ing-hich), *n.* *Naut.*, a slip-hitch which may easily bed is engaged; also, a certain hitch and number of turns made about a spar or cask, which will cause the latter to roll over and over when the hauling part of the rope is pulled upon.

pulling-roll (pu̇l'ing-rōl), *n.* A feeding-roll; a roll which pulls material into a machine. *Engin. Mag.*, June, 1904, p. 1.

Pullman (pu̇l'man), *n.* [Short for *Pullman car*, such cars being built and operated by a company bearing the same name, which is that of the original inventor or promoter.] In *car-building*, a parlor- or sleeping-car, specifically, and properly, one made by the Pullman Company.

pull-rod (pu̇l'rod), *n.* A rod which transmits a pull; a rod which is subjected only to tension; a link.

> The brake is operated by a lever and catch-rack through *pull rods* with levers below the body of the brougham, to a pair of pulley straps with friction on pulleys fixed to the motor shafts. *Hiscox*, Horseless Vehicles, p. 292.

pull-sensation (pu̇l'sen-sā″shọn), *n.* In *psychol.*, the sensation aroused by pull or traction upon the skin. It is not qualitatively different from the sensation aroused by adequate stimulation of a pressure-spot. *Baldwin*, Dict. of Philos. and Psychol., II. 397.

pullulative (pul'ụ-lạ-tiv), *a.* [*pullulate* + *-ive*.] Budding; causing to bud.

pulmobranch (pul'mọ-brangk), *n.* One of the *Pulmobranchiata*.

pulmonal (pul'mọ-nạl), *a.* [NL. **pulmonalis*, < L. *pulmo*(*n-*), lung.] Same as *pulmonary*. *Buck*, Med. Handbook, V. 607.

Pulmonary cavity, the cavity which contains the breathing-organ or 'lung' of a pulmonate mollusk or spider. Also called *pulmonary chamber* or *sac*.—**Pulmonary chamber.** See ★*pulmonary cavity*.—**Pulmonary docimasy.** See ★*docimasy*.—**Pulmonary heart.** Same as *right* ★*heart*.—**Pulmonary insufficiency.** See *valvular* ★*insufficiency*.—**Hypertrophic pulmonary osteoarthropathy.** See ★*osteoarthropathy*.—**Pulmonary pulse**, the second sound of the heart as heard over the pulmonary valve.—**Pulmonary sac.** (*b*) In *Mollusca*. See ★*pulmonary cavity*.

pulmonitis (pul-mọ-nī'tis), *n.* [NL., < L. *pulmo*(*n-*), lung, + *-itis*.] Inflammation of the lungs.

pulmotrachea (pul-mọ-trā'kẹ-ä), *n.*; pl. *pulmotracheæ* (-ē). [NL., < L. *pulmo*(*n-*), lung, + *trachea*.] A lung-sac of a spider.

pulmozym, pulmozyme (pul'mọ-zim), *n.* [L. *pulmo*, lung, + Gr. ζύμη, ferment.] A preparation of lung-tissue, suggested for therapeutic purposes. *Buck*, Med. Handbook, VI. 417.

pulp, *n.* (*g*) Fruit prepared to be made into marmalade.

> A jam factory is worked in conjunction with the fruit farm. *Pulp* is not made except when there is a glut of fruit. *Encyc. Brit.*, XXVIII. 532.

Pulp of the finger, the fleshy cushion at the tip of the finger.

pulpa (pul'pä), *n.* [L. *pulpa*, flesh, pulp.] The mass of connective-tissue cells, odontoblasts, nerve-cells, and blood-vessels lying within the cavity of a tooth or placoid selachian scale, from which the dentin of the tooth or scale is produced. Usually termed *pulp*. See *pulp* (*d*).

pulp-assay (pulp'ạ-sā″), *n.* In *metal.*, the assay of samples taken from the pulp after or during crushing.

pulp-beam (pulp'bēm), *n.* A device for ascertaining the percentage of weight of water in paper-pulp.

pulp-canal (pulp'kạ-nal″), *n.* See ★*canal*¹.

pulpifaction (pul-pi-fak'shọn), *n.* [L. *pulpa*, pulp, + *factio*(*n-*), a making, < *facere*, make.] Reduction to the condition of a pultaceous mass.

pulpification (pul″pi-fi-kā'shọn), *n.* [L. *pulpa*, pulp, + *-ficatio*(*n-*), < *-ficare*, < *facere*, make.] Same as ★*pulpifaction*. *Buck*, Med. Handbook, I. 17.

pulpit, *n.* **3.** In *mech.*: (*a*) The elevated platform or gallery from which the operation of a large central electrical station for power or lighting is supervised. [Slang.]

> Each of these is connected by shaft and gear under the floor with the gearing actuated by the rheostat wheel on the generator panel, so that the field current can be regulated either from the *pulpit* or from the switchboard.
> *Elect. World and Engin.*, Jan. 23, 1904, p. 166.

(*b*) A raised platform on which the operator of a machine stands so that he may oversee the machine as it works, or the process as it advances.

> The operator of the hoisting motor stands in a *pulpit* above the floor and by means of the large rheostat controller brings each skip in succession opposite the mouth of the hopper above the main crushing roll.
> *Elect. World and Engin.*, Dec. 26, 1903, p. 1051.

Pulpit spectacles. See ★*spectacle*.

pulpitis (pul-pī'tis), *n.* [NL., < L. *pulpa*, pulp, + *-itis*.] Inflammation of the dental pulp. *Sci. Amer.*, Dec. 20, 1902, p. 441.

pulp-mill, *n.* **2.** A mill or factory where wood-pulp is made for the manufacture of paper.

> With few exceptions, the *pulpmills* in making their returns, sent in their figures expressed in cords, as their purchases of timber are made that way, most of their logs being cut in lengths of four feet.
> *N. Y. State Forest, Fish and Game Commission*, [Seventh Rep., 1901, p. 24.

3. A paper-mill in which paper is made from wood-pulp.

pulpo (pöl'pọ̄), *n.* [Sp. *pulpo*, F. *poulpe*, < L. *polypus*, < Gr. πολύπους, polyp: see *polyp*, *polypus*.] The Spanish and Spanish-American name for the octopod.

pulp-stone (pulp'stōn), *n.* A stone used in grinding wood to a pulp for use in the manufacture of paper. A particular quality of sandstone capable of being operated in hot water is used. The best pulp-stones are made in Ohio, or are imported from Newcastle-upon-Tyne, England.

> *Pulpstones* differ from grindstones in having a much broader face (being much thicker). The stones are usually from 48 to 56 inches in diameter and 16 to 26 inches in thickness, weighing from 2,300 to 4,800 pounds.
> *J. H. Pratt*, in Mineral Resources of U. S., U. S. Geol. [Surv., 1900, p. 789.

pulp-wood (pulp′wůd), *n.* Wood from which pulp is to be made. It may be in large pieces as first cut, or in small pieces ready to be ground in the pulp-mill. Poplar is preferred for this purpose, but pine, fir, and beech are used.

pulsational (pul-sā′shọn-al), *a.* [*pulsation* + *-al*1.] Pertaining to or of the nature of pulsation; throbbing; characterized by pulsation. *Trans. Amer. Inst. of Elect. Engin.*, 1904, p. 420.

pulse1, *n.* 5. In *phys.*, a proposed unit for the measurement of the time-integral of forces.

> In the British system this is that of one poundal acting for one second and is called 1 *pulse*.
> *Jude*, Physics, Experimental and Theoretical, I. 41.

Anadicrotic pulse, a pulse in which the ascending limb of the tracing shows two notches.—**Bamberger's pulse,** a pulsation in the jugular vein.—**Capillary pulse,** alternate redness and pallor of an area of skin or of the bed of the finger-nails, observed sometimes in cases of aortic regurgitation.—**Catacrotic pulse,** a pulse in which the highest wave is not the last, the descending limb of the pulse-curve showing a notch.—**Catadicrotic pulse,** a pulse in which two notches occur in the descending limb of the tracing.—**Decurtate pulse,** a pulse which progressively diminishes in strength until it finally ceases.—**Kussmaul's pulse.** Same as *paradoxical* ★*pulse*.—**Paradoxical pulse,** a pulse that becomes faint during inspiration and is of full strength during expiration, although there is no variation in the strength of the heart's action.—**Quincke's pulse,** a deepening of the pink under the nails, occurring synchronously with the radial pulse.—**Running pulse,** a pulse with but small excursions, and those sometimes irregular and oscillating, as when the blood-stream is in insufficient volume to fill completely a relaxed artery.—**Stokesian pulses,** in *phys.*, ether-waves of extremely short length emanating from surfaces that are subjected to cathodic bombardment. X-rays have been thus designated by Crookes.—**Trembling** or **tremulous pulse.** Same as *running* ★*pulse*.—**Trigeminal pulse,** a sequence of three regular pulse-beats followed by an intermission.—**Water-hammer pulse.** Same as *Corrigan's pulse* (which see, under *pulse*1).

pulse-valve (puls′valv), *n.* A local name of a check-valve which takes up the pulsations of a pump. *H. M. Wilson*, Irrigation Engineering, p. 515.

pulse-wave, *n.* 2. In *hydrodynam.*, a wave of compression in a pipe containing liquid, caused by periodic interruptions or fluctuations in the flow.

pulsific, *a.* **II.** *n.* A medicinal agent which increases the pulse.

pulsilogium (pul-si-lō′ji-um), *n.*; pl. *pulsilogia* (-ạ̈). [L. *pulsus*, pulse, + Gr. *-λογιον*, < *λόγος*, reckoning.] Same as *pulsimeter*.

pulsilogy (pul-sil′ọ̄-ji), *n.* [NL. *pulsilogium*.] Same as *pulsimeter*.

Pulsion diverticulum. See ★*diverticulum*.

pulsus, *n.*—**Pulsus bisferiens,** a markedly dicrotic pulse in which the waves are of nearly equal height.—**Pulsus deficiens,** a pulse in which there is an occasional intermittence owing to failure of the ventricle to contract.—**Pulsus intercidens,** a pulse in which there is an intercurrent beat.—**Pulsus pseudointermittens,** a pulse in which there is an occasional intermittence due to a feeble contraction of the ventricle.—**Pulsus rarus,** slow pulse.

pulverin, *n.* 2. A yellow crystalline substance which occurs in the lichen *Pulveraria latabratum*.

pulverization, *n.* 2. The reduction of liquids in the form of spray and the projection of the latter with force upon the surface of the body.

> Various sprays and *pulverizations* for nasal and faucial troubles. *Buck*, Med. Handbook, I. 736.

pulverizing-mill, *n.* 2. In *candy-making*, a power-machine for reducing granulated sugar to the extremely fine flour of sugar used in sweetening chocolate. It is essentially a centrifugal mill with an air-blast for removing dust and discharging the finished flour into barrels.

pulvic (pul′vik), *a.* [Anagram of *vulpic* (acid).] Related to vulpic acid.—**Pulvic acid,** an orange powder or brown crystalline acid, $C_{18}H_{12}O_5$, made by boiling vulpic acid with milk of lime. It melts at 214–215° C., and at a higher temperature yields water and *pulvic anhydrid*, $C_{18}H_{10}O_4$, a light-yellow crystalline substance. It melts at 220–221° C.

pulvinar, *n.* 4. In *Greco-Roman arch.*, a pillow-shaped or cushion-shaped detail; especially, in an Ionic capital, the drooping curve which joins two volutes on the same side.

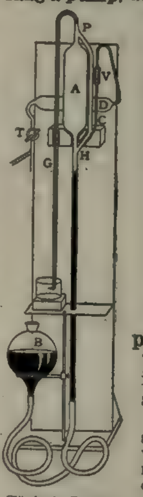
pulvis (pul′vis), *n.* [L.: see *powder*.] Powder.

puma, *n.* 1. Several species of puma have been recognized, besides local races or subspecies. The Florida form is *Felis coryi*, the large animal from Oregon and the northwest *F. oregonensis*, the eastern puma *F. cougar*, the term *concolor* being restricted to the species from Brazil and the adjoining region.

pumice, *n.*—**Artificial pumice,** a mixture of ground sandstone and clay, manufactured at Bietigheim, in Germany, as a substitute for natural pumice of volcanic origin: used in polishing metal, lithographic stones, wood, wax-cloth, and other materials.

pumiced (pum′isd or pū′misd), *a.* Noting a diseased condition or degeneration of the inside portions (laminæ) of the hoof and sole of horses' feet following founder, in which the laminæ become replaced by a soft, crumbly material. *U. S. Dept. Agri.*, Rep. on Diseases of the Horse, 1903, p. 372.

pump1, *n.*—**Air-pressure pump,** a water-lifting machine operated by the direct pressure of compressed air. A typical form employs an air-compressor and two air-tight tanks, placed near the water-supply, and a system of pipes and air- and water-valves. The two tanks are directly connected with the compressor by air-pipes, and each is connected with the water-supply and with a pipe through which the water is to be raised to the surface or to a tank above the water-supply, suitable valves controlling the movements of the air and water. The two air-pipes from the tanks to the compressor are also controlled by a valve which by its movement changes the air in each pipe from a pressure to a suction, and vice versa, alternately. When this valve is in one position, air, under suction by the compressor, draws the air out of the tank, the vacuum causing the tank to fill with water. At the same instant the compressor is delivering air under pressure to the other tank, which is already filled with water, and forcing the water out and into the uptake water-pipe. When all the water has thus been driven out of this tank, the valve is automatically reversed (either by an electric motor or by some mechanical device controlled by the compressor), and the process is reversed until the filled tank is emptied and the empty tank refilled. In this way the water-lifting (improperly called pumping) is continuous. Such a water-pressure lifting-machine may have a capacity of 15,000 gallons an hour.—**Baly's pump,** a mercury pump for the rapid production of high vacua in large vessels, where the collection of the gases is unnecessary.—**Bore-hole pump,** a pump designed to be lowered into the tube or casing of a drilled well, as an oil-well or artesian well.—**Conoidal pump,** a centrifugal pump having a conical sleeve on the shaft to guide the entering water to the root of the vanes with as little resistance as possible.—**Cornish pump.** See ★*Cornish*1.—**Cycloidal pump,** a rotary pump the impellers or revolving wheels of which are shaped to cycloidal curves.—**Deep-well pump,** a pump so constructed that it can be lowered into a well or bore, and be operated from the ground above, so as to have its valves and barrel less than thirty-two feet above the surface of the water or other liquid to be pumped.—**Displacement pump,** a water-lifting appliance which employs compressed air as a means of lifting water from wells and tanks; a direct air-pressure pump.—**Diving-bell pump,** a form of air-pump for supplying air to a diving-bell: usually a three-throw pump designed to produce continuous flow without pulsations.—**Double-cylinder pump** a pump which has two cylinders, usually side by side, within which pistons reciprocate alternately. In the form called the 'duplex pump' the piston of each cylinder pauses at the end of its stroke, allowing its valves to seat quietly, while the flow of water is not retarded, since the other piston is moving at its highest velocity.—**Double-piston pump,** a pump having two pistons in the bore of the cylinder which move in opposite directions and increase and diminish alternately the volume between them as well as the volume at each end.—**Driven-well pump,** a pump suitable for attachment to the tube or bore of a driven well. If the well should be deep and the water not rise in the tube to within thirty feet of the surface of the ground, the pump must be placed so far down in the bore that atmospheric pressure at that depth will always force water up into the barrel of the pump, and the water be forced upward by the pump the rest of the way.—**Duplex pump,** a pump having side by side two pumping-cylinders of the same size. See *double-cylinder* ★*pump*.—**Elastic-piston pump,** a pumping-apparatus in which the usual piston is replaced by a flexible diaphragm which is pushed forward and drawn back to vary the volume of the working-barrel.—**Fleuss pump,** a form of air-pump, with pistons running in oil, and having no mechanical valves, used instead of or in conjunction with a mercury pump in obtaining a high degree of exhaustion.—**Gaede pump,** a rotary air-pump containing mercury and used for the rapid production of high vacua.—**Geyser-pump,** an air-lift; a device for raising liquids by the use of compressed air which is carried downward by a pipe and discharged near the bottom of the rising main or column pipe of the water delivery. The upward motion and velocity of the air in the ascending column entrains the water and delivers it in a spurting discharge resembling the effect due to the action of steam in the natural geyser.—**Hot-water pump,** a pump for raising hot water. Such a pump must be so placed that the suction is always flooded to insure its working, and usually must have metallic valves, or valves not affected by heat.—**Hydraulic pump.** (*a*) A pump for supplying water under pressure to a hydraulic system. (*b*) A pump operated by hydraulic pressure to pump water at a higher or a lower pressure than that which operates the pump; a pressure-increaser or booster, or a pressure-reducer.—**Hydrostatic pump,** a pump for supplying a liquid under pressure for any purpose, as for operating a hydraulic press or producing an artificial head of water.—**Oil-line pump,** a pump used to force oil through a pipe-line.—**Pneumatic pump.** (*a*) An air-pump; a pump for compressing, exhausting, or moving air. (*b*) A pump for moving or raising a liquid by the pressure of air or by carrying the liquid along with the air; an air-lift.—**Riedler pump,** a steam- or air-pump having valves which are operated mechanically and positively by a valve-gear devised by Riedler of Berlin, Germany.—**Soap-pump,** a rotary, centrifugal pump without valves.—**String-pump,** in *mining*, a pump operated by power transmitted from a distant engine or water-wheel by means of stringers bolted together and mounted on levers so that they will oscillate easily.—**Three-throw pump,** a pump which has three cylinders set parallel side by side and the three pistons connected to three cranks on the same shaft. The cranks are usually 120° apart, thus giving a fairly constant discharge and requiring an approximately constant turning effort.—**To fang a pump.** See ★*fang*.—**Töpler's pump,** a mercury pump designed to remove a quantity of gas from a vessel and collect it without loss, and free from admixture with air.—**Unlimited pump,** a deep-well pump which is operated from the surface of the ground and lifts the water from the well to the required height above the ground.—**Volute-pump,** a centrifugal pump having blades the shape of which is derived from an involute curve.



Töpler's Pump.

A, pump-chamber; B, mercury-reservoir; C, entrance-tube for gas; D, drying-tube; G, capillary tube; T, tap; V, valve.

(From Travers's "Study of Gases.")

> The condensed steam is removed from the condenser by a Worthington *volute pump* directly connected to an induction motor. The operation of this pump is very interesting, since it requires neither valves nor floats and is not subject to vapor binding, as are reciprocating pumps.
> *Elect. Rev.*, Sept. 17, 1904, p. 453.

pump1, *v.* **I.** *intrans.* 2. To throb; beat.—3. To issue in intermittent jets, as blood from a wounded artery.

II. *trans.*—**Pumping by heads,** a system in use for pumping oil-wells which do not flow freely enough to make continuous pumping practicable or profitable. The oil is allowed to accumulate until it is up to a certain level, and the well is then pumped practically empty.

pump-cylinder (pump′sil″in-dėr), *n.* The barrel or body in which the piston of a pump works; the water-cylinder of a pumping-engine; the cylinder of a pump.

pump-drill (pump′dril), *n.* See ★*drill*1.

pump-handle, *n.* 2. A wooden or iron piece running back on both sides of a carriage-body to support it on the rear springs. It is usually made with an ornamented or scrolled end. Sometimes called a *brake*.

pumping (pum′ping), *n.* In *elect.* See ★*surging*, 2 (*b*).

pumpkin-seed, *n.* 2. (*b*) One of the common names of *Poronotus triacanthus*, a fish found on the Atlantic coast.

pump-lamp (pump′lamp), *n.* A lamp in which the fluid to be burned is pumped to the burner or wick: a moderator or Carcel type of lamp, in use when oil of high-ignition temperature is used, as in lighthouses.

pump-pipe (pump′pīp), *n.* In a locomotive, a supply-pipe or suction-pipe leading to the feed-pump or injector from the tank which carries the water.

pump-return (pump′rẹ̄-tėrn″), *a.* So arranged that a fluid will be returned by a pump to a tank or boiler, as opposed to a return by gravity.

pump-rod (pump′rod), *n.* 1. The piston-rod of a pump.—2. In *mining*, a vertical rod, often made up of sections, which reaches from an engine located at or near the surface to the pumps in the mine. These may be at the bottom or they may be arranged in a series so that the water is lifted in stages or in successive lifts. When this is done, the piston-rods of the series are driven from brackets off-setting them from the common pump-rod which drives them all.

pump-room, *n.* 2. The room of a waterworks where the pumps are located.

pump-sollar (pump′sol″ạ̈r), *n.* In *mining*, a platform or gallery on which to stand while cleaning or repairing the working parts of a lift or set of pumps.

pump-station (pump′stā″shọn), *n.* In *mining*, a chamber or recess at the side of a shaft, where a pump is located.

pump-tree (pump′trē), *n.* The barrel or cylinder of a wooden pump; the pump-stock.

pump-valve (pump′valv), *n.* A valve in a pump; a device to keep the fluid from flowing in an undesired direction.

pun3 (pun), *n.* [Also *punn*; Beng. *pun*, Hind. *paṇa*, < Skt. *pana*, a stake, wage, coin of a certain weight. Compare *fanam*.] A copper coin of Bengal, of the value of 80 cowries.

pun. An abbreviation of *puncheon*2.

puna, *n.* 2. Mountain-sickness.

> The effects of *puna* were very various. We found it affect us with intense headache at night-time. I had a terrible headache the first night I arrived at the 19,000-feet camp; and suffered from very severe pains in the lower limbs, such as I should describe as a sort of "growing pain." We also experienced extreme breathlessness and entire incapacity for doing any work.
> *S. M. Vines*, in Geog. Jour. (R. G. S.), XII. 487.

puna-goose (pö′nạ̈-gös), *n.* A handsome bird, *Bernicla melanoptera*, white with black wing-tips and yellow bill, common to the lakes and lagunes of the Peruvian Sierra and to Bolivia. It is easily domesticated. Commonly called in Peru *huachua*, and in Bolivia (Aymara) *hualata*.

puna-grass (pö′nä-gràs), *n.* The hard bunch-grass, *Stipa Ichu*, of the cold table-lands of Peru and Bolivia, the principal food of the llama and other ruminants of the genus *Auchenia:* used for covering Indian houses, and also eaten by mules, asses, horses, sheep, and cattle.

puñal (pön-yäl′), *n.* [Sp. *puñal* = Pg. *punhal* = It. *pugnale*, a dagger, prob. < ML. **pugionales*, neut. adj., < L. *pugio(n-)*, a dagger.] A poniard or dagger.

punaluan (pö-nä-lö′an), *a.* [Hawaiian *punalua*, a friend on equal terms with one, + *-an*.] Of or relating to a peculiar form of family, supposed by Morgan to have been a stage in the development of human marriage. Compare ★*group-marriage*. See the extract.

> The *Punaluan* Family. It was founded upon the intermarriage of several sisters, own and collateral, with each others' husbands, in a group; the joint husbands not being necessarily kinsmen of each other. Also, on the intermarriage of several brothers, own and collateral, with each others' wives, in a group; these wives not being necessarily kin to each other, although often the case in both instances. In each case the group of men were conjointly married to the group of women.
> *L. H. Morgan*, Ancient Society, p. 384.

punamu, *n.* Same as ★*pounamu*.

punch^1, *n.*—**Set-punch.** Same as *setting-punch*.

punch-box (punch′boks), *n.* A box with holes in its top plate to receive the punches of a Jacquard card-cutting machine.

puncher, *n.* **2.** A contraction of ★*cow-puncher;* a cow-boy. [Slang, Western U. S.]

punching (pun′ching), *n.* A piece of thin metal stamped from a plate by means of a die, such as the laminæ used in the cores of transformers and armatures.

> The four-pole pieces are made of laminated steel *punchings*, held between heavy end plates and secured by rivets.
> *Elect. World and Engin.*, March 28, 1903, p. 532.

punching-press (pun′ching-pres), *n.* A hand- or power press used for punching holes in sheet-metal or other material.

puncticulose (pungk-tik′ū-lōs), *a.* [NL. *punticulum*, dim. of L. *punctum*, point, + *-ose*.] Same as *puncticulate*.

punctograph (pungk′tọ-gràf), *n.* [G. *punktograph*, < L. *punctum*, a point, + Gr. *γράφειν*, write.] An instrument used in radiography to locate a foreign body embedded in the tissues. It consists of two rods, each having a metallic ring at one end. These are placed on opposite sides of the patient under examination. When the shadow of the foreign body appears, viewed with a fluorescent screen, in the center of each ring, marks are made on the person at these points. The position of the rods is then shifted and the operation is repeated several times. The intersection of all the imaginary lines connecting the several pairs of opposite points determines the position of the foreign body. *Encyc. Dict.*

puncture, *n.* **Diabetic puncture**, puncture of the floor of the fourth ventricle, which is followed, in animals, by glucosuria.—**Kronecker puncture**, in experimentation upon animals, puncture, with a long fine needle, of the inhibitory nerve-center for the heart. *Lancet*, Aug. 22, 1903, p. 523.—**Lumbar puncture**, puncture of the membranous sac of the spinal cord, in the lumbar region, with a hollow needle, and withdrawal of fluid for diagnostic purposes or to relieve pressure on the brain.—**Puncture culture.** Same as *stab* ★*culture*.—**Quincke's puncture.** Same as *lumbar* ★*puncture*.

pund^2 (pönd), *n.* [Dan. *pund* = E. *pound*^{2}.] The Danish and Swedish pound, equal to 1.1023 pounds avoirdupois.

Punfield beds. See ★*bed*^{1}.

punga-punga (pung′ạ̈-pung″ạ̈), *n.* [Maori.] **1.** The yellow pollen of the lesser cattail, or raupo, *Typha angustifolia*. The natives of New Zealand use it for food by mixing it with water into cakes and baking.—**2.** The bread so made. It is sweetish and light, somewhat resembling gingerbread. See ★*raupo* and *Typha*.

pungent, *a.* **1.** (*c*) In *ichth.*, stiff and sharp-pointed: as, a *pungent* spine. *Proc. Zool. Soc. London*, 1902, p. 337.

pungle (pung′gl), *v.*; pret. and pp. *pungled*, ppr. *pungling*. [Freq. of dial. *pung*, poke, push, pound, etc.] **I.** *trans.* To poke; push.

II. *intrans.* To take pains; labor assiduously with little progress. *Eng. Dial. Dict.* [Prov. Eng.]—**To pungle up**, to do something; 'get busy.' [Slang.]

> "Fuddleston," he said, "you can't make a sneak out of this game. *Pungle up*, or I 'll throw you out of the window!" It is recorded that Mr. Fuddleston at once *pungled up* to the extent of $5 for the first and only time in his religious career. *Chicago Tribune.*

Punicaceæ (pū-ni-kā′sẹ-ē), *n. pl.* [NL. (Horaninow, 1843), < *Punica* + *-aceæ*.] A family of dicotyledonous choripetalous plants of the order *Myrtales*, the pomegranate family, containing the single genus *Punica* (which see).

punicin (pū′ni-sin), *n.* [*Punic* (in def. 2 *Punica*) + *-in*^{2}.] **1.** The royal or Tyrian purple of the ancients, which is formed by exposing the colorless secretion of certain mollusks (*Purpura lapillus*, etc.) to the sun.—**2.** Same as *pelletierine*.

punk^2 (pungk), *v. t.* [Variant of *punch*^{1}, *v.*] To strike or pound with the closed fist. [Slang, U. S.]

punk^2 (pungk), *n.* [Variant of *punch*^{1}, *n.*] A punch or pound with the closed fist. [Slang, U. S.]

punt^1, *n.* **3.** A push or shove.

> Only practice enables one . . . to guide the raft by means of timely *punts* at the surrounding rocks with the pole with which one is armed.
> *H. Clifford*, in Geog. Jour. (R. G. S.), IX. 12.

punt^1, *v. i.*—**To punt out**, in *foot-ball*, to punt from behind the goal-line into the field: a play for a try at goal.

punt^3, *n.* **2.** In *glass-manuf.* Same as ★*milen*.

punt-gunner (punt′gun″ėr), *n.* One who shoots game from a punt. Also *punt-shooter*.

punt-gunning (punt′gun″ing), *n.* The practice of shooting game from a punt. Also *punt-shooting*.

punt-out (punt′out), *n.* In *foot-ball*, a punt made from behind the goal-line for a try at goal.

punt-shooter (punt′shö″tėr), *n.* Same as ★*punt-gunner*.

punt-shooting (punt′shö″ting), *n.* Same as ★*punt-gunning*.

pup, *n.* **2.** A local term current among the Klondike gold-miners for tributary streamlets of the second order. [Slang.]

> The principal streams [Klondike region] are known as creeks; the short steep tributaries which flow into them as 'gulches'; and the streamlets which feed these as '*pups*.' *Pop. Sci. Mo.*, July, 1902, p. 232.

pupa-case (pū′pạ̈-kās), *n.* In *entom.*: (*a*) The larval shelter of a caddis-worm, or other similar larval case. (*b*) The sheath in which an insect having a complete metamorphosis passes the pupa stage.

pupa-shell (pū′pạ̈-shel), *n.* Any shell of the family *Pupidæ*.

pupiferous (pụ-pif′ẹ-rus), *a.* [NL. *pupa*, pupa, + L. *ferre*, bear, + *-ous*.] Giving birth to the sexual generation: a term used by writers on *Aphididæ*. The pupiferous generation is composed usually of parthenogenetic return migrants which give birth to living young which develop into sexed individuals.

pupil^2, *n.*—**Hutchinson pupil**, marked dilatation of one pupil on the side of the lesion in cases of hemorrhage into the membranes of the brain.—**Pupil of entrance.** Same as ★*entrance-pupil*.—**Pupil of exit.** Same as ★*exit-pupil*.

pupillometry (pū-pi-lom′e-tri), *n.* [L. *pupilla*, pupil of the eye, + Gr. *μέτρον*, measure, + *-y*^{3}.] Measurement of the diameter of the pupil; the scientific use of the pupillometer.

pupilloscopy (pū-pi-los′kọ-pi), *n.* [L. *pupilla*, pupil, + Gr. *-σκοπια*, < *σκοπεῖν*, view.] **1.** Inspection of the pupil of the eye.—**2.** Same as *skiascopy*.

pupillostatometer (pū′pi-lọ-stạ-tom′e-tėr), *n.* [L. *pupilla*, pupil, + Gr. *στατός*, standing, fixed, + *μέτρον*, measure.] An instrument for measuring the distance between the two pupils.

Pupin cable. See ★*cable*.

puppy-foot (pup′i-fůt), *n.* The ace of clubs. [Slang.]

pupulo (pö-pö′lō), *n.* [Chamorro name.] On the island of Guam, the betel pepper, *Piper Betle*, the leaves of which together with the nuts of the betel palm (*Areca Cathecu*) and a little lime are used by the natives as a masticatory. See *betel*.

pupunha (pö-pö′nyä), *n.* [Tupi name.] The peach-palm, *Guilielma speciosa*.

pur, *v.* and *n.* A simplified spelling of *purr*.

Purbeckian (pėr-bek′i-ạn), *n.* [Isle of *Purbeck*, a peninsula in Dorset, England.] In *geol.*, the uppermost stage of the Upper Jurassic system of southern England. It comprises a lower series of marls and limestones, 100–150 feet thick; a middle series of limestones, 50–150 feet thick, some of which are valuable building-stones; and an upper series of clays; shales, and limestones, 50–60 feet thick. The fossil fauna of the Purbeckian shows an alternation of marine and fresh-water types, and is of great interest on account of the large numbers of terrestrial animals which it has afforded, including insects, fish, reptiles (dinosaurs, crocodiles, plesiosaurs, turtles), and multituberculate mammals.

purchase, *n.*—**Double purchase**, any device for doubling the intensity of a force; usually a hauling device which consists of two single blocks and a line or fall. The line is roved through one block, then through the second block, and brought back to the first block, to which it is fastened.—**Single purchase** (*naut.*), the same as *whip*, which consists of a rope rove through a single fixed block.—**Three-fold purchase** (*naut.*), two blocks having three sheaves each, through which the rope is rove to form the purchase.—**Two-fold purchase**, two blocks having two sheaves each, through which the rope is rove to form the purchase.

purdah (pėr′dạ̈), *v. t.* [*purdah*, *n.*] In India, to screen with a purdah.

purdonian (pėr-dō′ni-ạn), *n.* [Named after one *Purdon*, the designer of the shape of the box.] A coal-box intended for the drawing-room. *N.* and *Q.*, 7th ser., II. 455.

pure, *a.* **10.** In *biol.*, having germ-cells of only one kind and like those of a parent. See the extract.

> An organism can be defined as genetically *pure* if all its gametes when united with similar gametes reproduce the parent identically.
> *Bateson and Saunders*, Rep. Evol. Com. Roy. Soc., 1902, [I. 134.

Pure debt. See ★*debt*.—**Pure image.** See ★*image*.—**Pure number.** Same as *abstract* ★*number*.—**Pure sensation.** See ★*sensation*.

pure-blood (pūr′blud), *n.* In breeders' language, a pure-bred animal; an animal the ancestors of which have not been crossed with those of another breed.

> A quarter of a billion acres of grass, nurturing 10,000,000 head of cattle, to-day worth $200,000,000, alone by such agencies as yours can be doubled in value in a single decade, if only pure-blooded sires are used in all the cow herds during this time. Likewise fifty per cent. can be added to the value if *pure-bloods* only are used in the northern half of this territory.
> *Rep. Kansas State Board of Agr.*, 1901–02, p. 63.

pure-bred (pūr′bred), *a.* In breeders' language, noting an animal the ancestors of which are all of the same standard breed or race; not crossed with other breeds. *Biometrika*, Feb., 1903, p. 171.

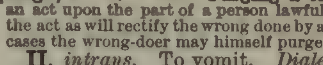
pure-breed (pūr′brēd), *v. t.* To breed from animals of one race or breed.

> Pure-bred mice usually are in-bred and von Guaita's unquestionably were; but this does not help us to decide whether the relative inability to transmit whiteness is due to in-breeding or *pure-breeding;* it only shows that it is not impossible that it may be due to in-breeding.
> *Biometrika*, Feb., 1903, p. 171.

purée, *n.* **2.** A dessert made of crushed fruit, sweetened and flavored with some cordial or orange- or lemon-juice.

purga (pör′gạ̈), *n.* [Russ. *purga*.] In Siberia and Labrador, a violent cold wind with drifting snow. See ★*burga*.

purgatin (pėr′gạ-tin), *n.* [*purgat(ive)* + *-in*^{2}.] A trade-name of a diacetylanthrapurpurin,



$C_6H_3(\overset{7}{O}H)\left\langle\begin{matrix}CO\\CO\end{matrix}\right\rangle C_6H_2(O\overset{1.}{C}\overset{2.}{O}CH_3)_2$: the relative positions of the two acetyl groups are not determined. It is a yellowish-brown powder and is used in medicine as an agreeable laxative.

purge, *v.* **I.** *trans.*—**Purging a tort**, in *law*, such an act upon the part of a person lawfully entitled to do the act as will rectify the wrong done by another. In some cases the wrong-doer may himself purge the tort.

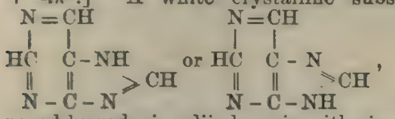
II. *intrans.* To vomit. *Dialect Notes*, III. iii. 225. [Dial., U. S.]

purge, *n.*—**Indian purge.** (*a*) The wild potato-vine, man-of-the-earth, or mecha-meck of the Indians, *Ipomœa pandurata*. (*b*) A plant of Virginia, probably *Triosteum perfoliatum*, the root of which was used as a purgative by the aborigines.

purification, *n.*—**Self-purification of streams**, the effect of sunlight, sedimentation, etc., upon running water, supposed by some to destroy the pathogenic bacteria and thus enable a stream to purify itself within the course of a few miles.

purifier, *n.* **3.** In the manufacture of coal-gas, the tank or chamber in which the gas is exposed to the action of slaked lime, or to a mixture of this with the oxyhydroxid of iron, in order to remove objectionable constituents, especially carbon dioxid and sulphureted hydrogen. *Sadtler*, Handbook of Indust. Chem., p. 364.—**4.** A device for cleansing water from injurious or undesirable impurities. *Elect. Rev.*, Sept. 24, 1904, p. 547.—**Feed-water purifier**, an apparatus for cleansing the feed-water for boilers by removing either solid matter in suspension, or precipitating out the soluble salts and subsequently removing them by filtration: much used where the water flows from or through limestone strata of rock.

purin (pū′rin), *n.* [Appar. ‹ L. *purus*, pure, + *-in*^{2}.] A white crystalline substance,



, prepared by reducing diiodopurin with zinc-dust. It dissolves in water and forms salts with both acids and bases. It melts at 216–217° C. Purin is the mother-substance of the uric-acid and xanthin group, some of the members of which are formed in the body by the decomposition of nucleic acids.—**Purin bases** or **bodies**, in the uric-acid group of bodies, various substances derived from purin, such as xanthin, guanine, adenin, and caffein.—**Purin group.** See ★*group*^{1}.—**Purin ring.** See *purin* ★*group.*

purity, *n.* (*g*) In *biol.*, the state or condition, with respect to reproduction, of an organism that is developed from a fertilized egg formed by the union of two identical germ-cells.

> Mendel generalised these statements as follows: In cases of complete dominance (parents differing in *n* ways), the number of different classes in the second generation will be 3^n, of which 2^n will be stable; the remainder will be hybrid, though indistinguishable from pure individuals, and the smallest number of individuals which, in the second hybrid generation, will allow of one pure individual to each visibly different class will be 4^n. This gave rise to a new conception of "*purity*": An animal or plant is pure if it produces gametes of only one sort, even though its grandparents may among themselves have possessed opposite characters.
> *Jour. Roy. Micros. Soc.*, Feb., 1904, p. 52.

Coefficient of purity. See ★*coefficient.*

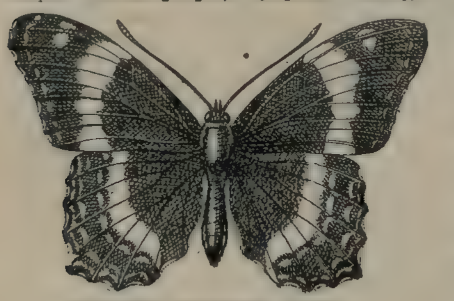
Purkinje effect, phenomenon. See *Purkinje* ★*phenomenon.*—**Purkinje's dizziness.** See ★*dizziness.*

purl^3, *n.* **6.** In *embroidered bookbinding*, a fine copper coil closely covered with colored silks. *C. Davenport*, in Burlington Mag., March, 1904, p. 268.

puromucous (pū-rọ̄-mū′kus), *a.* [L. *pus* (*pur-*), pus, + *mucus*, mucus, + *-ous.*] Same as *mucopurulent.*

puron (pū′ron), *n.* [Appar. *pur*(*in*) + *-on.*] A substance, $C_5H_8N_4O_2$, obtained from uric acid by electrolytic reduction.

purple. I. *n.*—**Aubergine purple,** in *ceram.*, a shade of purple like that of the fruit of the aubergine (*Solanum Melongena*), seen in Oriental porcelain. See ★*violet d'évêque.*—**Banded purple,** a nymphalid butterfly, *Basilarchia arthemis.* Also called the *arthemis butterfly.* See ★*arthemis.*—**Bishop's purple.** Same as ★*violet d'évêque.*—**Brilliant Hessian purple,** a direct cotton coal-tar color of the diazo type, derived from diaminostilbene-disulphonic acid. It dyes unmordanted cotton a bluish red from a soap bath.—**English purple, London purple** (*b*), **Paris purple** trade-names for insecticide materials made by boiling with lime the waste residue from the manufacture of aniline red or violet. Their essential constituent is arsenic, partly in the arsenious and partly in the arsenic condition, and present in varying quantity. *Purple poison* and *English purple poison* are other names of the same by-product.—**Hybrid purple,** an American nymphalid butterfly, *Basilarchia proserpina*, believed by some entomologists to be a hybrid between *B. astyanax* and *B. arthemis*, and by others to be a dimorphic form of *B. arthemis.*—**London purple.** (*b*) See *English* ★*purple.*—**Orseille purple,** a dye-stuff made by treating coloring-lichens with an aqueous solution of ammonia, precipitating the liquid with hydrochloric or sulphuric acid, redissolving the precipitate in aqueous ammonia, exposing this second solution to the air until a purple-violet color has developed, and a second time precipitating with a mineral acid.—**Paris purple.** See *English* ★*purple.*—**Red-spotted purple,** an American nymphalid butterfly, *Basilarchia astyanax*, which occurs throughout the eastern United States, except in northern New England and New York. Its larvæ feed on rosaceous plants.—**To be born to the purple,** to be born of a royal race. Compare *porphyrogenitus.*



Banded Purple (*Basilarchia arthemis*).

II. *a.*—**Purple bacteria,** the *Rhodobacteria. Sci. Amer. Supp.*, Nov. 23, 1907, p. 335.—**Purple madder.** (*b*) Same as ★*purple-black.*—**Purple patch,** a rhetorically elaborate or ornate passage; a bit of 'fine writing': translating the '*purpureus . . pannus*' of Horace. (*Ars Poetica*, l. 15.)

> Not quite my whole task [today] but I have a grand *purple patch* [The relief of Londonderry] and I must take time.
> *Macaulay*, Diary, Oct. 25, 1849.

> It is to Mr. Trevelyan's credit that there are no *purple patches.* We will not, therefore, do him the injustice of quoting from a poem which should be read and studied in its entirety.
> *Athenæum*, May 20, 1905, p. 620.

purple-black (pėr′pl-blak), *n.* A purple pigment prepared by precipitating alizarin in combination with a metallic oxid of aluminium and iron in the right proportion to give a purple. It is very permanent.

purple-grass, *n.* **2.** A slender, branching, rather low grass, *Pappophorum Wrightii*, with dense spike-like purple or lead-colored panicles, found in the southwestern United States and adjacent Mexico. It is reported to be fully as nutritious as grama or buffalo-grass and to be preferred by horses and mules.

purple-shell (pėr′pl-shel), *n. Murex trunculus*, so called because it was used by the ancients in the manufacture of purple dye; also a violet shell, one of the *Ianthinidæ.*

> An inscription of about 350 B.C. mentions the levying of tithes on the catch of fish and of *purple-shell.*
> *Science*, Dec. 4, 1903, p. 719.

purple-top (pėr′pl-top), *n.* **1.** The tall redtop, *Tricuspis seslerioides.*—**2.** See *bluejoint-* ★*grass.*

purple-veil (pėr′pl-vāl), *n.* The egg-mass of *Lophius piscatorius*, a fish, common on both sides of the North Atlantic, which belongs to the family *Lophiidæ* and is usually called *goose-fish* or *fishing-frog.* It consists of a thin sheet of a violet or purple color, which floats on the surface of the sea and is often over a hundred square feet in area. It has been estimated that a single egg-mass may contain as many as 1,000,000 eggs, the product of a single fish. *National Geog. Mag.*, July, 1905, p. 337.

purpose, *n.* **10.** In *biol.*, the result which a structure tends to secure, without any reference to an intelligent agent.

> When we speak of *Purpose* in the structure of a plant, we mean in fact nothing more than that the form or other characters of the organ are adapted to its conditions of life, which may be at once inferred from the very survival of the plant in the struggle for existence. The terms *Purpose*, Adaptation, and Metamorphosis express therefore the same thing, and may be used as synonymous.
> *Sachs* (trans.), Botany, p. 836.

purpura, *n.*—**Henoch's purpura,** a disease marked by intestinal disturbances and a purpuric eruption on the skin.—**Purpura fulminans.** Same as *Henoch's* ★*purpura.*—**Purpura pulicosa,** an eruption of purpura-like spots following the bites of parasitic insects.—**Purpura variolosa,** hemorrhagic smallpox.

purpurase (pėr′pụ̄-rās), *n.* [L. *purpura*, purple, + *-ase.*] A ferment found in the purple gland of *Murex brandaris*, which produces the color in the purple fluid of the animal by its action upon a substance which is termed *purpurin.*

purpurate^1, *n.*—**Ammonium purpurate.** Same as *murexide.*

purpurin, *n.*—**Brilliant purpurin R** and **5R,** direct cotton coal-tar colors of the diazo type, derived from toluidine. They both dye unmordanted cotton red from an alkaline salt bath.—**Delta purpurin 5B** and **7B,** direct cotton coal-tar colors of the diazo type, similar to the diamine reds.

purpurite (pėr′pū-rīt), *n.* [L. *purpura*, purple, + *-ite*^{2}.] A hydrous manganic ferric phosphate ($(Mn,Fe)_2O_3.P_2O_5.H_2O$) occurring in small irregular masses of a purple or dark red color: found in Gaston County, North Carolina, and also in San Diego County, California, and elsewhere.

purpurogenous (pėr-pụ̄-roj′e-nus), *a.* [L. *purpura*, purple, + Gr. *-γενης*, -producing, + *-ous.*] Producing a purple color: noting especially the layer of epithelium in the eye from which comes the visual purple.

purpuroxanthin (pėr″pụ̄-rok-san′thin), *n.* Same as ★*xanthopurpurin.*

purse, *n.*—**To make a purse,** to make a collection of money or to collect a certain sum of money as a gift and mark of gratitude, etc.

> The passengers . . . urged by the precedent in such matters, . . . "*made a purse*" for him, and a presentation address. *Cutcliffe Hyne*, A Master of Fortune, xii.

Purser's dip (*naut.*), a small candle; a kind of candle served out in the navy by the paymaster's assistant, clerk, or yeoman.—**Purser's name,** a name assumed by a sailor when enlisting, so that his right name may not be known.—**Purser's pound,** a weight once used in the British navy, which allowed the purser one eighth for the natural waste or loss of perishable food, so that the sailor received but seven eighths of the quantity supplied by government.

purse-rat (pėrs′rat), *n.* The pocket-gopher, or pouched rat; a rodent of the genus *Geomys* or some allied genus.

purse-web (pėrs′web), *n.* A tubular purse-like web made by several of the spiders of the genus *Atypus.*—**Purse-web spider,** a spider of the genus *Atypus* which makes a purse-like web.

purslane, *n.*—**Winter purslane,** *Claytonia perfoliata*, a plant native to western North America, often grown in Europe, and occasionally in the United States, as a pot-herb. It is a tufted annual, with fleshy basal leaves and a scape bearing a cluster of small white flowers with a leaf-like cup beneath. It occasionally grows wild in the eastern States.

purslane-bug (pėrs′lān-bug), *n.* An American lygæid bug, *Geocoris bullatus*, found in the western United States, where it damages sugar-beets.

purslane-moth (pėrs′lān-môth), *n.* The adult of the purslane-worm.

purslane-sphinx (pėrs′lān-sfingks), *n.* A common American moth, *Deilephila lineata.* Also called *white-lined morning-sphinx.* See *morning-sphinx*, under *sphinx*, with cut.

purusha (pö′rọ̈-shä), *n.* [Skt. *púrusha*, man, person, universal principle.] Original man or the highest personal principle or universal soul.

purveyor, *n.* **4.** Formerly, an officer of the medical department of the United States army, whose duty was to purchase supplies. The office was abolished in 1892.

push^1, *v. t.* **7.** In *cricket*, to guide or force (the ball) away from the wicket with the bat, usually to the 'on' side.

push^1, *n.* **7.** In *cricket*, a stroke by which the ball is guided or forced away from the wicket, usually to the 'on' side.—**8.** A gang; a set of hoodlums; in thieves' English, a set of men associated for a special robbery; hence, a clique; a party: the Government House *push*; to be in with the *push.* *E. E. Morris*, Austral English.

> The Premier, in consultation with the inspector-general of the police, has made arrangements to protect life and property against the misconduct of the lawless larrikin '*pushes*' now terrorising Sydney.
> *Argus*, July 1, 1893, p. 10.

> There was general instructions for an execution, but I never knew I had such a dependable *push* of mountebanks aboard, he says.
> *R. Kipling*, The Bonds of Discipline, Traffics and Discoveries, p. 65.

push-ball (push′bâl), *n.* A game played with a very large inflated ball, usually some 6 feet in diameter and stoutly constructed, which two sides of varying numbers of men endeavor to push toward opposite goals.

push-bar (push′bär), *n.* A strut; a bar which transmits a thrust or pushing force. See ★*push-block.*

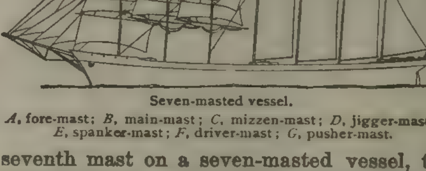
push-block (push′blok), *n.* In *car-building*, a metal plate fastened to the end-plate of a car at a corner. It has a recess in which the end of a push-bar may be inserted so that the car may be pushed by a locomotive on a parallel track: much used in switching and making up trains in railway-yards.

push-bolt (push′bōlt), *n.* A door-bolt that is moved by being pushed by hand instead of by a key.

push-cart (push′kärt), *n.* A light two-wheeled cart designed to be pushed by hand: used especially by street-venders of fruits and by other peddlers.

> It will be a misfortune if the discussion of the *pushcart* nuisance in New York is obscured by sentimental consideration for the people who elect to make their living in this way.
> *N. Y. Times*, July 25, 1903.

pusher, *n.* **4.** In *railroading*, an assisting locomotive placed behind a train to aid the train-engine in surmounting a steep grade. The use of a pusher over a short incline makes it possible to handle heavy trains with single engines over long levels above and below the incline.—**5.** A glove-like protection made of chamois-skin or soft leather to be slipped on over the toes and instep when wearing the shoes used in running and other athletic sports.—**6.** A small implement, usually of silver, used by a child, at table, to push its food upon a fork or spoon.—**7.** *Naut.*, the seventh mast on a seven-masted vessel, the masts being named in order as follows: fore-, main-, mizzen-, jigger-, spanker-, driver-, and pusher-mast.—**Pusher grade.** See ★*grade*^{1}.



Seven-masted vessel.

A, fore-mast; *B*, main-mast; *C*, mizzen-mast; *D*, jigger-mast; *E*, spanker-mast; *F*, driver-mast; *G*, pusher-mast.

pusher-mast (push′ėr-mȧst), *n.* On a seven-masted vessel, the seventh mast. See ★*pusher*, 7.

push-foot (pụsh′fụt), *n.* A foot, die, or anvil which is pushed upward or forward in a machine to meet the opposing punch, piston, or foot. Also used adjectively.

> The movement . . . was made by a *push-foot* connection from a three-throw crank shaft and the lifting and dropping of the feet by a smaller three-throw crank-shaft revolving in unison with the larger one.
> *Hiscox*, Horseless Vehicles, p. 37.

pushful (pụsh′ful), *a.* Full of push; active; energetic; enterprising: as, a *pushful* young man. [Colloq.]

pushing-bar (pụsh′ing-bär), *n.* Same as ★*push-bar.*

push-nipple (pụsh′nip″l), *n.* See ★*nipple.*

push-off (pụsh′ôf), *n.* In *push-ball*, the act of putting the ball into play by pushing it: analogous to the kick-off in foot-ball. The team having the push-off may either line up against the ball or, going back not more than 15 yards, make a flying rush at it.

push-pole (pụsh′pōl), *n.* A pole or rod used in pushing cars in a drill-yard. When used it is placed diagonally between a drill-engine on one track and a car on a parallel track.—**Push-pole car.** See ★*car*^{1}.—**Push-pole plate,** a casting on the corner of a car, which has a thimble for supporting the end of a push-pole. See ★*push-block.*

push-rod (pụsh′rod), *n.* In a freight-car air-brake, the rod which connects the piston-rod of the air-cylinder with the brake-setting mechanism.

push-up (pụsh′up), *n.* That part of a tile-press which raises the die to the plunger. See ★*tile-press.*

pussy-toes (pụs′i-tōz), *n.* Same as ★*dog-toes.*

pustulant (pus′tụ̄-lạnt), *a.* and *n.* [L. *pustulans*, ppr. of *pustulare*, blister. See *pustulate.*]
I. *a.* Causing the formation of pustules.
II. *n.* An irritant application causing pustulation. *Buck*, Med. Handbook, III. 304.

pustulated (pus′tụ̄-lā-ted), *p. a.* Covered with pustules.

pustule, *n.* **2.** (*b*) One of the swellings produced in the leaves and stems of plants by *Cystopus, Synchytrium,* and other fungi.

put^1, *v.* I. *trans.*—**Putting-out machine,** a machine for stretching skins. *C. T. Davis*, Manuf. of Leather, p. 356. See *to put out* (*c*), under *put*^{1}, *v. i.*—**To put in.** (*e*) To pass (as time).

> I heard her tell Bertha Dorset that she had six months *to put in* while her husband was taking the cure in the Engadine. *E. Wharton*, The House of Mirth, i. 4.

II. *intrans.*—**To put up.** (*e*) To develop or grow, as the antlers of a deer.

putcheky (puch′ẹ̄-ki), *a.* [Origin obscure.] Touchy; fussy; irritable. [Rare: New England.]

> An' I won't hev you answerin' so *putcheky*. You've been *putcheky* ever sence th' surprise party at th' Church last week. I guess surprise parties don't agree with you.
> *McClure's Mag.*, Feb., 1903, p. 385.

puthi (pö′tẹ̄), *n.* [Assamese?] An ancient manuscript or writing on bark preserved among certain tribes of India, such as the Ahoms of Assam. *Keane*, Man Past and Present, p. 200.

puting (pö′ting), *n.* [Chamorro *puting*, Philippine *botong*, Fijian *vutu*, Samoan *futu.*] On the island of Guam, a strand-tree, *Barringtonia speciosa*, having a four-cornered pyramidal fruit which is used as a fish-intoxicant. See ★*botong*, with cut.

put-out (pụt′out), *n.* The act of retiring the batsman or the runner in games like base-ball and cricket. Each put-out is credited in the score to the player who retires the man.

putresce (pụ̄-tres′), *v. i.*; pret. and pp. *putresced*, ppr. *putrescing.* [L. *putrescere.* See *putrescent.*] To begin to putrefy; exhibit putrescence.

putrescin (pụ̄-tres′in), *n.* [*putresc*(*ent*) + *-in*^{2}.] A ptomaine, tetramethylene diamine, $C_4H_{12}N_2$. It has been found in the urine in cases of cystinuria, where it is apparently formed in the tissues, and not as the result of bacterial activity. It is derived from ornithin, and thus from arginin. Originally found in putrefying cadavers.

putrilage (pū′tri-lạ̄j), *n.* [LL. *putrilago*, rottenness, decay, < *putris*, rotten.] The slough from an ulcer or ill-conditioned wound.

puttee (put′ẹ̄), *n.* [Also *putty*; Hind. *paṭṭī.*] A strip of woolen or other fabric, sometimes waterproofed, four inches wide and three yards long, with a tape at one end, designed to be wound spirally around the leg, from the ankle nearly to the knee. It forms an efficient protection to sportsmen and soldiers. See the extract.

> The British troops in Asia use *putties.* These are long bandages extending from the ankle to above the calf, applied as the ordinary spiral roller. The men soon learn to adjust them neatly and securely, so that they do not require re-arrangement on the march, and they seem to serve their nominal purpose much better than the leggings, and as additional articles of uniform they are more portable and are more easily cleaned. The mounted troops use them equally with the infantry.
> *Buck*, Med. Handbook, V. 796.

putting-cleek (put′ing-klēk), *n.* A club with an iron head, slightly lofted: used for putting.

putty^1, *n.* **6.** A composition golf-ball, no longer in use.

putty^2, *n.* Same as ★*puttee.*

putty-joint (put′i-joint), *n.* See ★*joint.*

putz (pöts), *n.* [G. *putz*, adornment, ornament, < *putzen*, earlier *butzen*, clean, scour, polish, decorate.] Among the Moravians, a Christmas decoration. Its essential is an evergreen tree, representing the tree of life. It is laden with nuts and fruit. See the extract.

> Only the chosen few can afford to have a really impressive "*putz*" which fills half a room, and represents a landscape in miniature, running brooks and ponds of real water, wild animals roaming on the hillsides, sawmills and railroad trains run by electricity, to show that the religion of Christ is for all men and all ages. This more elaborate "*putz*" requires not only money for its erection, but artistic handiwork. *N. Y. Times*, Dec. 14, 1902.

puy^2, *n.* **2.** In *geol.*, applied to a type of volcanic activity described by A. Geikie as occurring among the Carboniferous volcanics of Great Britain, and characterized by the ejection of small amounts of lava, usually of the basaltic type, and cinders from a single independent vent. Typical puys are seen in the ancient volcanic cones of central France.

puzzle, *n.*—**Indian puzzle,** a device which resembles a glove-finger, made of woven split-wicker. When it is passed over the finger it cannot be removed by pulling the tip, for this only tightens its grasp on the finger.

puzzle-box (puz′l-boks), *n.* In *comp. psychol.*, a box or pen in which animals are confined for experimental purposes, and from which they may release themselves by clawing a string, pressing a lever, etc.

> The dropping off of useless movements is further illustrated in those experiments where animals are required to work some kind of mechanism. This may be called briefly the *puzzle-box* method.
> *M. F. Washburn*, The Animal Mind, p. 232.

puzzle-mug (puz′l-mug), *n.* A drinking-vessel of pottery, with perforated sides and several hollow knobs or little spouts around the rim. A tube extends from one of these knobs to the bottom of the interior, and the liquid contents can be drunk without spilling only by drawing the liquid up through the open tube, after closing with the finger an air-hole in the under side of the handle.

Puzzle-mug. Pennsylvania-German Pottery, dated 1809.
(In the Pennsylvania Museum, Philadelphia.)

> Another of Mr. Haig's workmen makes a specialty of "*puzzle mugs,*" on the principle of those made at Brampton, England, in the last century, which are almost identical in form to some produced by John Wedgwood as early as 1691, of which an interesting example may be seen in the Museum of Practical Geology, London.
> *E. A. Barber*, Pottery and Porcelain of the U. S., p. 117.

p. v. [*l. c.* or *cap.*] An abbreviation of *post-village.*

pvt. A contraction of *private.*

P. W. D. An abbreviation of *Public Works Department.*

P. W. P. An abbreviation of *Past Worthy Patriarch.*

pwt. [*l. c.* or *cap.*] A contraction of *pennyweight.*

Pyanepsion (pī-ạ-nep′si-on), *n.* [Gr. Πυανεψιών, < Πυανέψια, a festival in honor of Apollo.] The fourth month of the Athenian calendar, corresponding to the last of October and the first of November. The feast of the Pyanepsia was held in this month.

pycnaster, *n.* **1.** It is a polyaxial ball-shaped element, with the rays represented by thorn-like processes on the surface.
2. [*cap.*] In the *Echinodermata*, a genus of phanerozoan starfishes found in the Upper Cretaceous formation of England.

pycnial (pik′ni-ạl), *a.* [*pycni*(*um*) + *-al*^{1}.] Of or pertaining to a pycnium.

pycniospore (pik′ni-ọ̄-spōr), *n.* [NL. *pycnium* + Gr. σπορά, seed (spore).] A spore borne in a pycnium.

pycnium (pik′ni-um), *n.*; pl. *pycnia* (-ạ̈). [NL., < Gr. πυκνός, dense, compact.] A term proposed by Arthur for the sorus of the spermogonial stage of uredineal fungi.

pycnogonid (pik-nọ̄-gon′id), *n.* Any one of the *Pycnogonida.*

pycnomorphic (pik-nọ̄-môr′fik), *a.* [Gr. πυκνός, dense, + μορφή, form, + *-ic.*] Containing much, or densely packed, deeply staining substance, such as chromatin: said of certain cells or cell-nuclei.

pycnomorphous (pik-nọ̄-môr′fus), *a.* Same as ★*pycnomorphic.*

> In some cells the chromatic elements are closely packed and the cell consequently takes a dense stain; these he [Nissl] describes as in the *pyknomorphous* condition.
> *Jour. Exper. Med.*, Oct. 1, 1901, p. 553.

pycnosis (pik-nō′sis), *n.* [NL., < Gr. πύκνωσις, condensation, < πυκνοῦν, condense, < πυκνός, dense.] **1.** A condition in which the nucleus of a cell stains more deeply than usual: usually a precursor of necrosis.—**2.** Thickening of a fluid or semisolid substance.

pycnotic (pik-not′ik), *a.* [Gr. πυκνωτικός, < *πυκνωτός, < πυκνοῦν, condense.] Same as ★*pycnomorphic. Vaughan and Novy*, Cellular Toxins, p. 143.

pyelonephrosis (pī″e-lọ̄-nef-rō′sis), *n.* [NL., < Gr. πύελος, trough, + νεφρός, kidney, + *-osis.*] Same as *surgical kidney* (which see, under *kidney*).

pyelotomy (pī-e-lot′ọ̄-mi), *n.* [Gr. πύελος, a trough, + -τομια, < ταμεῖν, cut.] In *surg.*, incision into the pelvis of the kidney.

pyemesis (pī-em′e-sis), *n.* [NL., < Gr. πύον, pus, + ἔμεσις, vomiting.] The vomiting of matter which contains pus.

pygarg, *n.* **3.** A book name of the European hen-harrier, *Circus pygargus*: an Englishing of the specific name.

pygomelian (pī-gọ̄-mē′li-an), *a.* and *n.* [*pygomel*(*us*) + *-ian.*] I. *a.* Relating to or resembling a pygomelus; having an extra leg, or extra legs, projecting from the rump between the other and normal pair.
II. *n.* A pygomelus. *W. Bateson*, Study of Variation, p. 379.

pygomelus (pī-gom′e-lus), *n.*; pl. *pygomeli* (-lī). [NL., < Gr. πυγή, rump, + μέλος, limb.] In *teratol.*, a monster having a supernumerary leg, or legs, projecting from the rump between the others. This abnormality occurs frequently among domesticated fowls.

pygopodine (pī-gop′ọ̄-din), *a.* [*pygopod* + *-ine*^{1}.] Pertaining to, or having the characters of, the *Pygopodes*, or diving birds. *Amer. Nat.*, Jan., 1904, p. 13.

pygostylous (pī-gọ̄-stī′lus), *a.* [*pygostyle* + *-ous.*] Resembling or pertaining to a pygostyle, the terminal portion of a bird's vertebral column. [Rare.]

> The last three or four elements of this part of the vertebral chain coössified together in the adult, forming a flat, horizontally compressed, *pygostylous* mass.
> *Amer. Nat.*, Jan., 1903, p. 61.

Pygurus (pī-gū′rus), *n.* [NL., < Gr. πυγή, rump, + οὐρά, tail.] A genus of spatangoid echinoids with rounded or cordate, convex dorsal surface, found in Upper Jurassic and Cretaceous rocks.

pyin (pī′in), *n.* [Gr. πύον, pus, + *-in*^{2}.] An albuminous mucin-like material found in pus: probably not a unity.

pyknomorphic, *a.* See ★*pycnomorphic.*

pyknosis, *n.* See ★*pycnosis.*

pyknotic, *a.* See ★*pycnotic.*

pyla, *n.* **2.** A perforation in the capsule membrane of a radiolarian.

pylocyte (pī′lọ̄-sīt), *n.* [Gr. πύλη, gate, + κύτος, a hollow, a vessel.] In some sponges, a porocyte in which the pore is situated at the inner end of a funnel-like depression.

Pyloric appendages. Same as *pyloric cæca* (*a*) (which see, under *pyloric*).—**Pyloric insufficiency.** See ★*insufficiency.*—**Pyloric valvule,** in *entom.*, an enlargement of the intestine which marks the boundary between the mid-intestine and the hind intestine.

pylorodiosis (pī-lō″rọ̄-dī-ō′sis), *n.* [NL., < Gr. πυλωρός, pylorus, + δίωσις, pushing asunder.] In *surg.*, an operation for dilatation of a contracted pylorus.

pyloroplasty (pī-lō'rọ-plas-ti), *n.* [Gr. *πυλωρός*, pylorus, + *πλαστος*, < *πλάσσειν*, form, + -*y*^{3}.] Plastic surgery in relation to the pylorus, with the object of repairing a defect of this opening or of enlarging it when contracted.

> With this idea in mind, Dr. Finney said he had devised an operation, known as *pyloroplasty*. He had been able to collect twenty-nine cases operated upon by this method, with a mortality of 6.8 per cent.
> *Med. Record*, March 7, 1903, p. 397.

pyloroptosis (pī″lō-rop-tō'sis), *n.* [NL., < Gr. *πυλωρός*, pylorus, + *πτῶσις*, falling.] Displacement of the pyloric extremity of the stomach.

> If the pyloric portion only [of the stomach] be displaced, the lesion is termed *pyloroptosis*.
> *Encyc. Brit.*, XXXI. 550.

pylorospasm (pī-lō'rọ-spazm), *n.* [NL. *pylorus* + E. *spasm*.] Spasmodic contraction of the pylorus. *Amer. Jour. Clin. Med.*, Oct., 1907, p. 1203.

pylorostenosis (pī-lō″rọ-stẹ-nō'sis), *n.* [NL., < Gr. *πυλωρος*, pylorus, + *στένωσις*, narrowing.] The more correct form of *pyloristenosis*.

pyococcus (pī-ọ-kok'us), *n.*; pl. *pyococci* (-sī). [Gr. *πύον*, pus, + *κόκκος*, berry, kernel.] Any of the pyogenic cocci.

> Undoubtedly the lesions are caused by microorganisms; there is the strongest evidence that these are the *pyococci*, and not, except rarely, the typhoid bacilli.
> *Med. Record*, July 25, 1903, p. 131.

pyocyanase (pī-ọ-sī'a̤-nās), *n.* [Gr. *πύον*, pus, + *κύανος*, blue, + -*ase*.] See the extract.

> The gratifying results obtained by von Emmerich in the treatment of diphtheria by means of *pyocyanase*, a product formed in cultures of the Bacillus pyocyaneus, have been corroborated by several other observers, who have stated that the local application of the agent to the diseased surfaces was followed by the disappearance of the membrane. *Med. Record*, April 25, 1908, p. 693.

pyocyanic (pī″ō-sī-an'ik), *a.* [Gr. *πύον*, pus, + *κύανος*, blue.] Producing blue pus.

> A virulent *pyocyanic* bacillus was isolated from the ice at the summit, and an exceedingly pure water taken near the Montanvert showed twelve colonies of a virulent Bacterium coli per cc. *Nature*, March 27, 1902, p. 504.

pyocyanin (pī-ọ-sī'a̤-nin), *n.* [NL. *pyocyaneus* (see def.) + -*in*^{2}.] A blue pigment produced by the *Bacillus pyocyaneus*. It is soluble in chloroform.

pyocyanolysin (pī″ọ-sī-a̤-nol'i-sin), *n.* [NL. *pyocyan*(*eus*) (see def.) + E. *lysin*.] A lysin directed against the *Bacillus pyocyaneus*.

pyocyte (pī'ọ-sīt), *n.* [Gr. *πύον*, pus, + *κύτος*, a hollow (a cell).] A pus-corpuscle; a body which resembles a lymphocyte or white blood-corpuscle, found in pus.

pyodermia (pī-ọ-dėr'mi-a̤), *n.* [NL., < Gr. *πύον*, pus, + *δέρμα*, skin.] Any disease of the skin which has suppurative lesions. *Buck*, Med. Handbook, III. 707.

pyodermic (pī-ọ-dėr'mik), *a.* [*pyodermia* + -*ic*.] Relating to or affected with pyodermia, or a suppurative skin-disease. *Buck*, Med. Handbook, III. 707.

pyogenin (pī-oj'e-nin), *n.* [Gr. *πύον*, pus, + -*γενης*, -producing, + -*in*^{2}.] A substance of the order of the cerebrosides, found in pus.

pyohæmia (pī-ọ-hē'mi-a̤), *n.* An improper form for *pyemia*.

pyoktanin (pī-ok'ta̤-nin), *n.* [Gr. *πύον*, pus, and -*κτανος*, < *κτείνειν*, kill.] A trade-name for each of two different substances used in the treatment of diseases of the eye, ear, nose, and throat, and as antiseptic and disinfectant applications to ulcers, burns, inflamed wounds, etc. *Blue pyoktanin* is the hydrochlorate of penta- and hexamethyl-pararosaniline, and is also used as a dyestuff under the names *methyl-violet*, *dahlia violet*, and *Paris violet*. *Yellow pyoktanin* is the hydrochlorate of imido-tetramethyl-diamido-diphenyl-methane, is less active than the other, and is known as *auramine* when used as a dye.

pyometritis (pī″ọ-mẹ-trī'tis), *n.* [NL., < Gr. *πύον*, pus, + NL. *metritis*.] Suppurative inflammation of the womb.

pyoperitoneum (pī-ọ-per″i-tọ-nē'um), *n.* [NL., < Gr. *πύον*, pus, + NL. *peritoneum*.] The presence of pus in the peritoneal cavity.

pyoplania (pī-ọ-plā'ni-a̤), *n.* [NL., < Gr. *πύον*, pus, + *πλάνος*, wandering.] Wandering of pus from one part of the body to another, as in the formation of a cold abscess.

pyopneumopericardium (pī-ọ-nū-mọ-per-i-kär'di-um), *n.* [NL., < Gr. *πύον*, pus, + *πνεῦμα*, air, + NL. *pericardium*.] The presence of pus and gas in the pericardial sac.

pyopoëtic (pī″ọ-pọ-et'ik), *a.* Same as ★*pyopoietic*.

pyopoietic (pī″ọ-poi-et'ik), *a.* [Gr. *πύον*, pus, + *ποιητικός*, < *ποιεῖν*, make.] Suppurating; pus-producing.

pyorrhagia (pī-ọ-rā'ji-a̤), *n.* [NL., < Gr. *πύον*, pus, + -*ραγια*, < *ῥηγνύναι*, break.] A sudden gush of pus from a confined space, as an abscess.

pyosepticemia (pī-ọ-sep-ti-sē'mi-a̤), *n.* [NL., < Gr. *πύον*, pus, + NL. *septicæmia*, septicemia.] Combined septicemia and pyemia.

pyosepticemic (pī-ọ-sep-ti-sē'mik), *a.* [*pyosepticem*(*ia*) + -*ic*.] Pertaining to or affected with pyosepticemia. *Buck*, Med. Handbook, VII. 123.

pyosin (pī'ọ-sin), *n.* [Gr. *πύον*, pus, + -*ose* + -*in*^{2}.] A substance, found in pus, which probably belongs to the so-called cerebrosides.

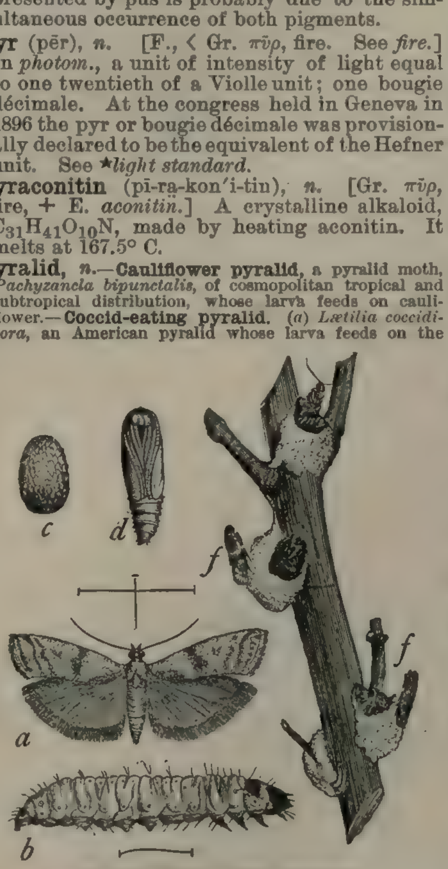
pyotoxinemia (pī-ọ-tok-si-nē'mi-a̤), *n.* [NL., < Gr. *πύον*, pus, + E. *toxin* + Gr. *αἷμα*, blood.] The presence in the blood of toxins formed by pus-producing microbes.

pyoxanthose (pī-ok-san'thōs), *n.* [Gr. *πύον*, pus, + *ξανθός*, yellow, + -*ose*.] A yellow pigment, producible from pyocyanin by exposure to light and air. The green color sometimes presented by pus is probably due to the simultaneous occurrence of both pigments.

pyr (pēr), *n.* [F., < Gr. *πῦρ*, fire. See *fire*.] In *photom.*, a unit of intensity of light equal to one twentieth of a Violle unit; one bougie décimale. At the congress held in Geneva in 1896 the pyr or bougie décimale was provisionally declared to be the equivalent of the Hefner unit. See ★*light standard*.

pyraconitin (pī-ra̤-kon'i-tin), *n.* [Gr. *πῦρ*, fire, + E. *aconitin*.] A crystalline alkaloid, $C_{31}H_{41}O_{10}N$, made by heating aconitin. It melts at 167.5° C.

pyralid, *n.*—**Cauliflower pyralid**, a pyralid moth, *Pachyzancla bipunctalis*, of cosmopolitan tropical and subtropical distribution, whose larva feeds on cauliflower.—**Coccid-eating pyralid.** (*a*) *Lætilia coccidivora*, an American pyralid whose larva feeds on the cottony maple-scale, *Pulvinaria innumerabilis*. (*b*) A European species, *Erastria scitula*, introduced into California, whose larva preys on the black scale, *Lecanium oleæ*.



Coccid-eating Pyralid (*Lætilia coccidivora*).
a, moth; *b*, larva; *c*, egg; *d*, pupa; *f*, *f*, moths, natural size, resting on egg-sacs of *Pulvinaria*. *a*, about twice natural size; *b*, *d*, more enlarged; *c*, highly magnified.
(Comstock, U. S. D. A.)

Pyrameis (pir-a̤-mē'is), *n.* [NL. (Huebner, 1816), appar. < Gr. *πυραμίς*, pyramid.] A large and wide-spread genus of butterflies of the family *Nymphalidæ*. It occurs in most parts of the world, and is represented in the United States by four species, of which *P. cardui* is a cosmopolitan form and is well known in England as the *painted-lady* (which see, with cut) and in the United States as the *thistle-butterfly*. Synonymous with *Vanessa*.

pyramid, *n.* **3.** In *crystal.*, limited by many authors to a form corresponding in shape to a pyramid as geometrically defined: thus a square pyramid (tetragonal system) would have but four triangular faces and similarly in other cases; the double pyramid is then called a *bipyramid*.

4. (*b*) One of the five large pieces in the dental apparatus of some echinoids.—**8.** A game of pool begun by arranging in a triangle 15 balls, which the various players in turn endeavor to pocket with a single cue-ball. Customarily each ball pocketed counts 1, and the player continues as long as he makes at each stroke and does not pocket the cue-ball.—**9.** A variety of checkers in which the pieces are arranged in the form of a pyramid.—**Apex of a pyramid**, the summit that is not on the base.—**Heronic pyramid**, a pyramid on a Heronic triangle, cyclic quadrilateral, or cyclic polygon as base, with rational lateral edges and volume. Such pyramids have a rational circumradius.—**Lateral edges of a pyramid**, those edges which meet at the apex.—**Lateral faces of a pyramid**, those faces which meet at the apex.—**Lateral surface of a pyramid**, the sum of the lateral faces.—**Pyramid of Lalouette**, the thyroid pyramid; an occasional conical lobe of the thyroid gland.—**Regular pyramid**, a pyramid whose base is a regular polygon and whose lateral faces are isosceles triangles.—**Seger's pyramids.** Same as *Seger's* ★*cones*.—**Truncated pyramid.** See *truncate*.

pyramid (pir'a̤-mid), *v. i.* In stock-dealings on margin, to speculate or continue to speculate on one's profits, that is, to use the profit made on one transaction as margin on a second and the profit on that (if any) as margin on a third, etc.

pyramidal, *a.* **3.** In *anat.*, noting a muscle whose fibers arise from a long base and converge to the point of their insertion: correlative with ★*prismatic*, 3, and ★*rhomboidal*, 2.—**Pyramidal cell.** See ★*cell*.—**Pyramidal class**, in *crystal.* See ★*symmetry*, 6.—**Pyramidal composition**, in the *fine arts*, a composition in which the central features or masses dominate the lateral in such a way as to bring the whole into resemblance to a pyramid.—**Pyramidal railroad.** See ★*railroad*.

pyramidize (pir'a̤-mid-īz), *v. t.*; pret. and pp. *pyramidized*, ppr. *pyramidizing*. [*pyramid* + -*ize*.] To make into a pyramid.

pyramidocephalic (pi-ram″i-dō-se-fal'ik), *a.* [Gr. *πυραμίς* (-*μιδ*-), pyramid, + *κεφαλή*, head, + -*ic*.] In *craniom.*, having a dolichocephalic skull, with carinated and pyramidal calvaria, and lozenge-shaped face, broadest below the orbits. *Aitken Meigs.*

pyramidone (pi-ram'i-dōn), *n.* [(*anti*)*pyr*(*in*) + *amide* + -*one*.] The dimethylamino derivative of antipyrin, $C_{11}H_{11}ON_2.N(CH_3)_2$.

pyramid-spot (pir'a̤-mid-spot), *n.* In *Eng. pool*, a spot between the billiard or red-ball spot and the center spot; in American pool, the billiard spot itself. *W. Broadfoot*, Billiards, p. 74.

pyranol (pir'a̤-nol), *n.* [Gr. *πῦρ*, fire, + -*an* + -*ol*.] A compound of the type  $\mathrm{O}\langle\begin{smallmatrix}\mathrm{R}\\ \mathrm{R}\end{smallmatrix}\rangle\mathrm{C}\langle\begin{smallmatrix}\mathrm{OH}\\ \mathrm{H}\end{smallmatrix}$, where R indicates a bivalent radical: for instance, dinaphthopyranol,  $\mathrm{O}\langle\begin{smallmatrix}\mathrm{C_{10}H_6}\\ \mathrm{C_{10}H_6}\end{smallmatrix}\rangle\mathrm{C}\langle\begin{smallmatrix}\mathrm{OH}\\ \mathrm{H}\end{smallmatrix}$.

pyrantin (pī-ran'tin), *n.* Same as ★*phenosuccin*.

pyrarenyte (pī-rä'ren-īt), *n.* [Gr. *πῦρ*, fire, + L. *arena*, sand, + -*yte* (-*ite*).] A rock of the texture of sandstone, produced by igneous agencies and composed of coarse volcanic tuff. *Amer. Geol.*, April, 1904, p. 246.

pyrazin (pī-raz'in), *n.* [Gr. *πύρ*, fire, + E. *azin*.] A crystalline base,  $\begin{array}{c}\mathrm{CH{-}N{-}CH}\\ \|\quad|\quad\|\\ \mathrm{CH{-}N{-}CH}\end{array}$, made by distilling aminoacetic aldehyde with mercuric chlorid solution and in other ways. It has the odor of heliotrope and melts at 55° C. In general the name is applied to the substitution-products of pyrazin. Also called *piazin* and *paradiazin*. See ★*azin*.

pyrazole (pī-raz'ōl), *n.* [Gr. *πῦρ*, fire, + E. *azole*.] A crystalline base,  $\mathrm{HC}\langle\begin{array}{l}\mathrm{NH.N}\\ \qquad\ \|\\ \mathrm{CH.CH}\end{array}$, made by heating pyrazole di- or tricarbonic acid. It melts at 70° C.

pyrazoline (pī-raz'ọ-lin), *n.* [*pyrazole* + -*in*^{2}.] A basic liquid,  $\mathrm{HN}\langle\begin{array}{l}\mathrm{N=CH}\\ \qquad|\\ \mathrm{CH_2.CH_2}\end{array}$, made by the action of acrolein on hydrazine in ethereal solution. It boils at 144° C.

pyrazolone (pī-raz'ọ-lōn), *n.* [*pyrazole* + -*one*.] A crystalline base,  $\mathrm{HN}\langle\begin{array}{l}\mathrm{CO.CH_2}\\ \qquad|\\ \mathrm{N=CH}\end{array}$, made by the action of hydrazine sulphate on sodium-formyl-acetic ester. It melts at 165° C. Its most important derivative is antipyrin, which is 1-phenyl-2,3-dimethyl-pyrazolone.

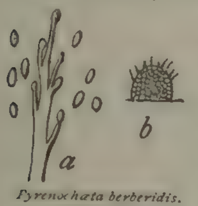
pyrenemia (pī-rẹ-nē'mi-a̤), *n.* [NL., < Gr. *πυρήν*, the stone of a fruit, + *αἷμα*, blood.] The presence of nucleated red corpuscles in the blood.

pyrenic (pī-ren'ik), *a.* [*pyrene* + -*ic*.] Derived from pyrene.—**Pyrenic acid**, a yellow crystalline acid, $C_{15}H_8O_3$, made by oxidizing pyrene with chromic acid. It turns black when heated above 250° C.

Pyrenidiaceæ (pī-rẹ-nid-i-ā´sẹ-ē), *n. pl.* [NL., < *Pyrenidium* + *-aceæ.*] A small family of pyrenolichens: so named from the genus *Pyrenidium.*

Pyrenidium (pī-rẹ-nid´i-um), *n.* [NL. (Nylander, 1865), < Gr. πυρήν, the stone of a fruit, + dim. -ιδιον.] A monotypic genus of lichens having a small crustaceous thallus bearing small perithecia with four-spored asci. The species, *P. actinellum,* occurs on chalk rocks in England.

Pyrenochæta (pī-rē-nọ-kē´tạ̈), *n.* [NL. (De Notaris, 1849), < Gr. πυρήν, the stone of a fruit, + χαίτη, mane (bristle).] A genus of sphæropsidaceous fungi. They have globose or pyriform black pycnidia provided with setæ about the upper part. The spores are simple and usually hyaline. About 30 species have been described. *P. Berberidis* is a common species on *Berberis* in Europe.



Pyrenochæta berberidis.
a, pycnidium strongly magnified; *b*, pycnidia slightly magnified.

pyrenoid, *n.* **2.** One of the colorless plastids, or leucoplasts, found in the chromatophores of algæ and constituting centers for the formation of starch. *Schmitz,* 1883.

pyrenolichen (pī-rē-nọ-lī´ken), *n.* [NL. *pyrenolichen* (singular).] A member of the *Pyrenolichenes* (which see).

pyrenoline (pī-ren´ọ-lin), *n.* [(*amino*)*pyrene* + *-ol* + *-ine*².] A golden-yellow crystalline base, $C_{19}H_{11}N$, made by heating a mixture of aminopyrene, glycerol, nitrobenzene, and concentrated sulphuric acid. It melts at 152–153° C. Its dilute solutions have a green fluorescence.

pyrenolysis (pī-rẹ-nol´i-sis), *n.* [Gr. πυρήν, the stone of a fruit, + λύσις, breaking up.] In *cytol.,* the breaking down, fragmentation, or pulverization of the nucleoli to form granules which may escape from the nucleus into the cytoplasm of the cell.

> L. Launoy describes in the mid-gut gland of Eupagurus bernhardus the division of the nucleolus without subsequent nuclear division; the pulverisation of one or more of the nucleoli; the passage into the karyoplasm of internucleolar granulations or the dissolution of these in the fundamental acidophilous substance of the nucleolus—a process which he sums up in the term *pyrenolysis.*
> *Jour. Roy. Micros. Soc.,* April, 1903, p. 178.

Pyrenomycetineæ (pī-rē-nọ-mī-sẹ-tin´ẹ-ē), *n. pl.* [NL., < *Pyrenomycetes* + *-ineæ.*] A name applied by some recent authors to the fungi of the suborder *Pyrenomycetes.*

pyrenosoma (pī-rē-nọ-sō´mạ̈), *n.*; pl. *pyrenosomata* (-mạ-tạ̈). [NL., < Gr. πυρήν, the stone of a fruit, + σῶμα, body.] Same as ⋆*plasmosome.*

pyrenosome (pī-rē´nọ-sōm), *n.* Same as ⋆*plasmosome.*

Pyrenula (pī-ren´ụ-lạ̈), *n.* [NL. (Acharius, 1810), < Gr. πυρήν, the stone of a fruit, + dim. *-ula.*] A genus of pyrenolichens which have a crustaceous thallus and simple black perithecia. The spores are usually ellipsoid, brown, and 2- to 6-celled. About 100 species are known, occurring on the bark of trees. *P. nitida* is a cosmopolitan species.

Pyrenulaceæ (pī-ren-ụ-lā´sẹ-ē), *n. pl.* [NL., < *Pyrenula* + *-aceæ.*] A family of pyrenolichens named from the genus ⋆*Pyrenula.*

pyrethric (pī-reth´rik), *a.* [*Pyrethr*(*um*) + *-ic.*] Noting an acid obtained by the hydrolysis of pyrethrin.

pyrethrin (pir´e-thrin), *n.* [*Pyrethr*(*um*) + *-in*².] A resinous compound found in pellitory resin from the root of *Anacyclus Pyrethrum.*

Pyrethrum camphor. Same as ⋆*pyrethrin.*

pyretogenetic (pir″e-tọ-jẹ-net´ik), *a.* Same as ⋆*pyretogenic.*

pyretogenic (pir″e-tọ-jen´ik), *a.* [Gr. πυρετός, fever, + -γενης, -producing, + *-ic.*] Causing fever.

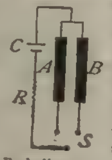
pyretogenous (pir-e-toj´e-nus), *a.* Same as ⋆*pyretogenic.*

pyretography (pir-e-tog´rạ-fi), *n.* [Gr. πυρετός, fever, + -γραφια, < γράφειν, write.] A description of or treatise on fevers.

pyrgoides (pėr-goi´dēz), *n.* [Gr. πυργοειδής, like a tower, < πύργος, a tower, + εἶδος, form.] In *anthrop.,* a cranium with high, steep occiput resembling the wall of a tower. *G. Sergi* (trans.), Var. of the Human Species, p. 56.

pyrgom (pėr´gom), *n.* [G. *pyrgom* (Breithaupt, 1830), < Gr. πύργωμα, a towered place, < πυργοῦν, fence with towers, < πύργος, a tower.] Same as *fassaite.*

pyrheliometer, *n.* In the earlier forms given to this instrument, such as that of Pouillet (see *pyrheliometer*), the heat of the sun's rays was determined by the rise of temperature of water or mercury contained in a vessel which exposed to sunlight a known area of surface. In modern practice electrical methods have been employed which are of far greater sensitiveness, accuracy, and convenience. The compensated pyrheliometer of Ångström, which belongs to the latter class of instruments, consists of two very thin metal strips (AB) of equal size, mounted a few millimeters apart. The strips are blackened on the face which is to be exposed to radiation. To the back of the strips are attached the two junctions of a thermo-element, in circuit with which is a delicate galvanometer by means of which their temperatures may be compared. If one of the strips, as A, is exposed to radiation while the other is screened, the rise in temperature of the former will produce an electric current in the circuit containing thermo-junctions and cause a deflection of the galvanometer. If, now, current from a battery, C, is sent through the shaded strip, this also will be heated and by adjustment of a variable resistance, R, the heating effect of the current in B may be made precisely to counterbalance the heating effect of radiation in A. When the current from the battery is just sufficient for this purpose the galvanometer deflection is reduced to zero. If *i* is the intensity current necessary to produce a balance, *r* the resistance of the strip through which it flows per centimeter of length, *b* its width, and *a* the absorbing power of the surface, the intensity of the radiation upon the exposed strip will be given by the equation



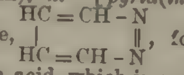
Pyrheliometer.

$$q = \frac{i^2 r}{4.19.ab.} \text{ cal. per sec. per } \overline{\text{cm}}^2.$$

The temperature of the two strips being the same, the losses by radiation, convection, and conductivity are equal and these troublesome corrections are avoided. Because of the small thermal capacity of the instrument its final temperature is reached in a few seconds. The metal of the strips is usually platinum, but manganin, for which the coefficient of resistance with temperature is very small, is to be preferred. The frame which carries the strips is mounted in a tube which likewise contains the screen for protecting the unexposed strip. This screen can be shifted so as to expose first one and then the other strip to the sun's rays. By means of the switch *S* the compensating current can be sent through either strip at will.

pyric (pī´rik), *a.* [*pyr*(*oxene*) + *-ic.*] In *petrog.,* in the quantitative system of classification of igneous rocks (see ⋆*rock*¹), having the characters of or containing normative pyroxene.

pyridazin (pir-i-daz´in), *n.* [*pyrid*(*ine*) + *-azin.*] An oily base,



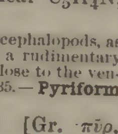
$$\begin{array}{l} HC = CH - N \\ | \qquad\qquad\quad \| \\ HC = CH - N \end{array}$$

formed from its tetracarbonic acid, which is made by oxidizing dibenzorthodiazin. It boils at 208° C. and has the odor of pyridine. Also called *orthodiazin.*

pyridyl (pir´i-dil), *n.* The radical C_5H_4N, which is derived from pyridine.

pyriform, *a.*—**Pyriform sac,** in some cephalopods, as *Nautilus,* a vestigial structure, probably a rudimentary seminal vesicle, situated on the left side close to the ventricle. *Parker and Haswell,* Zoology, I. 735.—**Pyriform sinus.** See ⋆*sinus.*

pyrimidine (pī-rim´i-din), *n.* [Gr. πῦρ, fire (?) + *imide* + *-ine*².] An organic compound, composed of carbon, hydrogen, and nitrogen, so arranged that the carbon and nitrogen atoms form a ring or chain, as shown in the formula



$$\begin{array}{ccc} & N - CH & \\ & \| \qquad \| & \\ HC & & CH. \\ & | \qquad | & \\ & N = CH & \end{array}$$

> Pyrimidine is the mother-substance of such bodies, occurring in the animal and vegetable organism, as cytosin, uracil, and thymin. Alloxan, which is an essential component of the purin group, is also a derivative of pyrimidine, and a close relationship thus exists between the purin and pyrimidine bodies.

pyrites, *n.*—**Auriferous pyrites,** any kind of pyrites which carries gold.—**Cupreous pyrites,** iron pyrites containing in admixture a small proportion of copper pyrites or chalcopyrite: found in great abundance in the north of Spain, and used to furnish sulphur for the manufacture of sulphuric acid, with metallic copper as a by-product.—**Pyrites smalls.** See ⋆*small.*—**Variegated pyrites,** bornite.—**Yellow pyrites,** chalcopyrite.

Pyritic smelting, a process for smelting copper ores (without any previous roasting) in water-jacket furnaces. Very little fuel is required, most of the necessary heat being produced by burning the sulphur in the pyrites. The matter obtained in the water-jacket furnace is run into a converter and subjected to an air-blast for from 80 to 100 minutes, copper of about 99.4 purity being produced.

> Some progress has been made towards smelting ores by the heat of combustion of their own elements, through what is known as *pyritic smelting.*
> *Encyc. Brit.,* XXVII. 234.

Pyritohedral class in *crystal.* See ⋆*symmetry,* 6.

pyritoid (pir´i-toid), *a.* and *n.* **I.** *a.* Same as *pyritohedral.*

II. *n.* Same as *pyritohedron.*

pyro. In *photog.,* an abbreviation of *pyrogallol.* [Colloq.]

pyro-arseniate (pī″rō-är-sē´ni-āt), *n.* [*pyro-arsen*(*ic*) + *-i-* + *-ate*¹.] A salt derived from or corresponding to pyro-arsenic acid, as sodium *pyro-arseniate,* $Na_4As_2O_7$.

pyro-arsenic (pī″rọ-är-sen´ik), *a.* [Gr. πῦρ, fire, + E. *arsenic, a.*] Noting an acid, $H_4As_2O_7$, obtained in crystalline form by heating orthoarsenic acid to 180° C., water being formed and given off as vapor.

pyro-aurite (pī-rọ-â´rīt), *n.* [Gr. πῦρ, fire, + L. *aurum,* gold, + *-ite*².] A hydrate of ferric iron and magnesium occurring in golden-yellow or silvery-white hexagonal scales.

pyrobitumen (pī″rọ-bi-tū´men), *n.* [Gr. πῦρ, fire, + L. *bitumen.*] A division of the solid bitumens including, according to the classification of Clifford Richardson, albertite, elaterite, and wurtzelite derived from petroleum, and anthracite, bituminous coal, lignite, and peat derived from direct metamorphosis of vegetable growth. *Science,* March 13, 1903, p. 419.

pyroborate (pī-rọ-bō´rāt), *n.* [*pyrobor*(*ic*) + *-ate*¹.] A salt derived from or corresponding to pyroboric acid, as sodium pyroborate ($Na_2B_4O_7$).

pyroboric (pī-rọ-bō´rik), *a.* [Gr. πῦρ, fire, + E. *boric.*] Noting an acid, $H_2B_4O_7$, obtained as a glass-like brittle mass by heating orthoboric or boracic acid for a long time to 140° C.

pyrocatechin (pī-rọ-kat´e-chin), *n.* [Gr. πῦρ, fire, + E. *catechin.*] Same as ⋆*pyrocatechol.*

pyrocatechinol (pī-rọ-kat´e-chi-nol), *n.* Same as ⋆*pyrocatechol.*

pyrocatechol (pī-rọ-kat´e-chol), *n.* [Gr. πῦρ, fire, + E. *catechu* + *-ol.*] A white crystalline substance, $C_6H_4(OH)_2$; orthodihydroxybenzene. It occurs in the urine of horses as pyrocatechol-sulphuric acid, and also in human urine and in some plants. It is made by fusing phenol, bromphenol, etc., with caustic potash and by the dry distillation of catechin and many tannins; it melts at 104° C. Also called *pyrocatechin, pyrocatechinol, oxyphenic acid;* and *catechol.*

pyrocatechuic (pī-rọ-kat-e-chö´ik), *a.* [Gr. πῦρ, fire, + E. *catechu* + *-ic.*] Noting an acid, once thought to be responsible for the peculiar reactions of alkapton urine.

pyrochemical (pī-rọ-kem´i-kal), *a.* [Gr. πῦρ, fire, + E. *chemical.*] Productive of chemical change at high temperatures, such as those of furnaces.

> Calcium is, at temperatures above a red heat, the strongest metallic base existing, and is therefore the most powerful *pyrochemical* reagent.
> *J. W. Richards,* in Science, June 17, 1904, p. 911.

pyrocholesteric (pī″rọ-kol-es-ter´ik), *a.* [Gr. πῦρ, fire, + E. *cholesteric.*] Noting an acid, $C_{11}H_{16}O_7$, an oxidation-product of cholalic acid.

pyrochromate (pī-rọ-krō´māt), *n.* [*pyrochrom*(*ic*) + *-ate*¹.] A salt derived from or corresponding to pyrochromic acid, as potassium pyrochromate ($K_2Cr_2O_7$). Also called *dichromate.*

pyrochromic (pī-rọ-krọ´mik), *a.* [Gr. πῦρ, fire, + χρῶμα, color, + *-ic.*] Same as *anhydrochromic acid.* (See ⋆*anhydrochromic.*) Also called *dichromic acid.*

pyroclastic, *a.* **II.** *n.* A pyroclastic rock.

> The gravels of Slate Creek contain representatives of all the rock types found in Miller Gulch, and in addition a certain proportion of material derived from the older quartzites, *pyroclastics,* and granitic intrusives occurring on the south side of its lower valley.
> *Contrib. to Econ. Geol.,* U. S. Geol. Surv., Bulletin 213, [1902, p. 73.

pyrocoll (pī´rọ-kol), *n.* [Gr. πῦρ, fire, + κόλλα, glue.] A yellowish crystalline compound, $C_{10}H_6O_2N_2$, made by the dry distillation of gelatin. It melts at 268–269° C.

pyrocomenic (pī″rọ-ko-men´ik), *a.* [Gr. πῦρ, fire, + E. *comenic.*] Made by heating comenic acid.—**Pyrocomenic acid.** Same as ⋆*pyromeconic acid.*

pyrocondensation (pī″rọ-kon-den-sā´shọn), *n.* [Gr. πῦρ, fire, + E. *condensation.*] A condensation effected by means of heat. It usually involves a loss of water.

pyrocresol (pī-rọ̄-krē′sol), *n.* [Gr. *πῦρ*, fire, + E. *cresol.*] One of three isomeric compounds, $C_{15}H_{14}O$, found in coal-tar and obtained as a by-product in the preparation of phenol and cresol. *Alpha-pyrocresol* forms white crystals which sublime very easily and melt at 195° C.; *β-pyrocresol* solidifies at 124° C.; and *γ-pyrocresol* crystallizes in needles which solidify at 104–105° C.

pyrocrystalline (pī-rọ̄-kris′ta-lin), *a.* [Gr. *πῦρ*, fire, + E. *crystalline.*] In *petrog.*, crystalline from a molten magma or highly heated solution.

pyro-electrolyte (pī″rọ̄-ẹ̄-lek′trọ̄-līt), *n.* [Gr. *πῦρ*, fire, + E. *electrolyte.*] A substance, such as glass or magnetite, which is non-conducting or of low conductivity at ordinary temperature, but which becomes conducting at higher temperatures, usually at incandescence. *Trans. Amer. Inst. Elect. Engin.*, Jan. 3, 1902, p. 77.

pyro-electrolytic (pī″rọ̄-ẹ̄-lek-trọ̄-lit′ik), *a.* Pertaining to or having the properties of a pyro-electrolyte.—**Pyro-electrolytic lamp.** Same as *Nernst* ★*lamp.*

pyrofuscin (pī-rọ̄-fus′in), *n.* [Gr. *πῦρ*, fire, + L. *fuscus*, dusky, + *-in*².] A peculiar kind of ulmin-like substance extracted from various kinds of bituminous coal by treating with alkaline solutions.

pyrogallol (pī-rọ̄-gal′ol), *n.* [Gr. *πῦρ*, fire, + E. *gall*(*ic*²) + *-ol.*] A white crystalline compound, $C_6H_3(OH)_3$, obtained by the distillation of gallic acid, whence the name: also made synthetically. It is used as a photographic developer. The alkaline solution is sometimes used in gas analysis to absorb oxygen. It has a bitter taste, is poisonous, and melts at 132.5–133.5° C. Also called *pyrogallic acid.*

pyrogas (pī′rọ̄-gas), *n.* [Gr. *πῦρ*, fire, + E. *gas.*] A trade-name of a gaseous mixture obtained by Tobianski, in Belgium, by burning garbage, rags, sawdust, waste paper, etc., in a specially constructed furnace with limited access of air, and carrying the smoke through a tower containing coke or some other porous absorbent soaked with naphtha or alcohol. It is proposed to use the product as a source of heat, light, and mechanical or electrical energy. *Sci. Amer. Sup.*, March 21, 1903, p. 22753.

pyrogen, *n.* **3.** A substance formed by the action of heat; specifically, a carbon compound formed in this way.

pyrogenic, *a.* **2.** In *geol.*, having an igneous origin; igneous.

> The first of these groups includes the well recognized igneous rocks, to which the term *pyrogenic* is applicable.
> *Amer. Geol.*, April, 1904, p. 230.

II. *n.* A rock or mineral produced by the cooling of igneous magmas.

pyrograph (pī′rọ̄-gråf), *n.* [Gr. *πῦρ*, fire, + *γράφειν*, write.] **1.** A design made by pyrography.—**2.** A railway danger-signal. The explosion of a torpedo on the track makes a blast of compressed air to pass through a tube and cause a toothed device to cut a disk from a card, thus showing a red signal.

pyrographic (pī-rọ̄-graf′ik), *a.* [*pyrograph* + *-ic.*] Pertaining to or made by pyrography.

> The temperature range is very great. The maximum is high enough for pyrography, the minimum affords a low heat for gilding. Where *pyrographic* heat is required, small recessed plates are heated very hot upon which tools of varying design are heated.
> *Elect. World and Engin.*, Jan. 9, 1904, p. 87.

pyrographitic (pī″rọ̄-grā-fit′ik), *a.* [Gr. *πῦρ*, fire, + E. *graphitic.*] Noting an oxid, a substance produced as a fine powder by heating graphitic acid, the latter being formed by the interaction of graphite with potassium chlorate and strong nitric acid. The production from it of pyrographitic oxid is attended with notable intumescence. *Roscoe and Schorlemmer*, Treatise on Chem., I. 730.

pyrography, *n.* **2.** The process of burning a design or inscription on wood, leather, or other substance by means of a heated point which is held or guided by the hand.

> Many examples of *pyrography* were shown, the most delicate being on soft white velvet photograph cases, handkerchief holders and such things, into which the designs were daintily burned.
> *N. Y. Tribune*, Dec. 27, 1898.

pyroguaiacine (pī-rọ̄-gwī′a-sin), *n.* [Gr. *πῦρ*, fire, + E. *guaiac*(*um*) + *-ine*².] A crystalline compound, $C_{18}H_{18}C_3$, formed toward the end of the distillation of guaiacum. When distilled with zinc-dust it yields the hydrocarbon guaiene.

pyrojapaconitine (pī″rọ̄-jap-a-kon′i-tin), *n.* [Gr. *πῦρ*, fire, + E. *japaconitine.*] An alkaloid, $C_{32}H_{45}O_9N$, formed when japaconitine is heated to 200–210° C. It crystallizes in needles which melt at 168° C.

pyrolic (pī-rol′ik), *a.* [*pyr*(*oxene*) + *ol*(*ivin*) + *-ic.*] In *petrog.*, in the quantitative system of classification of igneous rocks (see ★*rock*¹), having equal or nearly equal amounts of normative pyroxene and normative olivin or akermanite.

Pyrolignite of iron, a trade-name for the black-liquor or iron-liquor prepared by acting on scrap-iron with crude pyroligneous acid, the impure acetic acid from destructive distillation of wood. It is used as a mordant in dyeing and calico-printing.

pyrolutite (pī-rọ̄-lū′tīt), *n.* [Gr. *πῦρ*, fire, + L. *lutum*, mud, + *-ite*².] In *petrog.*, a mud-rock derived from volcanic material, or from igneous rocks. *Grabau*, 1904.

pyrolysis (pī-rol′i-sis), *n.* [Gr. *πῦρ*, fire, + *λύσις*, breaking up, dissolution.] Chemical decomposition produced by exposure to a high temperature.

pyrolytic (pī-rọ̄-lit′ik), *a.* [*pyrolysis* (*-lyt-*) + *-ic.*] Related to or involving pyrolysis or chemical decomposition brought about by exposure to a high temperature.

pyromalic (pī-rọ̄-mā′lik), *a.* [Gr. *πῦρ*, fire, + E. *malic.*] Made by heating malic acid.—**Pyromalic acid,** a general name for maleic and fumaric acids.

pyromeconic (pī″rọ̄-mẹ̄-kon′ik), *a.* [Gr. *πῦρ*, fire, + E. *meconic.*] Made by heating meconic acid.—**Pyromeconic acid,** a crystalline acid, $C_5H_5O_2(OH)$, made by distilling comenic and meconic acids. It melts at 121° C. Also called *oxypyrone* and *pyrocomenic acid.*

pyromellitic (pī″rọ̄-me-lit′ik), *a.* [Gr. *πῦρ*, fire, + E. *mellitic.*] Made by heating mellitic acid.—**Pyromellitic acid,** a crystalline acid, $C_6H_2(COOH)_4 + 2H_2O$, or 1,2,4,5-benzene-tetracarboxylic acid, made by the dry distillation of mellitic acid. It melts at 264° C., yielding pyromellitic anhydrid, $C_6H_2(CO)_4O_2$, a crystalline substance which melts at 286° C.

pyromeride (pī-rom′ẹ-rid), *n.* [Gr. *πῦρ*, fire, + *μέρος*, part, + *-ide.*] In *petrog.*, a somewhat altered spherulitic quartz-porphyry or rhyolite (Monteiro). This name, first applied by Haüy to the orbicular diorite of Corsica (corsite or napoleonite), was given because it was thought that only a part of the minerals in the rock was fusible, quartz being at that time considered infusible.

pyrometer, *n.*—**Amagat pyrometer,** an instrument for measuring high temperatures by determining the heating effect upon a current of water of causing it to flow past the point of which the temperature is required, the quantity of water circulated and its initial temperature being known.—**Bake-oven pyrometer,** a heat-indicator applied to an oven. By its use bread, cake, and crackers can be baked more uniformly.—**Féry's absorption pyrometer.** See *optical* ★*pyrometry.*—**Holborn-Kurlbaum pyrometer.** See *optical* ★*pyrometry.*—**Le Chatelier's optical pyrometer.** See *optical* ★*pyrometry.*—**Optical pyrometer,** an instrument for the determination of the temperature of a glowing body by means of the visible radiation which it emits. See *optical* ★*pyrometry.*—**Wanner's pyrometer.** See *optical* ★*pyrometry.*

Pyrometric cones. Same as *Seger's* ★*cones.*—**Pyrometric effect.** Same as ★*calorific intensity.*—**Pyrometric telescope.** See ★*telescope.*

pyrometry, *n.*—**Optical pyrometry,** the determination of the temperature of glowing bodies by means of the visible radiation emitted by them. Optical pyrometers are based upon the law of the increase of visible radiation with the temperature. In most cases the intensity of a selected set of rays from the visible spectrum of the body whose temperature is to be measured is compared with the intensity of the corresponding rays in the spectrum of an incandescent source of known temperature. The rays employed are usually those of the red end of the spectrum, for the reason that at the lower temperatures of incandescence the red is the only part of the spectrum which is of sufficient brightness. This method is of great delicacy on account of the rapid increase of the intensity of light with rise of temperature. Red light from a glowing body, for example, increases over 2,000 times as the body rises in temperature from 1,000° C. to 2,000° C. Since the amount of light emitted by incandescent bodies at a given temperature depends not only on their temperature but likewise on the character of the radiating surface, optical pyrometry is rigorously applicable only to the case of solids the radiation from which approaches that of a black body. However, it may be extended to other bodies the radiating power of which in terms of that of a black body is definitely known. It has been shown by Stefan that the total radiation from a black body is proportional to the fourth power of its absolute temperature; but since the total radiation is not available in optical pyrometry, it is necessary to make use of the more complicated relation established by Wien, according to which the intensity of radiation of a given wave-length is a function of the wave-length and of the absolute temperature. See *laws of* ★*radiation.* *Le Chatelier's pyrometer.* In this instrument (Fig. 1) a gasolene flame, L, is used as a comparison source, and its light is reflected by means of a mirror, M, into the eyepiece, E, of the instrument, where it is viewed through a red glass. The light from the glowing body the temperature of which is to be measured enters the pyrometer through a tube mounted in a direction at right angles to the path of the rays of the comparison-lamp. The beam traverses the objective O, passing by the mirror M, the edge of which is in the focus of the eyepiece and bisects the field of view. The observer thus sees two contiguous fields, one illuminated by the comparison-lamp and the other from the source to be measured. The brightness of the latter is suitably reduced by the interposition of an absorbent glass, A, the transmitting power of which has been determined. Equality of the two fields of view is produced by opening and closing the iris diaphragm, D, and the size of the aperture of this diaphragm, read off upon a suitable scale, affords a measure of the intensity of the light and consequently of the temperature of the source from which it comes. The instrument is calibrated by making readings upon some source of known temperature. *Féry's optical pyrometer.* This instrument is similar in principle to Le Chatelier's pyrometer, but the reduction of the light from the source to be measured is attained by means of a pair of wedges of absorbent glass used in place of the iris diaphragm. *Wanner's pyrometer.* In this instrument (Fig. 2) monochromatic red light is obtained by the use of the direct-vision prisms *p,p.* Light from the glowing body whose temperature is to be measured enters the instrument through the slit s_1 and is dispersed by the prisms. Light from the comparison source enters at the other slit, s_2, and is similarly dispersed. The red rays of these two spectra, isolated by a screen, are doubly refracted by the Rochon prism R, and the combination of lens and biprism B serves to bring two of the red images thus formed into the field of view in the eyepiece. The brightness of these, which are polarized at right angles to each other, varies with the position of the Nicol prism N. The method of measurement consists in turning the latter until the two images are of equal brightness. The temperature of the glowing body is read off upon a circular scale suitably calibrated. *Morse's thermogage.* This instrument, which is a simple form of optical pyrometer, is designed for determining the temperature of heated metals and of furnaces. It depends upon the fact that the filament of an incandescent lamp, when interposed between the eye and the glowing surface the temperature of which is to be measured, can no longer be distinguished when the temperature of the lamp filament is the same as that of the glowing body. In circuit with the lamp are a rheostat and a milliammeter. The measurement of the temperatures is determined from the readings of the current, the instrument having been previously calibrated. *The Holborn-Kurlbaum pyrometer.* The principle of this instrument is the same as that of the Morse thermogage. It has an objective and eyepiece, between which the incandescent lamp is mounted, and absorbent mirrors for reducing the light from the glowing body. The measurement is made by noting the current necessary to bring the lamp to the same temperature as the source with which it is to be compared.

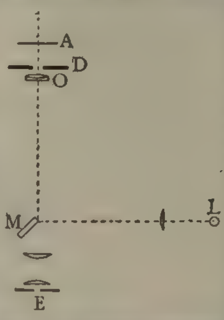


Fig. 1. Le Chatelier's Pyrometer.

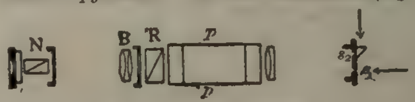

Fig. 2. Wanner's Pyrometer.

pyromucic (pī-rọ̄-mū′sik), *a.* [Gr. *πῦρ*, fire, + E. *mucic.*] Made by heating mucic acid.—**Pyromucic acid,** a crystalline acid, $C_5H_4O_3$, made by the dry distillation of mucic acid. It melts at 133–134° C. and sublimes at as low a temperature as 100° C.

pyrone (pī′rōn), *n.* [Gr. *πῦρ*, fire, + *-one.*] A crystalline ketonic compound, $C_5H_4O_2$, made by heating chelidonic acid. It melts at 32.5° C.

Pyronema (pī-rọ̄-nē′mä), *n.* [NL. (Carus, 1835), irreg. < Gr. *πῦρ*, fire, + *νέμειν*, inhabit.] A genus of discomycetous fungi, of the family *Pyronemaceæ*, having the ascomata sessile and fleshy, with a very slight peridium. The spores are simple and colorless. About 20 species are known. *P. omphalodes* is widely distributed in Europe and America, growing on ground where fire has been.

Pyronemaceæ, Pyronemataceæ (pī″rọ̄-nẹ̄-mā′sẹ̄-ē, pī-rọ̄-nē-ma-tā′sẹ̄-ē), *n. pl.* [NL., < *Pyronema* + *-aceæ.*] A small family of discomycetous fungi: so named from the principal genus, *Pyronema.*

pyronin (pī′rọ̄-nin), *n.* [*pyrone* + *-in*².] A basic aniline dye, of a red color, used in histological technique. Chemically it is the chlorid of tetramethyl- or tetraethyl-diaminodiphenyl-carbidtrioxid.

pyropen (pī′rọ̄-pen), *n.* [Gr. *πῦρ*, fire, + E. *pen*².] In *pyrography*, the heated pen or pointed instrument with which the designs are burned into the wood or other surface.

pyropentylene (pī-rọ̄-pen′ti-lēn), *n.* [Gr. πῦρ, fire, + πέντε, five, + *-yl* + *-ene.*] An unsaturated oily hydrocarbon, C_5H_6, found in illuminating-gas from petroleum. It boils at 42.5° C.

pyrophanite (pi-rof′ạ-nīt), *n.* [Gr. πῦρ, fire, + -φανης, < φαίνεσθαι, appear.] Manganese titanate, $MgTiO_3$, occurring in lustrous deep blood-red tabular rhombohedral crystals near ilmenite in form: found in Sweden.

pyrophile (pī′rọ̄-fil), *n.* [Gr. πῦρ, fire, + φιλεῖν, love.] A lover of fire; specifically, one who explains volcanoes by the natural internal heat of the earth, as opposed to electrical or other cause contributed from outside. [Rare.]

> This advice M. Tarquin holds to have been based on . . . false hypotheses. . . . The theory of the "*pyrophiles*" is dangerous to humanity.
> *Nature*, Nov. 27, 1902, p. 91.

pyrophorine (pī-rof′ọ̄-rin), *n.* [*Pyrophorus* + *-ine*^{2}.] A substance, found in the photogenic organs of beetles of the genus *Pyrophorus*, which is concerned in the production of light.

pyrophosphorite (pī-rọ̄-fos′fō-rīt), *n.* [Gr. πῦρ, fire, + NL. *phosphorus* + *-ite*^{2}.] A calcium-magnesium phosphate, perhaps essentially a pyrophosphate (hence the name), occurring in snow-white earthy masses: found in the West Indies.

pyrophosphoryl (pī-rọ̄-fos′fọ̄-ril), *n.* [Gr. πῦρ, fire, + E. *phosphoryl.*] The radical P_2O_3, which may be viewed as existing in pyrophosphoryl chlorid, $P_2O_3Cl_4$, related to pyrophosphoric acid as the result of the replacement of hydroxyl by chlorin.

pyrophotometer (pī″rọ̄-fọ̄-tom′e-tėr), *n.* [Gr. πῦρ, fire, + E. *photometer.*] A form of optical pyrometer. See *pyrometer* and ★*pyrometry.*

pyroplasmosis, *n.* See ★*piroplasmosis.*

Pyroracemic alcohol. Same as ★*acetol.*

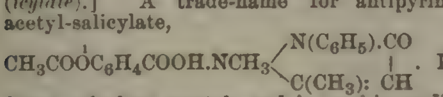
pyroradioactivity (pī″rọ̄-rā″di-ọ̄-ak-tiv′ị-ti), *n.* [Gr. πῦρ, fire, + E. *radioactivity.*] The emission of obscure rays, called 'pyro-rays,' by a wire heated to incandescence by the electric current. *Sci. Amer.*, July 23, 1904, p. 63.

pyro-ray (pī′rọ̄-rā), *n.* [Gr. πῦρ, fire, + E. *ray*^{1}.] One of the rays, other than ordinary light-rays, described by Tommasina as being given off from an incandescent wire. They are said to produce ionization of the air, to discharge an electroscope, and to be of three sorts, possibly corresponding to the *α-*, *β-*, and *γ*-rays from radium. *Sci. Amer.*, Jan. 7, 1905, p. 2.

pyroretin (pī-rọ̄-ret′in), *n.* [Gr. πῦρ, fire, + ῥητίνη, resin.] A brown resin obtained from a variety of Bohemian lignite.

pyrorudite (pī-rọ̄-rö′dīt), *n.* [Gr. πῦρ, fire, + L. *rudus*, rubble, + *-ite*^{2}.] In *petrog.*, a conglomerate or breccia of igneous rocks; a pyroclastic rock. *Grabau*, 1904.

pyrosal (pī′rọ̄-sal), *n.* [(*anti*)*pyr*(*in*) + *sal*(*icylate*).] A trade-name for antipyrin-acetyl-salicylate,



$$CH_3CO\overset{1}{O}C_6H_4COOH.NCH_3\left\langle\begin{array}{l}N(C_6H_5).CO\\ \qquad\qquad\;|\\ C(CH_3):\;CH\end{array}\right.$$

. It forms colorless crystals and is used in medicine as an antipyretic and analgesic.

pyrosine (pī′rọ̄-sin), *n.* [Gr. πῦρ, fire, + *-ose* + *-ine*^{2}.] Same as ★*erythrosin.* **Pyrosine B.** Same as ★*erythrosin.*— **Pyrosine J.** Same as ★*erythrosin G.*

Pyrosoma bigeminum, the sporozoan parasite of Texas fever in cattle. See ★*Piroplasma. Theobald Smith*, 1893.

pyrosphere (pī′rọ̄-sfēr), *n.* [Gr. πῦρ, fire, + σφαῖρα, sphere.] In *geol.*, the interior of the earth, believed to be highly heated, as contrasted with the relatively cold crust which is called the *lithosphere.*

> The hypothesis that within the solid lithosphere lies a *pyrosphere* of intensely high temperature, and successively in a plastic, fluid, and finally at the centre gaseous state.
> *Geog. Jour.* (R. G. S.), XV. 88.

pyrostat, *n.* **2.** An apparatus for maintaining constancy of temperature; a thermostat; specifically, a thermostat for high temperatures.

pyrosulphate (pī-rọ̄-sul′fāt), *n.* [Gr. πῦρ, fire, + E. *sulphate.*] A salt derived from or corresponding to pyrosulphuric acid, as sodium pyrosulphate, $Na_2S_2O_7$. Also known as *disulphate.*

pyrotartaric, *a.*— **Normal pyrotartaric acid.** Same as ★*glutaric acid.*

pyroterebic (pī″rọ̄-tē-reb′ik), *a.* [Gr. πῦρ, fire, + E. *terebic.*] Made by heating terebic acid.— **Pyroterebic acid**, an unsaturated oily acid, $(CH_3)_2C=CHCH_2CO_2H$, made by the dry distillation of terebic acid. It has a sharp odor.

Pyrotherium (pī-rọ̄-thē′ri-um), *n.* [Gr. πῦρ, fire, + θηρίον, a wild beast.] A large extinct animal from Patagonia made by its describer (Ameghino) the representative of a distinct family, *Pyrotheriidæ*, and suborder, *Pyrotheria.* It is characterized by 3 premolars and 3 molars above, and 2 premolars and 3 molars below. The molar crowns are composed of two transverse crests. There are two large tusks in the lower jaw, projecting anteriorly. The systematic position and affinities of this animal cannot be stated at present, owing to the incomplete material described. Its remains occur in strata below the Patagonian formation, probably of Oligocene Tertiary age (*Pyrotherium* beds).

pyrotoxin (pī-rọ̄-tok′sin), *n.* [Gr. πῦρ, fire, + E. *toxin.*] A toxin which is capable of producing elevation of temperature in the animal body.

pyrotritaric (pī″rọ̄-trī-tar′ik), *a.* [Gr. πῦρ, fire, + τρι-, three-, + E. (*tar*)*taric.*] Same as ★*uric.*

pyroxam (pī-rok′sạm), *n.* [Gr. πῦρ, fire, + *ox*(*ygen*) + *am*(*mönia*)(?).] Same as *xyloidine.*

pyroxenite (pī-rok′sẹ̄-nīt), *n.* [*pyroxene* + *-ite*^{2}.] In *petrog.*, a phaneric rock composed almost wholly of pyroxene of any kind. If without olivin it is pyroxenite in the sense advocated by G. H. Williams (1890). The name has been used in this sense by Coquand (1857) and Sterry Hunt; by French geologists for pyroxene-gneiss; and by some petrographers for lavas composed chiefly of pyroxene without olivin (augitite).

pyroxenolite (pī-rok-sen′ọ̄-līt), *n.* [*pyroxene* + Gr. λίθος, stone (see *-lite*).] In *petrog.*, a phaneric rock composed of pyroxene with little or no other minerals: used as equivalent to pyroxenite by G. H. Williams in 1890. *Lacroix*, 1895.

pyroxylin, *n.* This term is now usually applied to the less highly nitrated product of the interaction of cellulose and nitric acid, soluble in a mixture of ether and alcohol, not to the more highly nitrated insoluble guncotton used as an explosive.

pyrrharsenite (pi-rär′se-nīt), *n.* [Gr. πυρρός, reddish, + E. *arsenite.*] A variety of berzeliite containing a considerable amount of manganese and a small percentage of antimony. It has been called *manganberzeliite.*

pyrrhochrome (pir′ọ̄-krōm), *a.* [Gr. πυρρός, reddish, + χρῶμα, color.] Of a reddish or orange color; of the color of red hair.

pyrrhocorid (pi-rok′ọ̄-rid), *n.* and *a.* **I.** *n.* One of the *Pyrrhocoridæ.*

II. *a.* Having the characters of or belonging to the heteropterous family *Pyrrhocoridæ.*

pyrrhotism (pir′ọ̄-tizm), *n.* [Gr. πυρρός, reddish, + *-t-* + *-ism.*] The fact or condition of being red or orange in color: specifically applied to the fact of having red hair.

> Finally, red hair is derived from dark hair by the conversion of more or less of the dark pigment into an equal amount of the orange. This last group for which he suggests the name *pyrrhotism* (pyrrhos=foxy-red) he considers to result from an easily occurring chemical modification of the melanochrome into pyrrhochrome pigments.
> *Nature*, July 2, 1908, p. 205.

pyrrol (pir′ol), *n.* [Gr. πυρρός, reddish, + *-ol.*] A secondary amine (C_4H_5N) of feebly basic character and heterocyclic structure. It is a colorless liquid of chloroform-like odor which boils at 131° C., and turns brown on exposure to the air. It occurs in coal-tar and in Dippel's animal oil or bone-oil. The name was given because of the fiery red color produced by this substance when brought in contact with a pine-shaving moistened with hydrochloric acid.

pyrrolic (pi-rol′ik), *a.* [*pyrrol* + *-ic.*] Derived from or related to pyrrol.— **Pyrrolic nucleus**, the atomic grouping  $\begin{array}{l}C=C\\ |\\ C=C\end{array}\!\!>N$, existing in pyrrol.

pyrrolidine (pi-rol′i-din), *n.* [*pyrrol* + *-id* + *-ine*^{2}.] A basic liquid,  $\begin{array}{l}H_2C-CH_2\\ \quad\;|\\ H_2C-CH_2\end{array}\!\!>NH$, or tetrahydropyrrol, made by reducing pyrroline with red phosphorus and hydriodic acid. It boils at 87.5–88.5° C. Also called *pentazane.*

pyrroline (pir′ọ̄-lin), *n.* [*pyrrol* + *-ine*^{2}.] A liquid base,  $\begin{array}{l}\;\;HC=CH\\ \quad\;|\\ H_2C=CH_2\end{array}\!\!>NH$ or  $\begin{array}{l}HC-CH_2\\ \;\;\|\\ HC-CH_2\end{array}\!\!>NH$, made by reducing pyrrol with zinc-dust and acetic acid. It boils at 90–91° C. Also called *dihydropyrrol.*

pyr-steradian (pēr-stẹ̄-rā′di-ạn), *n.* A unit of light-flux; the flux through a solid angle of one steradian when the source is one pyr or *bougie décimale*; one lumen. See ★*pyr.*

pyruvin (pī-rö′vin), *n.* [Gr. πῦρ, fire, + E. *uv*(*ic*) + *-in*^{2}.] The crystalline glycid ester of pyroracemic acid, $C_3H_3O_3.C_3H_5O$, made by heating glycerol with tartaric acid. It melts at 82° C.

Pythiaceæ (pith-i-ā′sẹ̄-ē), *n. pl.* [NL., < *Pythium* + *-aceæ.*] A small family of saprolegnious fungi named from the genus *Pythium.*

pythid (pith′id), *n.* and *a.* **I.** *n.* One of the *Pythidæ.*

II. *a.* Having the characters of or belonging to the coleopterous family *Pythidæ.*

Pythium (pith′i-um), *n.* [NL. (Nees von Esenbeck, 1823), irreg. < Gr. πύθειν, rot.] A genus of saprolegnious fungi, of the family *Pythiaceæ*, having more or less globose zoösporangia and conidia similar in size and shape. The oögonia are thick-walled. *P. De Baryanum* is a common species which attacks the seedlings of various plants and produces a disease sometimes called *damping-off.* See ★*damp*, 6.

> A plant may be diseased as a whole, because nearly all its tissues are in a morbid or pathological condition, owing to some Fungus pervading the whole—e.g., *Pythium* in seedlings.
> *Encyc. Brit.*, XXXI. 574.

Pythoctonos (pī-thok′to-nus), *n.* [Gr. Πυθοκτόνος, the python-slayer.] In *Gr. antiq.*, an epithet of Apollo as slayer of the python. On the coins of Rhegium he is represented as bending the bow, with the serpent and tripod.

pythogenesis, *n.* **2.** The origin of putrefaction.

pythogenous (pi-thoj′e-nus), *a.* Same as *pythogenic.*

python, *n.* **3.** Nine species of this genus are recognized, the rock-python or tiger-python, *P. molurus*, being the most common species and the largest. The West African python, *P. sebæ*, is almost as large, reaching a length of 23 feet. The Australian python, or diamond-snake, is a small serpent attaining a length of only six or seven feet.

Pythonichthys (pī-thọ̄-nik′this), *n.* [NL., < Gr. πύθων, python, + ἰχθύς, fish.] A genus of morays found in the West Indies, inhabiting rather deep water.

pyxie (pik′si), *n.* [*Pyxi*(*danthera*).] A local name of the dwarf evergreen *Pyxidanthera.*

pyxis, *n.* **10.** In old arms and armor, an engine-of-war: probably the same as *culverin*, the early form of cannon.

pyx-jury, *n.* See *pix-jury.*

Q 3. An abbreviation (*g*) in *electrotechnics*, of *quantity*; (*h*) [*l. c.*] of *quasi*; (*i*) [*l. c.*] of *quintal*; (*j*) of the Latin *Quirites*.—5. Same as *cue*^{1}, 3 (*a*): as, to give or take the *Q*.

> For the consequence of sentences, you must be sure that every clause do give the *Q.* one to the other, and be bespoken ere it come. *B. Jonson*, Discoveries, IX. 229. (Gifford.)

6. In *psychophys.*, the symbol for the Fechnerian space-error. *E. B. Titchener*, Exper. Psychol., II. i. 75.

qcm. An abbreviation of *square centimeter*.

q. d. An abbreviation (*b*) of the Latin *quasi dictum*, as if said; (*c*) of the Latin *quasi dixisset*, as if he had said.

q. e. s. system. A system of physical units elaborated by the British Association for the Advancement of Science, in which the unit of length is 1×10^{-11} times the quadrant of the earth measured from the equator to the north pole, the unit of mass is the gram, and the unit of time is the second. The name proposed for this system was the *quadrant-eleventh-gramme-second system*, hence the abbreviation *q. e. s.*

Q. H. P. An abbreviation of *Queen's Honorary Physician*.

Q. L. An abbreviation (*a*) in *psychophys.*, of *quotient limen*; (*b*) [*l. c.*] of the Latin *quantum libet*, as much as is required.

Q. M. L. In *psychophys.*, an abbreviation of *quotient mixture limen*.

q. p., q. pl. Abbreviations of the Latin *quantum placeat*, as much as seems good.

q. t. or **Q. T.** A contraction of *quiet*.—**On the strict q. t.**, with absolute secrecy; on the quiet. [Slang.]

> The subject was so sweet, and the moments were so fleet, that we talked for quite an hour *on the strict q. t.* *G. B. Shaw*, Irrational Knot, vi.

Qto. An abbreviation of *quarto*.

qu. An abbreviation (*c*) of *quarter*.

quack^1, *n.* 3. See ★*couac*.

quacky^1 (kwak'i), *a.* [*quack*^{1} + *-y*^{1}.] Having a flat, metallic quality, resembling the quack of a duck: said of the voice.

> Our women's voices are, on the whole, ungentle; . . . they are pitched unpleasantly high and hardened by throat contractions into an habitual "*quacky*" or metallic quality. *F. Osgood*, in The Forum, June, 1895, p. 502.

quacky^2 (kwak'i), *a.* [*quack*^{2} + *-y*^{1}.] Suited to a quack; quackish; using the methods of quackery.

> Who although a little *quacky* per se has . . . a whole legion of active quacks at his control. *Poe*, Criticism, Works, III. 23.

quad^5 (kwod), *n.* [*quad*(*ricycle*).] A bicycle for four riders. [Colloq.]

quad. An abbreviation (*a*) of *quadrant*, the unit of self-inductance; (*b*) of *quadrate*; (*c*) of *quadruplex* (telegraph).

quad-meter (kwod'mē''tėr), *n.* [*quad*(*rant*), 6, + *meter*.] An instrument for the measurement of inductance; a secohmmeter.

quadrain†, *n.* and *a.* See ★*quadran*.

quadral (kwod'ra̤l), *a.* [NL. **quadralis*, < L. *quadru-*, four- (LL. *quadrus*, four-cornered, L. *quadra*, a square).] Divided into four parts.

quadran†, *n.* and *a.* [Also *quadron*, *quadrain*, etc.: reduced from *quadrant*.] **I.** *n.* A square. **II.** *a.* Square.

quadrangle, *n.* 4. (*a*) A square block of buildings. (*b*) Any square block, as of stone.—5. A region measuring 15′ lat. by 15′ long. (or 30′ lat. by 30′ long., or 1° lat. by 1° long., according to the density of the population) as shown on an atlas sheet of the United States Geological Survey.

> The Philadelphia Special folio, embracing four fifteen-minute *quadrangles*. *Science*, Aug. 7, 1903, p. 187.

Equianharmonic quadrangle, any four quantities $z_1z_2z_3z_4$ such that $(z_1-z_3)(z_2-z_4) = -v^2(z_1-z_2)(z_3-z_4)$, where v is an imaginary or neomonic cube root of unity.—**Harmonic quadrangle**, any four quantities $z_1z_2z_3z_4$ such that $(z_1-z_2)(z_3-z_4) = (z_2-z_3)(z_1-z_4)$.—**Median quadrangle**, the quadrangle formed by the median eyes of a spider.—**Ocular quadrangle**, the quadrangle, on the cephalothorax of certain spiders, at the angles of which the eyes are placed.

quadrangled (kwod'rang-gld), *a.* 1. Quadrangular.—2. Containing a quadrangle.

quadrannulate (kwod-ran'ụ-lāt), *a.* [L. *quadr-* (*quattuor*, four) + *annulus* + *-ate*^{1}.] Composed of four annuli, as certain segments of the body of some earthworms. *Proc. Zool. Soc. London*, 1901, p. 202.

quadrant, *n.* 7. In *embryol.*, one of the four blastomeres or cleavage-cells in the four-cell stage of the ovum.—8†. A square or one of its sides.—9. An oscillating arm attached to a spinning-mule to give a proper rotation to the spindles during the winding of the yarn on the cop.—**Earth quadrant**, one quarter of a great circle passing through the poles of the earth. Its length was carefully computed by French scientists to serve as the basis for the metric unit, which was to be one ten-millionth of such a quadrant. The measurement was later proved to be erroneous, so that the actual meter is at present a purely arbitrary length. See *meter*^{3}. *Smithsonian Rep.*, 1899, p. 217.—**Legal quadrant**, one practical unit of inductance, or henry, as defined by the International Congress of 1893, and not in terms of the c. g. s. unit.—**Quadrant of safety**, the region toward which it is best for a person to run when he sees a tornado approaching. In the United States, if the tornado is west or southwest of him and moving eastward, he should go toward the southeast; if it is more directly south or north, it is probably passing by him, and he is already in the quadrant of safety and may remain quiet.

quadrantal, *a.* 3†. Square.—**Quadrantal deviation**, a compass error; the deviation which arises from the induction both of thwartships and fore-and-aft horizontal iron in the ship, this deviation being compensated by soft-iron balls, or lengths of soft-iron chain in boxes on the sides of the binnacle—these latter being known as *quadrantal correctors*.

quadrantile (kwod'ra̤n-til), *a.* [*quadrant* + *-ile*.] Same as *quadrantal*.

quadrantly† (kwod'ra̤nt-li), *adv.* In a way suggestive of the square: as, to multiply *quadrantly*, that is, to square.

quadrant-plate (kwod'ra̤nt-plāt), *n.* A metal plate at the end of a screw-cutting lathe headstock, which carries a stud on which one or more gears may be placed to connect the lead-screw to the spindle. The plate is hinged on the lead-screw and the stud for the intermediate gears is in a slot so that gears of almost any desired diameter can be used, thus making possible a great many changes in the speed of the lead-screw and providing for the cutting of different threads on the work.

quadrant-rack (kwod'ra̤nt-rak), *n.* The sector-gear of the quadrant of a spinning-mule, operated in conjunction with the spindle-carriage by means of a pinion and band.

quadrapartite (kwod-ra̤-pär'tīt), *a.* and *n.* Same as *quadripartite*.

quadrat, *n.* 4. In *exper. agri.*, a square area of convenient size laid off for the purpose of accurate planting.—5. In *phytogeog.*, a similar square laid off for close study of the relative abundance of species or of other questions.—**Corner quadrat**, a type for a blank space, made in the form of a right angle, to aid the proper joining of mitered brass rules at the corners of a page.

quadrate, *n.* 5†. A quarter; a quadrant.

quadratic, *n.*—**Incomplete quadratic**, the equation $ax^2+bx+c = 0$, if either b or c is zero.—**Pure quadratic**, an equation of the form $ax^2+bx+c = 0$, when $b = 0$.

quadratical (kwod-rat'i-ka̤l), *a.* [*quadratic* + *-al*^{1}.] Same as *quadratic*.

Quadratojugal fossa. See ★*fossa*^{1}.

quadratoquadrat† (kwod-rā-tọ-kwod'rat), *n.* In *alg.*, the fourth power.

quadrature, *n.* 5. In *elect.*, phase difference of 90°, or one quarter period.—**In quadrature**, in *elect.*, having a phase-difference of 90°: said of alternating currents, or of such a current and the electromotive force with which it is associated.—**Mechanical quadrature.** (*b*) Quadrature by a planimeter, or any mechanical contrivance.—**Quadrature field**, in *elect.*, a magnetic field having two components of magnetic flux at right angles to each other.

> In the monocyclic motor one of the two superimposed *quadrature fields* is excited by the primary energy circuit. *Steinmetz*, Elect. Engineering, p. 264.

Quadrature of the lune, the description, with ruler and compasses alone, of a lune and triangle equal to one another by Hippocrates of Chios (about 450 B.C.).

quadriad (kwod'ri-ad), *n.* [L. *quadri-*, four, + *-ad*^{2}.] A series of four; a group of four. [Rare.]

> The advent of the explosive and electric motors for vehicle propulsion, added other and powerful impulses in the agitation for good roads, and with the pressure from the vast bicycle interest the *quadriad* of forces has come together with a combined power that will, we hope, make road improvement a foregone conclusion. *Hiscox*, Horseless Vehicles, p. 15.

quadric, *n.*—**Oval quadric**, a quadric which cuts externally the sides of any principal triangle whose three vertexes lie within it.

quadriceptor (kwod-ri-sep'to̤r), *n.* [L. *quadri-*, four, + *-ceptor*, < *capere*, take.] In *immunology*, an intermediary body having four combining-groups. *Vaughan and Novy*, Cellular Toxins, p. 132.

quadricovariant (kwod''ri-kō-vā'ri-ant), *n.* [L. *quadri-*, four, + E. *covariant*.] In *math.*, a Hessian. *A. Cayley.*

quadricuspid (kwod-ri-kus'pid), *a.* [L. *quadri-*, four, + E. *cuspid*.] Same as *quadricuspidate*.

quadricuspidal, *n.* **II.** *a.* Having four cusps.

quadricycle, *n.* 2. A vehicle of the 'cycle' type, having four wheels and propelled by a small gasolene (or other) motor: usually constructed to carry one person.

> An improvement in placing the pivots in the central plane of rotation of the steering wheels has entirely removed the hand shock by the direct lever connection, and has given to the automobile *quadricycle* the bicycle facility for steerage. *Hiscox*, Horseless Vehicles, p. 26.

quadricycler (kwod'ri-sī-klėr), *n.* Same as ★*quadricyclist*.

quadricyclist (kwod'ri-sī-klist), *n.* [*quadricycle* + *-ist*.] One who propels or rides a quadricycle.

quadrifilar (kwod'ri-fi-la̤r), *a.* [L. *quadri-*, four, + *filum*, a thread, + *-ar*^{3}: see *file*^{3}.] Consisting of or characterized by four filaments: referring to a peculiar balance for extremely delicate weighings in which the beam is suspended by four threads or fibers so arranged that a very slight preponderance on either side will cause a wide azimuthal movement of the index. *Nature*, April 21, 1904, p. 599.

quadrifolium (kwod-ri-fō'li-um), *n.*; pl. *quadrifolia* (-a̤). [L. *quadri-*, four, + *folium*, leaf.] In *geom.*, the rose of four leaves. See ★*rose*^{1}, 18.

quadrifrontal (kwod-ri-frun'ta̤l), *a.* [L. *quadri-*, four-, + *frons* (*front-*), front, + *-al*^{1}.] Having four fronts or faces.

quadrigabled (kwod-ri-gā'bld), *a.* [L. *quadri-*, four, + E. *gabled*.] Four-gabled. *N. E. D.*

quadrigamist (kwod-rig'a̤-mist), *n.* [**quadrigam*(*y*) (L. *quadri-*, four, + Gr. γάμος, marriage) + *-ist*.] One who has four wives or husbands at the same time. *Blount*, Glossographia.

quadrigatus (kwod-ri-gā'tus), *n.*; pl. *quadrigati* (-tī). [L., marked with the figure of a quadriga, < *quadriga*, a chariot: see *quadriga*.] A Roman silver denarius with the representation of a four-horse chariot.

quadrijugal (kwod-ri-jö'ga̤l), *a.* [*quadrijug*(*ate*) + *-al*^{1}.] Having or drawn by four horses yoked abreast; having four yoked horses.

quadrilateral. **I.** *a.*—**Quadrilateral construction**, the construction of the fourth harmonic point to three given costraight points by means of a complete quadrilateral or tetrastigm. *G. von Staudt*, 1847.

II. *n.*—**Circumscriptible quadrilateral**, a quadrilateral in which a circle can be inscribed.—**Cyclic quadrilateral**, a quadrilateral whose four vertexes are concyclic.—**Heronic cyclic quadrilateral**, a cyclic quadrilateral whose sides, diagonals, and area are expressible by whole numbers.

quadrilingual (kwod-ri-ling′gwal), *a.* [L. *quadri-*, four, + *lingua*, tongue, language, + *-al*¹.] In or using four languages: as, a *quadrilingual* inscription; a *quadrilingual* interpreter.

quadrille, *n.* 6†. A small squadron; a cluster of richly caparisoned horsemen at a tournament or mounted fête. They were distinguished by different colors. *Meyrick*, Ancient Armour, III. Glossary.

quadrilled (kwod-rild′), *a.* Same as *quadrillé*.

quadrillion, *n.* **II.** *a.* The cardinal numeral obtained from a quadrillion: used like *hundred*. *Nicolas Chuquet*, 1484.

quadrillionth (kwod-ril′yonth), *a.* and *n.* [*quadrillion* + *-th*.] **I.** *a.* Being one of a quadrillion.

II. *n.* One of a quadrillion parts; the quotient of unity divided by a quadrillion.

quadrimolecular (kwod″ri-mō-lek′ū-lär), *a.* [L. *quadri-*, four, + NL. *molecula*, molecule, + *-ar*³.] Consisting of or concerning four molecules. *Nature*, Oct. 16, 1902, p. 613.

quadrinate (kwod′ri-nāt), *a.* [L. *quadrini*, four each, + *-ate*¹.] Quadruple; in *bot.*, having four leaflets to a petiole; quadrifoliate.

quadrinodal (kwod-ri-nō′dal), *a.* [L. *quadri-*, four, + *nodus*, node, + *-al*¹.] Having four nodes, as a vibrating string or organ-pipe, or the oscillating surface of a seiche.

> A trinodal seiche should have a period of about twenty-four minutes, and a *quadrinodal* seiche should oscillate in about eighteen minutes.
> *G. H. Darwin*, The Tides, p. 27.

quadripartite, *a.* 2. In *law*, having four parts, or parties: as, a *quadripartite* government; a *quadripartite* agreement, etc.

quadripinnate (kwod-ri-pin′āt), *a.* [NL. *quadripinnatus*, < L. *quadri-*, four, + *pinna*, wing: see *pinnate*.] In *bot.*, having four pinnæ or side leaflets. *N. E. D.*

quadripolar (kwod-ri-pō′lär), *a.* [L. *quadri-*, four, + *polus*, pole, + *-ar*³.] In *biol.*, having four poles: said of a cell.

quadriquadric, *a.* 2. In *geom.*, determined by the intersection of two quadric surfaces.

quadriradiate, *a.* **II.** *n.* A sponge-spicule which has four rays.

> Gastral *quadriradiates* can here and there be made out in spaces in the interior.
> *Proc. Zool. Soc. London*, 1900, p. 129.

quadriramose (kwod-ri-rā′mōs), *a.* [L. *quadri-*, four, + *ramus*, branch, + *-ose*.] Having four branches, as the antenna of an insect.

quadrisect (kwod′ri-sekt), *v. t.* [L. *quadri-*, four, + *sectus*, pp. of *secare*, cut.] To divide into four equal parts.

quadriserial, *a.* 2. In *bot.*, having the four regular series or whorls in the flower, that is, calyx, corolla, stamens, and pistils.

quadrituberculy (kwod″ri-tū-bėr′kū-li), *n.* [*quadritubercul(ar)* + *-y*³.] The fact or condition of having molars with four tubercles or cusps. [Rare.]

> Inferior molars evolved from quinque- to *quadrituberculy* by reduction of paraconid.
> *H. F. Osborn*, in Bull. Amer. Mus. Nat. Hist., June 28, [1902, p. 179.

quadri-unguiculate (kwod″ri-ung-gwik′ū-lāt), *a.* [L. *quadri-*, four, + E. *unguiculate*.] Bearing, or provided with, four claws or hooks.

> The dactylus in Iais was *quadriunguiculate*.
> *Proc. Zool. Soc. London*, 1900, p. 548.

quadriurate (kwod-ri-ū′rāt), *n.* [L. *quadri-*, four, + *urate*.] A salt of uric acid of which the constitution may be represented by the general formula $MH(C_5H_2N_4O_3).H_2(C_5H_2N_4O_3)$, M standing for a monad metal, such as potassium or sodium. It has been shown by Bence Jones and Sir William Roberts that such salts exist normally in the urine and form practically the whole of the solid matter in the urine of birds and reptiles. Sir William Roberts considers that all or nearly all the morbid phenomena in the body which are referable to uric acid depend upon secondary changes in the quadriurates.

quadrivalence (kwod-riv′a-lens), *n.* [*quadrivalen(t)* + *-ce*.] The quality of being quadrivalent.

quadrivalent, *a.* **II.** *n.* A quadrivalent atom or element.

quadrivium, *n.* 2. A place where four ways meet.

> In obedience to the law as it then stood, he [a suicide] was buried in the centre of a *quadrivium*, or conflux of four roads, . . . with a stake driven through his heart.
> *De Quincey*, Three Memorable Murders.

quadrivoltine, *n.* **II.** *a.* Having four crops of cocoons each year, and therefore having four generations annually: said of certain races of the silkworm of commerce.

quadront†, *n.* and *a.* See ★*quadran*.

quadroon, *a.* 2. Fourth in descent from a negro parent, one parent in each generation having been white. *N. E. D.*

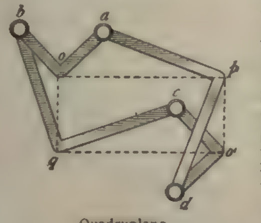
quadrule (kwod′röl), *n.* [LL. *quadrula*, a little square, dim. of *quadra*, a square.] Same as ★*mere*⁶.

quadrumanal (kwod-rö′ma-nal), *a.* [*quadrumane* + *-al*¹.] Having four hands or hand-like limbs; quadrumanous.

quadrupart† (kwod′rö-pärt), *a.* [L. *quadru-*, four, + *pars* (*part-*), part.] Quadripartite.

quadruplane, *n.* 2. A system of four plane links pivoted together so that the pivots are vertexes of a contraparallelogram. It is an extension by Sylvester and Kempe of what Sylvester called the plagiograph or skew-pantograph to Hart's contraparallelogram.

> This apparatus . . . is of course . . . formed of four plane links . . . on which the various points are taken. This explains the name given to it by Professor Sylvester, the "*Quadruplane*."
> *A. B. Kempe*, How to Draw a Straight Line, [p. 26.



Quadruplane.

a, b, c, d, vertexes of a contraparallelogram. If *o* is pivoted to *a* and *q* to *c* of the Peaucellier cell, then *p* describes a straight line inclined to *cc* at the angle the bars are bent through. (See *cell*.) *d*, fourth vertex of a parallelogram, determined by *opq*, of constant angles and constant area, so that the product of two consecutive sides is constant.

quadruplate† (kwod′rö-plāt), *v. t.* [*quadruple* + *-ate*².] To quadruple.

quadruplator (kwod′rö-plā-tōr), *n.*; pl. *quadruplatores* (kwod-rö-plā-tō′rēz). [L.] In *Roman law*, an informer who was entitled to a fourth part of confiscated property upon conviction and confiscation following an information given by him.

quadruple, *a.* 2. Consisting of four parts; completed in four separate or successive operations.

> All modern marine engines of high power have either triple or (in a few cases) *quadruple* expansion.
> *Encyc. Brit.*, XXXII. 542.

Quadruple alliance, an alliance of four powers; especially, the alliance of Great Britain, France, the Netherlands, and Austria in 1718, and that of Great Britain, France, Spain, and Portugal in 1834.—**Quadruple-expansion engine**, a compound engine in which the steam passes successively through four stages in four or more cylinders. There may be more than four cylinders in the engine, as the second intermediate and low-pressure cylinders are frequently divided into two cylinders each. The initial pressure of the steam is usually from 180 to 250 pounds per square inch, and it is expanded from 18 to nearly 30 times its original volume. See cut, next column.

quadruple-screw (kwod′rö-pl-skrö), *a.* Having four screws: said of turbine-propelled vessels, so equipped.

quadruplet, *n.* 3. A bicycle for four riders.—4. In *music*, same as *quartole*.

quadruplum (kwod′rö-plum), *n.*; pl. *quadrupla* (-plä). [L. *quadruplum*, a fourfold amount, neut. of *quadruplus*, fourfold: see *quadruple*.] In *medieval music*: (*a*) The fourth part in polyphonic composition, counting upward from the tenor as one, usually a part duplicating the latter. (*b*) A composition for four voices. Compare *triplum*.

quædam (kwē′dam), *n.* [L. *quædam*, fem. of *quidam*, a certain person. See *quidam*.] A woman; a female, unspecified. See *quidam*.

> A Sermon . . . very tart against the sinfulness of vain Attire; wherein wanton *Quædams* in those days came to that excess, that they delighted altogether in the Garb, and Habit, . . . of Men.
> *Bp. Hacket*, Life of Abp. Williams, i. 35.

quaf, *v.* and *n.* A simplified spelling of *quaff*.

quahog (kwa-hog′, or -hâg′), *v. i.*; pret. and pp. *quahogged*, ppr. *quahogging*. [Also *quahaug*: < *quahog*, *n.*] To dig or search for quahogs.

> "How 's the *quahaugin'* nowadays? Gittin' a fair price?" *J. C. Lincoln*, Partners of the Tide, iv.

quail³, *n.*—**Harlequin quail**, a name given by J. H. Gurney to the small African species, *Coturnix delgorguii*.—**New-Zealand quail**, a small game-bird, *Coturnix novæ-zealandiæ*, once common in New Zealand, but now extinct or nearly so.

> No specimen of the once very abundant *New Zealand quail* (Coturnix novæ zealandiæ) has been seen for a quarter of a century; of the celebrated Notornis mantelli only three perfect specimens have been obtained; it is probably extinct. *Pop. Sci. Mo.*, Jan., 1903, p. 223.

Painted quail. (*a*) See *painted*. (*b*) The mountain quail, *Oreortyx pictus*, of the western United States: so named from its bright marking of white and chestnut. (*c*) An Australian hemipod, or button-quail, *Turnix varius*.—**Snow-quail**, sometimes applied to the ptarmigan, *Lagopus leucurus*.—**Stubble-quail**, a true quail, *Coturnix pectoralis*, found in Australia: so called from frequenting fields after the grain has been harvested.—**Valley quail**, *Callipepla californica vallicola*, a geographic race or subspecies of *C. californica*, distinguished by paler coloration, found in the dry valleys and foothills from Cape St. Lucas to western Oregon.

> In some portions of California complaints have been made that the *valley quail* (Callipepla Californica vallicola) destroys wheat to a serious extent.
> *Yearbook U. S. Dept. Agr.*, 1897, p. 352.

White quail. Same as *snow-★quail*.

quail-dove, *n.* 2. See ★*partridge-dove*.

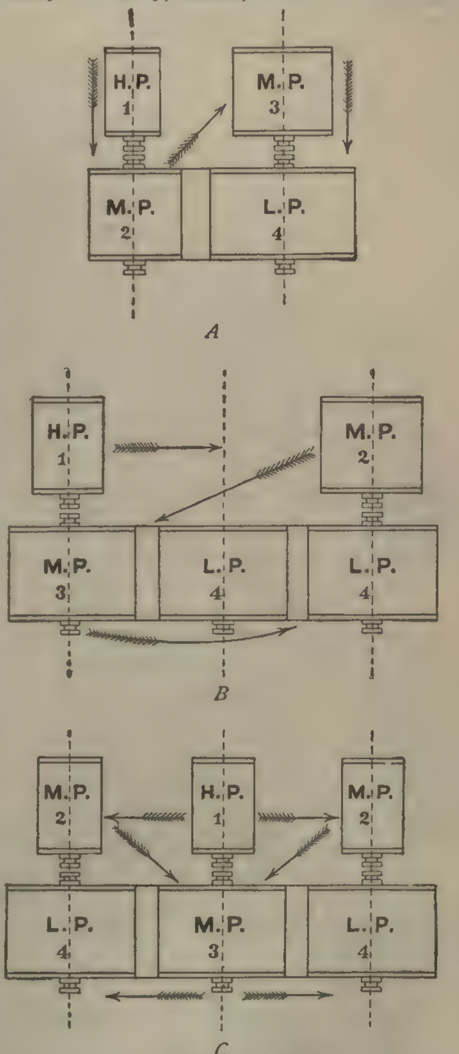
quailery (kwā′lėr-i), *n.* [*quail*² + *-ery*.] A place where quails are bred and fattened. *N. E. D.*

quail-hawk (kwāl′hâk), *n.* An Australian sparrow-hawk, *Hieracidea berigora*.

Quain's degeneration. See ★*degeneration*.

quake² (kwāk), *n.* [British Guiana.] A rather large basket with rounded bottom, made of open wickerwork, used for packing, storing provisions, etc.

Quaker, *n.* 5. A Philadelphian or Pennsylvanian: from the historical association of Quakers with that city and that State. [Colloq.]—**Free Quaker**, a name assumed by those Quakers who were disowned by the Society of Friends, at the time of the Revolutionary War, for actively supporting the cause of the colonists. They organized as a separate body, which ceased to exist after the death of its original members.—**Wet Quaker**, a hypocrite; a man who pretends to great piety and is a "dram-drinker on the sly." *N. and Q.*, 10th ser., II. 197.



Grouping of Cylinders in Quadruple-Expansion Engines.

H.P., high-pressure or first cylinder; M.P., mean-pressure cylinders, the numbers indicating the sequence of the expansion process, or the steps of such expansion, and the arrows the direction of flow; L.P., low-pressure or fourth stage, the number denoting in each case the fact that the expansion is final in the single largest cylinder or in the indicated pair of cylinders of equal volume.

quaker-ladies (kwā′kėr-lā″diz), *n. pl.* A name given to the delicate bluish-gray flowers of the *Houstonia cærulea*, from an idea that they suggest the pale colors of the dress adopted by 'Quaker ladies'; bluets. [U. S.]

> In their little grey-blue bonnets
> Chatting, brim to brim,
> Half a million *Quaker Ladies*,
> Straight and small and slim.
>
> *Sarah J. Day*, Houstonias, in From Mayflowers to Mistletoe.

Quakerly (kwā′kėr-li), *adv.* In the manner of a Quaker.

> "Do I write *quakerly* and simply, 't is my most Master Mathews' like intention to do it."
> *Lamb*, in Final Mem., viii. 288.

quaker-parrot (kwā′kėr-par″ọt), *n.* See ★*parrot.*

quale⁴, *n.* Specifically—**2.** In *psychol.*, in the phrases *spatial quale, quale of spatiality*, the irreducible element or attribute of spaciousness, bidimensional, tridimensional, or indefinite, posited by nativistic theories of space-perception for some or all sensations.

> So far, all we have established or sought to establish is the existence of the vague form or *quale* of spatiality as an inseparable element bound up with the other peculiarities of each and every one of our sensations.
> *W. James*, Prin. of Psychol., II. 145.

Quale theory, in *psychol.*: (*a*) The hypothesis that pain is not a specific sensation, but rather a tone or organic accompaniment of sensation—a secondary effect of the stimulus which primarily arouses sensation.

> The opposite doctrine, which has of late been called the *quale-theory*, is often maintained in an unsatisfactory form. *Ribot* (trans.), Psychol. of Emotions, p. 39.

(*b*) A nativistic theory of space perception. See ★*quale*⁴, 2.

qualification, *n.*—**Testimonial qualifications.** See ★*testimonial.*

qualified, *p. a.* **4.** Prefixed by a qualifying adjective; in a slang use, damned.

> Cranze said he refused to be chided by a *qualified* teetotaller, and mixed himself further king's pegs.
> *Cutcliffe Hyne*, A Master of Fortune, xi.
>
> Then he was marched out of the rain into the refreshment-room and told not to make a *qualified* fool of himself.
> *R. Kipling*, Arrest of Lt. Golightly, Plain Tales from the Hills, p. 342.

Qualitative mathematics. See ★*mathematics.*

quality, *n.* **12.** Specifically, in *acoustics*, that in a particular sound or tone which distinguishes it from other sounds or tones of the same pitch and loudness; timbre; tone-color: as, the *quality* of a violin tone. See *timbre*³.

> Of course, if clang could not be used, Prof. Tyndall's suggestion to translate Prof. Helmholtz's Klangfarbe by clangtint fell to the ground. I can find no valid reason for supplanting the time-honoured expression *quality* of tone.
> *A. J. Ellis*, in Helmholtz (trans.), Sensations of Tone, p. 36, note.

13. In the *fine arts*, especially *painting*, often used to designate body, richness, and depth of color, or similar attributes of style in modelling or of relief in architectural detail.—**14.** In *psychophys.*, one of the constituent attributes of the elementary mental process, sensation, or affection; that attribute which individualizes the element and from which it receives its name.

> Some sensations have four such aspects; every sensation has at least three. The four are *quality*, intensity, extent, and duration.
> *E. B. Titchener*, Outline of Psychol., p. 37.

quality (kwol′i-ti), *v. t.*; pret. and pp. *qualitied*, ppr. *qualitying.* [*quality, n.*] **1**†. To supply with qualities or a quality.—**2.** To estimate at a certain value.

> The warren contained 878 acres, much of which was *qualitied* at 9s. to 10s. per acre.
> *Batchelor*, Agr. Surv. Bedfordshire, p. 236. *N. E. D.*

qualtagh (kwăl′taċh), *n.* [Manx.] A Christmas or New Year's ceremony, in the Isle of Man; one who takes part in the ceremony. See the first extract.

> A company of young lads or men generally went in old times on what they termed the *Qualtagh*, at Christmas or New Year's Day, to the houses of their more wealthy neighbours; some one of the company repeating in an audible voice the following rhyme; 'Ollick ghennal erriu,' &c. . . . When this was repeated they were then invited in to partake of the best that the house could afford. *N. and Q.*, quoted in Eng. Dial. Dict.
>
> "Are you going to put the new year in anywhere, Philip?" said Kate. . . .
> "I should be the first-foot here, only I 'm no use as a *qualtagh*," said Philip.
> "Why not?"
> "I 'm a fair man, and would bring you no luck, you know." *Hall Caine*, The Manxman, ii. 2.

Quamasia (kwa-mas′i-ạ̈), *n.* [NL. (Rafinesque, 1818), < Amerindian *quamash* or *camass.*] A genus of North American plants of the family *Liliaceæ*, including camass and wild hyacinth. See *Camassia* and *camass.*

quandel (kwon′del), *n.* [Origin obscure.] A stake which charcoal-burners drive into the ground, and about which they pack the billets of wood to be charred, in the construction of a heap or mound in the open air, which is then covered with earth.

quandong (kwan′dong), *n.* Same as *quandang.* See also *Fusanus.*—**Brisbane quandong.** Same as *blue* ★*fig.*

quantifiable (kwon′ti-fī-ạ-bl), *a.* [*quantify* + *-able.*] That may be quantified; that can be measured as a quantity.

Quantitative rules, in *evidence*, those which call for a special kind of witness to certain facts, as an eye-witness; also those which require specific or complete rather than general or fragmentary evidence. *Wigmore*, Evidence, § 2030.

quantity, *n.* **9.** Specifically, same as *duration* or *time-value*: said of musical tones or notes.—**Phase of a complex quantity.** See ★*phase*¹.—**Vector quantity,** a quantity to which is attributed both magnitude and direction.

quantometer (kwan-tom′e-tėr), *n.* [*quant*(*ity*) + Gr. *μέτρον*, measure.] In *elect.*, an instrument with moving coil, for the measurement of induced currents in cases where an ordinary ballistic galvanometer is inapplicable on account of the gradual character of the effect to be observed.

> His "*quantometer*" is designed to take the place of the ballistic galvanometer and to do what it fails to do, i. e., to sum up in a single throw quantities conveyed by currents lasting an appreciable time.
> *Elect. World and Engin.*, Jan. 24, 1903, p. 166.

quantuplicity, *n.* **2.** Number-of-times-ness. *De Morgan*, 1836. [Rare.]

> Ratio is the relation of one magnitude to another with respect to *quantuplicity.*
> *Halsted*, Elem. of Geom., p. 177.

quaqua (kwä′kwä), *n.* [An imitative name, perhaps of African origin. Compare negro-Eng. of Guiana *kwakwa*, a duck (see Eng. *quack*¹).] A musical instrument of the southern negroes of the United States resembling a drum.

> He [the negro slave] . . . walks six or seven miles in the night . . . to a negroe dance, in which he performs with astonishing agility, . . . keeping time and cadence, most exactly, with the music of a banjor (a large hollow instrument with three strings), and a *quaqua* (somewhat resembling a drum), until he exhausts himself.
> *John F. D. Smyth*, Tour in the U. S. of Amer., 1784, I. 46.

quaquadrate† (kwā-kwod′rāt), *n.* [*qua*(*drate*) + *quadrate.*] In *math.*, the sixteenth power.

quaquaversal, *a.* **II.** *n.* **1.** A ridge between two adjoining watersheds which is worn down so that the basins connect and become the common origin of two systems of rivers. Usually this arrangement can be only temporary, and one river soon absorbs the entire drainage.—**2.** In *phys. geog.*, a domed structure with the strata dipping away in all directions from a center.

quar. An abbreviation (*a*) of *quarter*; (*b*) of *quarterly.*

quarantiner (kwor′ạn-tē-nėr), *n.* [*quarantine* + *-er*¹.] One who quarantines; also, one who is quarantined.

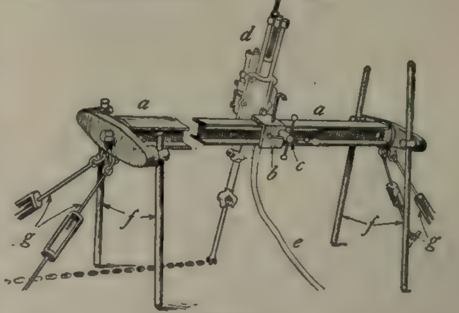
quardofelic (kwâr-dō-fel′ik), *a.* [*quar*(*tz*) + *do*(*minantly*) + *fel*(*dspar*) + *-ic.*] In *petrog.*, in the quantitative system of classification of igneous rocks (see ★*rock*¹), having normative feldspars dominant over normative quartz, that is, within the proportion $\frac{Q}{F}\langle\frac{7}{1}\rangle\frac{5}{3}$.

quarfelic (kwâr-fel′ik), *a.* [*quar*(*tz*) + *fel*(*dspar*) + *-ic.*] In *petrog.*, in the quantitative system of classification of igneous rocks (see ★*rock*¹), having equal, or nearly equal, normative quartz and feldspar, that is, within the ratio $\frac{Q}{F}\langle\frac{5}{3}\rangle\frac{3}{5}$.

quaric (kwâr′ik), *a.* [*quar*(*tz*) + *-ic.*] In *petrog.*, in the quantitative system of classification of igneous rocks (see ★*rock*¹), pertaining to or characterized by the presence of normative quartz.

quarry¹ (kwor′i), *v. t.*; pret. and pp. *quarried*, ppr. *quarrying.* [*quarry, n.*] To pave with quarries. See *quarry*¹, 1 (*a*).

quarry-bar (kwor′i-bär), *n.* A strong rectangular steel bar, supported by iron legs at each end and stayed by guy-rods, used to support a rock-drill. The drill is movable along the bar, and may be fixed in a horizontal or vertical position for drilling a line of holes in a wall or upon a floor.



Quarry-bar.

a, quarry-bar (much longer than shown); *b*, carrier traversing bar and supporting rock-drill; *c*, set-screw fixing carrier to bar; *d*, rock-drill; *e*, air- or steam-hose; *f*, adjustable legs supporting bar; *g*, guy-rods with twin buckles.

quart¹, *n.* **6**†. A quarter of the horizon.

quart² (kärt), *v.* **I.** *intrans.* In *fencing*, to make a pass while holding the sword hand with the nails turned upward.—**To quart and tierce.** See *quart and tierce*, under *quart*².

II. *trans.*—**To quart the head,** to draw back the head and shoulders while using the position "quart."

> The *Quarting* of your *head* preserveth you from being hit in the face.
> *Sir W. Hope*, Fencing-Master, p. 31. *N. E. D.*

quart. An abbreviation (*a*) of *quarter*; (*b*) of *quarterly.*

quartane (kwâr′tān), *n.* [L. *quartus*, fourth, + *-ane.*] An obsolete name for ★*butane.*

quartenylic (kwâr-te-nil′ik), *a.* [L. *quartus*, fourth, + *-ene* + *-yl* + *-ic.*] Containing four atoms of carbon in the molecule.—**Quartenylic acid.** Same as ★*isocrotonic acid.*

quarter¹, *n.* **6.** Same as ★*peg*, 7. [Local, U. S.]—**Fifth quarter,** the hide, fat, and other less valuable parts of a slaughtered ox or sheep.—**Lee quarter,** the quarter of a vessel on the leeward side.

quarter¹, *v. i.* **6.** To enter into a new quarter, as the moon.

> They would have bad weather until the moon *quartered.* *G. Keate*, Pelew Island, p. 227. *N. E. D.*

quarter², *n.*—**To cry quarter,** to beg for quarter; to cry for mercy to a conquering foe.

quarter-bend, *n.* **2.** A long-radius elbow; a pipe-fitting curved to an arc of 90° for connecting two pipes at right angles to each other.

quarter-bleach (kwâr′tėr-blēch), *n.* A process of partial bleaching, especially of linen cloth, by which full whiteness is not obtained but risk of injury to the fiber is lessened.

quarter-box (kwâr′tėr-boks), *n.* In *mech.*, a box or journal made up of four parts, instead of two. The bottom and top parts can be adjusted vertically and the other two parts can be adjusted horizontally. Such bearings are used only for the crank-shaft boxes in large engines.

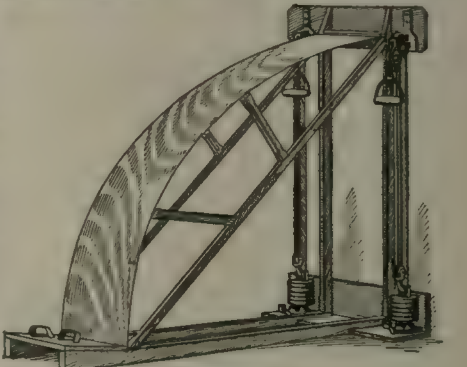
> Journals.—In the main bearings a four-part, or *quarter-box*, arrangement is used, the bearings being adjustable horizontally by wedges set up by bolts extending through the caps. *Elect. Rev.*, Sept. 24, 1904, p. 517.

quarter-breed (kwâr′tėr-brēd), *n.* A person having one fourth American Indian and three fourths white blood.

> Henry was a *quarter-breed*, quarter-back Cherokee, educated East in the idioms of football and West in contraband whiskey. *McClure's Mag.*, Feb., 1903, p. 428.

quarter-butt (kwâr′tėr-but), *n.* In *billiards*, a cue which is smaller than a half-butt.

quarter-circle (kwâr′tėr-sėr″kl), *n.* A piece of gymnasium apparatus consisting of a long strip of board bent into a quarter-circle, with



Quarter-circle.

straps for the feet at the bottom and pulleys for the hands at the top, designed for various exercises, particularly those calling upon the abdominal muscles.

quarter-crack (kwâr'tėr-krak), *n.* In *vet. surg.*, a fissure or crack in that portion of the wall of a horse's hoof between the toe and the heel which is known as the quarter.

quarter-crank (kwâr'tėr-krangk), *a.* Having two or more cranks at an angle of 90° to one another. *The Engineer* (London), July 24, 1903, p. 87.

quarter-davits (kwâr'tėr-dav"its), *n. pl.* The boat davits on the quarters of a vessel, that is, between the midships and stern.

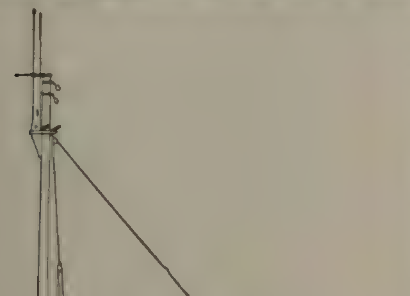
quarter-deck, *n.*—**Jack's quarter-deck** (*naut.*), the forecastle deck.

quarter-galley (kwâr'tėr-gal"i), *n.* A name given to a Barbary man-of-war.

quartering, *n.* 8. The change of the moon from one quarter to the next.

> Changes of weather . . . at the moon's *quarterings*.
> *L. Tomlinson*, tr. of Arago, Astronomy, p. 67. *N. E. D.*

quarter-lifts (kwâr'tėr-lifts), *n. pl. Naut.*, double boom-topping lifts which lead from the iron band on the after part of the main (or spanker) boom (about a quarter way in from the end) up to and through single blocks under the eyes of the rigging at the lower-masthead, and thence down on deck, and are designed to support the weight of the boom and for topping up that spar.



Quarter-lifts.

quarter-line, *n.* 3. In United States land surveys, either of two lines which divide a section into quarter-sections.—4. *Naut.*, a mooring rope or hawser, leading from the quarter of the vessel. Also called *quarter-fast*.

quarter-mat (kwâr'tėr-mat), *n.* A chafing-mat hung on a vessel's quarter, or over the side of a dock to protect the vessel.

quartern, *n.* 2. (*d*) A weighing of six pounds, or 1,536 drams, avoirdupois, employed in the woolen-yarn trade of Yorkshire, England, to indicate the counts of yarn. For example, if one skein, or 1,536 yards, weighs one quartern the count of that yarn is one; if it takes 20 skeins to weigh one quartern the count is 20's. *C. Vickerman*, Woolen Spinning, p. 342.

quarter-phase (kwâr'tėr-fāz), *a.* In *elect.*, pertaining to a system of electrical distribution in which two alternating currents are used which differ in phase by a quarter of a period, so that, at equal intervals of time, first the first current reverses its direction, then the other, then again the first, and so on.

quarter-saw (kwâr'tėr-sâ), *v. t.* To saw into quarters. See *quartered*, 4. *Yearbook U. S. Dept. Agr.*, 1896, p. 417.

quarter-shot (kwâr'tėr-shot"), *n.* In *golf*, a stroke shorter in distance than a half-shot: about equivalent to a wrist-stroke, although sometimes played with a stiff arm.

quarter-wave (kwâr'tėr-wāv"), *n.* In *phys.*, one fourth of a wave-length; the distance measured along the path of a wave-train which corresponds to a fourth of a period, or to a difference of phase of $\frac{\pi}{2}$.

quartet, *n.* 4. In *embryol.*, a group of four cleavage-cells considered as a unit, either because they arise at the same time, or because they have a similar origin or prospective function.

quartettino (kwär-tet-tē'nọ̄), *n.* [It. dim. of *quartetto*, quartet.] In *music*, a short or condensed quartet. See *quartet*, 1.

quartic. I. *a.*—**Weddle quartic surface.** See ★*surface.*

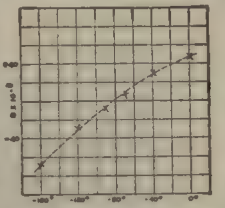
II. *n.* 2. In *geom.*, a curve or surface of the fourth degree or order.

> The singular surface of the general quadratic complex is the famous *quartic*, with sixteen nodes and sixteen singular tangent planes, first discovered by Kümmer.
> *Encyc. Brit.*, XXVIII. 662.

quartile, *n.* 2. That point on a frequency-curve above or below which one fourth of the total number of cases are found.

II. *a.* Involving an angular distance of 90°.

quartz, *n.*—**Hungry quartz**, unpromising quartz. [Australian mining term.]—**Quartz drift.** See ★*drift.*—**Quartz glass**, a material obtained by fusing clear quartz crystals in the oxy-hydrogen flame and allowing the molten mass to solidify in noncrystalline form. Quartz glass or fused quartz is a hard, transparent, and colorless solid which can be made into rods, tubes, beakers, flasks, and numerous other utensils for the construction of which glass is commonly used. Quartz glass has some remarkable properties that make it valuable in scientific and technical work. The coefficient of linear expansion is exceedingly small. At 0°C. it is less than 1/20 that of ordinary crown glass and diminishes rapidly with falling temperatures (see Fig. 1). At about −80°C. the coefficient becomes zero, and at lower temperatures is negative. Quartz glass may be heated to much higher temperatures than ordinary glass without softening, and on account of the small temperature coefficient a vessel of this material may be brought suddenly to a red heat and then plunged into water or even liquid air without fracture. The transparency of quartz glass for ultra-violet rays makes it invaluable in the construction of vacuum-tubes and other apparatus for the photographic study of the shorter wave-lengths of the spectrum. When fused, quartz may be drawn into fibers too fine to be visible to the naked eye and of very great tensile strength and elasticity. The use of such fibers, which are capable of sustaining a greater weight than any other known material of the same diameter, has made it possible to increase enormously the delicacy of many scientific instruments, such as the galvanometer, electrometer, radiometer, and torsion balance, and to measure accurately effects such as the force of gravitation between small masses, the heat from the stars, and the pressure due to light-waves, which were previously too small to be detected.—**Quartz spectrograph.** See ★*spectrograph.*—**Quartz thread.** Same as *quartz* ★*fiber*[1].—**Vein-quartz**, quartz deposited from solution in cracks or larger fissures, as contrasted with the variety which crystallizes as a component of the acidic igneous rocks, directly from fusion. Crystals of the former are bounded by the prism and rhombohedrons; those of the latter very rarely have other than rhombohedron faces. *Geikie*, Text-book of Geol., p. 196.



Curve showing the variation of the coefficient of expansion of quartz glass with temperature. (After measurements by Dorsey.)

quartz-battery (kwârts'bat"ėr-i), *n.* A quartz-mill; two or more stamps for pulverizing quartz, operated as one machine. *E. E. Morris.* [Australia.]

quartzen (kwârt'sen), *a.* [*quartz* + *-en*[2].] Made of quartz; quartz.

> First and foremost comes the stone money, which consists of *quartzen* wheels, varying from 6 to 8 inches to 12 feet in diameter. *Geog. Jour.* (R. G. S.), XIII. 129.

quartz-field (kwârts'fēld), *n.* A non-alluvial gold-field. *E. E. Morris*, Austral English.

quartzic (kwârt'sik), *a.* [*quartz* + *-ic.*] Same as *quartziferous*.

quartzine (kwârt'sin), *a.* and *n.* [*quartz* + *-ine*[1].] I. *a.* Composed of or resembling quartz.

II. *n.* Anhydrous silica having a fibrous structure but differing from normal quartz in having a slightly lower density and also in optical characters. See ★*lutecine.*

quartzite, *n.*—**Hartshill quartzite**, a division of the Cambrian formation in the Nuneaton district (including Hartshill) of Warwickshire, England. It lies at the base of the series and is overlain by the Stockingford shale.—**Ignacio quartzite.** Same as *Ignacio* ★*formation.*—**Malvern quartzite**, a division of the Cambrian rocks lying at the base of the series as exposed in the Malvern Hills of England.—**Parting quartzite**, a name first applied by S. F. Emmons (*Monograph XII.*, U. S. Geol. Survey) to a quartzite about 70 feet thick, which, at Leadville, Colorado, separates the Carboniferous Blue Limestone stratum carrying the ores from the lower-lying Silurian White Limestone, believed to be barren. The formation has since been traced in other parts of the State.—**Wrekin quartzite**, the lowest division of the Cambrian in the Wrekin district of England. It is from 100 to 200 feet thick, and carries no fossils except worm-burrows. It is overlain by the Comley or Hollybush sandstone.

quartz-mill, *n.*—**Huntington's quartz-mill**, a centrifugal-roller amalgamating quartz-mill in which the crushing is done by rolls revolving along the inner face of the ring which surrounds the pan. The pressure is supplied by the revolving disk which, by moving the spindles of the rolls outward, presses the rolls against the wall of the ring where they come in contact with the ore. The amalgam collects in the pan-bottom below the rolls.

quartz-mining (kwârts'mī"ning), *n.* 1. The process of taking gold-bearing quartz out of reefs.—2. Mining in the solid rock. [California.]

quartzophyre (kwârt'sọ̄-fīr), *n.* [*quartz* + (*por*)*phyr*(*y*).] In *petrog.*, in the quantitative system of classification of igneous rocks (see ★*rock*[1]), any porphyry characterized by quartz phenocrysts.

quartzophyric (kwârt-sọ̄-fir'ik), *a.* [*quartzophyre* + *-ic.*] In *petrog.*, having the characters of or pertaining to quartzophyre or quartz-porphyry.

quartz-reefer (kwârts'rē"fėr), *n.* One who digs or mines at a reef of gold-bearing quartz. *E. E. Morris*, Austral English. [Australia.]

quartz-reefing (kwârts'rē"fing), *n.* The operation of mining for gold in a quartz-reef. *E. E. Morris*, Austral English.

quartzware (kwârts'wãr), *n.* Ware fashioned out of pure quartz which has been fused either by the aid of the heat of an oxy-hydrogen flame or by that of an electric furnace. It is adapted for chemical work at high temperatures and is very resistant against chemical reagents. See ★*quartz glass.*

quashy (kwosh'ı), *n.* [Also *quashee*; a generalized use of *Quashy, Quashee, Quassy, Quassi*, a frequent name of negroes (see *Quassia*). Compare ★*cuffy.*] A negro. [West Indies.]

quasi-affinity (kwā"sī-a-fin'i-ti), *n.* In *civil law*, the affinity which the law regards as established between two persons one of whom has been betrothed, but not yet married, to one of the kindred of the other.

quasi-crime (kwā sī-krīm"), *n.* In *law*: (*a*) An offense in the nature of a crime, not amounting to a crime or misdemeanor, which may be repressed or punished by a forfeiture or penalty. (*b*) An offense for which the master or director of the perpetrator is responsible.

quasi-deposit (kwā"sī-dẹ̄-poz'it), *n.* Involuntary lawful possession of another's property, as by finding.

quasi-derelict (kwā"sī-der e-likt), *n.* In *mar. law*, a vessel not abandoned, but in such condition that those on board are incapable of doing anything for its safety.

quasi-inversion (kwā'sī-in-vėr'shọn), *n.* In *math.*, the transformation of a plane figure by substituting for each of its points the symmetrical of its inverse, with regard to a symmetry-axis through the center of inversion.

quasi-partners (kwā"sī-pärt'nėrz), *n. pl.* A term used to denote persons who are part owners of lands or chattels but between whom the legal relation of partnership does not exist.

quasi-personalty (kwā-sī-pėr'sọn-ạl-ti), *n.* Property which by itself would be personal but by reason of its relation to realty is regarded in law as realty.

quasi-purchase (kwā-sī-pėr'chạ̄s), *n.* In *civil law*, a purchase which arises from the presumed consent of the owner of a thing: for example, A, having the property of B, consumes it without any agreement, but intending to pay B for it; the presumption is that B consented to sell, and the purchase is binding upon A.

quasky (kwas'ki), *n.* [Of like origin with *oquassa*.] The blue-back trout, *Salvelinus oquassa*, of the Rangeley Lakes, Maine. *Jordan and Evermann*, Fishes of North and Middle Amer., p. 514.

quassic (kwas'ik), *a.* [*quassia* + *-ic.*] Derived from quassin.—**Quassic acid**, a crystalline acid, $C_{30}H_{38}O_{10} + H_2O$, made by heating quassin with concentrated hydrochloric acid. It melts, with decomposition, at 244–245° C.

quasside (kwas'id), *n.* [*quassia* + *-ide.*] A bitter crystalline substance, $C_{32}H_{40}O_9$, made by heating quassin with dilute sulphuric acid. When boiled with weak alcohol it is changed into quassin. It melts at 192–194° C.

Quassiremus (kwas-i-rē'mus), *n.* [NL., < L. *quassus*, shattered, + *remus*, oar. The name alludes to the rudimentary pectoral fins.] A genus of ophichthyoid eels containing two known species of the eastern Pacific.

quater-centenary (kwā′tėr-sen″te-nạ̄-ri), *a.* and *n.* [L. *quater*, four times, + *centenarius*, pertaining to a hundred years.] **I.** *a.* Comprising four hundred years; including or relating to an interval of four hundred years.

II. *n.* The four hundredth anniversary of some event.

quaternary, *a.* **5.** Fourfold or tetragonal: said of the symmetry of crystals. See ★*symmetry*, 6. – **Quaternary number.** See ★*number.*

quaternio (kwạ̄-tėr′ni-ō), *n.* [NL.] Same as *quaternion.*

quaternion, *n.* **4.** In *book-making*, a set or 'gathering' of four sheets of paper or parchment folded in two. *Blount.*

quaternionic (kwạ̄-tėr-ni-on′ik), *a.* [*quaternion* + *-ic.*] Of or pertaining to or of the nature of quaternions.

> He . . . seemed more and more inclined, for practical purposes, to reject the *quaternionic* analysis, notwithstanding its beauty and logical completeness, in favor of a simpler and more direct treatment of the subject.
> *Amer. Jour. Sci.*, Sept., 1903, p. 193.

quaternity, *n.* **3.** [*cap.*] Especially, the union of four persons in one godhead. Compare *trinity*, 3.

> [The Marcosians] instead of a Trinity . . . held a *Quaternity* composed of Ineffability, of Silence, of the Father, and of the Truth.
> *Echard*, Eccles. Hist., p. 349. *N. E. D.*

quatre (kätr), *n.* [F., < L. *quattuor*, four.] The number four; the four in dice; the four-spot in cards or dominoes.

quatty (kwot′i), *n.*; pl. *quatties* (-iz). [Origin obscure.] A local name for English 1½-pence silver pieces in Jamaica.

quaw (kwä), *n.* [Also *qua, quaa*; short for *quawmire.*] **1.** A quagmire. [Scotch.]

> She had seen the lassie rinnin' afore her ower the quakkin *quas* and the green morasses o' the Silver Flow o' Buchan.
> *Crockett*, Raiders, xxiii.

2. A hole from which peat has been dug. [Scotch.]

quawmire (kwä′mīr), *n.* [Var. of *quavemire.*] A quagmire. See ★*quaw.* [Scotch.]

quaxilote (kwä-shē-lō′tā), *n.* See ★*cuajilote.*

quayage, *n.* **2.** Quays collectively; a system of quays; space covered by quays.

> An outer and an inner port, with a total length of *quayage* 3772 feet. *Encyc. Brit.*, XXVII. 443.

quebrachamine (ke-bräch′am-in), *n.* [*quebracho* + *amine.*] A bitter crystalline alkaloid found in small quantity in quebracho-bark, *Aspidosperma Quebracho.* It melts at 142° C.

quebrachine (ke-brä′chin), *n.* [*quebracho* + *-ine*¹.] A bitter alkaloid, $C_{21}H_{26}O_3N_2$, found in quebracho-bark. It melts, with decomposition, at 214–216° C. It is very poisonous.

quebrachite (ke-brä′chīt), *n.* [*quebracho* + *-ite*².] The methyl ether of levo-inosite, $C_6H_{11}O_5.OCH_3$. It is a crystalline substance found in quebracho-bark, *Aspidosperma Quebracho-blanco.* It melts at 186–187° C.

quebrachoform (ke-brä′chō-fôrm), *n.* [*quebracho* + *-form.*] A product of the same type as tannoform but made with the tannic acid of quebracho-bark. *Buck*, Med. Handbook, IV. 246.

quebrachol (ke-bräch′ol), *n.* [*quebracho* + *-ol.*] A crystalline alcohol, $C_{20}H_{34}O + xH_2O$, found in quebracho-bark, *Aspidosperma Quebracho-blanco*, from which it is extracted by ether, chloroform, or ligroin. It melts at 140° C.

queen¹, *n.* **5.** (*b*) Same as ★*queen-wasp.*—**9.** A female cat. In modern catteries the name is given only to female cats used for careful and scientific breeding. Also called *queen-cat.*

> The new cattery has a very necessary improvement in the shape of comfortable houses for the exclusive use of the *queens.* *The Animal World*, Aug., 1897, p. 301.

10. The female of a termite or white ant. See ★*king*¹, 6.—**Cross-mated queen,** a queen-bee which has been fertilized by a drone of another race.—**Hybrid queen,** a queen-bee which is the offspring of a queen of one race and a drone of another, or one which is mated with a drone of another race.—**Pure queen,** a queen-bee of pure blood mated with a drone of the same race.—**Queen's Bishop's Pawn's defense.** See ★*defense.*—**Queen's Knight's début.** Same as *Vienna opening.* See *opening*, 9.—**Queen's parade.** See ★*parade.*—**Queen's pipe,** a furnace formerly used in England for burning smuggled and damaged tobacco. *N. E. D.* Also called *queen's tobacco-pipe.*—**Queen's regulations.** See *king's* ★*regulations.*—**Queen's** (or **King's**) **shilling,** a shilling formerly given, in Great Britain, to a recruit on enlisting. If he accepted it, he was irrevocably bound, unless he was bought out.—**Tested queen,** a queen-bee whose worker progeny indicate that she is of a pure race and mated to a pure drone of the same race.—**Virgin queen,** a queen-bee not yet fertilized.

queen-bee (kwēn′bē), *n.* See *bee*¹.

queen-cage (kwēn′kāj), *n.* A small box with a wire-gauze-covered opening, constructed for transporting queen-bees by mail or otherwise.

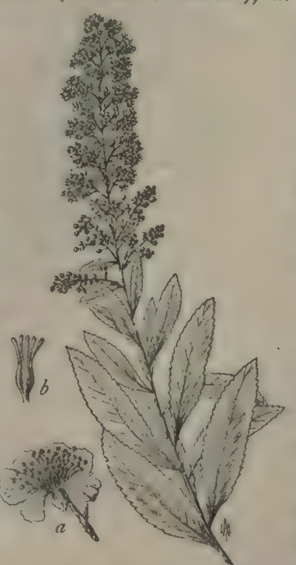
queen-cat (kwēn′kat), *n.* Same as ★*queen*¹, 9.

queen-of-orchids (kwēn″ọv-ôr′kidz), *n.* See ★*Grammatophyllum.*

queen's-conch (kwēnz′kongk), *n.* See *queen-conch*: a trade-name used by cameo-cutters.

queen-snake (kwēn′snāk), *n.* A water-snake, *Natrix leberis*, of the central and eastern United States. Its general color is chocolate brown, yellowish below, with black and yellow markings. *Smithsonian Rep.* (Nat. Mus.), 1900, p. 104.

queen's-needlework (kwēnz″nē′dl-wėrk), *n.* The American meadow-sweet, *Spiræa salicifolia.*



Queen's-needlework (*Spiræa salicifolia*). *a*, a flower; *b*, pistil.

queen-wasp (kwēn′wosp), *n.* A perfect female wasp. *N. E. D.*

> The *queen wasp* alone survives the winter, and deposits her first eggs in the ensuing spring.
> *E. Bevan*, Honey Bee, p. 17.

queen-wood (kwēn′wụd), *n.* **1.** A small Australian tree of the bean family, *Daviesia arborea*, or its wood, which may be obtained in logs from 6 to 12 inches in diameter. The wood is hard, close-grained, streaked with beautiful pink lines, and takes a high polish.—**2.** The wood of the angico, *Stachychrysum rigidum.* It is very hard, dark reddish-brown, often streaked with black, and may be obtained in the form of trimmed logs from 6 to 10 inches in diameter. See ★*angico* and *Piptadenia.*

queer¹, *v. t.* **3.** To put wrong (unexpectedly); throw out of its proper status or working; ruin the success of; render useless by interference or infelicitous aid. [Slang.]

> [He] will *queer* the whole thing. His appearance before the National Committee will recall . . . things that knocked Tammany out in 1901.
> *N. Y. Tribune*, Jan. 12, 1904, p. 2.

> Without having you come in and *queer* me right in the middle of it [my story].
> *J. L. Ford*, Bohemia Invaded, p. 91.

quel, *v.* and *n.* A simplified spelling of *quell.*

quell² (kwel), *v. i.* [G. *quellen*, OHG. *quellan*, well out.] To well or flow out. [Rare.]

> Out of a low cave of rock, at the foot of a limestone crag, the great fountain rose, *quelling*, and bubbling, and gurgling. *Kingsley*, Water-Babies, i. *N. E. D.*

quell² (kwel), *n.* [G. *quelle*, < *quellen*, well out.] A spring; a fountain; a source from which water wells out.

> He was still singing, and she was the goddess of his Muse,—the *quell* of living waters out of which he drew fresh strength for new lays.
> *G. Egerton*, Discords, p. 209. *N. E. D.*

quenastite (ken-as′tīt), *n.* [*Quenast*, Belgium, + *-ite*².] In *petrog.*, a variety of diorite composed of lime-soda feldspar and hornblende with quartz and sometimes orthoclase.

quench, *v. t.* **6.** To produce a series of crusts on (molten metal), each being taken off as soon as it is formed.

quench, *n.* **2.** A pit or cavity in which water can be thrown upon hot coke just manufactured in an oven, so as to cool it and leach out the soluble sulphur elements.

> From *quenches* 6 feet below ground 1,400 pounds of coke are delivered to the charging holes of the water-gas retort 40 feet above ground, the operation consuming but three minutes, though the effected points are 400 feet apart and two right angle curves intervene.
> *Jour. Franklin Inst.*, Oct., 1904, p. 286.

quercetagetin (kwėr-set-ạ̄-jē′tin), *n.* A yellow crystalline coloring matter, $C_{27}H_{22}O_{13}$, obtained from the flowers of the African marigold, *Tagetes erecta.*

quercic (kwėr′sik), *a.* [L. *quercus*, oak, + *-ic.*] Derived from the oak.—**Quercic acid.** Same as ★*quercin.*

querciform (kwėr′si-fôrm), *n.* [L. *quercus*, oak, + *-form.*] A product of the type of tannoform, made with oak-tannin. *Buck*, Med. Handbook, IV. 246.

quercimelin (kwėr-si-mel′in), *n.* [L. *quercus*, oak, + *mel*(*o*), melon, + *-in*².] Same as *quercitrin.*

quercimeric (kwėr-si-mer′ik), *a.* [L. *quercus*, oak, + Gr. *μέρος*, part, + *-ic.*] Derived from the oak.—**Quercimeric acid,** a crystalline acid, $C_8H_6O_5 + H_2O$, made by heating quercitrin with caustic potash.

quercin (kwėr′sin), *n.* [L. *quercus*, oak, + *-in*².] **1.** A crystalline monosaccharide, $C_6H_{12}O_6$, occurring in oak-bark. It is obtained from the mother-liquors of quercite. It is optically inactive and melts at 340° C.—**2.** A variety of tannic acid, $C_{15}H_{12}O_9 + 2H_2O$, found in oak-bark. It is a light-brown hygroscopic powder. Also called *quercic acid.*—**3.** A bitter crystalline compound found in oak-bark.

quercitan (kwėr′si-tan), *n.* [*quercite* + *-an.*] An alcohol, $C_6H_{10}O_4$, formed in small quantity when quercite is heated to 240–250° C. It does not crystallize.

Quercitannic acid, the kind of tannin or tannic acid which occurs in the bark of the various species of oak, giving value to such bark for the manufacture of leather. It is a powder of reddish-white color, the alcoholic solution of which produces a dark-blue color with ferric chlorid. The formulæ $C_{17}H_{16}O_9$ and $C_{19}H_{16}O_{10}$ have been attributed to it.

quercitric (kwėr-sit′rik), *n.* [*quercitr*(*on*) + *-ic.*] Derived from quercitron, the bark of the black oak, *Quercus velutina.*—**Quercitric acid.** Same as *quercitrin.*

Quercitron borer, an American cerambycid beetle, *Graphisurus fasciatus*, whose larvæ feed upon and destroy the quercitron-bark in newly felled trees. Also called *quercitron bark-borer.*

Quercy phosphorites. See ★*phosphorite.*

querent², *n.* **2.** In *horary astrol.*, the person who asks the question.

querflöte (kwãr′flė-te), *n.* [G.] The German name for the transverse or cross-flute.

Querimana (kwer-i-mä′nạ̈), *n.* [NL., < Pg. *queriman.*] A genus of little mullets found on the South Atlantic coast of the United States and the Pacific coast of tropical America.

querited (kwē′ri-ted), *p. a.* [Irreg. < L. *quærere* (pp. *quæsitus*), seek, ask, + *-ed.*] An erroneous form for ★*quesited.*

querulental† (kwer-ọ̈-len′tạ̈l), *a.* Same as *querulential.*

querulist† (kwer′ọ̈-list), *n.* [*querul*(*ous*) + *-ist.*] A dissatisfied, complaining person.

quesited (kwē-sī′ted), *a.* and *n.* [L. *quæsitus*, pp. of *quærere*, seek, ask. See *query, question.*] **I.** *a.* Sought for; inquired about.

> The remains are the Numbers *quesited.*
> *Jeake*, Arithmetic, p. 20. *N. E. D.*

II. *n.* In *astrol.*, the person or thing asked about.

> The future husband, or to speak in astrological parlance, the *quesited*, revealed himself.
> *The Churchman*, May 11, 1901, p. 594.

question, *n.* **12.** *pl.* The smaller catechism. Also called *question-book.* [Scotch.]

> 'The guilt of Adam's first sin, the want of original righteousness, and the corruption of my whole nature,' I said; for I judged from the look of the man he would think the better of me if I knew my *questions.*
> *R. L. Stevenson*, David Balfour, iii.

Social question, the labor question; the question of social reorganization or of socialism or anarchism.

> The Anglo-Saxon . . . has within his borders the emancipated but ostracized Negro, the English Poor Law, and the *Social Question.* *Kidd*, Social Evolution, p. 58.

questionary, *n.* **2.** A list of questions dealing with some topic, such as visualizing power, expression of emotion, mental habits, or other mental or psychophysical character easily accessible to observation, prepared for circulation among a large number of persons, the answers to which are intended to serve as the basis of a statistical treatment of the topic. The questionary was successfully employed by Darwin and F. Galton, and has been freely used of late years by G. S. Hall and his pupils.

> It is plain that the drawing-up of a *questionary* is no light task. *E. B. Titchener*, Exper. Psychol., I. ii. 388.

> There is a great discrepancy between my introspections and those of other trained observers. . . . on the one hand, and the mass-results of *questionaries*, on the other.
> *Jour. Philos., Psychol. and Sci. Methods*, Jan. 21, 1904, p. 39.

3. A questionist. *N. E. D.*

question-book (kwes′chọn-bůk), *n.* **1.** A school-book in which questions only are printed, the pupil supplying the answers, if he can, from recollection of previous instruction.—**2.** The shorter catechism. Also called *questions.* [Scotch.]

questionist, *n.* **3.** A professed questioner; specifically applied to Duns Scotus and other schoolmen. *N. E. D.*

question-mark (kwes′chọn-märk), *n.* In *printing,* an interrogation-point.

questionnaire (kes-tyo-nãr′), *n.* [F.] Same as ★*questionary,* 2.

> The answer is, as *questionnaire* returns plainly show, that it means very different things to different believers.
> *Amer. Jour. Relig. Psychol. and Education,* May, [1904, p. 50.

questorial (kwes-tō′ri-ạl), *a.* [L. *questor* + *-i-al*^{1}.] Of or relating to a questor, or his office.

quest-rope (kwest′rōp), *n.* [Altered, to suit a supposed etymology, from *guest-rope,* earlier *guess-rope.*] Same as *guess-rope.*

quet (ket or kwet), *n.* [*Quét(elet),* a noted Belgian statistician.] A proposed unit of consuming-power designed to reduce to a common basis the consuming-power of families which differ in sex- and age-composition. The consuming-power of an infant of less than one year is reckoned at unity, and one tenth is added for every year up to 20 for females and up to 25 for males.

> The object of such a table . . . is . . . to furnish an apparatus by which the expenditures of families of different composition may be reduced to some unit for comparison. Engel desired to give this unit the name of *Quet,* after the famous Belgian statistician Quetelet.
> *R. Mayo-Smith,* Statistics and Economics, p. 50.

Quételet's curve. See ★*curve.*

quetenite (ket′e-nīt), *n.* [*Quetena* (see def.) + *-ite*^{2}.] A hydrous sulphate of ferric iron and magnesium occurring in reddish-brown crystalline masses: found in Quetena, Chile.

queyou, queyu (kwā-ō′), *n.* [Also *kway;* Negro-Eng. (in D. spelling) *kwejoe,* < Arawak (in D. spelling) *kiwejoen.*] A small apron made of bark strings, worn by the Indians of Guiana. When the Indians are in contact with the whites, beaded strings are used in place of bark strings. [Guiana.]

quezal, *n.* Same as *quetzal.*

quia-quia (kē-ä-kē′ä), *n.* [Appar. a West Indian name.] Same as *scad*^{1}, 2.

quica (kē′kä), *n.* A small opossum, *Didelphys quica,* about the size of a rat, found in northern South America and Brazil.

Quichuan (kē′chö-ạn or kēch′wạn), *a.* and *n.* Of or pertaining to the Quichua, the principal native tribe of Peru; the Quichua language.

Quichuist (kē′chö-ist), *n.* [Sp. *Quichuista;* as *Quichua* + *-ist.*] One who is proficient in the Quichua language.

quick^{1}, *a.* **8.** Very elastic: as, a *quick* billiard cushion. *Recreation,* XIV. lxii. (advt.).

quick^{2} (kwik), *n.* In *mining,* an abbreviation of *quicksilver.* [U. S.]

quick-action (kwik′ak″shọn), *a.* Acting quickly or in the shortest possible time. —**Quick-action valve.** See ★*valve.*

quick-birth (kwik′bėrth), *n.* The birth of a living child; a birth in which the child is born alive. Same as ★*live-birth.*

quick-born (kwik′bôrn), *a.* Born alive; live-born.

> I saw your Romulus . . .
> Slay his own twin, *quick-born* of the same womb,
> Because he leapt a ditch.
> *Byron,* Deformed Transformed, i. 2.

quicken^{1}, *v. t.* **6.** In *nav. arch.,* to give a greater curve to.—**Quickening liquid,** a weak solution of one of the salts of mercury into which, preparatory to electroplating, metallic articles are dipped, in order to cleanse the surface and coat it with an extremely thin film of mercury, so that the silver afterward deposited may adhere firmly.

Quickening of mercury, a process of treating mercury whereby its effectiveness is restored. When, in the amalgamation process for extraction of the precious metals from their ores, mercury has become 'floured' or reduced to minute globules, coated with sulphid or oxid so that they will not run together or take up particles of gold or silver, the surface of the metal may be cleansed, and its effectiveness restored, by treatment with a solution of potassium cyanide or dilute nitric acid, or by addition of a little sodium amalgam.

quick-fire (kwik′fīr), *a.* Same as ★*rapid-fire.*

quick-flux (kwik′fluks), *n.* In *early chem.,* a mixture of three parts of niter, one of sulphur, and one of sawdust, which, pressed into a nutshell about a small silver coin and set on fire, burned fiercely and produced so high a temperature as to melt the coin.

quick-loader (kwik′lō″dėr), *n.* **1.** A piece of mechanism which effects the quick loading of a gun.—**2.** A quick-loading gun.

quickly, *adv.* **3**†. As if living; in a lifelike manner; to the life.

> Whereon stode a lybbard, crownyd with golde and stones,
> Terrible of countenaunce and passynge formydable,
> As *quikly* towchyd as it were flesshe and bones.
> *Skelton,* Garlande of Laurell, l. 592.

quicksand (kwik′sand), *v. t.* **1.** To catch in a quicksand.

> The animal and the cart became *quicksanded.*
> *Westminster Gazette,* May 20, 1899, p. 5. *N. E. D.*

2. To cover with quicksands: as, a *quicksanded* coast.

quick-saver (kwik′sā″vėr), *n.* *Naut.,* an old-fashioned device in the way of a span to prevent the courses (lowest sails) from bellying too much when the ship was off the wind.

quicksilver, *n.* **2.** A term popularly applied to the amalgam of mercury and tin on the back of a common mirror.

quick-stick (kwik′stik), *adv.* Quickly; without delay; shortly.

> This fellow has what must kill him inside. . . . If there it [the sword] is left, die he must, and *quick stick;* inflammation is set up already.
> *R. D. Blackmore,* Erema, lvi.

In quick-sticks, in short order.

quick-water (kwik′wâ″tėr), *n.* That part of a stream which has fall enough to create a decided current: opposed to ★*still-water.*

quidding (kwid′ing), *n.* [*quid*^{1} + *-ing*^{1}.] The forming, by an animal, of balls of well-chewed food which are dropped into the manger or on the floor of the stall instead of swallowed, on account of difficulty or painfulness of swallowing as a result of some disease of the mouth or throat. *U. S. Dept. Agr.,* Rep. on Diseases of the Horse, 1903, p. 22.

Quiescent ether. See ★*ether*^{1}.

quiet, *v. t.*—**To quiet title.** See ★*title.*

quietant (kwī′e-tạnt), *n.* [LL. *quietans,* ppr. of *quietare,* make quiet: see *quiet, v.*] That which quiets or tends to make quiet.

> A nocturnal *quietant* and hypnotic.
> *H. C. Wood,* Therapeutics, p. 340. *N. E. D.*

Quietula (kwī-et′ụ̄-lä), *n.* [NL., dim. of *quietus,* quiet. See *quiet, a.*] A genus of gobioid fishes found on the Pacific coast of North America.

quil, *n.* and *v.* A simplified spelling of *quill.*

quilers (kwī′lėrz), *n.* [Also *quoilers,* dial. variant of *coilers,* < *coil*^{1}, *v.*] The breeching-strap of a harness. *Eng. Dial. Dict.* [Prov. Eng. and U. S. (Pennsylvania).]

quill^{1}, *n.* **14.** In *mach.,* a hollow shaft; a cylinder; a pipe; specifically, in a turbine, the hollow shaft which carries the revolving blades or blade-wheels.

> The blade wheels are mounted on a large central *quill.*
> *Amer. Inventor,* June 1, 1904, p. 247.

Knight of the quill. See ★*knight.*

quill^{1}, *v. t.* **3.** To insert or adjust the quills of (a harpsichord or spinet).

quillaic (kē-lā′ik), *a.* [*quillai* + *-ic.*] Derived from quillai-bark.—**Quillaic acid,** an acid obtained from the extract of quillai-bark.

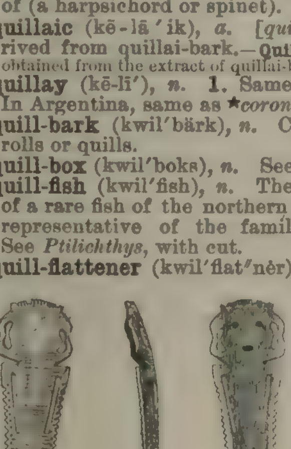
quillay (kē-lī′), *n.* **1.** Same as *quillai.*—**2.** In Argentina, same as ★*coronillo.*

quill-bark (kwil′bärk), *n.* Cinchona-bark in rolls or quills.

quill-box (kwil′boks), *n.* See ★*slip-cup.*

quill-fish (kwil′fish), *n.* The common name of a rare fish of the northern Pacific, the sole representative of the family *Ptilichthyidæ.* See *Ptilichthys,* with cut.

quill-flattener (kwil′flat″nėr), *n.* An implement used by the North American Indians to flatten porcupine quills to be used for embroidery. *Sci. Amer. Sup.,* July 23, 1904, p. 23878.



Quill-flattener of Antler: one eighth natural size. (In American Museum of Natural History, New York.)

quill-gnat (kwil′nat), *n.* A species of gnat; also an imitation of it, used as a lure in fishing.

quill-wheel (kwil′hwēl), *n.* A hand-wheel with spindle and driving-band for winding thread on a quill or tube for weaving. See *quill*^{1}, 8.

quilt^{1}, *n.* **4.** In *building,* a coarse, rough fabric used as a wall-lining in wooden houses.

quilt^{1}, *v. t.* **4.** To beat; thrash; 'lam.' [Slang or provincial.]

quilt^{2} (kwilt), *v. i.* and *t.* [Origin obscure.] To swallow; swallow (something). [Prov. Eng.]

quilt^{2} (kwilt), *n.* The point in the throat where swallowing begins.

quilting, *n.* **6.** *Naut.:* (*a*) A beating with a rope's end. (*b*) A coating for a water-vessel (such as an earthen monkey or jar), formed of sennit, rope-strands, etc.

quina^{2} (kē′nä), *n.* [West Indian?] Same as ★*boje.*

quinaldine (kwi-nal′din), *n.* [*quina* + *al-d(ehyde)* + *-ine*^{2}.] A base, *a*-methylquinoline, used in the preparation of certain artificial dyestuffs. Also *chinaldine.*

quinalgene (kwi-nal′jēn), *n.* [*quina* + *(an)-algene.*] Same as ★*analgene.*

quinalizarin (kwin″al-i-zä′rin), *n.* [*quin(a)* + *alizarin.*] A compound, $(OH)_2C_6H_2(CO)_2C_6H_2(OH)_2$ or 1,2,5,8-anthraquinonetetrol, made from alizarin and other anthraquinone derivatives; alizarin ★Bordeaux (which see). It crystallizes in deep-red needles with a green metallic luster, and is used as a dye.

quinaphthol (kwi-naf′thol), *n.* [*qui(na)* + *naphthol.*] A trade-name of a product of the union of quinine and β-naphthol sulphonate, offered for medicinal use in typhoid fever, intestinal tuberculosis, dysentery, etc. Also *chinaphthol.*

quinary, *a.* **3.** Based upon five.

> Of the notations based on human anatomy, the *quinary* and vigesimal systems are frequent among the lower races.
> *F. Cajori,* Hist. Elementary Math., p. 3.

Quinary notation, in *arith.,* the system with radix five.

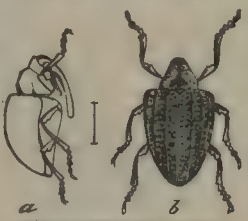
quinaseptol (kwin-a-sep′tol), *n.* [*quina* + *(anti)sept(ic)* + *-ol.*] A trade-name of a hydroxyquinoline-sulphonic acid. It is used as an antiseptic. Also called *diaphthol.*

quinazoline (kwi-naz′ọ̄-lin), *n.* The name given to phenmiazin,  $C_6H_4\!\left\langle\begin{matrix}CH = N\\ \mid\\ N = CH\end{matrix}\right.$, and to its derivatives. It crystallizes in leaflets which melt at 48° and it boils at 243° C.

quince^{1}, *n.*—**Black rot of quince.** See black ★*rot* (*c*). —**Native quince.** Same as ★*bitter-bark,* 1.—**Quince bag-worm.** See ★*bag-worm.*—**Quince leaf-spot.** See ★*leaf-spot.*

quince-borer (kwins′bōr″ėr), *n.* The round-headed apple-borer. See ★*apple-borer.*

quince-curculio (kwins′kėr-kū″li-ō), *n.* An American curculionid beetle, *Conotrachelus cratægi,* which injures quinces and crab-apples, ovipositing in the young fruit within which its larvæ subsequently feed.



Quince-curculio (*Conotrachelus cratægi*).

a, beetle in outline; *b*, dorsal view. Three times natural size.

quincentennial (kwin-sen-ten′i-ạl), *a.* and *n.* [L. *quin(que),* five, + NL. *centennium,* a hundred years, + *-al*^{1}.] **I.** *a.* Relating to a period of five hundred years; happening every five hundred years: as, a *quincentennial* celebration.

II. *n.* A five-hundredth anniversary.

quince-rust (kwins′rust), *n.* See ★*rust*^{1}.

quince-slug (kwins′slug), *n.* Same as *pear-slug.*

quincubital (kwin-kū′bi-tạl), *a.* [L. *quin(que),* five, + E. *cubital.*] In *ornith.,* possessing a fifth cubital remex or secondary quill.

> The swifts are *quincubital.*
> *Wray,* Proc. Zool. Soc., 1887, p. 348.

quincunx, *n.* **4.** A Roman brass coin of five unciæ.—**5.** A reliquary in the shape of a cross, the four parts of which can be folded over the central one. *Fallows.*

quincurion† (kwin-kū′ri-ọn), *n.* [*quincury* + *-on,* as in *centurion.*] A leader of five men. *N. E. D.* [Rare.]

quincury (kwin′kụ̄-ri), *n.* [L. *quinque,* five, + *-uria,* as in *centuria,* century.] A body of five men. *N. E. D.*

quindecad (kwin-dek′ad), *n.* [L. *quindec(im)*, fifteen, + *-ad*^{2} (after *decad*).] A set or series of fifteen.

quindecangle (kwin-dek′ang-gl), *n.* [L. *quindec(im)*, fifteen, + *angulus*, angle.] A quindecagon. *N. E. D.* [Rare.]

quindecennial (kwin-dẹ̄-sen′i-ạl), *a.* and *n.* [L. *quindecim*, fifteen, + *annus*, year, + *-i-al*^{1}.] **I.** *a.* Of or consisting of a period of fifteen years.

II. *n.* A fifteenth anniversary.

quindecylic (kwin-de-sil′ik), *a.* [L. *quindec(im)*, fifteen, + *-yl* + *-ic.*] Same as ★*pentadecylic.*—**Quindecylic acid.** Same as ★*pentadecylic acid* (*b*).

quindekagon, *n.* See *quindecagon.*

quinene (kwin′ēn), *n.* [*quina* + *-ene.*] A crystalline alkaloid, $C_{20}H_{22}ON_2$, made by boiling quinine chlorid with caustic potash dissolved in absolute alcohol. It melts at 81–82° C.

quinetum (kwi-nē′tum), *n.* [*quina* + *-etum*, a neut. participial ending.] A trade-name of a mixture of the alkaloids from *Cinchona succirubra*, used medicinally in the treatment of intermittent fever in malarial districts. Also *chinetum.*

quingentenary (kwin-gen′te-nạ̄-ri), *a.* and *n.* [L. *quingenti*, five hundred, + *-en-ary*, as in *centenary.*] Same as *quincentenary.* [Rare.]

quinhydrone (kwin-hī′drōn), *n.* [*quin(one)* + *hydr(oquin)one.*] A dark-green crystalline compound, $C_6H_4O_2.C_6H_4(OH)_2$, made by mixing solutions of quinone and hydroquinone, by the partial reduction of quinone, or by partly oxidizing hydroquinone by means of ferric chlorid. It breaks down into quinone and hydroquinone when boiled with water, and melts at 171° C.

quinine, *n.*—**Brandes's test for quinine.** See ★*test*^{1}.—**Florida quinine.** Same as *fever-tree*, 2.—**Wild quinine,** *Parthenium integrifolium*, a bitter weed of the southern United States, sometimes called *American feverfew.* See *Parthenium.*

quinine-bush (kwin′ēn-bu̇sh or kwī′nīn-bu̇sh), *n.* The bear-brush, *Garrya Fremontii:* so called because its leaves served pioneers in the place of quinine.

quinine-tree (kwin′ēn-trē or kwī′nīn-trē), *n.* **1.** The hop-tree, *Ptelea trifoliata.*—**2.** In Australia: (*a*) the horseradish-tree, *Gyrostemon cotinifolius;* (*b*) *Petalostigma quadriloculare.* See ★*bitter-bark*, 1.

quininic (kwi-nin′ik), *a.* [*quinine* + *-ic.*] Related to or derived from quinine.—**Quininic acid,** a crystalline compound, $C_{11}H_9NO_3$, made by oxidizing quinine by means of chromic anhydrid dissolved in dilute sulphuric acid. It melts, with decomposition, at about 280° C.

quininize (kwin′in-īz), *v. t.*; pret. and pp. *quininized*, ppr. *quininizing.* [*quinine* + *-ize.*] Same as *cinchonize.*

Quinisextine (kwin-i-seks′tin), *a.* Of or pertaining to the Quinisext Council, 692 A.D., the complement of the fifth and sixth ecumenical councils held at Constantinople. See *Constantinopolitan Council*, under *Constantinopolitan.*

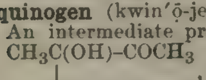
quinite (kwin′īt), *n.* [*quina* + *-ite*^{2}.] A bitter-sweet substance, $C_6H_{10}(OH)$ or 1,4-dihydroxyhexahydrobenzene, made by the action of sodium amalgam and carbon dioxid on diketohexamethylene. It melts at 144° C. Also called *quinitol.*

quinitol (kwin′i-tol), *n.* [*quinite* + *-ol.*] Same as ★*quinite.*

quinizarin (kwin-i-zä′rin), *n.* [*quina* + *(al)izarin.*] A red, or yellowish-red, crystalline substance, $C_6H_4(CO)_2C_6H_2(OH)_2$ or 1,4-dihydroxyanthraquinone, made by heating together phthalic anhydrid and hydroquinone; also in other ways. It gives blue solutions with alkalis. It melts at 192–193° C.

quinoform (kwin′ọ̄-fôrm), *n.* [*quina* + *form(aldehyde).*] A dry, bulky powder formed by precipitating an aqueous extract of cinchona to which formaldehyde has been added with hydrochloric acid: used as a dusting-powder in dermatology. Also *chinoform.*

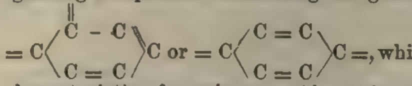
quinogen (kwin′ọ̄-jen), *n.* [*quina* + *-gen.*] An intermediate product, dimethylquinogen,



$$\begin{array}{l}CH_3C(OH){-}COCH_3\\ \quad|\\ \quad CH_2COCOCH_3\end{array}$$

, formed in the synthesis of p-xyloquinone from diacetyl; also, a similar product obtained in the synthesis of duroquinone.

quinoid (kwin′oid), *a.* [*quina* + *-oid.*] Designating compounds containing the grouping



which is characteristic of a quinone. Also *quinonoid.*

quinoidine (kwi-noi′din), *n.* [*quinoid* + *-ine*^{2}.] Same as *chinoidine.*

quinol (kwin′ol), *n.* [*quina* + *-ol.*] Same as *hydroquinone.*

quinolepidine (kwin-ọ̄-lep′i-din), *n.* [*quina* + *lepidine.*] Same as ★*lepidine*^{1}.

quinolic (kwi-nol′ik), *a.* [*quinol* + *-ic.*] Derived from quinoline.—**Quinolic acid,** a crystalline substance, $C_9H_6O_2N(NO_2)$ or nitrodihydroxyquinoline, made by oxidizing cinchonine with nitric acid. It forms salts with both acids and bases.

quinoline, *n.*—**Quinoline red,** an artificial dyestuff, a derivative of quinaldine: also used in the preparation of orthochromatic photographic plates.—**Quinoline yellow,** an artificial dyestuff, the sodium salt of quinoline-phthalon-sulphonic acid, applied to animal fabrics, wool, and silk.

quinolinic (kwin-ọ̄-lin′ik), *a.* [*quinoline* + *-ic.*] Derived from quinoline.—**Quinolinic acid.** (*a*) A crystalline acid, $C_5H_3N(COOH)_2$ or pyridine-dicarbonic acid, made by oxidizing quinoline from coal-tar or cinchonine by means of potassium permanganate. It begins to decompose at 190–195° C. and melts when heated to 231° C. (*b*) A crystalline acid made by oxidizing quinoline with potassium permanganate. It melts at 143° C.

Quinone dioxime, a crystalline substance, $C_6H_4(N.OH)_2$, which occurs as short colorless or long yellow needles which decompose at 240° C. It is made by treating quinone, hydroquinone, quinone monoxime, or paranitrosoaniline with hydroxylamine hydrochlorid.—**Quinone monoxime,** $C_6H_4(OH)(N.OH)$, a pale brownish-green crystalline substance made by boiling paranitrosodimethylaniline with dilute caustic soda, or by treating phenol with nitrous acid. It melts at 126° C. Also called *paranitrosophenol.*

quinonoid (kwin′ọ̄-noid), *a.* [*quinone* + *-oid.*] Same as ★*quinoid.*

quinophenol (kwin-ọ̄-fē′nol), *n.* [*quina* + *phenol.*] A colorless crystalline substance, $(OH)C_6H_3.C_3H_3N$ or 8-hydroxyquinoline, made synthetically. When cold it has the odor of saffron, but when heated it smells like phenol. It becomes yellow when dissolved in acids, alkalis, and dilute alcohol. It melts at 75–76° C.

quinopyrin (kwin-ọ̄-pī′rin), *n.* [*quina* + *(anti)pyrin.*] A trade-name of a solution of quinine hydrochlorate and antipyrin, for medicinal use as a febrifuge.

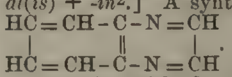
quinoral (kwi-nō′rạl), *n.* [*quin(ine)* + *(chl)oral.*] An oleaginous bitter liquid containing chloral and quinine: a hypnotic.

quinotannic (kwin-ọ̄-tan′ik), *a.* [*quina* + *tannic.*] Noting an acid, a very hygroscopic yellow glucoside found in cinchona-bark. When hydrolyzed with dilute acids it yields sugar and cinchona red. Also called *cinchonatannic acid.*

quinovic (kwi-nō′vik), *a.* [*quinov(in)* + *-ic.*] Derived from quinovin.—**Quinovic acid** a tasteless crystalline compound, $C_{32}H_{46}O_6$ or $C_{33}H_{52}O_7$ (?), occurring in tormentilla-root: also made by the hydrolysis of quinovin. It decomposes at 300° C.

quinovin (kwi-nō′vin), *n.* See ★*kinovin.*

quinoxalin (kwin-ok′sạ-lin), *n.* [*quina* + *oxal(is)* + *-in*^{2}.] A synthetic crystalline base,



. It may be regarded as quinoline with the CH group in the para position to nitrogen replaced by a second atom of nitrogen.

quinquagenary (kwin-kwaj′e-nạ̄-ri), *a.* and *n.* [L. *quinquagenarius*, consisting of fifty, < *quinquaginta*, fifty.] Same as *quinquagenarian.*

quinquagesimal (kwin-kwạ-jes′i-mạl), *a.* and *n.* [L. *quinquagesimus*, fiftieth (< *quinquaginta*, fifty), + *-al*^{1}.] **I.** *a.* Fiftieth; pertaining to the number fifty.

II. *n.* A fiftieth.

quinquangle†, (kwin′kwang-gl), *a.* and *n.* [L. *quinque*, five, + *angulus*, angle.] **I.** *a.* Having five angles.

II. *n.* A pentagon.

quinque-angle†, **quinque-angular**† (kwin-kwẹ̄-ang′gl, -ang′gụ̄-lạ̈r), *a.* [L. *quinque*, five, + E. *angle, angular.*] Pentagonal; quinquangular.

quinquecarinate (kwin-kwẹ̄-kar′i-nāt), *a.* [L. *quinque*, five, + E. *carinate.*] Having five ridges, like some of the scales on certain lizards, or the carapace of the lyre-turtle, *Dermochelys.* *Proc. Zool. Soc., London*, 1903, II. 70.

quinquecuspid (kwin-kwẹ̄-kus′pid), *a.* Same as ★*quinquecuspidate.*

quinquecuspidate (kwin-kwẹ̄-kus′pi-dāt), *a.* [L. *quinque*, five, + E. *cuspidate.*] Having five cusps or tubercles; quinquetubercular.

quinquelateral (kwin-kwẹ̄-lat′ẹ-rạl), *a.* [L. *quinque*, five, + *latus* (*later-*), side, + *-al*^{1}.] Five-sided.

quinqueloculine (kwin-kwẹ̄-lok′ụ̄-lin), *a.* [L. *quinque*, five, + *loculus*, a little place, a cell, + *-ine*^{1}.] Having five loculi or chambers, as the shells of some *Foraminifera;* quinquelocular.

quinquemolecular (kwin″kwẹ̄-mọ̄-lek′ụ̄-lạ̈r), *a.* [L. *quinque*, five, + E. *molecule* + *-ar*^{3}.] Consisting of, or relating to, five molecules.

> The velocity and mechanism of the reaction between potassium ferricyanide and potassium iodide in neutral aqueous solution. . . . The velocity of this reaction can be investigated by titration of the iodine liberated; the simplest interpretation shows that it is *quinquemolecular.*
> *Nature*, May 14, 1903, p. 46.

quinqueradial (kwin-kwẹ̄-rā′di-ạl), *a.* [L. *quinque*, five, + *radius*, ray, + *-al*^{1}.] Having five rays, as some echinoderms; pentameral; quinqueradiate. *E. R. Lankester*, Treatise on Zoölogy, III. 1.

quinquetuberculy (kwin″kwẹ̄-tụ̄-bėr′kụ̄-li), *n.* [*quinquetubercul(ar)* + *-y*^{3}.] The fact or condition of having molar teeth with five cusps or tubercles. *H. F. Osborn*, in Bull. Amer. Mus. Nat. Hist., June 28, 1902, p. 179.

quinquevalence (kwin-kwev′ạ-lẹns), *n.* [*quinquevalen(t)* + *-ce.*] The state of being quinquevalent; pentavalence.

quinquevalency (kwin-kwev′ạ-lẹn-si), *n.* Same as ★*quinquevalence.*

quinquevirate (kwin′kwẹ̄-vī-rāt), *n.* [L. *quinqueviratus*, < *quinquevir*, one of five men.] In *Rom. antiq.*, a temporary board of magistrates or commissioners consisting of five men. See *quinquevir.*

quinsied (kwin′zid), *a.* [*quinsy* + *-ed*^{2}.] Having quinsy; having been attacked by quinsy.

quint^1, *n.*—**Quint major,** the five highest cards in any suit.

quint^2 (kwint), *n.* An abbreviation of ★*quintet*, 2. [Colloq.]

> Betts was obliged to stop, the chain of his pacing *quint* having given way.
> *Daily News* (London), June 8, 1897, p. 9.

quintain^2 (kwin′tān), *n.* [L. *quintanus*, of the fifth. See *quintain*^{1}.] Same as ★*cinquain*, 2.

quintane (kwin′tān), *n.* Same as *pentane.*

quintant† (kwin′tạnt), *n.* [L. *quintus*, fifth, + *-ant.*] One fifth of a circle. *Wallis*, 1684.

quinternion (kwin-tėr′ni-ọn), *n.* [L. *quintus*, fifth, + E. *(quat)ernion.*] A set of five sheets of paper or parchment: a term in bookbinding. *N. E. D.*

quintet, *n.* **2.** A bicycle made to carry five.

> We would rather be spared the sight of two *quintets* racing neck and neck round a bend!
> *Westminster Gazette*, Oct. 28, 1896, p. 7. *N. E. D.*

quintillion, *n.* **II.** *a.* Noting a quintillion; the cardinal numeral corresponding to a quintillion: strictly a collective noun. See *hundred, a.*

quintocubital (kwin-tọ̄-kū′bi-tạl), *a.* The amended, but later, form of ★*quincubital.* *Pycraft*, 1899.

quintocubitalism (kwin-tọ̄-kū′bi-tạl-izm), *n.* [*quintocubital* + *-ism.*] In *ornith.*, the fact or condition of having the fifth secondary feather, with its coverts, present. *Trans. Linnean Soc.* (London), Oct., 1901, p. 221.

quinton (kaṅ-tôṅ′), *n.* [F., < L. *quintus*, five.] The French name of the obsolete treble viol with five strings. See *viola da braccio*, under *viola*^{1}.

quintuplet, *n.* **4.** A bicycle for five riders; a quintet.

quintuply (kwin′tụ̄-pli), *adv.* In a fivefold manner; with five times as much.

quint-viola (kwint′vē-ō″lạ̈), *n.* In *organ-building*, a stop of the gamba class, but yielding tones a twelfth above the pitch of the keys used.

quinua (kē′nöä), *n.* [Also *quinoa;* Quichua *quinua.*] A nutritive plant, *Chenopodium Quinoa*, of the Peruvian and Bolivian highlands, growing at altitudes of 12,000 feet and more. The white millet-like seeds of one of the varieties are one of the chief vegetable aliments of the Indians and are generally eaten by all classes. The name has been adopted generally in the Spanish language as the name of the plant.

quinzain, *n.* 1. (*b*) A period of fifteen days (in modern calculation fourteen, leaving out the day of the feast) after a church festival, on the principle of the octave of a feast: as, the *quinzain* of Easter.—3. Some event, social or other, which occurs every two weeks.

Aunt Sue intended to have *Quinzaines* (fortnightly soirees) this winter, if it had not been for the death of Tom O'Sullivan and Ellie's illness.
Mrs. Hawthorne, quoted in J. Hawthorne, Nathaniel [Hawthorne and his Wife, II. 85.

quire^2, *v. t.* 2. To nest within a once-folded outer sheet (one or more sheets of paper of the same size similarly folded); impose and print (separate pages of type) so that they can be properly outsetted or insetted in consecutive order.

Quirinal (kwir'i-nąl), *a.* and *n.* [L. *Quirinalis* (It. *Quirinale*), < *Quirinus*. See *Quirinalia.*] **I.** *a.* Relating to Quirinus or to the Quirinal Hill (one of the seven hills of Rome) or to the modern royal palace (a former summer palace of the popes) which is built upon it.

II. *n.* The palace of the Quirinal; hence, the Italian Court.

Quiritian (kwi-rish'ąn), *n.* [*Quirites* + *-ian.*] One of the Quirites; a Roman citizen.

Quirivelia (kwir-i-vē'li-ạ̈), *n.* [NL. (Poiret, 1804), from *kiriwael*, or *kirriwel*, the native Ceylonese name of *Q. frutescens*.] A genus of plants belonging to the family *Apocynaceæ*. There are 5 or 6 species, natives of India, the Malay Archipelago, and Australia. See *Ichnocarpus*.

quirlicue (kwėr'li-kū), *n.* Same as *curlicue*.

quirquincho (kēr-kēn'chọ̄), *n.* [Aymará of Bolivia.] A small species of armadillo indigenous to the elevated plateau of Bolivia; any armadillo.

quisby (kwis'bi), *n.* and *a.* [Origin obscure.] **I.** *n.* An idler; one who does not or will not work. [Slang.]—**Doing quisby**, idling; not working. [Slang.] *N. E. D.*

II. *a.* 1. Not quite the thing; queer. *N. E. D.*—2. Without money; 'hard up.' [Slang, in all uses.]

To say that a man is without money, or in poverty, some persons remark that he is down on his luck, . . . in Queer Street, . . . *quisby*, . . . sold up, in a fix.
Household Words, Sept. 24, 1853, p. 75.

quisqueite (kwis'kwẹ̄-īt), *n.* A carbonaceous mineral, resembling asphaltite, peculiar in containing a large amount of sulphur. It occurs in Peru with the vanadium sulphid called ★*patrinite*.

quisutsch (kē'such), *n.* The silver salmon, *Oncorhynchus milktschitsch* or *O. kisutch:* same as ★*kisutch*. See *salmon*, 2 (*d*).

quit^1, *a.*—**To cry quits**, to declare one's self even with another, in the matter of debts or demands of any kind. See *to be quits*, under *quit*^{1}, *a*.

quit^1 (kwit), *n.* [*quit*^{1}, *v.*] A term introduced by Professor H. A. Newton to denote the point on the celestial sphere from which the motion of a body is at any moment directed: thus, the earth's quit is always a point on the ecliptic about 90° east of the sun. The quit is opposite to the goal. See ★*goal*^{1}, 7.

quite^1, *adv.*—**Quite so.** (*b*) Quite right; quite in the right way; quite well. [Slang, New Eng.]

It was this way (you 're rowin' *quite so*, Harve), an' I tell you 'cause it 's right you orter know.
R. Kipling, Captains Courageous, iii.

quitted (kwit'ed), *p. a.* [pp. of *quit*^{1}, *v.*] In *whist* and *bridge*, said of a trick when it is turned down and the fingers have been removed from it.

quitter^1, *n.* 3. One who quits or gives up in the face of difficulties; one who has not the courage or determination to finish what he undertakes to do. [Colloq.]

Our plans have worked splendidly, yet here you are, right on the edge of Italy, crying like a *quitter* to give it up. *Bookman*, Jan., 1906, p. 512.

4. Specifically, a workman who has the habit of throwing up his job on slight pretenses. [Colloq.]—5. A young male fur-seal, old enough to enter the breeding-grounds toward the close of the season, but not strong enough and bold enough to hold his ground when disturbed: he therefore quits his place.

A *quitter*, however, is not a rookery bull until he is in possession of cows.
Alaskan Seal Fisheries, Senate Doc. 98, 59th Cong., 1st [Sess., p. 76.

quitter^2, *n.*—**Simple quitter**, a local inflammatory condition of the skin and underlying tissues immediately above the hoof, resulting in the formation of a slough with more or less pus.—**Skin quitter**, an extremely painful disease affecting the skin directly above the hoof and resulting in the formation of an ulcer.—**Subhorny quitter**, a local inflammation starting at the coronary band of the hoof and the adjacent skin, and spreading beneath the hoof to the sensitive tissue, which becomes degenerated with pus formation.—**Tendinous quitter**, a complication of simple quitter in which the disease has spread, involving the tendons of the leg and the ligaments of the joint. *U. S. Dept. Agr.*, Rep. on Diseases of the Horse, 1903, p. 381.

quiverful (kwiv'ėr-fůl), *n.* As much or as many as will fill a quiver: generally used with allusion to Ps. cxxvii. 5: "Happy is the man that hath his *quiver full* of them [children]."

quiver-leaf (kwiv'ėr-lēf), *n.* The American aspen or quaking asp, *Populus tremuloides*.

quoin, *n.* 3. The solid angle of a crystal in which three or more faces meet. Also written *coign*.

quoit, *n.* 4. In *archæol.*, same as *dolmen*. [Local.]

quoiter (kwoi'tėr), *n.* One who plays quoits. *N. E. D.*

quomodo (kwō-mō'dō), *n.* [L. *quomodo*, *quo modo*, in what manner: *quo*, abl. of *quis*, who, what; *modo*, abl. of *modus*, manner.] The way; the manner.

Mr. Northerton was desirous of departing that evening, and nothing remained for him but to contrive the *quomodo*, which appeared to be a matter of some difficulty.
Fielding, Tom Jones, vii. 15.

quor. An abbreviation of the Latin *quorum*, of whom or of which.

quot., quotid. Abbreviations of the Latin *quotidie*, daily.

quotative (kwō'tạ-tiv), *a.* [*quote* + *-ative.*] Quoting; of the nature of quotation; noting quotation.

The past tense takes a suffix, -GAn or -GAni, and appears to be used precisely like our own. Before the *quotative*, wAnsū'ga, this suffix takes the form of -añ, unless, as is barely possible, the latter is the continuative.
Amer. Anthropologist, July–Sept., 1902, p. 398.

quote-mark (kwōt'märk), *n.* A quotation-mark. [Colloq.]

The apostrophe is never used [in German] for a *quote-mark*. *De Vinne*, Mod. Book Composition, p. 252.

quotennial (kwọ̄-ten'i-ąl), *a.* [L. *quotennis*, of how many years (< *quot*, how many, + *annus*, year), + *-al*^{1}.] Of how many years (implying a long time). [Rare.]

The disputes about tythes and boundaries were then usually settled by bands of armed men. . . Hugh Stucley was in this state of *quotennial* warfare with his cousin Sir Amyas Pawlet from the 17th to the 22nd of Elizabeth's reign. *R. Simpson*, School of Shakspere, I. 60.

quotient, *n.* 2. In *geom.*, if b and c are any two sects, there is always one and only one sect a such that $c = ab$: this sect a is designated by the notation $\frac{c}{b}$, and is called the *quotient* of c by b.—**Quotient hypothesis**, in *psychophys.* Same as *Plateau's* ★*theory*.—**Quotient limen**, in *psychophys.*, the ratio $\frac{r_o}{r}$ or $\frac{r}{r_u}$, where r is the standard stimulus, r_o is r plus the upper differential limen, and r_u is r minus the lower differential limen.—**Quotient mixture limen**, in *psychophys.*, the stimulus limen regarded in Fechnerian terms as the quotient limen of a preëxisting excitation of the sensorium.

R. 3. An abbreviation (*h*) of *Radical*; (*i*) of *railway*; (*j*) [*l. c.*] of *rare*; (*k*) [*l. c.* or *cap.*] of *read*; (*l*) of *Réaumur* (see *thermometer*); (*m*) of *rector*; (*n*) of *Republican*; (*o*) [*l. c.*] of *residence* and *resides*; (*p*) of *response*; (*q*) of the Latin *Respublica*, 'the Republic'; (*r*) [*l. c.* or *cap.*] of *retired*; (*s*) of *river*; (*t*) [*l. c.* or *cap.*] of *rod* or *rods*; (*u*) of *Roma*, Rome; (*v*) [*l. c.* or *cap.*] of *rood* or *roods*; (*w*) [*l. c.*] in *geom.*, of *radius* (of the incircle); r_1, r_2, r_3, denote the ex-radii beyond *a*, *b*, *c*, respectively; *R* denotes the radius of the circumcircle; (*x*) [*cap.*] in *psychophysics*, an abbreviation of G. *Reiz*, stimulus.—4. As a symbol: (*a*) In *chem.*, *R* has been used for *rhodium*: more generally, *Rh.* (*b*) In *elect.*, *R* or *r* denotes *resistance*. (*c*) In *electrotechnics*, *r* stands for *radius*.—**The fourth R**, reasoning. See *the three R's*, under *R*.

> Mr. Mosely agrees with Prof. Armstrong that it is *the fourth "R"* which makes all the difference between the educational results in the United States and in this country. American teachers are right in giving more attention to the teaching of how to reason in a scientific manner than is common in English schools.
> *Nature*, June 9, 1904, p. 140.

The R months, those months the names of which contain the letter R: the notion that oysters are in season only in these months is an old one. *The Nation*, Aug. 6, 1903, p. 115.

ρ. In *electrotechnics*, the symbol for *specific resistance*.

ra^2 (râ), *n.* [Sw. *rå* = Icel. *rā*, a boundary, a landmark.] A terminal moraine. *Geikie*, Text-book of Geol., p. 1332.

Ra. A chemical symbol of *radium*. *Rd* is more generally used.

R. A. An abbreviation (*e*) of *Rear-Admiral*; (*f*) of *Royal Arcanum*; (*g*) of *Royal Artillery* (also *R. Art.*).

raad^2 (räd), *n.* [D. *raad* = G. *rath*, counsel, council, = AS. *ræd*, counsel. See *read*^{1}, *n.*] A council; specifically, as an abbreviation of *volksraad*, a legislative assembly.

raadhuis (räd'hois), *n.* [D., < *raad*, council, + *huis*, house.] The assembly-house of a raad, or volksraad.

raadzaal (räd'zäl), *n.* [D., < *raad*, council, + *zaal* = G. *saal*, hall.] The assembly-house or -hall of a raad or volksraad.

rabat^2 (ra-bat'), *v. t.*; pret. and pp. *rabatted*, ppr. *rabatting*. [Also *rabatte*; < F. *rabattre*, beat down, bring down, etc. See *rabate*, *v.*] In *geom.*, to revolve about an axis in the horizontal or vertical plane of projection into that plane.

rabb. An abbreviation of *rabbinical*.

rabbet, *n.*—**Rabbet of the keel**, in *wood ship-building*, a triangular groove cut in a wood keel to receive the inner edge of the garboard-strake which can thus have a square corner at the joint with the keel to permit the seam to be readily calked. See cut under *keel*^{1}, *n.*, 2. The *rabbet of the stem* and the *rabbet of the stern-post* are similar grooves on those parts to receive the hood-ends of the outside planking. In iron ships there is no rabbet of the keel, but the stem and stern-posts are frequently recessed to receive the outside plating, or the armor-plates of a war-ship, and to make the exterior surface of the stem and stern-post flush with the exterior surface of the plating. Such recess is also called a *rabbet of the stem* or *stern-post*.—**Square and rabbet**, a square-edged flat molding, as a listel, separated by a rabbet from the surface.

rabbinitic (rab-i-nit'ik), *a.* [*rabbin* + *-ite*^{2} + *-ic*.] Of or pertaining to the rabbins or their teachings.

rabbinize (rab'in-īz), *v.*; pret. and pp. *rabbinized*, ppr. *rabbinizing*. [*rabbin* + *-ize*.] **I.** *trans.* To train in the learning of the rabbis; imbue with the spirit of rabbinism.

II. *intrans.* To conform to the teachings of the rabbis; become rabbinical.

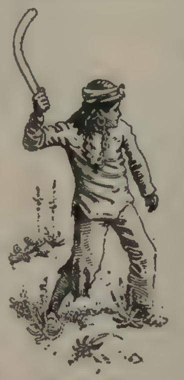
rabbit^1, *n.*—**Angora rabbit**, a domesticated breed having long, soft, silky fur, sometimes from three to five inches in length.—**Himalayan rabbit**, a domesticated breed having the body white, and ears, nose, feet, and tail dark brown; the hair is short and fine.—**White rabbit**, sometimes applied to the varying hare, *Lepus americanus*, in its white winter coat.

rabbit-bandicoot (rab'it-ban"di-kōt), *n.* The typical species of bandicoot, *Perameles lagotis*, so called from its long ears.

rabbit-fish, *n.* 4. A fish, *Promethichthys prometheus*, belonging to the family *Gempylidæ*, found in rather deep water about the tropical islands of the Atlantic.

rabbit-mouthed (rab'it-moutht), *a.* Having a rabbit-mouth; harelipped.

rabbit-stick (rab'it-stik), *n.* A throwing-stick, similar to the Australian boomerang, used by the Indians of the southwestern United States in hunting rabbits and other small game.



Rabbit-stick.

rabbit-weed (rab'it-wēd), *n.* See ★*Picradenia*.

rabble^3, *n.*—**Mechanical rabble**, a mechanical device for stirring and skimming iron in puddling.

rabble-arm (rab'l-ärm), *n.* An arm or rod by which a stirring or agitating action is produced in a bed or mass of ore under treatment in a furnace. In puddling by hand, the molten bath is stirred by the puddler's rabble; in roasting-furnaces where the metal is not in fusion, the mass can be mechanically kept from agglomerating, and every part be exposed to oxidation by a revolving arm or arms producing the action of a rabble. *Electrochem. and Metal. Industry*, May, 1905, p. 194.

rabbling-tool (rab'ling-tōl), *n.* Same as *rabble*^{3}.

Rabic tubercles. See ★*tubercle*.

rabies, *n.*—**Dumb rabies**, a form of rabies in which there is paralysis of the muscles of the jaw and of the legs.

rabiform (rā'bi-fôrm), *a.* [L. *rabies*, rabies, + *forma*, form.] Resembling rabies: noting the symptoms shown by animals which are affected with rabies (hydrophobia).

> The death of 18 cattle . . ., 7 out of one herd of 50, all showing *rabiform* symptoms.
> *Yearbook U. S. Dept. Agri.*, 1900, p. 214.

rabitic (rạ-bit'ik), *a.* [*rabies* + *-it-ic*.] Rabid; rabietic: as, *rabitic* dogs.

> *Rabitic* dogs generally take three days before they die.
> *Whitmarsh*, Pasteur Treatment, p. 33. *N. E. D.*

Rabula (rab'ụ-lạ̈), *n.* [NL., < L. *rabula*, a brawling advocate, a wrangler, < *rabere*, rave, be mad: see *rabies*.] A genus of eels of the family *Murænidæ*, found on both coasts of tropical America.

rabulistic (rab-ụ-lis'tik), *a.* [L. *rabula*, a brawling advocate, a wrangler, + *-ist* + *-ic*.] Of or pertaining to a wrangler or disputatious speaker; disputatious.

> It is unfortunate . . . to become prematurely interested in one side of any great open question, but perhaps the gravest evil is the danger of cultivating too great readiness in speech. This tends to superficiality, loose thinking, and *rabulistic* ratiocination.
> *G. S. Hall*, Adolescence, II. 437.

R. A. C. An abbreviation (*a*) of *Royal Agricultural College*; (*b*) of *Royal Arch Chapter*.

raccontando (rä-kon-tän'dọ), *adv.* [It., ppr. of *raccontare*, narrate. See *recount*^{1}.] In *music*, in the style of a narrator, as if reciting.

raccount (ra-kount'), *v. t.* [F. *raconter* (= It. *raccontar*), < *re-* + *-aconter*, account. See *account*, *v.*, and cf. *recount*^{1}.] To recount. [Obsolete or rare.]

> Meanwhile let me *raccount* this, which I heard just before I left Paris.
> *K. de Forest*, in Harper's Bazar, Sept. 2, 1899, p. 730.

race^1, *n.* 7. The circular path traversed by a horse in driving a machine by a horse-whim; a gin-ring or gin-race.—8. In *mech.*, an annular ring or groove in which the rollers of a roller-bearing, or the balls of a ball-bearing, travel; a ball-race; a roller-race. For a roller-bearing, the race is usually the frustum of a very flat cone, the rollers being frusta of the complementary cone.—9. A narrow passage, fenced with hurdles, for sheep; a lane. [New Zealand.]—**Dongola race**, a race in which a punt or the like is propelled by paddling, by three or four pairs (usually male and female). *N. E. D.*—**Open race**, a race in which any one may compete.—**Selling race**, a race run with the understanding that as soon as the winner is declared he shall be sold at auction.

> The *selling race* at a mile and forty yards, which Headlight II. at 12 to 1, cleverly ridden by Clawson, captured in 1:44 3-5. *Spirit of the Times*, Nov. 12, 1898, p. 417.

race^2, *n.*—**Tidal race**, a very swift current induced by the tide.

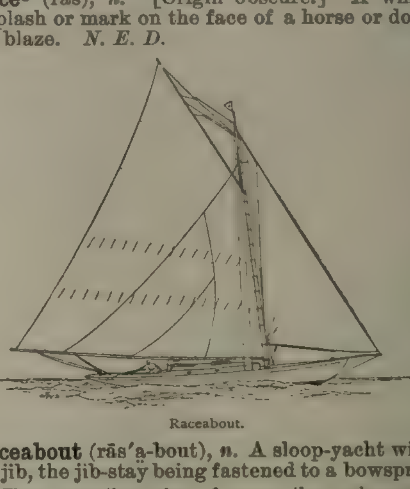
> At New York a high tide entering from the harbor reaches the rocky narrows of Hell Gate when a low tide arrives through Long Island sound; and six hours later a low tide from the harbor meets a high tide from the sound. Thus a rapid current is caused to flow back and forth in the narrow passage, which was dangerous to vessels until the channel was widened by blasting away its reefs. A current of this kind is sometimes called a *tidal race*. *W. M. Davis*, Elem. Phys. Geog., p. 122.

race^3, *n.* 5. (*c*) In *agri.* and *hort.*, a group of cultivated plants, having well-marked differentiating characters, which propagate true to seed except for slight individual variations. The various groups of peas, beans, radishes, wheat, oats, cotton, corn, etc., commonly referred to as varieties are, in a more restricted sense, races. Boone County White, Leaming, Reid's Yellow Dent, Hickory King, etc., are among the best-known races of field-corn; and Peterkin, Peerless, King, Truitt, etc., are among the best-known races of cotton. Compare ★*strain*^{2}, 1 (*b*). *H. J. Webber*, in Science, Oct. 16, 1903.—**Baumes-Chaudes race.** See *Cro-Magnon* ★*race*.—**Cephalic, chromatic race.** See ★*cephalic*, ★*chromatic*.—**Cro-Magnon race**, a prehistoric race of Europe, characteristic remains of which were found in the cave of Cro-Magnon near Les Eyziès, a hamlet on the Vézère in Dordogne. The remains belong to the mesolithic or early neolithic period, and the type is characterized by a very long head, low face and orbits, and tall stature. The skulls from the Baumes-Chaudes cave, Lozère, called by Hervé the *Baumes-Chaudes race*, are of the same age and of similar type.—**Ethnic race**, a group of closely related nationalities, speaking closely related languages, and having well-marked psychological characteristics in common. *Amer. Anthropologist*, April–June, 1902, p. 362.—**Glottic race**, a group of people speaking related languages. *Amer. Anthropologist*, April–June, 1902, p. 362.—**Laugerie-Chancelade race**, the type of man belonging to the Magdalenian period, characterized by dolichocephaly, high and broad forehead, absence of large superciliary ridges, and heavy cheek-bones. See ★*Laugerian*.—**Littoral race.** See ★*Atlanto-Mediterranean*.—**Metamorphic race**, one of the races which have originated by recent modification and intermixtures from the archimorphic races. *Stratz*.—**Natural race**, a people whose culture has not advanced far enough to free it from the bondage of natural environment.—**Protomorphic races**, in *anthrop.*, the fundamental races of man. *Stratz*.—**Race psychology.** See ★*psychology*.

race^5 (rās), *n.* [*race*^{5}, *v.*] The heart, liver, and lungs or lights of an animal, especially of a calf: same as *pluck*^{1}, 4.

race^6 (rās), *n.* Same as *rase*^{1}.

race^8 (rās), *n.* [Origin obscure.] A white splash or mark on the face of a horse or dog; a blaze. *N. E. D.*



Raceabout.

raceabout (rās'ạ-bout), *n.* A sloop-yacht with a jib, the jib-stay being fastened to a bowsprit.

There were other prizes, of course: the much-coveted silver cup, called "the Commodore's Cup," for knockabouts, pennants for the *raceabouts* and half-raters, and a first money prize of twenty-five dollars for the fishermen's sloops. *St. Nicholas*, Aug., 1905, p. 865.

race-bit (rās'bit), *n.* A light bridle-bit with large loose rein-rings. These rings are frequently three or more inches in diameter.

race-board (rās'bōrd), *n.* 1. The top of the lay or lathe in a loom on which the shuttle runs as it is thrown from one end to the other. *T. W. Fox*, Mechanism of Weaving, p. 267.—2. A gang-plank.

race-cut, *n.* See ★*rase-cut.*

race-end, *n.* See ★*rase-end.*

race-horse, *n.* 4. *pl.* A French gambling-game. See *petits chevaux* (under ★*cheval*).

racemamide (ras-ē-mam'id), *n.* [*racem*(*ic*) + *amide.*] The amide of racemic acid, $C_4H_7O_5N$. Also called *paratartramide.*

racemate (ras'ē-māt), *n.* [*racem*(*ic*) + *-ate*^{5}.] In *chem.*, the name of any compound obtained by replacing the basic hydrogen of racemic acid by a metal or other basic radical: see ★*racemic acid*, under *racemic.*

racemic, *a.* 2. In *chem.*, composed of two optically opposite isomeres. The typical case is that of racemic acid (see below), but racemic forms are of frequent occurrence among organic compounds. The racemic form does not act on polarized light.—**Racemic acid.** It is found occasionally in grape-juice and as a by-product in the manufacture of tartaric acid. It is made by heating tartaric acid with dilute acids or water, especially in the presence of alumina; also by crystallizing a mixture of equal parts of dextro- and levo-tartaric acids, and by the oxidation of many polyacid alcohols and carbohydrates, and in many other ways. It is optically inactive and may be separated into the two isomeric, active tartaric acids by crystallizing the sodium-ammonium salt at a low temperature, or by crystallizing the quinicine or cinchonicine salts. It melts at 203–204° C., or at 205–206° C. when anhydrous.—**Racemic compound**, in *phys. chem.*, a compound whose optical relations are analogous to those of racemic acid. *A. Findlay*, The Phase Rule, p. 214.

racemism (ras'ē-mizm), *n.* [*racem*(*ic*) + *-ism.*] In *chem.*: (*a*) The character of an optically inactive substance which is separable into two substances, each of which has the same chemical composition as the other and as the parent substance, but one of which is dextrorotatory and the other levorotatory in relation to polarized light, as racemic acid may be separated into dextro- and levotartaric acids. (*b*) Same as ★*racemization.*

> It is shown that in single ring nuclei, *racemism* is generally theoretically possible, and often observed. In the cases of some double nuclei (as the camphor group) *racemism* appears to be impossible owing to the peculiar molecular structure. *Science*, Aug. 5, 1904, p. 178.

racemization (ras″ē-mi-zā'shon), *n.* [*racem*(*ic*) + *-ize* + *-ation.*] The process of rendering racemic; the transformation of a single optically active (dextro- or levorotatory) compound into the racemic form. It involves the change of one half of the molecules of the substance into the isomeric form with opposite optical rotation.

> The Catalytic *Racemisation* of Amygdaline. *Nature*, Nov. 6, 1902, p. 24.

racemoid (ras'ē-moid), *a.* [*raceme* + *-oid.*] Same as ★*racemic*, 2.

Racemose vesicle. See ★*vesicle.*

racer, *n.* 9. Same as *race-plate.*—10. In the Southern States, applied to the corn-snake, *Callopeltis getulus*, a large harmless snake of a reddish-brown color with redder markings.

race-sense (rās'sens), *n.* The consciousness of a race that all its members are of a kind and different from other races.

race-tankard (rās'tang″kärd), *n.* A piece of plate in the shape of a tankard given as a prize to the winner of a race.

raceway, *n.* 3. In a composing-machine, a space into which type drops; a device for carrying type along.

> This machine will select the type, place them in a *raceway* and move them along until a line is set up; it then inserts the exact spaces required and conveys the justified line to the galley, either leaded or solid, and registers each line as set. *Inland Printer*, Nov., 1898, p. 178.

4. A protecting tube or other inclosure surrounding electric wires within a subway or conduit.

rachiagra (rā-ki-ag'rä), *n.* [Also *rhachiagra*; NL., < Gr. ῥάχις, spine, + ἄγρα, a catching. See *podagra.*] Gouty or rheumatic pain in the spine. Also *rachisagra.*

rachialgia, *n.* 2. Painters' colic.

rachialgitis (rā″ki-al-jī'tis), *n.* [Also *rhachialgitis*; NL., < Gr. ῥάχις, spine, + ἄλγος, pain, + *-itis.*] Myelitis.

rachiform (rā'ki-fôrm), *a.* [Also *rhachiform*; Gr. ῥάχις, spine, + L. *forma*, form.] Formed like a rachis.

rachigraph (rā'ki-gråf), *n.* [Also *rhachigraph*; Gr. ῥάχις, spine, + γράφειν, write.] An apparatus for recording the outlines of the spine and back.

> His [M. G. Demeny's] thoracometer, the profile inscriber, and *rachigraph* have been used in hospitals and large gymnastic establishments. . . . These apparatus give the form of the body by continuous tracings. *Sci. Amer. Sup.*, Oct. 31, 1903, p. 23272.

rachiocampsis (rā″ki-ō-kamp'sis), *n.* [Also *rhachiocampis*; NL., < Gr. ῥάχις, spine, + κάμψις, a bending.] A permanent abnormal curve of the spine.

rachiocyphosis (rā″ki-ō-sī-fō'sis), *n.* [Also *rhachiocyphosis*; NL., < Gr. ῥάχις, spine, + κύφωσις, humpbacked condition.] Same as *cyphosis.*

rachiokyphosis (rā″ki-ō-kī-fō'sis), *n.* [Also *rhachiokyphosis.*] Same as ★*rachiocyphosis.*

rachioparalysis (rā″ki-ō-pa-ral'i-sis), *n.* [Also *rhachioparalysis*; < Gr. ῥάχις, spine, + E. *paralysis.*] Paralysis of the spinal muscles.

rachioplegia (rā″ki-ō-plē'ji-ä), *n.* [Also *rhachioplegia*; NL., < Gr. ῥάχις, spine, + πληγή, stroke.] Paraplegia of spinal origin.

rachioscolioma (rā″ki-ō-skol″i-ō'mä), *n.* [Also *rhachioscolioma*; NL., < Gr. ῥάχις, spine, + σκολίωμα, a bend, curve.] Same as *scoliosis.*

rachioscoliosis (rā″ki-ō-skol″i-ō'sis), *n.* [Also *rhachioscoliosis*; NL., < Gr. ῥάχις, spine, + σκολίωσις, a bending.] Same as *scoliosis.*

rachiotome (rā'ki-ō-tōm), *n.* [Also *rhachiotome.*] The more correct form of *rachitome.*

rachiotomy (rā-ki-ot'ō-mi), *n.* [Also *rhachiotomy.*] The preferable spelling of *rhachiotomy.*

rachiphyma (rā-ki-fī'mä), *n.*; pl. *rachiphymata* (-ma-tä). [Also *rhachiphyma*; NL., < Gr. ῥάχις, spine, + φῦμα, a swelling.] A spinal tumor.

rachirrheuma (rā-ki-rö'mä), *n.* [Also *rhacirrheuma*; NL., < Gr. ῥάχις, spine, + ῥεῦμα, rheum.] Lumbago.

rachisagra (rā-kis-ag'rä), *n.* [Also *rhachisagra.*] Same as ★*rachiagra.*

rachischisis, *n.* The preferable spelling of *rhachischisis.*

rachitic, *a.* 3. Of or pertaining to a mountain ridge or range.

> Some details are given respecting the vegetation of the coast, which south of San Quintin suddenly becomes *rachitic.* *Geog. Jour.* (R. G. S.), XIII. 663.

Rachitic rosary. See ★*beaded ribs.*

rachitism (rā'ki-tizm), *n.* [Also *rhachitism*; *rachit*(*ic*) + *-ism.*] A rachitic tendency or disposition.

rachitomy (rā-kit'ō-mi), *n.* [Gr. ῥάχις, spine, + -τομια, < ταμεῖν, cut.] Same as ★*rachiotomy* (the more correct form).

Rachycentridæ (rā-ki-sen'tri-dē), *n. pl.* [Also *Rhachycentridæ*; NL., < *Rachycentron* + *-idæ.*] A family of fishes including a single species, *Rachycentron canadus*, a strong, voracious shore-fish, found in most warm seas.

Rachycentron (rā-ki-sen'tron), *n.* [Also *Rhachycentron*; NL. (prop. *Rachi-* or *Rachio-*), < Gr. ῥάχις, the lower part of the back, + κέντρον, a spine.] A genus of fishes. See ★*Rachycentridæ.*

racing-car (rā'sing-kär), *n.* A form of motor-car designed to secure the highest speed for racing purposes: made with multiple cylinders, and with the weight of the car and frame reduced as far as is consistent with safety. Such cars have run for considerable distances at speeds of over 100 miles an hour. See ★*automobile*, 2.

racing-cup (rā'sing-kup), *n.* Same as *race-cup.*

racing-line (rā'sing-līn), *n.* A circle, or one of a series of concentric circles, turned on the face of a flange, in which red-lead, flax, or metallic packing is placed to make a tight joint.

racing-plate (rā'sing-plāt), *n.* Same as *race-plate.*

rack^1, *v. t.* 13. To move by means of a rack and pinion.—**To rack down**, to tie down: said of balks and rails of a pontoon-bridge.

rack^1, *n.* 12. A screen composed of parallel narrow strips of plank or iron, occupying a vertical or slightly inclined position and placed across a canal, flume, or mill-race, for the purpose of preventing floating objects from entering the canal or flume.

> At the forebay on the hill above the power station the canal widens into an entrance chamber that is 60 ft. broad at the *racks.* These *racks* are about 20 ft. high and have a slope that amounts to 4 ft. in horizontal projection. *Elect. World and Engin.*, Feb. 13, 1904, p. 307.

13. *pl.* The sheet piling on the sides of a ferry-slip which serves as a buffer for the boats coming into the slip. [U. S.]

> Another Americanism we miss under *Racks*, the technical name for the side plankings or buffers of our ferry slips. *The Nation*, Aug. 6, 1903, p. 115.

14. A horse all skin and bone; a rackabones; also the bones of a dead horse used for various purposes by knackers.—**Stepped rack**, a rack which is divided longitudinally into two or more parts, one part being set ahead of the other and the pinion divided to match, thus giving a smoother motion than a single rack. It is also often arranged so that one part of the rack can be shifted ahead to take up the backlash or play in the teeth. *Nasmith*, Cotton Spinning, p. 360.

rack-board (rak'bōrd), *n.* Same as *pipe-rack.*

rack-deal (rak'dēl), *n.* Deal dried in a rack or frame which exposes it to the air. Also called *air-dried deal.*

racket^1, *n.* 6. Hustle; the quality of 'getting there.' [Slang.]

> He had . . . no progressiveness, and no "*racket.*" *Bret Harte*, Openings on the Trail, iii.

To stand the racket. (*a*) To stand the consequences. See *racket*1, *n.*, 4. (*b*) To stand the strain. [Slang in both uses.]

> Iver proposed to him to go to town and act as his representative [in an important business transaction]. . . . "Well," . . . [said] Bob, . . . "I like a quiet life, you see—with my horses, and my crops, and so on. Don't believe I could *stand the racket.*" *Anthony Hope*, Tristram of Blent, xix.

To tumble to the racket, to catch the idea; understand what is meant. [Slang.]

> 'Buy 'im?' says the missis, not *tumblin' to the racket* [not comprehending how or why a thief should want to pay for a dog]. *The Strand*, Sept., 1905, p. 347.

racketer^2 (rak'et-ėr), *n.* One who uses a racket, as in tennis-playing or snow-shoeing.

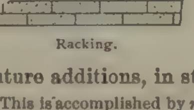
> These listless *racketers* rarely, if ever, hit the ball twice before it dropped. In very successful moments, one of the players would strike the ball, and the other would manage on its rebound to hit it again, but this was very unusual. *All the Year Round*, July 28, 1860, p. 366.

racketry (rak'et-ri), *n.* A prolonged rattling, clattering, or tumultuous noise.

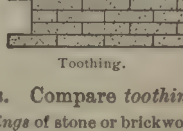
> It seems to be the non-voters that constitute the muscle and sinew of the campaign *racketry*—a word made indispensable by political conventions. . . . All this *racketry* has been going on by the watch for seven minutes. *J. Bryce*, Amer. Commonwealth, II. App., note to ch. [LXX.

rack-feed (rak'fēd), *n.* 1. A racking-gear.—2. The feeding-motion imparted to a tool, or to the work in a machine, by a rack and pinion. The tool-carriage of most engine-lathes is moved lengthwise by a rack-feed.

racking^1, *n.* 4. In *masonry*, the act of leaving unfinished masonry, as prepared to receive future additions, in steps. Compare *toothing.*



Racking.



Toothing.

> This is accomplished by *rackings* of stone or brickwork, or steppings of concrete. *Encyc. Brit.*, XXVI. 437.

5. In *mech.*: (*a*) The act of operating or moving a slide-rest, or other feeding device, by a rack-and-pinion motion. (*b*) The act of running the hoisting-crab or trolley of a crane in or out, backward or forward, to place it in proper position.

racking-back (rak'ing-bak), *n.* In *brewing*, a vat in which beer, after the first or principal fermentation, is allowed to become clear by deposition of suspended matter before being drawn off into casks.

racking-bellows (rak'ing-bel″ōz), *n. sing.* or *pl.* A bellows used to hasten the drying of articles placed on a rack for that purpose.

racking-bit (rak'ing-bit), *n.* A bit having a port mouthpiece with long cheeks, the lower ends being from four to six times the length of the upper. The rein-rings are at the lower ends.

racking-gear (rak′ing-gēr), *n.* The device or mechanism, consisting essentially of a rack and pinion and turning apparatus, for moving a crane-carriage, tool-carriage, or other part of a machine.

rack-lashing (rak′lash″ing), *n.* *Milit.*, a lashing or fastening made somewhat on the principle of a tourniquet, the rope being twisted with a strong stick.

rackmaster (rak′mȧs-tėr), *n.* An official who had charge of the rack, in the days when that instrument of torture was used as a punishment or as a means of extorting confession.

> His [Thomas Norton's] punishment of the Catholics, as their official censor from 1581 onwards, led to his being nicknamed "*Rackmaster*-General."
> *Encyc. Brit.*, XXXI. 265.

rack-pillar (rak′pil″är), *n.* In *organ-building*, one of the small upright pieces of wood on which the rack-boards rest. Also called *rack-pin.*

rack-rental (rak′ren″tal), *n.* The amount obtained or possible to obtain at rack-rent. *Southey.*

raclage (ra-kläzh′), *n.* [F., < *racler*, scrape, rub.] In *surg.*, removal of softened tissue by rubbing.

> It [lupus exedens] is best treated by destructive cauterization and *raclage.* *Buck*, Med. Handbook, I. 396.

raconteuse (ra-kôṅ-tėz′), *n.* [F., fem. of *raconteur.*] A woman who has the gift of telling stories well.

racoon, *n.*—**Crab-eating racoon**, *Procyon cancrivorus*, a species found on, or near the coast, from French Guiana to southern Mexico.

racoon-bridge (ra-kön′brij), *n.* In some of the Southern States, a sapling thrown across a stream.

> We were obliged to carry every article of our effects, and this by no other bridge than a sapling felled across it, which is called a *racoon bridge*, and over this my Indian friehd would trip as quick and light as that quadruped.
> *W. Bartram*, Travels through North & South Carolina, [Georgia, East & West Florida, p. 445.

racoon-fox (ra-kön′foks), *n.* The cacomixl, *Bassariscus astutus*, so called from its black and white ringed tail.

> From the raccoon have been named the following: . . . *raccoon-fox*, or cacomixtli of Mexico.
> *Jour. Amer. Folk-lore*, Oct.-Dec., 1902, p. 256.

rad^{6} (rad), *n.* [L. *rad(ius)*, ray.] In *photom.*, a proposed unit of quantity of light equal to the amount of energy in luminous form obtained in one second from a light-flux of one lumen. The rad is $\frac{1}{3600}$ of a lumen-hour.

raddled (rad′ld), *a.* [Origin obscure.] Drunk; fuddled. *Motteux*, Rabelais, V. xxxix. *N. E. D.*

raddling (rad′ling), *n.* [*raddle*^{1} + *-ing.*] 1. The operation of wreathing brushwood. *Eng. Dial. Dict.* [Prov. Eng.]—2. *pl.* Wood cut into strips about four feet long for kindling, and tied in bundles. [Prov. U. S., in the form *rattlings.*]

räderflorin (rā′dėr-flō-rēn″), *n.* [G. *räder-*, pl. of *rad*, wheel, + *florin*, florin.] A German money of account at Cologne: 1½ räderflorins equal 1 rix-dollar.

räderschilling (rā′dėr-shil″ing), *n.* [G. See ★*räderflorin.*] A German shilling current in the diocese of Trèves in the sixteenth century.

radiability (rā″di-a̤-bil′i̤-ti), *n.* [*radiable* (*-bil-*) + *-ity.*] The property of transmitting cathode rays, X-rays, or allied forms of radiation.

radiable (rā′di-a̤-bl), *a.* [NL. **radiabilis*, < *radiare*, radiate. See *radiate, v.*] Pervious to cathode rays, X-rays, or similar forms of radiation.

> A square frame of non-*radiable* metal.
> *Elect. Rev.*, March 7, 1903, p. 332.

radial. I. *a.*—**Radial brick, canal, wheel.** See ★*brick*^{2}, ★*canal*^{1}, *wheel*^{1}.

II. *n.* (*e*) In *ichth.*, one of the cartilaginous rays supporting the median fins of elasmobranchs.

> The dorsal fin in this species is sustained by a great number of very elongate and closely set cartilaginous rays, or, as they may be for distinction termed, *radials.*
> *Trans. Zool. Soc. London*, 1879, p. 439.

Axillary radial. See ★*axillary, n.*, 2.

radian, *n.* 2. A unit of angular velocity equivalent, approximately, to 0·15916 revolutions per second, or, strictly, to $\frac{1}{2\pi}$ revolutions per second: in full, *radian per second.*

radianal (rā-di-ā′nal), *n.* [*radi(al)* + *anal.*] In the calyx of the *Crinoidea*, a plate which, when present, rests within the reëntrant angle of two adjoining basals, to the right of the true anal plate, and is the lower half of a bisected radial which in certain genera only assumes anal functions. *Nature*, Dec. 5, 1907, p. 117.

radiance, *n.*—**X-radiance**, the radiation emanating from an X-ray tube.

radiant. I. *a.*—**Radiant efficiency.** See ★*efficiency of a source of light.*

II. *n.* 3. In *geom.*, a ray conceived as revolving about its starting-point.—4. A substance that emits rays, specifically N-rays.

> M. Blondlot's latest discovery is that *radiants* which give out N-rays can communicate a similar variety of radioactivity to some neutral bodies upon which the N-rays fall.
> *Elect. World and Engin.*, Dec. 26, 1903, p. 1034.

radiate, *v.* **I.** *intrans.* 4. To be directed, as rays, toward a common center: as, "spokes *radiating* to an axle." *Rogers*, Agric. and Prices, I. 543. *N. E. D.* [Rare.]

II. *trans.*—**Radiating keyboard.** See ★*keyboard*, 1.

radiation, *n.* 1. Radiation is a form of energy consisting of transversal vibrations of the ether, a hypothetical medium supposed to fill all space and penetrate all bodies, these vibrations traveling with a velocity of 188,000 miles per second. A stream of such radiation is called a *ray.* It differs in character by the wave-length of the ray, or its frequency of vibration. Rays of wave-length between .0007 and .0004 of a millimeter are visible to the human eye as *light*, the longer one as red light, then, with increasing shortness of wave-length, as orange, yellow, green, blue, and violet light. Waves shorter than .0004 of a millimeter are not visible, but are observed by their chemical or photographic action, and by the fluorescence which they produce (see *fluorescence*), and are called *ultra-violet light* or *actinic* or *chemical rays.* Radiations of still very much shorter wave-length (of a wave-length comparable with the sizes of the molecules of matter) are the *X-rays*, occasionally called *Röntgen rays*, from their discoverer. X-rays are not reflected or refracted, but merely irregularly scattered and absorbed by solid matter as well as by air. They are able, however, to penetrate bodies which are opaque to ordinary light,—the more, the less the density of the body,—and are therefore used to determine and photograph the structure of opaque bodies, as, in surgery, the interior of the human body. They are observed by fluorescence of screens of platinum-barium cyanide or calcium tungstate, and by photography. Physiologically, long exposure to powerful X-rays and also to very short ultra-violet rays, as given by a mercury arc in a quartz tube, is harmful. Radiations of greater wave-length than .0007 of a millimeter are noticed by their heating effect, and are called *heat-radiating* or *ultra-red rays.* Waves of still very much greater length, from a few inches to many miles, are called *electromagnetic waves*, since they are produced by electric currents of the proper frequency or wave-length. They are used in wireless telegraphy. Substances which absorb or reflect the radiation are called *opaque*; those that permit the rays to pass through more or less completely are called *transparent.* Opacity or transparency of a substance largely depends upon the wave-length. For instance, glass is transparent for light waves and for electromagnetic waves, but opaque for ultra-violet rays of short wave-length, and nearly opaque for X-rays and for long heat-waves. Aluminium is fairly transparent for X-rays, but opaque for all other waves. Quartz and gypsum are transparent for ultra-violet and ultra-red rays. A body which sends out only or largely rays of particular wave-lengths, or range of wave-lengths, is said to have a *selective radiation*; a body which absorbs only certain wave-lengths is said to have a *selective absorption.* Luminous gases and vapors, as the mercury arc, have a selective radiation; colored glasses a selective absorption. The transversal vibration of the ether atoms may take place in all directions at right angles to the ray, or in one plane only, and in the latter case the ray is said to be *polarized.* Many substances, as radium, uranium, thorium, send out continuously rays which travel with high velocities. These rays, the α- and *β-rays*, are best explained by the hypothesis that the substance continuously throws off, in straight lines, material particles of extreme minuteness. The meaning of the term *radiation* is therefore usually extended to include these rays, together with a third type known as *γ-rays*, given by radioactive substances, and also the *cathode rays*, which are material particles propelled with high velocity from the negative electrode of a Crookes tube (a vacuum-tube with very high vacuum) and the *Lenard rays*, which are cathode rays which have penetrated outside of the vacuum-tube. Light and heat radiation is usually produced by heat, ultra-violet rays by electric arcs and sparks, X-rays by the impact of cathode rays in a vacuum-tube, and electromagnetic waves by high-frequency electric currents.

4. In *biol.*: (*a*) The divergent evolution of several different organisms from a single ancestral form: as, the *radiation* of the placental mammals.

> The arboreal "*radiation*" (to use a term now extensively employed by American zoologists) of marsupials differentiates them from the extinct creodonts, or primitive Carnivora, of the early Tertiary epoch, which appear to have been essentially terrestrial types.
> *Nature*, Jan. 21, 1904, p. 284.

(*b*) A group of organisms that is undergoing divergent modification.

> Appreciation of animal divergence, or of divergence in special structures and organs, naturally belongs to the evolutionary period of anatomical thought; a period beginning with the branching system of Lamarck and continued in the still clearer perception of divergence in the writings of Darwin. I have elsewhere proposed to employ the term 'adaptive radiation' for the general phenomenon of divergence as observed in a single group, distinguishing such a group in process of divergence as a '*radiation*,' either a 'continental *radiation*' where diverging on a large scale, or a 'local *radiation*' where diverging in a more restricted environment.
> *H. F. Osborn*, in Science, June 23, 1905, p. 961.

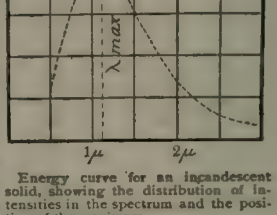
5. In *psychol.*, the extension of excitation within the nervous system to give rise to concomitant or secondary sensations.

> We shall do better therefore to avoid the expression "association" in connection with secondary sensation and make use of the term "*radiation.*" We are all aware that the pain caused by a carious tooth may often spread . . . until it finally attacks the entire half of the head.
> *T. Ziehen* (trans.), Introd. to Physiol. Psychol., p. 252.

Adaptive radiation, in *biol.*, the dispersal of animals from a given point of origin, with accompanying modifications or changes in structure, presumably to adapt them to changed conditions.

> I have elsewhere proposed to employ the term '*adaptive radiation*' for the general phenomenon of divergence as observed in a single group, distinguishing such a group in process of divergence as a 'radiation,' either a 'continental radiation' where diverging on a large scale, or a 'local radiation' where diverging in a more restricted environment.
> *H. F. Osborn*, in Science, June 23, 1905, p. 961.

Atmospheric radiation, the loss of heat by the earth's atmosphere. Pure, dry air radiates and absorbs only a small percentage of the long heat-waves; but the ordinary moist and dusty atmosphere has a larger coefficient of radiation, which has been shown to be quite uniform throughout the whole globe. The radiating power of the visible surface of a cloud is very nearly proportional to the mass of the visible water-particles. The coefficient or unit of radiation is, properly speaking, the radiating power of a unit mass of air, but sometimes a unit volume of air is used instead. The best determination, that by Trabert, shows that a unit mass of average dusty, moist air radiates in one hour 0.036 gram-calories toward a surface whose temperature is lower by one degree centigrade.—**Continental radiation.** See the extract under *adaptive* ★*radiation.*—**Dark radiation**, radiation, usually of wave-lengths longer than those of the visible spectrum, which does not affect the retina.—**Gratiolet's radiations.** See *optic* ★*radiations.*—**Laws of radiation**, laws which express the relation between the character and intensity of the ether-waves which a radiating body emits and its temperature or its physical or chemical constitution. All bodies, whatever their nature, send out the ether-waves which constitute radiation, at all temperatures above the absolute zero. The amount of radiation emitted by a body at a given temperature depends upon the nature of the body, the law (*Kirchhoff's law*) being that bodies radiate only wave-lengths which they are capable of absorbing and in proportion to their absorbing power. A body which neither reflects nor transmits radiation, but absorbs all waves falling upon it, whatever their wave-length, will consequently have the highest power as a radiator: it will radiate waves of all possible wave-lengths and in the greatest possible amount. Such a body is called an *ideal black body* (See ★*black body.*) The ideal black body does not exist in nature, but certain bodies such as lampblack approximate closely to it in their properties. Radiation from the interior of a hollow body is identical in character with that from an ideal black body, and such radiation is termed in physics *black-body radiation.* The only exception to Kirchhoff's law occurs in the case of bodies whose radiation is due to luminescence. (See ★*luminescence.*) The wave-lengths of the known rays emitted by radiating bodies vary from 60. microns to .10 micron, but it is probable that both longer and shorter waves than these exist undetected. The ideal black body is capable of emitting all wave-lengths between these limits, forming a continuous spectrum. The spectrum of the waves emitted by solids is likewise continuous; but when, as is generally the case, the distribution of intensities in such spectra differs from that of the spectrum of a black body, the body is said to be a *selective radiator.* All bodies the absorption-spectra of which contain absorption-bands exhibit *selective radiation.* The radiation from a body, measured as energy, regardless of the wave-length, is termed the *total radiation.* The total radiation is a function of the temperature of the body, increasing in direct proportion to the fourth power of the absolute temperature (*Stefan's law*). The distribution of energy in the emission-spectrum of a radiating body is expressed by means of a curve, called the *energy curve* (see ★*curve of energy*), the abscissæ of which are wave-lengths, while the ordinates represent the intensity of each wave-length. The form of the energy curve depends upon the temperature of the body and upon the character of its surface. The energy curve for an incandescent black body is given in the figure. The curve has a maximum at a definite wave-length designated as λ_{max}, on either side of which the intensity of radiation falls off rapidly. As the temperature of the radiating body rises, the intensity of all the wave-lengths in its spectrum increases; but that of the shorter wave-lengths increases more rapidly than that of the long ones, so that the position of the wave-length of maximum intensity is a function of the temperature. It has been shown by Paschen that $\lambda_{max} T = \text{Const.}$ This relation is known as *Paschen's law* or the *displacement law.* By means of it the absolute temperature of a radiating body may be computed from its energy curve, or the position of the maximum of that curve may be calculated if the temperature is known. Since the intensity of each wave-length in the spectrum of a radiating body increases with rise of temperature,



Energy curve for an incandescent solid, showing the distribution of intensities in the spectrum and the position of the maximum.

the law of increase depending also upon the wave-length, it follows that the law of variation of intensity of any given wave-length is a function of both the temperature and the wave-length. Analytical expressions of this relation have been published by Planck, Thiesen, Lummer, Rayleigh, Wien, and others. Wien's equation,

$$I = C_1 \lambda^{-5} e^{-\frac{c_2}{\lambda T}},$$

in which I is the intensity of radiation of any wave-length λ, T is the absolute temperature of the radiating body, and C_1 and c_2 are constants, has been found to express very closely the experimental results obtained for wave-lengths lying between .7 micron and 9. microns. The relation given in this equation is known as *Wien's law.*—**Le Chatelier's law of radiation.** See ★*law*^{1}.—**Local radiation,** in *biol.*, the diversity that is exhibited by allied animals in areas that are separated by barriers, considered as an index of the rate at which species are modified. See the extract under *adaptive* ★*radiation.*—**Obscure radiation,** non-luminous radiation of the infra-red or ultra-violet regions of the spectrum; radiation incapable of stimulating the retina.—**Optic radiations,** nerve-fibers which pass from the pulvinar (thalamus) in a radiating direction toward the occipital cortex. These radiating fibers are continuous with others from the optic tract to the pulvinar. Also known as the *radiations of Gratiolet. Philos. Trans. Roy. Soc.* (London), 1898, ser. B, p. 2.—**Radiation constant.** See ★*constant.*—**Radiations of Gratiolet.** Same as *optic* ★*radiations.*—**Radiation spectrum.** Same as *emission* ★*spectrum.*—**Secondary X-radiation.** See *X*-★*radiator.*—**Selective radiation.** See *laws of* ★*radiation.*—**Total radiation.** See *laws of* ★*radiation.*—**X-radiation,** the obscure radiation obtained from an X-ray tube.

radiational (rā-di-ā′sho̤n-a̤l), *a.* [*radiation* + *-al*^{1}.] Of or pertaining to radiation.

This wider theory is founded upon Maxwell's theory of electromagnetic radiation, and may be accordingly termed the *radiational* theory. . . . The principal difficulties are concerning the various functions of wires. The fundamental *radiational* part is comparatively easy.
Encyc. Brit., XXXIII. 213.

radiation-fog (rā-di-ā′sho̤n-fog), *n.* A fog formed near the ground by the radiation of heat from moist air to the surface of the earth. Here the short heat-waves are lengthened, so that they pass back through the atmosphere with relatively slight absorption.

A class of fogs, termed by Herschel '*radiation fogs,*' are formed in valleys or over damp meadows in the evenings. The ground is cooled by radiation below the dew-point, and all the superfluous moisture in the lowest stratum of air is deposited in the form of dew, while the air close to the soil is left saturated, and at the same time colder than the strata above it. If . . . no mixture takes place, no fog will result, . . . but if there be the least difference of level, the colder air on the upper ground will flow down and produce a disturbance of the arrangement of the air-layers below, causing a mixture, which results in the condensation of a quantity of moisture in the form of fog.

. . . These fogs are produced by cold air flowing down into a warm and damp atmosphere, and they disappear after sunrise, as soon as the heat is sufficient to enable the air to take up all the moisture which has been condensed out of it. *R. H. Scott*, Elem. Meteorol., p. 121.

radiation-pressure (rā-di-ā′sho̤n-presh″ṳ̄r), *n.* See ★*pressure.*

radiation-weather (rā-di-ā′sho̤n-weᴛʜ″ėr), *n.* The weather that accompanies an area of high pressure, clear sky, and light winds, and that is largely controlled by radiation of heat from the ground through the clear air into space.

radiator, *n.* **3.** Same as ★*cooler*, 2 (*b*).

The *radiator* in the tonneau is of a cellular cooler type and in the light touring car a flanged pipe radiator entirely of aluminum is used.
Amer. Inventor, Feb. 15, 1904, p. 74.

4. In the transmission of electric waves, as in wireless telegraphy, an apparatus for the emission of electric oscillations; a form of oscillator.

The "aerial," or *radiator*; that was, the tall wire which corresponded to the tube of the siren, and sent electric waves off into the ether in the same way that the siren sent air waves into the atmosphere.
Sci. Amer. Sup., July 4, 1903, p. 23000.

The second patent embodies specifically a *radiator* or resonator system, . . . made in the form of a cone and having a large capacity. The cone may be made of sheet metal or formed of a network of wires. This horizontal metal cone serves to deflect the radiated waves and direct them along the surface of the earth. A horizontal conductor, the length of which is equal to the base of the cone, extends in the direction the waves are to be propagated and may include an inductance, as shown.
Elect. World and Engin., March 19, 1904, p. 570.

Perfect radiator, a body whose emissivity equals that of the ideal black body (which see, under *laws of* ★*radiation*).—**Secondary X-radiator.** See *X*-★*radiator.*—**Selective radiator,** a body, as a metallic oxid, which exhibits selective radiation. See *laws of* ★*radiation.*—**X-radiator,** a body that emits X-rays. Many substances when exposed to X-rays send out other X-rays differing more or less in quality from the exciting rays. These are called *secondary X-rays*, and the bodies emitting them *secondary X-radiators.*

radiature (rā′di-ā-tū̆r), *n.* [*radiate* + *-ure.*] The act of radiating; the rays emitted from a radiating body. *N. E. D.*

radical. I. *a.* **5.** In *astrol.*, belonging to the radix or original scheme of nativity; in *horary astrol.*, ripe and proper for judgment.—**Radical axis of three spheres,** the straight line common to the three radical planes of the pairs of spheres.—**Radical center of four spheres,** the cointersection point of the four radical axes of the four triads of spheres.—**Radical circle,** the locus of a point on a sphere such that the spherical tangents drawn from it to two given small circles are equal.—**Radical equation.** See ★*equation.*—**Radical product.** See ★*product.*

II. *n.* **6.** A minute vessel which unites with others to form a large branch or trunk. See *radicle*, 2.—**7.** In England, the name given to a white hat which was formerly somewhat worn by Radicals, owing to the fact that Henry Hunt [a radical English politician, 1773–1835] wore a white hat at various political gatherings in 1820. *N. E. D.*—**Salt radical,** the electronegative part of a salt which, in union with a metal or electropositive radical, constitutes the salt itself, or in union with hydrogen constitutes the corresponding acid.

radicicolous, *a.* **2.** In *bot.*, same as *rhizanthous.*

radicle, *n.* **5.** In the graptolites, the proximal extension of the virgula.

radiescent (rā-di-es′ẹnt), *a.* [*radi(ate)* + *-escent.*] Growing radiant; throwing out rays of gradually increasing intensity.

radiferous (rạ-dif′ẹ-rus), *a.* [NL. *radium* + L. *-fer*, -bearing, + *-ous.*] Containing radium as a constituent.

Mme. Curie, having obtained about a decigramme of pure radium chloride by fractional crystallization of *radiferous* barium chloride, has endeavored to determine the atomic weight of radium.
Sci. Amer., July 18, 1903, p. 43.

radioaction (rā″di-ọ-ak′sho̤n), *n.* [L. *radius*, ray, + E. *action.*] Same as ★*radioactivity.*

radioactivate (rā″di-ọ-ak′ti-vāt), *v. t.*; pret. and pp. *radioactivated*, ppr. *radioactivating.* [*radioactive* + *-ate*^{2}.] To render radioactive; impart radioactivity to. *Sci. Amer. Sup.*, Dec. 26, 1903, p. 23395.

radioactivating (rā″di-ọ-ak′ti-vā-ting), *p. a.* Rendering radioactive: said of the process by which surfaces commonly inactive are made capable of emitting obscure rays.

Radio-Activity near Waterfalls. . . . An account of the investigation of the *radio-activating* process at the foot of waterfalls.
Elect. World and Engin., March 28, 1903, p. 529.

radioactive (rā″di-ō-ak′tiv), *a.* [L. *radius*, ray, + E. *active.*] Exhibiting or pertaining to ★radioactivity (which see): as, *radioactive* substances.

The law of *radio-active* transformation can be very simply and aptly illustrated by an hydraulic analogy.
E. Rutherford, in Nature, March 5, 1908, p. 422.

Radioactive tellurium. See *Marckwald's* ★*rods.*

radioactivity (rā″di-ọ-ak-tiv′i̤-ti), *n.* [*radioactive* + *-ity.*] The property possessed by certain substances of spontaneously emitting obscure rays of a nature distinct from the ether-waves of ordinary radiation. The radiation from radioactive substances does not affect the retina directly, but it has the power of ionizing gases, of discharging electrified bodies, of affecting photographic plates, of exciting fluorescence and phosphorescence, and of producing certain chemical and physiological results. It is by means of these effects that the existence of this type of radiation has been discovered and that the properties of the obscure rays from radioactive substances have been investigated. Radioactivity appears to be a property common to the elements uranium, thorium, radium, polonium, and actinium, and to their compounds. It was first detected in 1896 by Becquerel who discovered that when compounds of uranium were placed in the neighborhood of a photographic plate, completely protected from the direct action of light, the plate was acted upon, and that the photographic action occurred even though a thin layer of metal was placed between the radioactive substances and the sensitive film. In the search for similar properties in other substances, Mme. Curie, and independently Schmidt, discovered that the element thorium and its compounds were radioactive, and it was further observed by Mme. Curie that certain minerals containing uranium possessed this property in a higher degree than uranium itself. The extraordinary activity of pitchblende led to the study of this mineral with a view to the separation of the substance to which this property was due, and to the discovery, by M. and Mme. Curie, of a new element, radium, the compounds of which are more than a million times as active as uranium. The most delicate method for the detection of radioactivity depends upon the power of the rays to render air a conductor of electricity and thus to discharge electrified bodies. By means of the rate of discharge, as measured by a sensitive electrometer, the radioactivity of different substances can quantitatively be compared and a degree of radioactivity $\frac{1}{100,000}$ as intense as that of uranium can be detected. By this means radium has been shown to be a widely distributed element, present in minute quantities in rocks, soils, and waters in various parts of the world. The rays from radium have been divided into three types, the α-, β-, and *γ-rays.* (See *obscure* ★*rays.*) The kinetic energy of the α-rays is very great, and since they are readily absorbed even by the surrounding air, there is a constant development of heat sufficient to cause the radioactive material to maintain itself at a temperature appreciably higher than that of its surroundings. The β-rays emitted by radium are capable of passing through thin layers of metal. They are strongly deflected from their path by the action of a magnet. The β-rays are supposed to consist of a stream of negatively charged particles or electrons. The γ-rays have an extraordinary penetrating power, being capable of passing through several centimeters of metal. Like the α- and β-rays, they produce photographic effects and also fluorescence and phosphorescence. They are not deflected from their course in the magnetic field. In addition to the emission of obscure rays, radioactive substances are autoluminescent (see ★*luminescence*) and shine in the dark with a faint fluorescent light, which, unlike the luminescence of other substances, is independent of external excitation. The phenomenon is observable, however, only in the case of compounds of considerable purity, in which the radioactivity is very intense. The radioactive elements possess the remarkable property of undergoing spontaneous disintegration. The first disintegration-product of radium is a radioactive gas termed the *emanation* (see ★*emanation*, 5), which possesses the property of imparting to surrounding objects a temporary radioactivity, due to the production and deposition of a series of further disintegration-products known as *radium A*, *radium B*, *radium C*, etc., which are solids. Thorium and actinium produce intensely radioactive non-volatile substances which have been designated by the terms *thorium X* and *actinium X*; and from these, emanations called *thorium emanation* and *actinium emanation* have their source. No gaseous emanation from uranium has as yet been discovered. The thorium emanation and the actinium emanation, however, like that of radium, are found to produce spontaneously a series of further active non-gaseous disintegration-products, *thorium A*, *B*, and *C*, and *actinium A*, *B*, and *C*. The rate at which these transformations take place appears to be an inherent property of the respective substances and incapable of being retarded, hastened, or in any way modified by external means, or effected by the state of chemical combination. The obscure rays from radioactive substances are also capable of producing certain chemical changes, such as the decomposition of water and the conversion of ordinary phosphorus into the red variety. The rays from radium appear to facilitate oxidation. The radiation from strong preparations of radium affects the skin, producing serious burns, and if such a radioactive compound is brought near the head a sensation of light is produced even though the eyes be closed. The temporary radioactivity produced on the surface of objects in contact with an emanation is variously called *excited radioactivity*, *induced radioactivity*, and *imparted radioactivity.*

[[1] On induced *radio-activity* and on the emanation from radium, by M. P. Curie. In a former note it was shown that the disappearance of the *radio-activity* induced by radium in a closed vessel and maintained at a constant temperature followed an exponential law with the time.
Nature, Feb. 5, 1903, p. 335.

radio-atom (rā′di-ō-at″o̤m), *n.* An atom possessed of or exhibiting radioactivity; a radioactive atom.

The theory that the phenomena of radio-activity are due to the disintegration of the *radio-atoms.*
Sci. Amer. Sup., Oct. 22, 1904, p. 24087.

radiobe (rā′di-ōb), *n.* [*radium* + Gr. *βίος*, life (compare *microbe*).] A structure observed by J. B. Burke in gelatin after protracted exposure of films of that substance to the action of radium salts and described by him as intermediate between a crystal and a microbe.

There appears to be a tendency amongst text-book writers to classify minute bodies which are not bacteria as crystals, but really without sufficient reason, and as these bodies cannot be identified with microbes, on the one hand, nor with crystals on the other, I have ventured, for convenience, in order to distinguish them from either of these, to give them a new name, *Radiobes*, which might, on the whole, be more appropriate as indicating their resemblance to microbes, as well as their distinct nature and origin.
J. B. Burke, in Nature, May 25, 1905, p. 79.

radiobismuth (rā″di-ọ-biz′muth), *n.* [L. *radius*, ray, + E. *bismuth.*] See ★*polonium.*

radiochemistry (rā″di-ọ-kem′is-tri), *n.* [L. *radius*, ray, + E. *chemistry.*] That part of chemistry which treats of radioactive bodies and of the phenomena produced by them.

Under chemical energetics we find the mass law relations for equilibrium and reaction velocity, thermochemistry, the phase rule, electrochemistry, photochemistry and *radiochemistry. Jour. Phys. Chem.*, Oct., 1904, p. 506.

radiochroism (rā″di-ok′rọ-izm), *n.* [L. *radius*, ray, + Gr. *χρόα*, color, + *-ism.*] That property of a body which renders it less opaque to certain varieties of X-rays than to others. Radiochroism is selective absorption in regard to X-rays. It is analogous to diathermancy and to color, which denote the same property in regard to the infra-red rays and the rays of the visible spectrum respectively.

Finally, I have observed that bodies possess a property which can be called their *radiochroism*, because it is comparable to the color of certain transparent substances in the light, and that in consequence the relation of the opacities of two substances changes with the mass traversed and with the quality of X-rays employed, the most rapid change being produced by the densest bodies.
L. Benoist, in Sci. Amer. Sup., May 4, 1901, p. 21196.

radioconductor (rā″di-ọ-kọn-duk′to̤r), *n.* [L. *radius*, ray, + E. *conductor.*] Any apparatus by which electric waves in the atmosphere are caught, detected, and recorded and measured so as to show the existence of a distant center of electric disturbance. The receiving instruments of the Marconi, Fessenden, Weather Bureau, De Forest, Arco, or other system of wireless telegraphy constitute radioconductors. The instruments for the study of thunder-storms as devised by Lephay, Odenbach, and Hoser are special forms of radioconductors for catching the natural currents attending every discharge of lightning.

Forecasting of storms by a process based upon the use of *radio-conductors*. [i. e. Natural signals caught by the apparatus used in wireless telegraphy.—Ed.]
U. S. Monthly Weather Rev., May, 1903, p. 235.

radiocondylar (rā″di-ọ-kon′di-lär), *a.* [L. *radius*, ray, + E. *condylar*.] Situated on the outer, or radial side of the condyle of the humerus; ectepicondylar.

radiodermatitis (rā″di-ọ-dėr″ma-tī′tis), *n.* [L. *radius*, ray, + NL. *dermatitis*.] Inflammation of the skin caused by X-rays or the radiations from radioactive substances.

The skin disease called *radio-dermatitis* is the consequence of excessive exposure of the skin to Röntgen or Becquerel rays. Its pathology and treatment are fully described by Dr. Oudin. It is a painful and troublesome malady which may last for eighteen months, and is difficult to cure. *Sci. Amer. Sup.*, Feb. 28, 1903, p. 22709.

radiodiagnostics (rā″di-ọ-dī″ag-nos′tiks), *n.* [L. *radius*, ray, + E. *diagnostics*.] The science of diagnosis by means of X-rays or the radiations from radioactive substances.

"A Contribution to the *Radio-Diagnostics* of Diseases of the Head and of the Brain," may be mentioned.
Elect. Rev., Sept. 17, 1904, p. 431.

radiodigital (rā″di-ọ-dij′i-tạl), *a.* [L. *radius*, forearm, + *digitus*, digit, + *-al*¹.] Belonging to the radius and the digits.

radio-element (rā′di-ọ-el″ẹ-mẹnt), *n.* [L. *radius*, ray, + E. *element*.] A radioactive element; an elementary chemical substance which undergoes spontaneous disintegration, with or without the emission of Becquerel rays, and which is either produced from or itself produces an element which is the source of such a radiation.

The rays from the three most studied *radio-elements*, uranium, thorium and radium, can be separated into three distinct types, known as the α, β, and γ rays.
E. Rutherford, in Pop. Sci. Mo., May, 1905, p. 6.

radio-energy (rā′di-ọ-en″ėr-ji), *n.* The energy of ether-waves; radiation.

With radium we have a direct transformation of the potential gravitational energy into *radio-energy*.
A. Heydweiller, in Science Abstracts, VI. Sec. A., 297.

radiogram (rā′di-ọ-gram), *n.* [L. *radius*, ray, + Gr. γράμμα, a writing.] A picture taken by means of the action of Röntgen rays, or of similar obscure rays such as those emitted by radium, upon a sensitized plate; a print from a radiographic negative.

radiograph, *n.* **2.** An impression produced on a sensitized plate by X-rays or the radiations from radioactive substances. See ⋆*ray*¹ and ⋆*radioactivity*.

As I was the first surgeon in Ireland (on March 23rd, 1896 . . .) to remove from a patient a foreign body, the presence of which was clearly shown in a *radiograph*, . . . the subject of radiography has always had an attraction for me, and I have used it very extensively for many purposes.
R. B. McCausland, in Brit. Med. Jour., May 7, 1898, [p. 1196.

X-radiograph, a term applied to a photographic picture obtained by the use of the X-rays.

radiograph (rā′di-ọ-gräf), *v. t.* [*radiograph*, *n.*] To produce an image of upon a sensitized plate by means of X-rays or the rays emitted from a radioactive substance. *Amer. X-Ray Jour.*, May, 1899, p. 572.

radiographer (rā-di-og′rạ-fėr), *n.* [*radiograph(y)* + *-er*¹.] One who makes pictures by means of X-rays or who studies the action of such rays by the photographic method.

The new apparatus enables *radiographers* to repeat any exposure under precisely the same conditions.
Elect. World and Engin., June 25, 1904, p. 1204.

radiographic (rā″di-ọ-graf′ik), *a.* [*radiograph* + *-ic*.] Of or pertaining to radiography; related to the production of images on a sensitized plate by means of X-rays or the rays from radioactive substances.

radiographically (rā″di-ọ-graf′i-kạl-i), *adv.* By means of radiography.

radiography (rā-di-og′rạ-fi), *n.* [L. *radius*, ray, + Gr. -γραφια, < γράφειν, write.] The production of images on sensitized plates by means of the X-rays or the rays from radioactive substances.

Radiography was practiced daily, with the tube at distances of from 13 to 20 centimeters from the skin, and with the tubes of great intensity.
Amer. X-ray Jour., May, 1899, p. 574.

Radiohumeral index. See ⋆*index*.

Radiolarian coprolites. See ⋆*coprolite*.

radiolead (rā′di-ọ-led), *n.* [L. *radius*, ray, + E. *lead*.] A substance formed by the disintegration of radium and the fourth of the series of radioactive disintegration-products following the emanation, for which reason it is known as *radium D*. It has not been found to emit a radiation, but slowly changes into other products, radium E, radium F, and radium G (polonium), which are always present unless the radiolead has been freshly prepared and are the source of both α- and β-rays. It is found associated with the lead obtained from uranium minerals and shows great similarity to lead in its chemical properties. It was first observed by Hofmann and Strauss in the lead sulphate separated from pitchblende.

radiolite, *n.* **3.** In *petrog.*, the name given by Bořicky (1882) to spherulites with radial arrangement of component crystals.

radiologic (rā″di-ọ-loj′ik), *a.* [*radiolog(y)* + *-ic*.] Of or pertaining to the theory, production, or application of X-rays or the rays from radioactive substances.

radiology (rā-di-ol′ọ-ji), *n.* [L. *radius*, ray, + Gr. -λογια, < λέγειν, speak.] The science and art of the production and therapeutic application of X-rays or the rays from radioactive substances. *Pop. Sci. Mo.*, May, 1900, p. 110.

radiometer, *n.* **3.** An instrument for the detection and measurement of small amounts of radiant energy. An adaptation of Crookes's form of radiometer to delicate heat-measurements has more recently been devised by E. F. Nichols. The Nichols radiometer has two vanes at the ends of a short cross-arm, suspended by a quartz fiber in vacuo. In order to protect the instrument from the effects of stray heat, the containing-vessel is usually of metal, with a window of transparent rock-salt or fluorite for the admission of the radiation to be measured, and a second window of glass through which the angular movement of a light mirror attached to the suspended parts may be observed. The construction of the radiometer varies considerably according to the work for which it is designed. The form of instrument constructed for the measurement of the heat of the fixed stars is shown in Fig. 1. The vanes *D*, *D* and the mirror *M*, the plane of which is perpendicular to that of the vanes, are mounted upon a fine rod of drawn glass, *AB*, the upper end of which is attached to a very fine quartz fiber, 32 millimeters long, *BC*. The vanes are disks of thin mica coated with lampblack and about 2 millimeters in diameter. The distance between the centers of the vanes is 4.5 millimeters. The mirror, which is 3 × 2 millimeters, consists of a silvered portion of thin microscope-cover glass. The apparatus is essentially a torsion balance, the mass (about 6 milligrams) and moment of inertia of which are exceedingly small. When radiation passing through the fluorite window *F* (Fig. 2) falls upon one of the vanes, the vane is repelled, and the balance revolves through an angle such that the torsional elasticity of the quartz fiber precisely counteracts the torque due to radiation. The deflection thus produced is measured by observing the angular movement of a beam of light reaching the mirror *M* through the window *W* (indicated in the diagram by the dotted circle). The sensitiveness of this form of radiometer and of the corresponding forms used in the exploration of the spectrum is greater than that of any other device known to the physicist. It was found possible, for example, to measure the heat received from Arcturus, which is approximately equal to the one hundred-millionth part of that from a candle at a distance of one meter, and even the heat from Vega, which is only half as bright as Arcturus. The sensitiveness of the radiometer varies with the pressure of the gas in which the vanes are suspended, reaching a maximum at a pressure of about .05 millimeters. It also depends upon the distance between the vanes and the fluorite window. The best effect is produced when this window is within two or three millimeters of the vanes, as shown in Fig. 2.

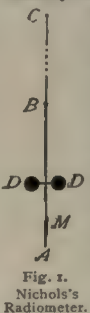


Fig. 1. Nichols's Radiometer.

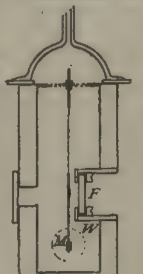

Fig. 2. Nichols's Radiometer.

radiometry (rā-di-om′e-tri), *n.* [L. *radius*, ray, + Gr. -μετρια, < μέτρον, measure.] The detection and measurement of radiant energy by means of the radiometer.

radio-oro (rā″di-ọ-ō′rō), *n.* [A Spanish-looking form, < Sp. *radio*, radium, + *oro*, gold.] So-called 'radium-gold,' a new alloy of a brilliant yellow color like that of gold. It is said not to tarnish and to be as elastic as steel and as ductile as gold. It is also said to coat well; but it is somewhat friable, and it contains neither radium nor gold.

radiopelvimetry (rā″di-ọ-pel-vim′e-tri), *n.* [L. *radius*, ray, + E. *pelvimetry*.] Estimation of the diameters of the pelvis by means of X-ray examination. *Encyc. Dict.*

Radiophonic sound, a sound produced in the receiver of a radiophone by the heating and cooling effect of the intermittent rays falling upon the diaphragm of that instrument.

radiopraxis (rā″di-ọ-prak′sis) *n.* [L. *radius*, ray, + Gr. πρᾶξις, doing.] Treatment of disease by any of the forms of radioactivity.

Radio-praxis (with Special Reference to the Ultra-violet Rays). *Med. Record*, March 7, 1903, p. 392.

radioscope (rā′di-ọ-skōp), *n.* [L. *radius*, ray, + Gr. σκοπεῖν, view.] **1.** An instrument for detecting, studying, or applying X-rays. It consists usually of a fluorescent screen and accessories to facilitate the viewing of the same.—**2.** A thin hammered-brass plate having an accurately bored smooth round hole, and so mounted that it can be adjusted to a camera to produce a pinhole camera. *Sci. Amer.*, July 16, 1904, p. 46.—**3.** A form of ⋆spinthariscope (which see).

radioscopic (rā″di-ọ-skop′ik), *a.* [*radioscope* + *-ic*.] Of or pertaining to the study of X-rays, specifically by means of the fluorescent screen.

radioscopy (rā-di-os′kọ-pi), *n.* [L. *radius*, ray, + Gr. -σκοπια, < σκοπεῖν, view.] **1.** The detection, study, or application of X-rays, specifically by observations with a fluorescent screen.—**2.** Examination of opaque objects by means of the X-rays or other form of radioactivity. *Sci. Amer. Sup.*, June 13, 1903, p. 22943.

radioserial (rā″di-ọ-sē′ri-ạl), *a.* [L. *radius*, ray, + E. *serial*.] Radially divergent; exhibiting divergent series. [Rare.]

First, in the study of organisms we are dealing with plastic substances showing definite gradations which can be arranged in their natural *radio-serial* divergent lines of classification. *A. Hyatt*, Biol. Lectures, 1899, p. 145.

radiotelegram (rā″di-ọ-tel′ẹ-gram), *n.* [L. *radius*, ray, + E. *telegram*.] A message transmitted by wireless telegraphy. *Sci. Amer. Sup.*, Nov. 15, 1902, p. 22474.

radiotelegraph (rā″di-ọ-tel′ẹ-gräf), *n.* [L. *radius*, ray, + E. *telegraph*.] A telegraph in which the transmission is by means of electric waves; a wireless telegraph.

A Reuter message from Rome states that the Marquis Luigi di Solari has submitted to Mr. Marconi, on behalf of the Italian Government, a convention for the establishment on the coast and on the islands off the Italian coast of a system of twelve Marconi *radio-telegraph* stations of an average range of 300 kilometres.
Nature, April 23, 1903, p. 590.

radiotelegraphic (rā″di-ọ-tel-ẹ-graf′ik), *a.* [*radiotelegraph(y)* + *-ic*.] Of or pertaining to wireless telegraphy.

A scheme has been proposed to the Italian Minister of Posts and Telegraphs by Mr. Marconi for the creation of a *radio-telegraphic* station communicating with the stations established or to be established by the Marconi companies in London and in America.
Nature, Sept. 25, 1902 p. 538.

radiotelegraphy (rā″di-ọ-tel′ẹ-graf-i, or -tẹ-leg′rạ-fi), *n.* [L. *radius*, ray, + E. *telegraphy*.] Telegraphy by means of electric waves; wireless telegraphy.

It is surprising yet none the less true that nearly every improvement in wireless telegraphy may be traced back to the original researches of Heinrich Hertz, on the action of electromagnetic waves in air. This is again strikingly illustrated in a new system of *radiotelegraphy* recently patented by Georg Friedrich Rudolph Blockmann, of Kiel, Germany.
Elect. World and Engin., Jan. 16, 1904, p. 132.

radiotelephone (rā″di-ọ-tel′ẹ-fōn), *n.* [L *radius*, ray, + E. *telephone*.] A telephonic instrument, invented by L. De Forest, used in wireless ⋆telephony (which see).

radiotelephony (rā″di-ọ-te-lef′ọ-ni), *n.* [*radiotelephone* + *-y*.] The use of the radiotelephone; in general, wireless telephony. See ⋆*telephony*.

radiotellurium (rā″di-ọ-te-lū′ri-um), *n* [L. *radius*, ray, + NL. *tellurium*.] A substance found by Marckwald in extremely minute quantity in bismuth from the pitchblende of Joachimsthal. It is identical with polonium

radiotherapeutics (rā″di-ọ-ther-ạ-pū′tiks), *n.* [L. *radius*, ray, + E. *therapeutics*.] Radiotherapy; the treatment of disease by exposure to light, the X-rays, or radium and other radioactive substances. *Med. Record*, Oct. 12, 1907, p. 620.

radiotherapy (rā″di-ọ-ther′ạ-pi), *n.* [L. *radius*, ray, + Gr. θεραπεία, medical treatment.] Treatment of disease by any of the forms of radioactivity. This term has been applied more particularly to methods of treatment in which the Rontgen rays are employed, but since the discovery of the Becquerel rays and of the possibility of their use in the treatment of disease, the term has been extended to include the therapeutic use of radioactive substances as well as X-rays. The value of the Rontgen rays has become firmly established for certain affections of the skin, such as epithelioma, rodent ulcer, mycosis fungoides, acne, keloid and hypertrophic scars, chronic eczema, obstinate ringworm of the scalp, etc. Radium and other radioactive substances have more recently been employed for the same purposes as the X-rays. Their effects seem to be practically the same, though they have not yet been used in therapeutics a sufficient length of time to determine their relative value as compared with the Röntgen rays. The fact that tubes of radium can be introduced into cavities where it is not practicable to employ the X-rays has enabled this substance to be used with benefit in certain cases of stricture of the esophagus or rectum. The cathode ray has been suggested as a substitute for radium, which, by reason of its great cost, is of very restricted application. The X-rays have also been employed in the treatment of leucemia, with apparent benefit in certain cases.

A Crookes bulb for *radiotherapy*, by M. Audin. A description of an X-ray tube specially adapted for the treatment of cancer of the mouth and throat.
Nature, Dec. 3, 1903, p. 120.

radiothorium (rā″di-ọ-thō′ri-um), *n.* [L *radius*, ray, + NL. *thorium.*] A radio-element produced by the disintegration of thorium and intermediate between mesothorium, of which it is a product, and thorium emanation, of which it is the parent. It closely resembles thorium in its chemical properties, and was discovered by Hahn in 1905.

A series of analogous considerations has been established for another radioactive substance—thorium. In this case thorium as a primary substance generates *radiothorium*, a substance recently discovered, which gives rise to the gaseous radioactive emanation of thorium and various products of radioactivity induced by this emanation. Actinium also gives place to a series of transformations similar to those of thorium, and it, like radium, produces helium. *Smithsonian Rep.*, 1906, p. 114.

radiotint (rā′di-ọ-tint), *n.* [L. *radius*, ray, + E. *tint.*] A picture obtained by taking a photograph upon a specially prepared dry plate, developing, washing, and drying in the usual manner, and treating the positive or print made from this negative with a special solution and the three dyes, blue, green, and red, in succession, the result being a colored picture.

radiotropic (rā″di-ọ-trop′ik), *a.* [L. *radius*, ray, + Gr. τρέπειν, turn.] In *biol.*, tending to turn or move toward (or away from) a source of radiation. *Science*, Feb. 28, 1908, p. 331.

radio-ulna (rā″di-ō-ul′nä̤), *n.*; pl. *radio-ulnæ* (-nē). The united radius and ulna, as found in such animals as the frog; the ulnoradius of Cope.

radish-tree (rad′ish-trē), *n.* An Australian timber tree, *Gyrostemon cotinifolius.* See ★*horseradish-tree*, 2.

radium (rā′di-um), *n.* [NL. *radium*, < L. *rad(ius)*, ray, + *-ium.*] A chemical element of very remarkable character, discovered in 1898 by Mme. Sklodowska Curie, working with her husband and M. Bémont. The element itself has not been isolated, and many writers incorrectly use the name radium when in reality a salt of the element, generally the chlorid or bromide, is meant. In following up the researches of Becquerel on the radioactivity of uranium and its compounds, Mme. Curie found that certain ores of uranium manifest this activity to a greater extent than can be accounted for by the uranium they contain. By patient and laborious examination of the constituents of pitchblende, a mineral containing a high proportion of uranium, she was able to separate a substance exhibiting radioactive properties greatly superior to those of uranium. This substance was found associated with the barium salts removed from the pitchblende and resembled barium so closely in its chemical properties that a separation of the two elements could be effected only by the repeated fractional recrystallization of the mixed chlorids, the radium chlorid becoming more concentrated in the less soluble portion. On further investigation it was found that the radium, present only in minute proportion in pitchblende, was retained and somewhat concentrated in certain residues obtained from pitchblende in the commercial extraction of uranium at the works in connection with the mines at Joachimsthal in Austria. These residues had accumulated for years under the supposition that they were valueless and a considerable quantity was placed at the disposal of M. and Mme. Curie for the continuation of their researches. The residues consist chiefly of the sulphates of lead and calcium together with the oxids of silicon, aluminium, and iron. They also contain greater or less quantities of nearly all the metals (copper, bismuth, zinc, cobalt, manganese, nickel, vanadium, antimony, thallium, the rare earths, niobium, tantalum, arsenic, barium, etc.). They were subjected to suitable chemical treatment by which the barium and radium were removed and obtained in the form of a mixed chlorid. The radium and barium chlorids were then separated from one another by fractional crystallization repeated many hundreds of times, and a pure chlorid of radium was obtained. In this way the Curies separated about one gram of fairly pure radium chlorid from eight tons of residues, representing nearly eighty tons of the original ore. Giesel has slightly modified the process, conducting the recrystallization with the bromides instead of the chlorids, which considerably facilitates the isolation of a pure radium salt. Pure radium chlorid or bromide resembles common salt in general appearance when freshly prepared, but quickly acquires a yellowish or brownish color. It gives a fine carmine-red color to flame, and affords characteristic flame and spark spectra. It is visibly luminous in a dark room. Radium belongs to the class of the alkaline-earth metals, calcium, strontium, and barium, and its compounds in general resemble theirs. Its atomic weight, as first determined by Mme. Curie, was 225 (O = 16); later she obtained the figures 226.5. The element occupies, in the periodical classification, the same position in the twelfth of Mendeléjeff's series as Ca, Sr, and Ba do in the fourth, sixth, and eighth. Its radioactivity is about one million times greater than that of uranium. It produces phosphorescent luminosity in the diamond, kunzite, and various other minerals, and on screens coated with barium platinocyanide, crystalline zinc sulphid, etc. Radium salts give off α-, β-, and γ-rays (see ★*radioactivity*). The nature of the α-particles has been closely investigated by Rutherford, who has shown that they are of atomic dimensions, have a mass equal to that of helium atoms, and are therefore in all probability the source of the helium continuously evolved by radium salts as demonstrated in the experiments of Ramsay and Soddy. In addition to helium, a radium salt produces also a highly radioactive gaseous substance known as the radium emanation, which accumulates in the solid salt and escapes when this is heated or dissolved in water. This emanation is a gas of the argon family, autoluminescent and giving a characteristic bright-line spectrum. It has an atomic weight (as determined from the diffusion rate and assuming the molecule to be monatomic) differing but little from that of radium and is condensed at a temperature of from −150 to −155° C. It gradually loses its radioactivity and is transformed, at a rate corresponding to a change of one.half the amount present in 3.8 days, into a series of successive, rapidly-changing, solid, radioactive products known as *radium A*, *radium B*, and *radium C*, which are deposited on the surface of any object in contact with the emanation and impart to this a temporary radioactivity. The continuous production of the emanation in radium salts is wholly independent of the chemical character of the salt and is directly proportional to the amount of radium contained in it. It has also been observed that radium salts evolve heat at the surprising rate of about 118 calories per hour for each gram of radium which they contain and are thus enabled under favorable conditions to maintain their temperature considerably above that of their surroundings. These and other considerations have led to the explanation of the behavior of radium and other radioactive elements by the so-called disintegration theory, first proposed by Rutherford and Soddy. According to this theory the radium atoms are unstable systems and a certain proportion of the total number present are constantly undergoing disintegration, being transformed into atoms of other elements having distinctive physical and chemical properties. Thus an atom of radium breaks up, expelling an α-particle constituting an atom of helium, and produces an atom of the gaseous emanation, the latter undergoing subsequent transformation into an atom of radium A, etc. The energy appearing in the course of these changes is assumed to be inherent in the original atom and to manifest itself only when this is altered or destroyed. On this assumption the behavior of radioactive substances is in no way contradictory to the doctrine of the conservation of energy. On the basis of this theory it is obvious that in any given quantity of a radium salt in the course of time the amount of radium present must gradually decrease, and it has been experimentally demonstrated that the time required for exactly one half of the radium to disappear would be about 2000 years. It can be shown that at this rate of disintegration the earth, if composed initially of pure radium, would, after the lapse of 100,000 years, contain a smaller proportion of radium than is now present in the common rocks and soil which constitute its surface. Since the age of the earth is certainly greater than 100,000 years, it is evident that the radium now in existence must have been renewed or formed in some manner. The origin of radium has therefore been the subject of careful investigation and the conclusion has been reached that radium is formed through the atomic disintegration of another radioactive element, uranium, which is much more abundant, and is widely distributed. Radium has been found present in the natural mineral substances containing uranium in a constant and unvarying proportion, three parts by weight of radium occurring associated with every one hundred million parts of uranium. It has been found that radium is not formed directly from uranium, and it has been shown by Boltwood that another radio-element, ionium, is first produced by the disintegration of the uranium atoms which after further change are converted into radium atoms. A continuation of the atomic transformation results in the successive production of a further series of radio-elements or products: radium emanation, radium A, radium B, radium C, radium D (radiolead), radium E, radium F, and radium G (polonium). As no further radioactive products have been detected in this series it is presumed that after radium G an unchanging, stable form of matter is attained. Although the evidence as to the nature of this final product is indirect and not wholly conclusive, there is reason for believing that it is ordinary lead. Radium has been found widely distributed in minute proportions in the rocks and minerals of the globe, in soils, in the waters of thermal springs, in sea-water, and in marine deposits. The chief source of the radium salts which have been prepared has been almost entirely the pitchblende residues from the Austrian factories, and owing to the comparative rarity of this material and the laborious and costly methods of treatment necessary for its extraction, radium salts have commanded extraordinarily high prices, being frequently sold in small quantities at a rate exceeding $150,000 per gram of radium. The radiation from radium salts, especially the β- and γ-rays, reduces sensitive silver salts and produces an image upon a photographic plate screened by black paper. It also brings about other chemical changes, converting oxygen into ozone and ordinary phosphorus into red phosphorus, and causing the decomposition of water (with an excess of hydrogen over oxygen in the gaseous product as collected). It produces darkening of color in diamonds, quartz, mica, and especially glass, some specimens of glass becoming brown and others, more commonly, acquiring a violet or purple tinge. Various other substances become more or less colored. Radium salts, even at some little distance from the human skin, produce reddening in a few hours, and after days give rise to painful sores, difficult to heal. They have been used with some degree of success in the treatment of lupus and other forms of disease of the superficial tissues. They exert a marked germicidal action on various micro-organisms.—**Radium A**, the first disintegration-product of the radium emanation, having the emanation as parent and being itself the parent of radium B. See above.—**Radium B**, the second disintegration-product of the radium emanation, having as parent radium A and being the parent of radium C. See above.—**Radium-barium bromide**, barium bromide containing an admixture of radium bromide in varying, usually very small, proportion.—**Radium bromide**, the compound of radium which probably admits best of separation from the accompanying barium bromide by fractional crystallization, and has hence been used for this purpose by Giesel. It is soluble in water, though less soluble than the corresponding salt of barium. Exposed to the air it loses bromine and acquires an alkaline reaction.—**Radium C**, the third disintegration-product of the radium emanation, having as parent radium B and being parent of radium D. See above.—**Radium D**, a product of the radium emanation, having as parent radium C.—**Radium electroscope.** See ★*electroscope.*—**Radium rays**, Becquerel rays emitted by the radioactive element radium or by its compounds. See *obscure* ★*rays*, ★*radium*, and ★*radioactivity.*

radius, *n.* 4. (*b*) One of the principal longitudinal veins in an insect's wing, between the subcosta and the præmedia. It is vein III of Comstock's system.—**Angular radius.** Same as *spherical* ★*radius.*—**Basal pectoral radius.** See ★*pectoral.*—**Focal radii**, sects from a point to the foci.—**Radius and cubitus.** See ★*cubitus.*—**Radius of an eccentric**, the distance from the center of the sheave to the axis of the shaft.—**Radius of convergence**, the radius of the circle of convergence of a power-series.—**Radius of inversion.** See ★*inversion.*—**Radius of symmetry.** Many animal forms are symmetrical in reference to a number of systems of radii, designated *perradii*, *interradii*, *adradii*, and *subradii*. In a quadrate jellyfish there are four perradii, four interradii, eight adradii, and sixteen subradii. Four of the eight marginal sense-organs of *Chrysaora* are perradial and four interradial; of its twenty-four tentacles eight are adradial and sixteen subradial.—**Radius of vision**, the tangent to the earth's surface drawn from the eye of an observer situated at any given height above the earth; the line from such a point of view to the horizon. At sea, or above a level plain, where the horizon is a circle, the radius of vision is the side of a cone whose apex is the point of view and whose base is the horizon.—**Spherical radius**, an arc of a great circle from a pole of a circle on a sphere to a point of the circle.

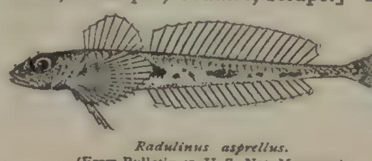
radius-bar, *n.* 2. A link or bar connected with the front truck of a locomotive so as to permit it to swing laterally enough to adjust itself to track-curves of varying radius without stress upon the frame.

radius-finder (rā′di-us-fīn″dėr), *n.* Same as ★*center-square.*

radius-rod (rā′di-us-rod), *n.* In a steam-engine, the rod in a Gooch link motion, which connects the link-block to the valve-stem.

radix, *n.* 6. In *astrol.*, the original figure of birth, the source of all judgments and predictions.—**Radix mesencephali**, the mesencephalic root of the trigeminus nerve.—**Radix of the scale.** Same as *base of the* ★*scale.*—**Radix trigemini**, the root of the trigeminus nerve.

Radulinus (rad-ụ-lī′nus), *n.* [NL., < L. *radula*, a scraper, < *radere*, scrape.] A genus of cottoid fishes which inhabit the Pacific coast in rather deep waters.



Radulinus asprellus.
(From Bulletin 47, U. S. Nat. Museum.)

raffinade (rä-fẹ-nä′de̤), *n.* [G. *raffinade*, < F. **raffinade*, < *raffiner*, refine.] A trade-name in Germany for the finest grade of white sugar made from beet-root.

raffinase (raf′i-nāz), *n.* [F. **raffinase*, < *raffiner*, refine, + *-ase.*] A ferment which causes the inversion of raffinose.

raffinosate (ra-fin′ọ-sāt), *n.* [*raffinose* + *-ate*^{2}.] A compound of raffinose with a base, as calcium raffinosate, $3CaO.C_{18}H_{31}O_{16} + 2H_2O$, a crystalline powder, by means of which raffinose can be separated from saccharose, because it is less soluble in alcohol than calcium saccharate. When treated with an acid it yields raffinose and the calcium salt of the acid.

raffinose (raf′i-nos), *n.* [F. **raffinose*, < *raffiner*, refine, + *-ose.*] A crystalline sugar, $C_{18}H_{32}O_{16} + 5H_2O$, found in Australian manna from different species of *Eucalyptus*, sugar-beets, cotton-seed, and barley. It has no sweet taste. When heated with dilute sulphuric acid it first yields fructose and melibiose, then the latter is broken down into glucose and galactose. It is dextrorotatory and ferments only partly with yeast. Also called *melitose*, *gossypose*, and *melitriose*. *Inactive raffinose* is found in sugar-cane and in beet-molasses. It does not crystallize.

rafflesiaceous (raf-lē-zi-ā′shius), *a.* Belonging to the *Rafflesiaceæ*, a family of parasitic plants; resembling the genus *Rafflesia*.

rafle (räf'l), *n.* [F.] A febrile eruptive disease observed in cattle of northern France. The eruption occurs after four or five days, on the inner side of the hind limbs and sometimes of the fore-legs, extending down to the hoof.

raft-body (råft'bod"i), *n.* In a war-ship, the part of the vessel above the protective deck in the vicinity of the water-line which is divided into a large number of watertight compartments. See ★*battle-ship*.

rafter¹, *n.*—**Auxiliary rafter**, an additional rafter used in a roof-truss to stiffen the principal rafter, often for a part of its length only.—**Dwarf rafter**, one of the short rafters which frame into a hip-rafter or angle-rafter, reaching from it to the plate.

rafter-dam (råf'tėr-dam"), *n.* A dam in which long timbers are set on the upper side at an angle to the stream of from 20 to 40 degrees. The pressure of the water against the timbers holds the dam solidly against the stream-bed.

rafting-spear (råf'ting-spēr), *n.* A thick iron-shod pole, used as a spear.

> Thus Mr. Tregear remarks:—"I have seen a Maori speared with a big *rafting-spear* (an iron-shod pole thicker than the wrist), the point driven through the breast, just under the collar-bone, and coming out at the back. *H. H. Ellis*, The Criminal, p. 114.

raft-spider (råft' spī"dėr), *n.* A European lycosid spider, *Dolomedes fimbriatus*, which spins together floating leaves, using them as a raft on which it lives while capturing aquatic insects.

rag¹, *n.* **3.** In *bot.*: (*d*) The pithy axis and the membranes separating the sections of the orange and other citrus fruits.

> The fruit resulting [from organic manures] is . . . inclined to be large and rough, with a thick rind and abundant *rag*. *Yearbook U. S. Dept. Agri.*, 1894, p. 196.

12. A coat; a tunic: army slang in India in the last century; still used. Also ★*raggie* (which see).

> Are you going to sport the blue *rag* or the red one? [The Navy or the Army.]
> *Quoted in N. and Q.*, 9th ser., XII. 513.

Hard rags, rags from felted cloth, such as broadcloth, kersey, beaver, etc.—**Soft rags**, rags from loosely woven or unfelted cloth.—**To chew the rag**, to work oneself up over a grievance; complain; scold; talk violently. [Slang.]

> "There are a few sore-heads," one man remarked to me, "who *chew the rag* about corruption an' the way the town 's run, but they don't represent you an' me an' the citizens. They 're sore 'cause they ain't got any offices, that 's what 's troublin' them." *McClure's Mag.*, April, 1901, p. 576.

> A pardon if too much I *chew the rag*
> But say, it 's getting rubbed in good and deep.
> *Wallace Irwin*, Love Sonnets of a Hoodlum, xix.

II. *a.*—**Rag fallow.** See ★*fallow*².

rag² (rag), *n.* [*rag*², *v.*] In Oxford University, a noisy, disorderly outbreak, in violation of established regulations: originally peculiar to English university life.

> The College is preparing for a good old *rag* tonight.
> *Isis*, 1892, No. xiii, p. 88. *N. E. D.*

raga (rä'gä), *n.* [Skt. *rāga* (Hind. *rāg*), coloring, passion, loveliness, beauty (of voice or song), a musical mode, < √*raj*, be colored, be red, be pleased, etc.] In *Hindu music*, a scale or similar recognized series of tones.

rag-bag (rag'bag), *n.* A bag to contain rags or heterogeneous clippings of cloth; hence, a receptacle for any collection of odds and ends.

> The Convention was a *rag-bag* of dissent, made up of bits so various in hue and texture that the managers must have been . . . puzzled to arrange them in any kind of harmonious pattern. *Lowell*, Works, V. 156.

rag-boiler (rag'boi"lėr), *n.* A closed vessel in which rags are boiled under a slight pressure in the paper-making process.

rag-book (rag'bůk), *n.* An 'indestructible' picture-book for children, printed on heavy linen with a brilliant, glossy surface.

> The improvements recently made in the productions called *rag-books* are strikingly exemplified . . . [they are] absolutely untearable, even washable.
> *Athenæum*, Dec. 16, 1905, p. 833.

rag-box (rag'boks), *n.* **1.** A box in which clothes are kept (see *rag*¹, *n.*, 12). [Slang.] —**2.** The mouth: as, to shut the *rag-box*, to hold the tongue. [Slang.]

> You shut up your *rag-box* an' 'ark to my lay.
> *R. Kipling*, The Young British Soldier, st. 2.

rag-burning (rag'bėr"ning), *n.* The process of calcining or roasting tin-witts or tin-ore that has been dressed but contains pyrites or other impurities. [Cornwall, Eng.]

rag-duster (rag'dus"tėr), *n.* In *paper-making*, a duster which employs an endless apron or wire cloth, on which the stock is thrown, after it has been torn apart or opened by revolving cutters, and the dust has been beaten out.

rag-fair, *n.* **2.** The kit inspection of a company of soldiers. [Slang.] *Grose.*

rag-fish (rag'fish), *n.* A fish of the genus *Icosteus*, found on the shores of California, remarkable for its flat, flabby body.

Ragged fallow, jacket. See ★*fallow*², etc.

ragged-robert (rag'ed-rob'ėrt), *n.* The herb-robert, *Geranium Robertianum*.

raggedy (rag'e-di), *a.* [*ragged* + *-y*³.] Having a ragged appearance; ragged. Also *raggety*.

> A *raggedy* colt makes a good horse. *Old Irish Saying.*

> There were a great many cattle, some limping wearily on. . . . Then fore and aft of the herd there were *raggety* boys holding the beasts in check and playing pranks among themselves. *Crockett*, Raiders, xxiii.

> O The *Raggedy* Man! He works fer Pa;
> An' he 's the goodest man ever you saw!
> He comes to our house every day,
> An' waters the horses, an' feeds 'em hay. . . .
> Ain't he a' awful good *Raggedy* Man?
> *Raggedy! Raggedy! Raggedy* Man!
> *J. W. Riley*, The Raggedy Man, in Rhymes of Child-[hood, p. 217.

raggety, *a.* Same as *raggedy*.

raggie (rag'i), *n.* Diminutive of ★*rag*¹, 12 (which see).

> As for myself in my scarlet *raggie*, . . . black waist-belt and regulation sword, in my own opinion I looked quite the god of war.
> *Capt. F. J. Bellew*, Memoirs of a Griffin, ix.

ragging¹, *n.* **3.** In *mech.*, the rough-dressing of a grindstone; the operation of taking imperfections out of the working-face of a grindstone.

ragging² (rag'ing), *n.* [*rag*², *v.*, + *-ing*.] A scolding; a tongue-lashing.

ragging-hammer (rag'ing-ham"ėr), *n.* In *mining*, a hammer which is used for breaking off the worthless part of the ore in the first separation.

ragging-table (rag'ing-tā"bl), *n.* See *racking-table*.

raggle, *n.* **2.** A groove cut in a stone, especially in the upper stones of a wall, to hold the edge of a roof.

rag-house (rag'hous), *n.* A tent. [Slang.]

ragout (ra-gö'), *v. t.* [*ragout*, *n.*] To make a ragout of; to make a spicy mixture of; hence figuratively, to give spiciness or piquancy to, as speech or literary style.

> There would have been some grand officer of the household, . . . taking upon himself to allow beef to be *ragouted* in small kitchens, and in pans of peculiar size.
> *Westminster Rev.*, Jan., 1833, p. 33.

Rag-pickers' disease. (*b*) A form of pneumonoconiosis occurring in rag-pickers.

Rag-sorters' disease. Same as *rag-pickers' disease* (*a*) and (*b*).

ragstone, *n.* **3.** The weathered first bed or upper layer of a quarry in England. Also *raggstone*.

> The Ragg of the Quarry: It is the very Strata of Stone that makes the Roof of the Subterraneous Quarries.
> *M. A. Green*, Eighteenth Century Architecture of Bath, [p. 94.

rag-time (rag'tīm), *n.* and *a.* [*rag* for *ragged* (?) + *time*.] In *music*, a rhythm or movement that has many irregular accents and jerky inversions of emphasis, similar to those described under *Scotch catch* or *snap*. The term appears to have been first used (as an adjective) of negro melodies of the southern United States, but it has been extended indiscriminately to all sorts of popular songs, often of a vulgar character. [Colloq.]

> An Italian band played Chinese *ragtime* with German thoroughness and a French finish as the guests of the State piled into carriages for a drive to the Fifth Avenue Hotel. *N. Y. Press*, Feb. 2, 1906.

Rag-time music, music characterized by rag-time, especially songs or dances imitated or caricatured from negro melodies.

> The sound of *ragtime music* came from the two music halls across the way. *M. E. Seawell*, Papa Bouchard, i.

rag-trade (rag'trād), *n.* **1.** Trade in rags which are sold to the paper-mills.—**2.** The buying of false bank-notes which are palmed off on victims who give good money in exchange. [Slang.]—**3.** The tailoring trade. *Barrère and Leland*, Slang Dict.

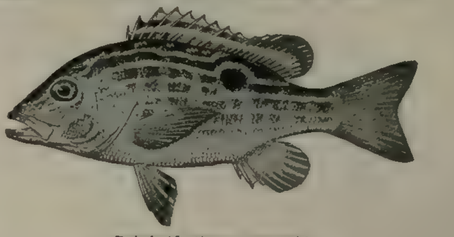
ragweed, *n.*—**Giant ragweed, tall ragweed**, the great ragweed, *Ambrosia trifida*.

ragweed-fever (rag'wēd-fē"vėr), *n.* Same as *hay-fever*.

rah (rä), *interj.* and *n.* A shortened form of *hurrah*: usually repeated.

> Around her raved the cheers of thousands, but the rocketing "*rahs*" for Yale sounded in her ears like some barbaric funeral chant. *Scribner's Mag.*, July, 1905, p. 18.

raiado (rä-i-ä'dō), *n.* [Sp. *rayado*, striped.] *Lutianus synagris*, one of the snappers, known from Florida to Brazil.



Raiado (*Lutianus synagris*).
(From Bulletin 47, U. S. Nat. Museum.)

Raibl beds. See ★*bed*¹.

raiiform (rā'i-fôrm), *a.* [NL. *raia*, ray, + L. *forma*, form.] In *ichth.*, of the shape of the ray.

Raiküll beds. See ★*bed*¹.

rail¹, *n.*—**Adhesion-rail.** See ★*adhesion-rail*.—**Barlow rail**, a saddleback rail; an old form of metal rail having sides which curve rapidly downward and outward so as to form a broad base, thus allowing the rail to be laid directly on the ballast and avoiding the necessity for sleepers or wooden ties.—**Base-rail**, a railroad rail, invented about 1831, which had side projections about every two feet to give it a bearing surface on the road-bed.—**Bull-headed rail.** See ★*bull-headed*.—**Duplex rail.** Same as *compound rail* (which see, under *rail*¹).—**Service-rail.** Same as ★*adhesion-rail*.—**Slot-rail**, one of a pair of rails which form a slot, or between which is an opening in which a trolley or a cable-grip or plow runs. This slot is usually midway between the rails on which the car runs, and for street-car service, the top of the slot being flush with the street surface. *Elect. World and Engin.*, Feb. 27, 1904, p. 406.—**Stock-rail.** Same as ★*adhesion-rail*.—**Third rail**, a supplementary, insulated rail laid beside the track of an electric line, to carry the current used by the motor-cars. It is usually placed near one rail, outside the track, in convenient reach of a shoe that slides upon it, and takes the current from it to the motor. In street roads two light insulated rails in a tunnel under the track take the place of the third rail. See cut under *electric* ★*conduit*.—**Vignolles rail**, a railroad-rail of the same shape as the T-rail. [Eng.]

rail⁴, *n.*—**Pectoral rail**, in Australia, *Rallus philippensis*. *Austral Eng.*

railage (rā'lāj), *n.* Charge for transportation by rail; also the transportation itself.

> Labour, cartage and *railage*.
> *Auckland Star, N. Z.*, Oct. 1, 1891, p. 4. *N. E. D.*

rail-bird² (rāl'bėrd), *n.* One who perches on or hangs over the rail or fence at a race-course, or a fair, not having a reserved seat. [Slang.]

> Pity the poor judges when thirty bull calves romp out before them; pity the "*railbirds*" who pass judgment on the judges. *Rep. Kansas State Board Agr.*, 1901–2, p. 203.

> Along the fence where in the forenoon the "*rail birds*" had perched, muffled and humped, talking sagely of "Himyar hoses," "St. Blaise hocks," "iron legs," and "selling skates." *Munsey's Mag.*, Sept., 1902, p. 916.

rail-bond (rāl'bond), *n.* An electric conductor used to unite the adjacent ends of two railroad-rails so as to form a good electrical contact. It is usually composed of one or more copper wires the ends of which are given good metallic contact with the rails by soldering them in plugs fitted in holes in the foot. *Jour. Franklin Inst.*, Feb., 1904, p. 114.

rail-car (rāl'kär), *n.* A contraction of *railway-car*. [Local, U. S.]

rail-clamp, *n.* **2.** A rail-drill; a frame or clamp for holding a drill while drilling holes in the web of a rail.

rail-clip (rāl'klip), *n.* A tie-piece attached to a balance-crane, or a crane mounted on a car, for the purpose of securing the crane to its iron rails, thus preventing its overturning when lifting a heavy load.

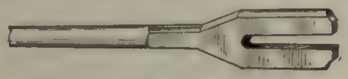
rail-drill (rāl'dril), *n.* A rail-drilling machine; a portable device for drilling holes in the web of a rail for the bolts required at the joints. *Jour. Franklin Inst.*, Feb., 1904, p. 112.

rail-drop (rāl'drop), *n.* The fall of potential between the rails of an electric railway, where these are used for the return circuit, and the grounded terminal of the generator.

> Now if, as the result of plant installation such as is represented in the lecturer's diagram, voltages existed such as therein graphically shown, such voltages would have to be diagrammatically illustrated somewhat as shown in Fig. 7; in which, ZZ' being the zero line and A the voltage of the low-voltage pole of the generator, CC' would represent the voltage at different points of the rail-return (*rail-drop*) and EE' the voltage at different points of the accidental auxiliary returns (earth-drop, pipe-drop, etc.). *Elect. Rev.*, Oct. 8, 1904, p. 569.

rail-feeder (rāl′fē″dėr), *n.* A generator or battery used to regulate the distribution of voltage through the rails or earth return-circuit of an electric road.

rail-fork (rāl′fôrk), *n.* A track-layers' bar having two parallel blunt arms at the end the space between which is designed to fit the web of the rail. It is used in lifting the end of a rail.



Rail-fork.

rail-gage (rāl′gāj), *n.* A bar, either of iron or wood, having a projection near each end at right angles to it. The distance apart of the outer faces of the projections is the distance required between the heads of the rails. See *railway-★gage.*

rail-head (rāl′hed), *n.* 1. The upper portion of a rail; that part of a rail with which the wheels of the vehicles of a railway come in contact in passing.

> All of the lines run on the public highway, and as the *railheads* are flush with the street, wagon traffic suffers no interference. The rails are laid on a foundation made up of large stones covered by rubble.
> *Elect. World and Engin.*, March 19, 1904, p. 554.

2. The terminus of railway transportation; the farthest point to which transportation by rail is open.

> *Rail-head* having arrived at the requisite point in the summer of last year, our party, consisting of six Europeans, left Marseilles on June 10.
> *Geog. Jour.* (R. G. S.), XV. 454.

rail-ingot (rāl′ing″gọt), *n.* A steel ingot from which rails are to be rolled. Bessemer or open-hearth steel is commonly used for this purpose.

rail-jack (rāl′jak), *n.* A screw, ratchet, or hydraulic jack having a foot or bracket at the bottom of the movable ram for lifting a rail or anything close to the ground.

rail-joint (rāl′joint), *n.* See *joint*, 1 (*d*).

rail-jointer (rāl′join″tėr), *n.* An artisan employed to make the electrical connections or bonding of the rails of an electric road.

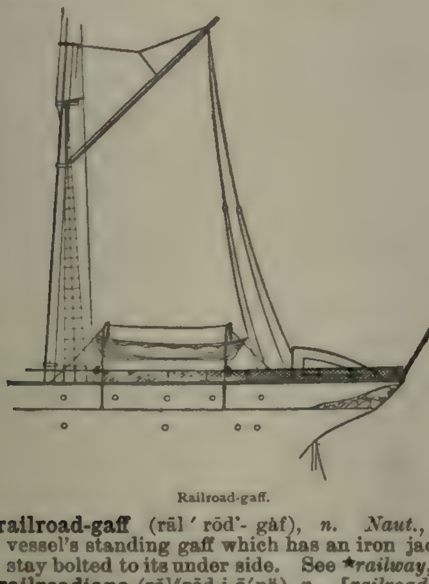
rail-lock (rāl′lok), *n.* In *railroading*, a lock for controlling the ends of the track-rails at the edge of a drawbridge, where the rail-ends must be raised before the draw can be opened. It locks the rails in their raised position and at the same time locks all train-signals against the bridge until the bridge is closed and the rails are lowered.

rail-mill (rāl′mil), *n.* A rolling-mill in which rails are rolled. *Uhland*, Corliss-Engines, p. 43.

railroad, *n.*—**Funicular, industrial, light, mountain, pyramidal, scenic railroad.** See *funicular ★railway*, etc.

railroad, *v. t.* 2. To build railroads through (a country).—3. To carry by railroads.—4. In *printing*, to mark with parallel lines.

II. *v. i.* 1. To work on railroads; to be in the railroad business.—2. In *printing*, to overrun: indicated in proof-reading by parallel lines.



Railroad-gaff.

railroad-gaff (rāl′rōd′-gȧf), *n.* *Naut.*, a vessel's standing gaff which has an iron jackstay bolted to its under side. See ★*railway*, 3.

railroadiana (rāl″rōd-i-ā′nạ̈), *n.* [*railroad* + *-i-* + *-ana.*] Scraps of information or gossip about railroads; railroad literature. [Rare.]

railroad-iron (rāl′rōd-ī″ėrn), *n.* 1. Wrought-iron suitable for making articles for railroad use, as coupling-links, pins, etc.—2. Iron or steel pieces used in railroad construction or operation, as rails, wheels, couplers, etc.—3. Steel rails: the first rails having been of iron, the term has been carried over to the newer practice.

railroad-plow (rāl′rōd-plou″), *n.* 1. An excavating plow or scraper drawn by a locomotive and used for ditching or grading beside a track.—2. A snow-plow pushed by a locomotive for removing snow from a track.

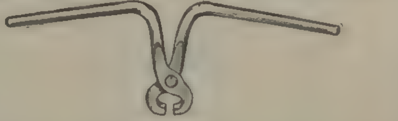
rail-saw, *n.* 2. A saw for cutting off the crop-ends of rails after they leave the rolls and for cutting the rails to lengths.

rail-sickness (rāl′sik″nes), *n.* Physiological disturbances caused by the motion of railway-cars, similar in origin and effects to those of sea-sickness; car-sickness. The rapid motion of objects through the visual angle of the eye; the swaying of the car-body as the direction of motion is changed at curves; the lurching due to centrifugal force on curves when the outer rail cannot be adequately elevated by reason of other traffic at less speeds; and, in general, the disturbances incident to travel, affect the nerve-centers and produce headache, nausea, faintness, and other phenomena which vary with the subject.

> In running over its mountain division the . . . flyer, if it is to be on time, will have to negotiate the curves at a speed for which no amount of super-elevation of the outer rail can fully compensate, and "*rail-sickness*" may claim its victims.
> *Sci. Amer.*, June 17, 1905, p. 478.

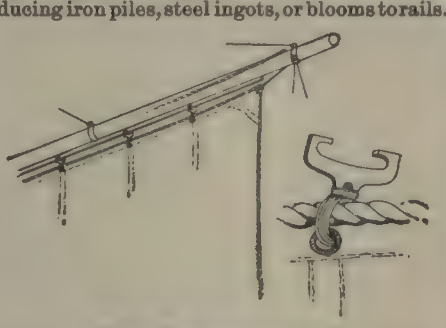
rail-tester (rāl′tes″tėr), *n.* An instrument for testing the bonding of rails on an electric road. It usually consists of a millivoltmeter the terminals of which are attached to two steel points with which contact on either side of the joint to be tested may readily be made.

rail-tongs (rāl′tôngz), *n. pl.* Track-layers' tongs for lifting rails. They have short jaws designed to clasp the rail head and two long handles bent at a right angle.



Rail-tongs.

rail-train (rāl′trān), *n.* A train of rolls for reducing iron piles, steel ingots, or blooms to rails.

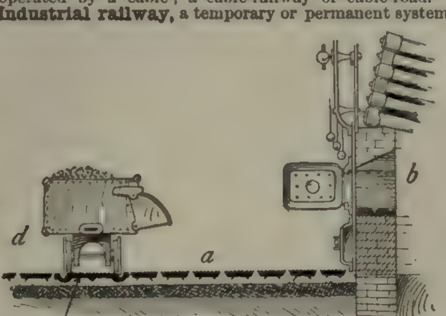


Railway, with single traveler in detail.

railway, *n.* 3. *pl.* *Naut.*, iron jackstays bolted on the under side of standing gaffs which carry fore-and-aft sails, with or without booms. Small grooved iron shapes called "travelers" are sewed to the head of the sail, and slide along the railway, so that the canvas may be spread along the gaff by means of a whip or outhaul.—**Funicular railway**, a railway operated by a cable; a cable-railway or cable-road.—**Industrial railway**, a temporary or permanent system of narrow-gage tracks laid in a mine or quarry, on a plantation, about a blast-furnace, or in a shipyard, lumber-yard, sawmill, factory, shop, or other industrial plant, for the transportation of raw material or finished products. The most simple track is made in rail-length sections, consisting of light T-rails bolted to steel ties, at a gage of twenty-four inches. The sections are joined by fish-plates and are laid on the ground or on wooden or cement floors. For contractors' use, wooden ties and heavier rails are used. Another type of track is composed of sections of T-rails riveted to steel ties, and of 21½-inch gage, outside measurement. Another is composed of cast-iron plates having the rails cast at the edge on each side. The figure shows a section of a cast-plate track bedded in the floor of a boiler-room, the floor being composed of cast-iron plates resting on concrete. On such a track the flanges are on the outside of the wheels and run in the grooves at the sides, the space between the rails being roughened to form a foothold. Heavy cast plates of this pattern are also used for street roads and are bedded in concrete. Such plate tracks are also laid on wooden floors, with side strips, to allow for the easy crossing of trucks; and in boiler-rooms are laid in concrete, with plain floor-plates. Simple forms of crossovers and switches are used in all forms of industrial roads, and in shops, where abrupt turns must be made, small, ball-bearing turn-tables are used in place of curves and switches, as shown in the figure. Hand transfer-cars are also used. The car-loads on such roads are often very light and the cars are moved about and the turn-tables operated by hand. For heavy loads and trains of cars electric motors are in almost universal use. A great variety of shop, mill, quarry, and other cars are used on industrial roads, such as cane-, coke-, sugar-, ash-, slag-, and logging-cars, and the tracks are often laid on elevated structures and on bridges between buildings. In some instances the body of the car is suspended below the car-trucks, under the elevated tracks. See *dumping-car* and *dumper.*—**Light railway.** (*a*) A railway built with light rails and using light rolling-stock. (*b*) A railway built under enactments to secure light charges for transportation.

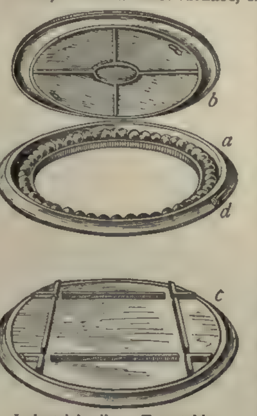
> Such *railways* are not "*light*" in the technical sense of having been made under enactments intended to secure permanent lowness of cost as compared with standard lines.
> *Encyc. Brit.*, XXXII. 166.

Mountain-railway, a railway having grades steeper than 3 feet in 100 feet. Such railways are sometimes provided with a rack or a cable so that the tractive force of the locomotive may not depend entirely on the adhesion of the wheels to the track.—**Pyramidal railway**, a mono-rail road; a railroad having a single central rail supported on short posts and straddled by the cars. There are guide-rails on the sides of the posts, at the bottom.—**Railway gage.** See ★*gage*2.—**Railway head.** See ★*head* and ★*rail-head.*—**Railway-jack.** Same as ★*rail-jack.*—**Railway kiln.** See ★*kiln.*—**Scenic railway.** (*a*) A railway line which passes through a region notable for the beauty of its scenery. (*b*) A short track upon which cars are run, generally by gravity, and which passes through artificial scenery intended to be beautiful or weird: a source of amusement at pleasure-resorts.—**Tube-railway**, a railway constructed in a tube or tunnel; an underground railway; a subway.



Industrial Railway.

a, cast-iron plates, bedded in concrete for boiler-room floor; *b*, section of boiler; *c*, cast-iron track; *d*, charging-car with outside-flange wheels.



Industrial-railway Turn-table.

a, circular base with channel for ball-bearing, showing ring of balls; *b*, under side of table; *c*, table in position, showing cross-tracks; *d*, latch for cover. A car is run by hand on the turn-table, the table turned one quarter of the way round, and the car run off on a track at right angles to the first track.

railway-beetle (rāl′wā-bē″tl), *n.* A South American lampyrid, probably a larviform female, luminous in patches along the sides, thus resembling a miniature railway-train at night.

railway-crane (rāl′wā-krān), *n.* See ★*crane*2.

railway-grease (rāl′wā-grēs), *n.* The lubricant used in the axle-boxes of railway rolling-stock. It varies in composition, but is very commonly a sort of imperfect soap, made by melting together tallow and palm-oil and stirring in a solution of carbonate of soda until a uniform mixture is produced.

rain1, *n.* 2. (*a*) Red or brown dust is sometimes carried by violent winds into the upper atmosphere and many miles from its source. If afterward precipitated with rain, it imparts to the latter a red color.—**Agricultural rains**, rains which occur during the growing season; specifically, rains which occur during that portion of the year in which the average daily temperature of the air is above 40° F. or 5° C.—**Artificial rain**, a rain caused to fall by human agency. Efforts to produce rain by special human intervention have been made from time immemorial, by the ringing of bells, the firing of cannon, the upward discharge of vapors and gases, and possibly other devices, but in no instance has it been shown satisfactorily that rain is thus produced.—**Belt of rains**, the region between the northeast trades of the northern hemisphere and the southeast trades of the southern hemisphere which approximately surrounds the globe in the neighborhood of the equator. It is characterized by frequent rains throughout the year. It moves northward and southward through a range of about five degrees annually and is generally spoken of as the *equatorial rain-belt*, being in the center of a rather broader region called the *equatorial cloud-belt.*—**Black rain**, rain-water discolored by the fine dust from a black soil or by soot washed down out of the atmosphere. Probably the fine particles are carried very high up and form the nuclei of condensation for the raindrops.—**Coast rain**, a rain peculiar to the coastal regions of a continent or island: almost invariably the special result of uprising currents due to winds blowing from the water to the land.—**Dynamic theory of the formation of rain**, the theory developed by Espy, Ferrel, Hann, and later meteorologists according to which the formation of clouds, rain, hail, and snow is a process of thermodynamics. The work done by the expansion of air under pressure is done at the expense of the heat contained in the air and vapor and soon reduces the temperature of the vapor to its dew-point. The further cooling and the consequent condensation give rise to an evolution of the latent heat of the vapor so that the process of cooling is retarded in proportion as the rate of condensation is increased. The total quantity of heat represented by the falling rain, hail, or snow is left in the cloud and promotes further rise and overflow, but is eventually lost by radiation. So long as the cloud or air retains this excess of heat it is more buoyant than neighboring air and promotes the formation of winds and storms.—**Luminous rain**, a rain in which occur luminous electric discharges or sparks between the drops and the ground as they approach it. *Encyc. Brit.*, XXIII. 329.—**Red rain.** See *blood-rain*, under *rain*^{1}, 2 (*a*).

rain-area (rān'ā″rē-ạ̈), *n.* 1. The region over which rain has fallen, shown on a daily weather-map.—2. Any area over which rain is falling at any time.—3. That quadrant of an extended cyclonic storm in which the most rain usually falls. It is the southeast quadrant in the storms of the United States, but the southwest quadrant in Europe, and a northerly quadrant in the storms of the southern hemisphere.—4. That portion of the storm-area over which rain is falling, as distinguished from the portion over which snow is falling.

rain-belt (rān'-belt), *n.* A region in which rains occur with frequency, as contrasted with a contiguous arid or relatively arid region. —**Equatorial rain-belt.** See *belt of* ★*rains.*

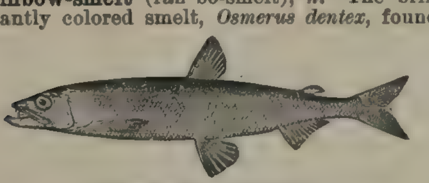
rainbelter (rān'bel-tėr), *n.* A farmer, in the western part of the United States, who settles on the semi-arid plains during a wet season, relying upon a continuance of sufficient rainfall.

> Just now there is a fever of speculation in farm lands in the Northwest and the tide of immigration has set in strongly toward a region heretofore considered valuable only for grazing. There is again an influx of the "*rainbelters*," a venturesome and foolhardy class of settlers, who, disregarding or without knowledge of the experience of the pioneers of the early eighties, are crossing the meridian beyond which the rainfall is scanty and uncertain. It is impossible to fix the exact boundaries of the region known as "Semi-arid America," but it is generally considered to include that territory between the 97th and the 101st meridian. The difficulty in definitely bounding this region is due to the fact that for a succession of years the high plains of which it is largely composed receive more than the average rainfall.
> *N. Y. Tribune*, Sept. 30, 1902.

rainbow (rān'bō), *v. t.* To color like a rainbow, or so brightly as to suggest the rainbow; curve over or surround, as with a rainbow.

rainbow-fish, *n.* (*c*) A new Zealand fish, *Heteroscarus castelnaui.* *E. E. Morris*, Austral English.

rainbow-smelt (rān'bō-smelt), *n.* The brilliantly colored smelt, *Osmerus dentex*, found on the coast of Alaska. It forms an important part of the food of the natives. Also called *Alaska smelt.*



Rainbow-smelt (*Osmerus dentex*).
(From Bulletin 47, U. S. Nat. Museum.)

rainbow-trout, *n.*—**McCloud River rainbow-trout**, a trout, *Salmo irideus shasta*, found in the Sierra Nevada mountains from Mount Shasta southward.

rainbow-tub (rān'bō-tub), *n.* In *calico-printing*, a tub used to print rainbow colors. *N. E. D.*

rainbow-weed (rān'bō-wēd), *n.* The purple loosestrife, *Lythrum Salicoria.*

rain-breed† (rān'brēd), *a.* Producing rain.

> Hee chaunts: . . .
> How floods be engendred, so how fire, celestial Arcture,
> Theē *rainebreede* seunstars, with both the Trionical orders.
> Why the sun at westward so tymely in wynter is housed.
> *Stanyhurst*, tr. of First Four Books of the Æneis, i. 754.

rain-breeder (rān'brē″dėr), *n.* Same as *weather-breeder.*

rain-channel (rān'chan″el), *n.* In *geol.*, a furrow excavated by the rain: especially pronounced upon surfaces of loose sand or soft rocks.

rain-char (rān'chär), *n.* A salmonoid fish, *Salvelinus pluvius*, found in abundance in the mountain streams and lakes of Hondo and Hokkaido, Japan. It is a beautiful fish, reaching a weight of two or three pounds.

rainer (rā'nėr), *n.* One who produces the rain. [Nonce-word.]

> The human mind is so made . . . that it must think . . . a *rainer* behind the rain.
> *Max Müller*, Nat. Religion, xv. 404.

Rainey's corpuscle. Same as *Miescher's* ★*corpuscle.*

rainfall, *n.*—**Zone of maximum rainfall.** See ★*zone.*

rain-gage, *n.*—**Symon's rain-gage**, a glass receiver inclosed in a metal jacket, with openings for observation. It is graduated in cubic centimeters.

rain-maker, *n.* 2. One who pretends to be able to cause rain by some physical process. The ringing of bells, the explosion of gunpowder or dynamite (Dyrenforth's method), the mixing of chemicals producing various vapors (Melbourne's method), the burning of piles of brushwood (Espy's method), are among the methods that have been tried.

> There is abundant evidence that many are deceived and much money wasted by the so-called *rain-makers* and others. . . . In Italy, Austria, and France a widespread delusion prevails as to the possibility of preventing hail by the bombardment of the clouds, analogous to the short-lived delusion promoted by Dyrenforth in the United States, to the effect that rain could be brought down by bombarding the clouds.
> *Encyc. Brit.*, XXX. 714.

rain-making (rān'mā″king), *n.* The attempt to produce rainfall by some mechanical or other means. See ★*rain-maker*, 2. The planting of forests or the formation of ponds, lakes, and swamps by irrigation so as to increase the rainfall is one of the methods used.

rain-pit (rān'pit), *n.* An indentation in the ground made by a drop of rain.

> The easiest way of comprehending the preservation of them is to suppose dry sand . . . to have swept over and filled up the foot-prints, *rain-pits*, and hollows of every kind.
> *Penny Cyc.*, XIX.-XX. 270.

rain-quail, *n.* 2. In India, one of the small painted quails, *Excalfactoria chinensis*; also a species of *Microperdix.*

rain-stone (rān'stōn), *n.* A stone which under certain conditions (for example, when placed in water) is imagined to be able to cause rain. *Ratzel* (trans.), The History of Mankind, III. 39.

rain-warp (rān'wârp), *n.* A loam, found beneath the vegetable soil in southern England, consisting of the accumulated fine materials washed out of heavier stony deposits by the action of rain. See *warp*, 4. *J. Geikie*, The Great Ice Age, p. 394.

Rain-water head. See ★*head.*

rainwater-fish (rān'wâ″tėr-fish), *n.* A small fish, *Lucania parva*, of the family *Pœciliidæ*, found in Florida.

rain-wind (rān'wind), *n.* A wind blowing from the point from which the principal rains come. The rain-wind is usually one that blows from an ocean, from the equator, or up a mountain-slope.

rain-worm (rān'wėrm), *n.* The earthworm; the angleworm. *N. E. D.*

rainy-day (rā'ni-dā″), *a.* Pertaining to or suitable for a rainy day: as, the *Rainy-day* Club.

> She . . . was really a vision to see,
> For she wore—the flirt!—a *rainy-day* skirt, of a kind
> that was bound to allure.
> *N. Y. Times*, Sept. 28, 1902.

raise^1, *v. t.* 23. In *poker*, to increase (the amount bet by any preceding player).—**Heave and raise the dead!** An order given to the men at the windlass to break the anchor away from the bottom—from its mud grave.—**To raise a mouse** (*naut.*), to make a mouse (see *mouse*, 6) on a stay, etc.—**To raise steam**, to get up steam; produce steam, as in a boiler; produce or generate steam at a required pressure, starting with water which is not hot enough to give off such steam.—**To raise upon**, in *nav. arch.*, to heighten the upper works of (a vessel).

raise^1, *n.* 5. In *mining*, a rise; a riser; an opening at the back of a level to connect it to the level above.

raisin, *n.*—**Wild raisin**, the sheepberry, *Viburnun Lentago.*

raising, *n.* 1. (*e*) The production of a nap or pile on fabrics by means of a napper, gig, or similar machine. *Georgievics*, Chem. Technol. of Textile Fibres, p. 290.

raising-machine (rā'zing-ma-shēn″), *n.* A machine, as a napper or gig, for raising a nap or pile on fabrics. *Georgievics*, Chem. Technol. of Textile Fibres, p. 290.

rake^1, *n.* 3. A lean, meager person.

> Let us revenge this with our pikes, ere we become *rakes.*
> *Shak.*, Coriolanus, i. 1.

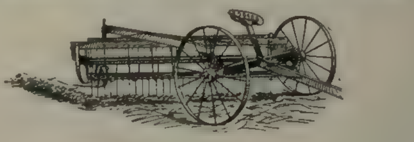
4. A local miners' term in Derbyshire, England, for veins of galena in joints in limestone, as contrasted with fault-fissures. The joints are often enlarged by the solution and removal of the walls, but they may be and usually are limited or cut off sharply by an underlying stratum. Also written *rake-vein.* Compare *gash-vein.*

> One of those upward fissures that the miners of the country call "*rakes*"; it is from 18 to 30 feet wide, and inclines from 75° to 80° towards the horizon. It is an unfinished abyss; that is to say, it is a crack that erosion has not enlarged up to the surface of the earth, for its orifice has not been found above.
> *Geog. Jour.* (R. G. S.), X. 507.

As lean or **as thin as a rake**, very lean or thin.

> *As lene* was his hors *as is a rake*,
> And he nas nat right fat, I undertake.
> *Chaucer*, Gen. Prol. to C. T., l. 287.

Side-delivery rake, a horse-rake in which the rake is suspended between the axle of the pair of wheels and a third or caster-wheel trailing at the end of the rake, and placed in a position diagonal to the direction in which the machine moves. By means of suitable mechanism, operated through gearing on the axle, the hay, as fast as it is gathered, is delivered at the side of the rake and deposited on the ground in the form of a windrow.



Side-delivery Rake.

rake^1, *v. t.* 7. In *turpentining*, to clear combustible material away from (the base of a tree), as a precaution against fire.—8. In *salt-making*, to remove the salt from (the evaporating-pans) to the draining-table.

> After a sufficient amount of salt has collected in the first section of the front pan, it is removed to the "drip" for drainage. This is called drawing or *raking* the pans.
> *Sci. Amer. Sup.*, Oct. 3, 1903, p. 23198.

rake-hook (rāk'hůk), *n.* A set of hooks fixed on a bar which is dragged along the bottom of a river or lake so as to catch fish by the body. *N. E. D.*

rake-off (rāk'ôf), *n.* 1. In gambling games, the amount or percentage taken by the house or the banker. Hence—2. An amount or percentage of money taken by a party to a contract or enterprise as his share of the spoils; specifically, a share of money illegally taken in a public enterprise.

raker, *n.* 3. Something superlative of its kind, as a heavy bet (a 'plunge'), or a fast rate of speed. [Slang.]

rake-teeth (rāk'tēth), *n. pl.* A condition in which the teeth do not touch, but are separated one from the other by a more or less considerable interval.

raking-bar (rā'king-bär), *n.* A long wrought-iron rod bent at the end for cleaning out a foundry cupola or melting-furnace after dropping the bottom.

Raku pottery. See ★*pottery.*

râle, *n.*—**Mucous râles.** Same as *moist râles* (which see, under *râle*).—**Râle redux**, returning râle; a crepitant râle heard at the termination of the stage of consolidation in pneumonia.

Ralli-car, -cart (ral'i-kär, -kärt), *n.* [*Ralli*, proper name.] A light two-wheeled driving-trap for four persons, named after the first purchaser (1885). *N. E. D.* [Eng.]

> Of two-wheeled vehicles the Polo-cart and *Ralli-cart* are most in favour.
> *Encyc. Brit.*, XXVI. 607.

rallié (räl-yā'), *n.* [F., pp., of *rallier*, come together, rally. See *rally*^{1}, *v.*] In recent French politics, a member of a group of Catholics, holding monarchical views, who, by advice of the Church authorities, acquiesced in the support of the Republic.

> Leo XIII. published in February 1892 an encyclical, bidding French Catholics accept the Republic as the firmly-established form of government. The papal injunction produced a new political group called the "*Ralliés*," the majority of its members being Monarchists who rallied to the Republic in obedience to the Vatican.
> *Encyc. Brit.*, XXVIII. 487.

rally^1, *v.* I. *trans.* 3. In *boxing*, to attack vigorously.

> Molineux *rallied* him with quickness.
> *Sporting Mag.*, XXXIX. 139. *N. E. D.*

4. In *sporting*, to parry.

> While the others *rallied* his covers.
> *Col. Hawkes*, Diary, I. 12. *N. E. D.*

rally^{1}, *n.* **5.** In *electioneering*, a mass-meeting of a political party: as, a Republican *rally* was held in the town hall.

At the last Presidential Election, at a great Republican *Rally*, there were two speeches made, significant and worthy of note. *N. Y. Tribune*, Dec. 21, 1904.

6. The military signal for rallying: as, to sound the *rally*.

ram^{2}, *n.* **1.** (*g*) In *mech.*, the reciprocating bar or slider which carries the tool-head of a shaper or slotter. (*h*) The plunger of a hydraulic elevator.

R. A. M. An abbreviation (*a*) of *Royal Academy of Music*; (*b*) of *Royal Arch Mason*.

ramada (rä-mä′dä), *n.* [Sp. *ramada*, usually *enramada*, < *enramar*, cover with branches, < *en-* + *ramo*, branch, < L. *ramus*, branch.] In Spanish-speaking countries, a shelter made of branches; a bower of branches.

Each and all of these examples of the Renaissance style of architecture, as it found expression in the valley of the Gila, was provided with a "*ramada*" in front, which at a small expenditure of labor in erecting a few additional upright saplings and cross-pieces, and a covering of cottonwood foliage, secured a modicum of shelter from the fierce shafts of a sun which shone not to warm and enlighten, but to enervate and kill.
Bourke, On the Border with Crook, i.

ramarama (rä″mä-rä′mä), *n.* [Maori.] In New Zealand, *Myrtus bullata*, a shrub belonging to the myrtle family, having opposite, broadly-ovate leaves, pale-pink flowers, and black berries. The name is often corrupted into *grama*. It is sometimes cultivated in greenhouses.

ramate (rā′māt), *a.* [L. *ramus*, branch, + *-ate*^{1}.] In the trophi of rotifers, having the rami crossed by two or three teeth, the fulcrum rudimentary and the manubria absent.

rambler, *n.* **2.** A variety of rose, which clambers freely: as, the crimson *rambler*.

ram-block (ram′blok), *n.* *Naut.*, an obsolete name for a deadeye.

rambunctious, *a.* **2.** Violent but satisfactory; goluptious. Also *rambunkshus*. [Slang.]

"What happens if he upsets?"
"The petrol will light up and the boiler may blow up."
"How *rambunkshus*! And —" Pyecroft blew a slow cloud.
R. Kipling, Steam Tactics, in Traffics and Discoveries, [p. 166.

R. A. M. C. An abbreviation of *Royal Army Medical Corps*.

ramdown (ram′doun), *n.* A steep declivity in a logging-road, upon which boughs (or hay) are placed, in winter, to check the movements of the loaded sleds. [Maine.]

Dolefully and silently they traversed wastes of splintered devastation, blocked *ram-downs*, choked twitch-roads, and hideous snarls of cross-piled timber.
Holman Day, King Spruce, p. 197.

rame (rām), *n.* [F. *rame*, < L. *ramus*, branch.] A branch. *Bannister*, Hist. Man, viii. 109. *N. E. D.*

The foles, languescent, pend from arid *rames*.
O. W. Holmes, Æstivation.

ramekin, *n.* **2.** The case or mold in which a ramekin is baked and served: also *ramekin-mold* or *-case*.

First buy a dozen *ramekins* to bake your Parmesan in.
Dainty Luncheon Dishes, p. 28.

ramental (rạ-men′ta̤l), *a.* [NL. *ramentum* + *-al*^{1}.] Of or pertaining to ramentum: specifically, in *paleobot.*, characterizing the copious flattened hairs or elongated scales which constitute most of the armor of silicified cycadean trunks. See ★*armor*, 5. The term is applied to the scales of ferns and other plants whether living or fossil.

ramentiferous (rā-men-tif′e̤-rus), *a.* Of the nature of or producing ramenta.

Rameseum (ram-e-sē′um), *n.*; pl. *Ramesea* (-ạ̈). [Also *Ramesseum*; NL. *Rameseum*, < *Rameses* + *-eum*.] In *Egypt. antiq.*, a monument to a king of the Rameside dynasty, especially that to Rameses II. at Thebes in Egypt.

rameta (ra-mē′tạ̈), *n.* [Marathi *ramita*.] A small tree of southern India and Ceylon, *Gnidia eriocephala*, belonging to the family *Daphnaceæ*. The acrid, poisonous bark yields a fiber used for cordage.

ramiferous (rạ-mif′e̤-rus), *a.* [L. *ramus*, branch, + *-ferous*.] Bearing branches.

ramigerous (rạ-mij′e̤-rus), *a.* Same as ★*ramiferous*.

ramming-blocks (ram′ing-bloks″), *n. pl.* Plaster or metal molds used as master-molds from which the casting-molds are made, instead of employing a loose pattern.

ramon (rä-mōn′), *n.* [Sp. *ramon*, a branch-tip, < *ramo*, branch.] In Porto Rico, *Trophis racemosa*, a low milky tree belonging to the *Moraceæ*. Its bark, sold in the drug markets of the island, is taken in the form of a decoction by women to stop lactation.

ramoncillo (rä-mōn-thēl′yō), *n.* [Sp. *ramoncillo*, dim. of *ramon*, a branch-tip.] In Porto Rico, a name of *Trophis racemosa*. Also called ★*ramon* (which see).

ramp, *v.* **I.** *intrans.* **5.** In *arch.*, to ascend or descend from one level to another: said of a wall.—**6.** To be greedy, and noisy; to rampage.

They 're [recruits] crammed wid bull-mate till they fairly *ramps* wid good livin'.
R. Kipling, The Taking of Lungtungpen, in Indian [Tales, p. 601.

II. *trans.* **3.** *Mil.*, to make ramps on, as a bank or wall; furnish with ramps.

ramp, *n.* **9.** An inclined traveling platform or carrier for transferring freight from a boat to a dock or warehouse. It is essentially a hinged landing-bridge, in which one portion of the surface of the bridge is covered by a fixed flooring, while the rest is formed by the upper surface of an apron-conveyer covered with wooden slats. The men and trucks are carried upward on the conveyer and the men walk down the fixed floor with the empty trucks. In loading from the dock to an upper deck of the boat, or at high tide, the motion of the conveyer is reversed. The inshore end of the ramp is pivoted and the outboard end is suspended by chains (assisted by counterweights) from the dock-structure to allow for adjustment to the changes in tide level. See ★*conveyer*, 4, with cut.

rampager (ram-pā′jėr), *n.* One who rampages; a violent, riotous, boisterous person.

ramper^{3} (ram′pėr), *n.* [Probably a corruption of *lamprey*.] The lamprey. Also *ramper-eel*. *N. E. D.*

ramper-eel (ram′pėr-ēl), *n.* See ★*ramper*^{3}.

rampick, rampike, *n.* **2.** A tree broken off by wind, with a splintered end on the portion left standing.

rampion, *n.*—**German rampion,** the evening primrose, *Œnothera biennis*.

ram-pump (ram′pump), *n.* **1.** A plunger pump.—**2.** A water-ram.

Ram-Ram (räm′räm′). [Hind. *Rām, Rām*, the name repeated as an exclamation or salutation, of *Rām*, Skt. *Rāma*, a Hindu deity.] A common salutation between Hindus, equivalent to 'good morning' or the like: originally an invocation of Rama.

ram-reel (ram′rēl), *n.* A stag-dance on shipboard. [Nautical slang.]

rams, rammes (rämz), *n.* Same as ★*ramsch*.

ramsch (rämsh), *n.* [G. *Ramsch*, a miscellaneous heap of goods, a job lot (*im Ramsch*, in the lump, in bulk), also a game, < F. *ramas*, a confused heap, < *ramasser*, heap up, < *re-* + *amasser*, heap up. See *amass*.] A card game, a mixture of euchre, spoil-five, and division loo. Also *rams* or *rammes*.

The German game *Ramsch* differs from Rounce in the following particulars: 1st. The game is played with a pack of thirty-two cards, the same as Euchre. 2nd. A player is not compelled to lead trumps if he has already done so twice. 3rd. If a player holds no trumps, and elects to play his hand, trusting to make a trick in good cards of other suits, he may, in his proper turn, lead his poorest card, face down, which card represents a trump, and such a lead calls for a trump from every player who holds one. In all other particulars *Ramsch* is identical with the American game of Rounce. *Amer. Hoyle*, p. 325.

Ramsden disk. Same as *interfusion* ★*disk*.

ram's-horn, *n.* **4.** A form of double hook used on cranes which do light and speedy work. It enables a chain sling to be easily and quickly caught, but is not so strong as the single hook, since the stress does not come into line with the hoisting-chain without side-strain. [Eng.]

ramular (ram′ū-lär), *a.* [L. *ramulus*, a small branch, + *-ar*^{3}.] Pertaining to branches.

Jeffrey considers the spaces between the internodal strands as gaps in an originally continuous cylinder, comparable to the large foliar gaps found in the cylindrical stele of the ferns, or the *ramular* gaps, occurring where branches are given off, in the lycopods.
Amer. Nat., May, 1905, p. 281.

Ramularia (ram-ū-lā′ri-ạ̈), *n.* [NL.; so called in allusion to the tubes of the lateral line, < L. *ramulus*, a little branch. See *ramulus*.] A genus of flounders found in rather deep water, in the Gulf of California.—**2.** A genus of hyphomycetous fungi having simple or sparingly branched conidiophores arising from the stomata of the host-plant and bearing septate light-colored conidia at the tips. Over 200 species have been described. All are parasitic and some attack cultivated plants, causing leaf-blight. *R. rufomaculans* causes leaf-blight of buckwheat.

ramus, *n.*—**Rami communicantes,** branches of communication between the sympathetic and spinal nerves.—**Ramus horizontalis,** the posterior part of the Sylvian fissure in the brain.—**Ramus hyomandibularis,** the hyomandibular branch of the seventh cranial nerve, supplying in *Chimæra monstrosa* the hyomandibular canal.—**Ramus mandibulæ,** each half or side of the mandible.—**Ramus ophthalmicus profundus,** the deep ophthalmic branch of the fifth cranial nerve.—**Ramus ophthalmicus superficialis,** the superficial ophthalmic branch of the seventh cranial nerve.

ranal (rā′na̤l), *a.* [*Ranal(es)*.] Of, pertaining to, or belonging to the *Ranales*, an order of dicotyledonous plants. See *Ranales*.

This, however, does not entitle us to assume the origin of Monocotyledones from Dicotyledones, although there is manifestly a temptation to connect helobic forms of the former with *ranal* ones of the latter.
Encyc. Brit., XXV. 440.

ranch^{2}, *n.* **1.** Also, a permanent Indian village.
3. A small hut or house in the country, not necessarily a cattle-breeding establishment. [U. S.]

rancho, *n.* **2.** A hut or cluster of huts where travelers can be accommodated, like the Dak bungalows of India.

The *Rancho* represents the "Traveller's Bungalow," lacking, however, cot, chair, and table, Thugs and Dacoits.
R. F. Burton, Highlands of Brazil, I. 102.

rancidity, *n.* The chief cause of rancidity in fats is hydrolysis of the glycerides, the elements of water being taken up and the free fatty acids and glycerin being formed. The favoring conditions of the change are the presence of moisture and atmospheric oxygen, exposure to light, and contact with albuminoid and mucilaginous impurities.

Rancocas formation. See ★*formation*.

Rancooria (ran-kö′ri-ạ̈), *n.* [NL. (Wight, 1906), from *rancooran*, one of the native names in Australia.] A genus of trees of the family *Meliaceæ*. See *Owenia*, 1.

randem (ran′dem), *adv.* [*random*, on the analogy of *tandem*.] With three horses harnessed tandem. Also *randem-tandem*. *N. E. D.*

His fellow-students . . . who drove tandem and *random* in great perfection, and were connoisseurs in good inns, had taught him to drink deep ere he departed.
Peacock, Nightmare Abbey, i.

randem (ran′dem), *n.* [*randem, adv.*] A turnout driven randem. Also used attributively. See the extract.

'A *randem* team.' That *randems* should be uncommon is natural enough.
Ill. Sport. and Dram. News, Feb. 10, 1883, p. 542. [*N. E. D.*

randing (ran′ding), *n.* A method of weaving basketwork for gabions.

Randlord (rand′lôrd), *n.* [*Rand*^{2} + *lord*: in allusion to *landlord*.] A landlord or landowner in the Rand (in full, Witwaters rand) in the Transvaal Colony, South Africa. [Colloq.]

Even were the reverse the case one thing is certain. If the *Randlords* are unable to exercise proper supervision over their labourers so that they menace the white population, they will have to go. The pockets of the *Randlords* might suffer from their exclusion, but the rest of South Africa could stand that. *Newspaper*.

random^{2}, *n.* (*c*) In *mining*, the direction of a rake-vein.

Random group. See ★*group*^{1}.

rang^{2}, *n.* **2.** In *petrog.*, in the quantitative system of classification, a division of igneous rocks lower than the 'order,' based on the character of the chemical bases in the preponderating group of standard minerals in each class. See ★*rock*^{1}.

So far, the possible minerals have given a position to the rock. We may, however, consider the "general character of the bases in the minerals of the preponderant group in each class," which enables us to assign a "*rang*" to the same rock. *Nature*, April 23, 1903, p. 579.

rangatira (ran-gä-tē′rä), *n.* [Maori.] In New Zealand, a chief; a master or mistress; hence, a gentleman or lady; an aristocrat. *E. E. Morris*, Austral English.

range, *v.* **I.** *trans.* **7.** *Naut.*, to sail parallel to: as, to *range* the coast.

II. *intrans. v.* **6.** (*b*) To find the range; determine the range.

For harbour defence, . . . an accurate range-finder is of first importance. This is largely the case because "*ranging*" cannot be resorted to in the same manner as in the field, where the targets are comparatively motionless. *Encyc. Brit.*, XXXII. 177.

range, *n.*—**Conic range,** in *geom.*, the range formed by the crosses of correlated straights of two coplanar non-copunctal flat pencils, projective but not perspective.—**Cottage range,** a special size and pattern of stove, usually having two ovens and a horizontal flue between.—**Harmonic range,** in *geom.* See ★*harmonic*.—**Perspective ranges** (*geom.*), ranges which are cuts of the same flat pencil.—**Range of conics,** in *geom.*, the assemblage of conics on which are the sides *a, b, c, d* of a given tetragram.—**Range of stability.** See ★*stability*.—**Range of the first degree,** a point row.— **Range of the second degree,** a conic range.— **Range-transmitter and -indicator** (*naval*), instruments connected mechanically or by electric wiring to transmit the range of the object to be fired at from the transmitter in a central position to the indicators in the vicinity of the guns. See ★*indicator*, 1 (*j*) (1).— **Sphere range.** See ★*sphere*.— **To pass over the range,** to die. [Western U. S.]

range-board (rānj'bōrd), *n.* A board which gives distances from a battery to prominent objects in the vicinity.

range-bred (rānj'bred), *a.* Raised on a range: applied to horses so raised, as well as to cattle.

range-finder, *n.*— **Depression range-finder,** an instrument used at sea-coast forts to determine the distance of an object. The height of the instrument above the water being known and the angle at the object subtended by this height being measured, the corresponding range is read from the instrument.— **Horizontal base range-finder,** an instrument used, at one end of a horizontal base-line, to make observations which, together with those made by the companion instrument, may be used to determine the distance of an object.

range-grass (rānj'gràs), *n.* See ★*grass*.

range-horse (rānj'hôrs), *n.* A horse which has been brought up on a stock-range.

> However we may look upon the *range-horse* personally, we must admit that the foundation is there for a very excellent horse stock. *Market Classes of Horses*, p. 31.

range-indicator (rānj'in''di-kā-tọr), *n.* See ★*indicator*, 1 (*j*) (1).

range-pole (rānj'pōl), *n.* In *surveying*, one of two or three slender rods or staffs (prominently painted or marked, and usually sharpened at one end or provided with a pointed shoe or with a tripod by which it may be placed firmly in or on the ground in a vertical position) used for the purpose of prolonging a straight line by setting the third pole or locating a point in the straight line through the other two prolonged.

> It seemed best to depend upon the sextant for this work. It was believed that greater accuracy could be secured than with the compass, and that it would be more practicable and less expensive than the *range-pole* method. *Science*, Jan. 10, 1902, p. 57.

Range-pole method. (*a*) In *hydrographic surveying*, the method of locating or marking a point offshore by establishing two ranges, each located by two range-poles or range-marks, in such position and direction that the two ranges intersect at the offshore point to be marked. (*b*) In *rough surveying*, a method by which one may place himself on a straight line between two distant visible points, by moving two range-poles into successive positions until the straight line through the two poles passes through the two distant points simultaneously.

ranger, *n.* **9.** In some parts of the United States, a county officer who takes charge of stray animals. See the extract.

> In Mississippi the coroner is also the county *ranger*, and performs the duties of that office. (It is the duty of the county *ranger* to take charge of stray horses, mules, jacks, cattle, sheep, or hogs.) Buck, Med. Handbook, III. 205.

10. A steer or horse raised on a cattle-range.

> The best *rangers* I ever saw on the Chicago market were high-grade Short-horns from Montana.
> 13th Bien. Rep't. Kan. State Board of Agri., 1901–2, [p. 15.

Rangoon rubber. See ★*rubber*.

rangy, *a.* **1.** (*b*) Said of an animal, especially a cow, which has a long and small barrel or body and narrow hind quarters, with unusual space between the front and hind legs. A rangy cow may be good for beef, but is poor for dairy purposes.— **3.** Mountainous. *E. E. Morris*, Austral English.

Ranikot beds. See ★*bed*^{1}.

rank^1, *a.* **13.** Unmanageable: said of a race-horse on the track. [Colloq.]

rank^2, *n.*— **Lineal rank,** the rank of an army officer in his branch of the service: as, the *lineal rank* of the officers of cavalry.— **Open ranks** (*milit.*), a line of two ranks with a distance of three paces between ranks.— **Rank of a determinant or matrix or system** of pq quantities. a_{ik} ($i = 1, 2 \ldots p$; $k = 1, 2 \ldots q$) is r if r is the greatest number for which not all determinants made from r rows and r columns of a_{ik} vanish.— **Relative rank.** (*a*) See *rank*^{2}, 4 (*a*). (*b*) Specifically, rank in the United States army according to date of last commission.

rank^2, *v. t.* **7.** In *logging*, to haul and pile regularly: as, to *rank* bark or cord-wood.

rank^3 (rangk), *n.* A name proposed by Perry for the thermodynamic quantity, $\int \frac{dH}{\theta}$.

> The name *Rank* is used by many English speaking people for the British unit of entropy, and it even appears sometimes in examination papers; it is most appropriate. *Nature*, April 14, 1904, p. 562.

ranked (rangkt), *a.* Arranged in ranks; having ranks: used in composition: as, a *four-ranked* galley, a galley having four ranks of oars.

ranker, *n.* **3.** A man in the ranks.

> I knew by the turn av his spache whin he was not takin' care to talk rough that he was a gentleman *ranker*.
> *R. Kipling*, 'Love-o'-women,' in Many Inventions, p. 298.

Gentleman ranker, a gentleman serving as an enlisted man in the army.

> A gentleman of England cleanly bred, machinely
> crammed,
> And a trooper of the Empress, if you please.
>
> . . . .
>
> *Gentlemen-rankers* out on the spree,
> Damned from hell to Eternity,
> God ha' mercy on such as we.
>
> *R. Kipling*, Gentlemen-Rankers, in Departmental [Ditties and Ballads and Barrack-Room Ballads, I. 13.

ranket (rang'ket), *n.* Same as *racket*^{2}, 7.

rank-rider† (rangk'rī''dėr), *n.* A highwayman; one who rides recklessly and furiously; also a jockey.

> There are those *rank-riders* of art, that have so spurgalled your lusty-winged Pegasus, that now . . . even only for provender's sake, is glad to shew tricks like Bankes his curtail. *Dekker*, Wonderful Year, Pref.

ranovin (ran'ọ-vin), *n.* [L. *rana*, frog, + *ovum*, egg, + *-in*^{2}.] An albuminous material extracted from frogs' eggs.

rantankerous (ran-tang'kẹ-rus), *a.* [A variant of *cantankerous*.] Cantankerous. [U. S.]

> Senator —— has had one [Christmas gift] coming to him. His "*rantankerous*" friend . . . has been getting it ready for him. *N. Y. Tribune*, Dec. 19, 1905.

Ranula lapidea, a salivary calculus.— **Ranula pancreatica,** a small cyst of the pancreas due to obstruction in one of the excretory ducts.

rapakiwi (rä-pä-kē'vẹ), *n.* [Finnish *rapakiwi*, self-weathering stone, < *rapa*, dregs, grounds, grouts, + *kiwi*, stone.] In *petrog.*, a variety of porphyritic granite, composed of flesh-colored orthoclase, with some oligoclase, smoky quartz, and a little biotite and hornblende. It has large phenocrysts of feldspar, often with circular zones of inclusions. It is used for monumental and building purposes in northern Russia, but falls to pieces upon weathering, hence the Finnish name.

rape-dust (rāp'dust), *n.* A powder made of ground rape-seed, used for manure. *N. E. D.*

raphania (rạ-fā'ni-ä), *n.* [NL., < Gr. ῥαφανίς, radish.] A convulsive disease, resembling ergotism, believed to be due to the eating of the seeds of the wild radish (*Raphanus Raphanistrum*).

raphanol (raf'a-nol), *n.* [Gr. ῥαφανίς, radish, + *-ol*.] A crystalline compound, $C_{29}H_{58}O_4$ (?), found in the black radish, *Raphanus sativus*, and in other crucifers. It melts at 62° C.

raphe, *n.* **3.** In *ornith.*, the groove along the under side of the rachis of a feather. *N. E. D.*

raphis, *n.* **2.** In sponges, a fine needle-shaped spicule having about the same diameter throughout its length.

> A few long slender toxa and one or two sigmata, together with some slender *raphides*, are present.
> *Proc. Zool. Soc. London*, 1900, p. 137.

rapic (rā'pik), *a.* [*rape*^{4} + *-ic*.] Derived from rape-oil.— **Rapic acid,** an acid, $C_{18}H_{34}O_2$, obtained from the oil of rape-seed. It is a liquid.

rapid, *a.* **5.** In *photog.*, said of plates, lenses, and subjects which require short exposure or print rapidly.

> A *rapid* plate is absolutely necessary with such . . . a subject. *The Amateur*, 1902, p. 180.

Rapid transit. See ★*transit*.

rapid-fire (rap'id-fīr), *a.* **1.** Constructed so as to discharge projectiles with rapidity; quick-firing; quick-fire.— **2.** Figuratively, marked by rapid movement of question and answer.— **Rapid-fire gun,** in *ordnance*, a gun having a quick-acting breech-mechanism which can be operated by a single continuous motion of the hand, loaded with fixed ammunition or a metallic cartridge-case, and supported on a gun-mount permitting its easy and rapid manipulation. An *automatic rapid-fire gun* is one in which the firing of the first shot automatically operates the breech mechanism to reload the gun and to fire it automatically as long as ammunition is fed to it. A *semi-automatic rapid-fire gun* is one in which the loading is partly automatic and partly by hand. The largest rapid-fire guns properly so called are of about 5-inch caliber, beyond which size metallic cartridge-cases are not convenient. A larger gun is properly a *quick-fire gun*, though the distinction is not always observed.

Rapier's method. In *nav.*, a system for drawing the great-circle track on a Mercator's chart by noting the maximum separation in latitude and then drawing through this point a line parallel to the rhumb-line between the two places. Having these three points, the track may be freely drawn by hand.

rapist (rā'pist), *n.* [*rape*^{2} + *-ist*.] One who is guilty of rape. [U. S.] *N. E. D.*

rappage (rap'āj), *n.* In *founding*, excess in the size of a casting over the size of the pattern, due to the fact that the pattern has been rapped too hard when drawing it from the sand, so that the hole it left in the mold was larger than the pattern itself.

Rappahannock series. See ★*series*.

rapper-dandies (rap'ėr-dan''diz), *n. pl.* **1.** The American wintergreen, *Gaultheria procumbens*. —**2.** The bearberry, *Arctostaphylos Uva-ursi*.

rapping, *n.* **2.** The striking of a foundry pattern while withdrawing it from the mold, to release the grip of the sand and prevent the sand from sticking to it. The blows are struck on an iron bar which is inserted in the pattern for that purpose.

rapping-bar (rap'ing-bär), *n.* A loosening-bar; a bar, one end of which is inserted in a foundry pattern, to jar the pattern while withdrawing it. See ★*rapping*, *n.*, 2.

rapping-hole (rap'ing-hōl), *n.* A hole in which to insert the rapping-bar in a foundry pattern.

rapping-mallet (rap'ing-mal''et), *n.* In *founding*, a light, round-faced wooden mallet used for striking patterns to loosen them from the sand during their withdrawal from the mold.

rapping-plate (rap'ing-plāt), *n.* An iron or brass plate set in the face of a foundry pattern and provided with a hole in which to insert the rapping-bar. If a hole for the lifting-rod is also provided, the plate is called a *rapping-and-lifting plate*.

rappist^2 (rap'ist), *n.* [*rap*^{1}, *v.*, + *-ist*.] **1.** One who is a believer in the rapping of spirits. *N. E. D.*—**2.** The spirit who is believed to rap. *N. E. D.*

rapport, *n.*— **Rapport à succession,** in *French law* (Louisiana), the giving back to the estate of a decedent of all property which may have been previously given by him to any of his heirs, in order that there may be an equal division among all the heirs.

rapt^3, *n.* **3.** A carrying off; an abduction.

> In the sixteenth and seventeenth centuries it [maiden-stealing] is more common than ever, and in the first half of the nineteenth century it was more in vogue still. The author remembers two *rapts* in his own childhood, in 1878 and in 1879.
> *M. V. Smiljanic*, in Amer. Anthropologist, Oct.–Dec., [1902, p. 777.

raptatorial, *a.* **2.** Specifically, in *ichth.*, hooked inward at the tips: said of the teeth of minnows, etc. *Jordan and Evermann*, Amer. Food and Game Fishes, p. xxxvii.

rapture (rap'ṭūr), *v. t.*; pret. and pp. *raptured*, ppr. *rapturing*. To enrapture.

rapturize (rap'ṭūr-īz), *v. i.*; pret. and pp. *rapturized*, ppr. *rapturizing*. To feel or speak ecstatically. [Rare.] *N. E. D.*

> I will not *rapturise* again but I give myself great credit in not being crazy out of pure delight . . . the conviction that I am walking in the New World is even yet marvellous in my own eyes.
> *Darwin*, in Life and Letters, I. 232.

Rapuntium (rạ-pun'ti-um), *n.* [NL. (Miller, 1759, adopted from Tournefort, 1700), apparently < *Rapunculus*, a related genus of Tournefort (now known as *Phyteuma*), a diminutive of *Rapa*, an early botanical name of the turnip, < Gr. ῥάπυς, the turnip.] A genus of plants of the family *Campanulaceæ*. See *Lobelia*, 2.

Rare earth. See ★*earth*^{1}.— **Rare-earth metals.** See ★*earth*^{1}.

rarefactional (rar-ẹ̄-fak'shọn-ạl), *a.* [*rarefaction* + *-al*^{1}.] Of or pertaining to rarefaction; pertaining to the density and pressure of a gaseous medium and to the resulting changes in its properties.

rariora (rā-ri-ō'rạ̈), *n. pl.* [L. *rariora*, pl. of *rarius*, neut. of *rarior*, compar. of *rarus*, rare.] Books, coins, objects of art, and the like, which are rather rare, or unusually rare. *Athenæum*, Dec. 17, 1904, p. 829 (advt.).

Raritan clay, formation, group. See ★*clay*, etc.

R. Art. An abbreviation of *Royal Artillery*.

R. A. S. An abbreviation (*a*) of *Royal Agricultural Society*; (*b*) of *Royal Asiatic Society*; (*c*) of *Royal Astronomical Society*.

rascacio (räs-kä'sẹ̄-ọ̄), *n.* [Sp. *rascacio*, otherwise *rescaza*.] A scorpion-fish, *Scorpæna Plumieri*, of Florida and the West Indies. The name is also applied to other species of *Scorpæna*. *Jordan and Evermann*, Fishes of North and Middle Amer., p. 1848.

rascalry (ràs'kạl-ri), *n.* [*rascal* + *-ry*.] **1.** A rascally action.—**2.** Rascals collectively.

> The writer who "stood back among the *rascalry*," looks on with grim pleasantry.
> *N. and Q.*, 9th ser., VII. 192.

rasciera (rä-sē-ā'rä), *n.* [See *rasher*^{2}.] A scorpænoid fish, *Sebastodes miniatus*, of the coast of California.

rase¹, *n.* 2. An imperfection in velveteen or other pile fabric after the pile is cut.

rase-cut (rās′kut), *n.* [*rase*¹, *v.*, + *cut.*] A certain cut of the pile in velveteen or other pile fabric. Also *race-cut.*

rase-end (rās′end), *n.* [*rase*¹, *v.*, + *end.*] Same as ★*rase*¹, *n.*, 2. Also *race-end.*

rash¹, *a.* 5. Quick, brisk, hot; causing too quick a result: as, a *rash* fire. [Colloq.]

rash⁵, *n.*— **Flannel rash**, a reddish, sometimes miliary, eruption on the body, due to irritation by the underclothing.— **Medicinal rash**, an eruption on the skin occasionally following the ingestion of certain drugs. Also called *drug eruption.*

rash⁷ (rash), *n.* [Imitative.] A crisp rustle; a crackle. [Rare.]

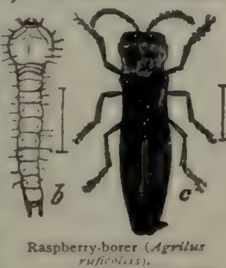
> I tell thee Jack, the whisking of a Silk-Gown, and the *rash* of a Tabby-Petticoat, are as comfortable sounds to one of these rich citizens as the chink of their Pieces of Eight. *Dryden*, An Evening's Love, i. 1.

raspador (räs-pä-dōr′), *n.* [Sp., a rasp, < *raspar*, rasp, *v.*] A machine for extracting the fiber of Sisal hemp leaves. It is a 54-inch wheel, with a capacity of 500 pounds of dry fiber a day of 10 hours.

raspatorium (ras-pa̤-tō′ri-um), *n.*; pl. *raspatoria* (-ä̤). [NL.] Same as *raspatory.*

raspberry, *n.*— **Cane-blight of raspberry.** See ★*cane-blight.*— **Native raspberry.** See *wild* ★*raspberry* below.— **Raspberry bud-beetle.** See ★*bud-beetle.* — **Raspberry bud-worm**, the larva of the raspberry bud-beetle (which see, under ★*bud-beetle*).— **Raspberry cane-borer.** See ★*cane-borer.*— **Raspberry fruit-worm.** See ★*fruit-worm.*— **Raspberry geometer.** See ★*geometer.*— **Raspberry leaf-roller.** Same as *neat strawberry leaf-roller* (which see, under ★*leaf-roller*).— **Raspberry plume-moth.** See ★*plume-moth.*— **Raspberry saw-fly.** See ★*saw-fly.*— **Wild raspberry.** (*a*) In Australia, a large-fruited raspberry, *Rubus rosæfolius*, found also in Asia and Africa. It is called also *Himalayan raspberry.* (*b*) In Tasmania, a native species, *Rubus Gunnianus*, peculiar to the country.

raspberry-borer, *n.* (*b*) The larva of a sesiid moth, *Bembecia rubi*, which channels the lower part of the cane to the root. (*c*) The red-necked *Agrilus*, a buprestid beetle, *Agrilus ruficollis*, whose larvæ, boring in the canes, form the so-called 'gouty galls.'



Raspberry-borer (*Agrilus ruficollis*).
b, larva; *c*, beetle. Magnified.

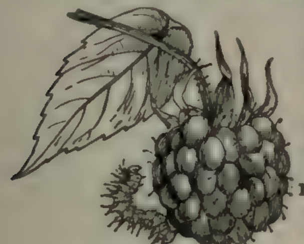
raspberry-bug (räz′ber-i-bug), *n.* The flea-like negro-bug. See *negro-bug* and ★*strawberry-bug*, 2.

raspberrying (räz′ber-i-ing), *n.* In *billiards*, playing the spot-stroke: so called because it engages the red ball only. [Slang.]

raspberry-rust (räz′ber-i-rust″), *n.* See ★*rust*¹.

raspberry-slug (räz′ber-i-slug″), *n.* The larva of the raspberry saw-fly.

raspberry-spanworm (räz′ber-i-span″wėrm), *n.* The larva of an American geometrid moth, *Synchlora ærata*, whose larvæ feed at first on the tender leaves, and later on the fruit, of the raspberry and the blackberry.



Raspberry-spanworm (*Synchlora ærata*), natural size.

raspite (räs′pīt), *n.* [Named after Mr. *Rasp*, who discovered the Broken Hill mines.] Lead tungstate ($PbWO_4$), like stolzite in composition but monoclinic in crystallization: found at the Broken Hill mines, New South Wales.

rasta (räs-tä′), *n.* and *a.* [An abbreviation of F. *rastacouère*, which see.] **I.** *n.* A rastacouère. [Slang.]

> You were a gentleman, not a *rasta*, like the others. *G. W. Carryl*, Transgression of Andrew Vane, xv.

II. *a.* Underbred; showy; parvenu. See ★*rastacouère.* [Slang.]

> A horrid, glossy creature, in a dress suit, with a top hat that was much too shiny, and a huge waxed moustache; . . . an undersized, dark, Hebraic-featured man, screamingly *rasta.* *H. Harland*, Comedies and Errors, p. 157.

rastacouère (räs-tä-kwãr′), *n.* [Also *rastaquouère*; F. for **rastracouère*, < Am. Sp. *rastracuero*, lit. 'drag-leather,' applied to a parvenu who has made a fortune in the leather business. *Hatzfeld and Darmesteter.*] One, especially a foreigner, who lives extravagantly and dresses showily, and whose social antecedents and actual financial status are unknown. [French Slang.]

> This is the rowdy, reactionary Paris, ever on view, which disapproves of the pope, and would assuredly array itself in garments of gaiety if M. Loubet were assassinated. This is the Paris which sneers at *rasta-quouères*, and is ever on the lookout for American heiresses for its needy titled sons. *H. Lynch*, French Life in Town and Country, ii.

rastellum (ras-tel′um), *n.*; pl. *rastella* (-ä̤). [NL., neut. (L. *rastellus*, masc.), dim. of L. *rastrum*, a rake.] A minute rake-like arrangement of spines on the mandibles of certain spiders. *Proc. Zool. Soc. London*, 1898, p. 506.

Rastrinus (ras-trī′nus), *n.* [NL., < L. *rastrum*, a rake.] A genus of deep-water cottoid fishes, found in the North Pacific.

rat¹, *n.* 7. *pl.* An exclamation used to indicate incredulity or ironical disagreement with a statement; humbug. [Slang.]

> "My cousin has lessons along with the younger children."
> "*Rats!*" declared Vic, smiling broadly; "she sees that they do theirs — that 's more like it." *Crockett*, Cinderella, xxvii.

Forest rat, a New Zealand name of the black rat, *Mus rattus*, which was introduced there at a very early date.

ratafia, *n.* 3. A flavoring essence of which the principal ingredient is benzoic aldehyde or oil of bitter almonds.

ratal (rā′ta̤l), *n.* [*rate*² + *-al*².] The ratio at which rates are assessed; also, the amount of rates assessed.

> The owner would also be placed in the unfortunate position that whereas by avoiding smoke he had conferred as much benefit upon all his neighbours as upon himself, he would have to pay the whole fine of increased *ratal* himself, and would still have all the disadvantages of his neighbours' smoke. *Nature*, Oct. 30, 1902, p. 670.

ratanhia-red (rä-tän′yä̤-red), *n.* [NL. *ratanhia*, prop. **ratania*, Braz. Pg. *ratanhia*, prop. *ratanha*, Sp. *ratañia*, < Peruv. *ratañia*, the name of a plant. See *ratany.*] A reddish-brown amorphous powder, $C_{26}H_{22}O_{11}$ or $C_{20}H_{18}O_8$, formed by treating ratanhia-tannic acid with dilute sulphuric acid.

ratanhia-tannic (rä-tän′yä-tan″ik), *a.* Derived from ratanhia-root or ratany.— **Ratanhia-tannic acid**, a red amorphous glucoside, $C_{20}H_{20}O_9$, found in ratanhia-root, *Krameria triandra.* Dilute sulphuric acid converts it into ratanhia-red.

ratch¹, *v. t.* 3. To cut; to hack; to notch.

> One of these screws, which was intended for *ratching* or cutting the teeth, was notched across the threads, so that the screw, when pressed against the edge of the wheel and turned round, cut in the manner of a saw. *Smithsonian Rep.*, 1890, p. 733.

ratchet, *n.* 2. In *printing*, a notched straight blade of brass which rotates the pinions attached to the movable clamps of an electrotype plate mounted upon a block.

ratchet-bar (rach′et-bär), *n.* A straight or slightly curved bar having sloping teeth along one side against which a dog or pawl acts, thus permitting motion in one direction and not in the other.

ratchet-crank (rach′et-krangk), *n.* A crank fitted with a pawl or dog which works on a ratchet, so that the shaft to which it is attached may be turned by an intermittent or oscillating motion of the crank.

ratchet-feed (rach′et-fēd), *n.* 1. A feeding motion derived by the motion of a pawl and ratchet.—2. A feeding device or feed-gear consisting essentially of a ratchet and pawl.

ratchet-gear (rach′et-gēr), *n.* A gear having ratchet-teeth with which a pawl engages; any gear used as a ratchet, or operated by a pawl.

ratchet-pawl (rach′et-pâl), *n.* A catch, click, dog, or detent used to engage the teeth of a ratchet-wheel.

ratchet-screw (rach′et-skrö), *n.* A screw having a buttress thread, or one whose section is that of the tooth of a ratchet-wheel.

ratchet-teeth (rach′et-tēth), *n. pl.* Teeth having one side radial, or nearly so, and the other side much inclined. A pawl, dog, or detent can slip over the inclined side but will catch on the radial side, thus permitting the wheel having such teeth to revolve in one direction only.

ratchet-toothed (rach′et-töțht), *a.* Having teeth which are not symmetrical on their front and back faces, but are adapted to receive and be constrained by a pawl or dog which falls into the spaces between them, so as to permit the wheel to turn in one direction, but not in the other. The front face is nearly radial and straight, while the backs are curved or inclined at an acute angle from the tangent to the wheel at the point of the tooth.

Ratchet-wheel burner. See ★*burner.*

rate†¹ (rāt), *n.* [*rate*¹, *v.*] A reproof; specifically, in *hunting*, a reproof to a dog.

> As long as they will stop at a *rate*, they are not chastised. *P. Beckford*, Hunting, p. 95. *N. E. D.*

rate², *n.*— **At that** (or **this**) **rate**, under these circumstances; if this goes on; etc. [Colloq.]

> *At this rate* overspeculation will be followed by declines, but there is a vast difference between a speculative reaction and a panic. *Boston Transcript*, Nov. 27, 1903.

Ground rate, a special local rate of fare or freight on a railway. *Stand. Dict.*— **Traveling rate.** See the extract.

> Thanks to the chronometer watches which were kindly lent me by the Royal Geographical Society, and to "*travelling rates*," having been several times ascertained, good chronometric values for longitude were obtained. By "*travelling rates*" I mean rates while travelling between places, the difference in longitude of which was determined trigometrically as we went on. This method of obtaining *travelling rates* has, I believe, never been used by explorers in unknown and unsurveyed country. *Geog. Jour.* (R. G. S.), XVI. 154.

rate², *v. t.* 5. (*a*) To fix at a rate of transportation: as, freight was *rated* as low as possible. (*b*) To convey or transport at a given rate.

> Large quantities of freight have been *rated* through to New York . . . by other lines. *Chicago Times*, Mar. 12, 1881. *N. E. D.*

raté (rä-tā′), *a.* and *n.* [Fem. *ratée*; F. pp. of *rater*, miss fire, fail to hit, < *rat*, rat.] **I.** *a.* Having missed fire, literally or figuratively; having failed.

> A dress-rehearsal to empty benches is a demonstration *raté*, because the third side of the triangle is wanting; author and actors alike are aiming their blows at a dark and dismal nothingness. *Bookman*, Sept., 1902, p. 45.

II. *n.* One who has failed; a person who is a failure.

> The unappreciated talent of the decayed actor, her father, . . . one of those *ratés* who furnish the mark for the keenest shafts of irony in [Daudet's] "Jack" . . . and . . . the mean spirit of D'Argenton, the poet, who, with his attendant group of *ratés*, the failures of literature and art, forms a sort of mutual admiration club, envious only of recognized talent. *B. W. Wills*, Modern French Lit., p. 476–77.

rateau (rä-tō′), *n.* [F., < L. *rastellus*, a rake. See ★*rastellum.*] Same as ★*rastellum.* *Proc. Zool. Soc. London*, 1896, p. 735.

ratel² (rä′tel), *n.* See *rotl.*

rate-limit (rāt′lim″it), *n.* In the *postal service*, the limit of weight allowed for any single rate of postage: as, the *rate-limit* for first-class mail-matter (sealed letters) is one ounce for two cents.

rat-fall (rat′fâl), *n.* A trap into which rats fall and are caught or killed. See the extract.

> A most excellent "*rat-fall*" may be made of a strong barrel, about half full of water. The cover should be placed on a pivot and well baited. Hundreds of rats may be caught with this device. *Yearbook U. S. Dept. Agr.*, 1896, p. 164.

rat-flea (rat′flē), *n.* Any one of several species of *Pulicidæ* found on rats. The following species occur on the Norway rat: *Ceratophyllus fasciatus*, *Ctenophthalmus bidentatiformis*, *Ctenopsyllus musculi*, and *Pulex brasiliensis.* The following are found on the roof-rat or black rat, *Mus rattus*: *Ctenopsyllus mexicanus*, *C. musculi*, and *Pulex brasiliensis.* They are specifically mentioned on account of their importance in the conveyance of the bubonic plague.

> The best article on "The Spread of Plague from Rat to Rat, and from Rat to Man by the *Rat-flea.*" *Nature*, Aug. 21, 1902, p. 397.

Rathbunella (rath-bu-nel′ä̤), *n.* [NL., named after Richard *Rathbun*, at one time connected with the U. S. Fish Commission.] A genus of fishes of the family *Bathymasteridæ*, found in rather deep water on the California coast.

rathite (rä′tīt), *n.* [Named after Professor G. vom *Rath* of Bonn, a German mineralogist.] A sulpharsenite of lead, analogous in composition to jamesonite, from the dolomite of the Binnenthal, Switzerland.

rathskeller, ratskeller (räts′kel-ėr), *n.* [G., < *rath*, a council, + *keller*, cellar.] The cellar of a town hall; a public wine-cellar; hence, a room, or rooms, below the level of the street, in which wine and beer are sold.

Ratibida (ra̤-tib′i-dä̤), *n.* [NL. (Rafinesque, 1818), of unknown significance.] A small genus of American composite herbs, two or three of which are garden-plants. It is closely allied to *Rudbeckia.* *Ratibida columnaris* is the leading cultivated species, particularly the variety *pulcherrima* (*Obeliscaria pulcherrima* of former seed-lists), native to prairies of the midcontinental region. This plant is two to three feet tall, with narrowly divided leaves, and yellow or purple rays on the terminal long-receptacled heads.

ratification, *n.*—**Judicial ratification,** in *Scots law,* an acknowledgment by a married woman before a judicial officer that a disposition or conveyance of her heritable property has been made of her own free will and without fear or coercion.

rating-badge (rā'ting-baj), *n.* A badge worn by a petty officer, sewed on the outside of the right or left sleeve (according as he belongs to the starboard or port watch) midway between the elbow and shoulder. It serves to indicate his rank and the particular specialty to which he is assigned, as master-at-arms, quartermaster, electrician, machinist, etc. [U. S.]

ratio, *n.*—**At a geometrical ratio,** in geometrical progression.—**Capacity ratio.** See ★*capacity.*—**Cross ratio,** anharmonic ratio. See *anharmonic.*—**Double ratio,** cross ratio; anharmonic ratio. See *anharmonic.*—**Exponent of a ratio.** See ★*exponent.*—**Geometrical ratio,** ordinary ratio; the relation between two quantities expressed by dividing one by the other.—**Mendelian ratio,** the ratio of 1:3 exhibited by the grandchildren of a cross between two parent races of pure blood which differ from each other with respect to some one characteristic. See *ancestral* ★*inheritance.*—**Metius's ratio** (for π), $355/113 = 3.1415929$: given in 1585 by Adriaan Anthoniszoon, father of Adrian Metius.—**Nutritive ratio,** in *stock-feeding,* the ratio between the digestible protein and the digestible fats and carbohydrates in a balanced ration. The former is always a moderate fraction of the latter, for example, for a dairy cow, about one fifth.—**Poisson's ratio,** in *elasticity,* the ratio of the lateral contraction to the elongation of a solid subjected to longitudinal stress.—**Ratio of transformation,** the ratio of the difference of potential between the terminals of the secondary windings of a transformer or induction-coil to that between the terminals of the primary windings.—**Trigonometric ratios,** sin a, cos a, tan a, cot a, sec a, cosec a.—**Ultimate ratio,** the limit of the ratio of two variables as they approach their limits.—**Velocity ratio,** in *elect.,* the ratio of the electrostatic to the electromagnetic units, numerically equal to the velocity of light.

ratiocinator (rash-i-os'i-nā-tor), *n.* [L., < *ratiocinari.* See *ratiocinate.*] One who ratiocinates; a reasoner.

ratiometer (rā-shi-om'e-tėr), *n.* [*ratio* + Gr. *μέτρον,* measure.] See the extract.

A mechanical device for obtaining rapidly any required set of numbers having the same ratio among themselves as any other given set of numbers. The instrument is known as the "*ratiometer,*" and was designed by Mr. A. E. Munby. It . . . consists of two graduated rules, which can be set at any angle, which with one edge of a T-square form a right-angled triangle. By means of a tongue and groove the base of the triangle slides along the stock of the T-square. *Nature,* Mar. 5, 1903, p. 424.

ration, *n.* 3. In *stock-feeding,* the sum of food regularly supplied to an animal, usually the amount per day. A scientific ration contains in due proportion and amount the essential food ingredients, namely, fats and carbohydrates, which supply heat and working-energy (heat-producers); and protein (nitrogenous substances), which provides for the upbuilding and repair of tissues (flesh-producers). The absolute and relative amounts required are learned from experience and vary with the animal and its occupation. See ★*feeding standard, nutritive* ★*ratio,* and phrases below. A ration is governed not by the actual amount of the ingredients, but by the amount digestible (often much less than the whole), this being determined by experiments the results of which are published in tables. Feeding standards are not now much used for precise calculation.—**Balanced ration,** a ration which embodies a right proportion of digestible protein, fat, and carbohydrates. See ★*ration,* 3.—**Complete ration,** a ration which contains a sufficiency of each essential ingredient. See ★*ration,* 3.—**Narrow ration,** in *stock-raising,* a ration in which there is a large proportion of protein.

Where the percentage of digestible crude protein is large in comparison with that of the other digestible constituents, it is spoken of as a *narrow ration.*
Yearbook U. S. Dept. Agr., 1897, p. 489.

Spirit ration (*naval*), a half pint of distilled spirits (rum or whisky) per day formerly allowed as part of the daily rations. The spirit ration in the United States navy was abolished in 1862.—**Wide ration,** in *stock-raising,* one in which the proportion of fats and carbohydrates is large.

rational. I. *a.*—**Rational curve.** Same as *unicursal curve* (which see, under *unicursal*).—**Rational geometry, mechanics** (*b*), **point, surface, symptoms.** See ★*geometry,* etc.

II. *n.* 3. In *math.,* a rational number.—4. One who is a believer in so-called 'rational' reforms, as in dress or food.

As a '*rational,*' . . . she thought that members should be free to adopt any costume that they liked.
Westminster Gazette, Nov. 28, 1896, p. 3. *N. E. D.*

rationality, *n.* 4. In *math.,* the state of corresponding to or being producible by a rational transformation or operation.

It is then clear enough that the resolvent equation, being irreducible and such that any solution is expressible rationally, with p parameters in terms of the solution ω, enables us to define a linear homogeneous group of transformations of $y, \ldots y_n$ depending on p parameters; and every operation of this (continuous) group corresponds to a rational transformation of the solution of the resolvent equation. This is the group called the *rationality* group, or the group of transformations of the original homogeneous linear differential equation.
Encyc. Brit., XXVII. 457.

rationally, *adv.* 2. In *math.,* as a rational function. *Encyc. Brit.,* XXVII. 457.—3. According to ratios or proportions.

Some of the refractory clays from the Carboniferous in the vicinity of Borowitschi have been *rationally* analyzed.
Rep. U. S. Geol. Surv., 1897–98, vi. p. 453.

ratlings, *n. pl.* See ★*rattlings.*

ratoon, *v.* II. *trans.* 1. To induce the growth of young shoots by cutting back (old plants); raise another crop from (the old stools): as, to *ratoon* sugar-cane. *U. S. Agri. Rep.,* 1879, p. 594.—2. In the West Indies, to continue the growth of (plants) after the close of the dry season and after seed has been sown for the new crop: as, to *ratoon* cotton. *Agricultural News,* IV. p. 84.

Rato pottery. See ★*pottery.*

ratsbane, *n.*—**Yellow ratsbane,** impure orpiment which, as commercially prepared, contains much arsenious oxid along with the yellow sulphid.

rattery, *n.* 2. A place where rats are kept or that is suitable for such use. *N. E. D.*

rattish, *a.* 2. Having the qualities of a political rat.

Small thought had I
My Sonnets should salute thee with a cheer.
Trimming, no doubt, and *rattish* thy career:
But be that now forgotten.
Fraser's Mag., XXII. 636.

rattle^1, *n.*—**Watchman's rattle.** See *rattle*1, 3.

rattle^2, *v. t.*—**To rattle down** (*naut.*), to seize and clove-hitch the ratlines across (the shrouds). These ratlines are usually separated about 14 inches, are parallel with the sheer-pole, and extend from the shroud next abaft the swifter (the forward shroud of its set) to the aftermast shroud; but every fifth ratline is seized to the swifter, and is known both as a catch-ratline and a sheer-ratline.—**To rattle up** (*naut.*), to rattle the rigging up from the sheer-pole, instead of down from the eyes of the shrouds.

rattle-nut (rat'l-nut), *n.* The water chinkapin, *Nelumbo lutea:* so called because the seeds rattle in the dried receptacle.

rattler, *n.* 6. A tumbling-box used to test the cohesive strength of bricks. A number of bricks are placed with a quantity of cast-iron balls in the box and the box is revolved at a fixed speed. The amount of wear shown by the bricks is a test of their power to resist abrasion: essentially a *ball-mill.* See *ball-grinder* and *tumbling-box.*

The tests made were abrasion in *rattler,* absorption, and transverse strength. The latter is expressed in terms of the modulus of rupture. The *rattler* used was polygonal in form, 29 inches in diameter, and 48 inches long.
Rep. U. S. Geol. Surv., 1897–98, vi. p. 474.

7. Something that is very good of its kind, as a horse. [Slang.]

If he can only jump . . . and get pretty quick over his fences, he ought to be a *rattler.*
W. Melville, Market Harborough, p. 127. *N. E. D.*

8. A hard, brittle coal, like jet, which generally lies on top of seams. *Gresley.*—**Flue-rattler,** in *mech.,* a device for cleaning the flues or tubes of locomotive-boilers from scale deposited from the water. In its usual form, it is simply a long tumbling-barrel in which the tubes are placed and rolled over one another by the revolution of the barrel, breaking off and disintegrating the hard, crystalline deposit. *Elect. World and Engin.,* July 30, 1904, p. 170.

rattle-root (rat'l-röt), *n.* The bugbane or black-snakeroot, *Cimicifuga racemosa.* Also *rattle-top.*

rattler-tree (rat'lėr-trē), *n.* The white poplar, *Populus alba.*

rattles (rat'lz), *n.* A disease of the grape in which the berries fall off just as they are ripening. It is attributed to defective nutrition, but may also be influenced by fungi and insects. Also called *shelling* and *shanking.*

rattlesnake, *n.*—**Pacific rattlesnake,** *Crotalus lucifer,* a species marked with rounded cross patches: found in the western United States.—**Red-diamond rattlesnake,** *Crotalus atrox ruber,* a subspecies of the Texan rattlesnake, found in southern California on the Pacific slope: of a red color, with dark red spots.—**Tiger rattlesnake,** *Crotalus tigris,* a rare species of the Southwest, named from its tawny color and dark cross stripes.—**White rattlesnake,** *Crotalus mitchelli,* a pale desert species found from the Colorado Desert to Cape St. Lucas.

rattlesnake-grass, *n.* 2. See ★*slough-grass.*

rattle-top (rat'l-top), *n.* Same as ★*rattle-root.*

rattling^1 (rat'ling), *adv.* Extremely; 'stunning': as, a *rattling* good speech. [Colloq.]

There is one thing about it . . . it does show it was a *rattling* good dam anyhow.
E. Nesbit, The Wouldbegoods, p. 158.

rattlings (rat'lingz), *n. pl.* [A variant of *raddlings.*] Wood cut into strips (about four feet long), for kindling, and tied up in bundles. [Prov., U. S.] See ★*raddling,* 2.

rat-trap, *n.* 2. A rat-trap pedal.

ratty (rat'i), *a.* [*rat*^{1} + *-y*^{1}.] 1. Looking like a rat; smelling like a rat; hence, dirty. [Slang.]

The king got out an old *ratty* deck of cards after breakfast, and him and the duke played seven-up awhile, five cents a game. *The Century,* Feb., 1885, p. 548.

2. Miserable; wretched; poor. [Slang.]

Mr. . . . had a good one in the ring, the bay gelding Clonmel, but the noble beast was handicapped by a "*ratty*" driver. *Rider and Driver,* March 30, 1901, p. 7.

3. Full of rats: as, a *ratty* cellar.

ratwood (rat'wůd), *n.* [Name in the Bahamas.] Same as *eboe-light.*

rauning (râ'ning), *n.* [Australian native name?] A name used in Australia for a species of lizard fish, *Laurida tumbil.*

raupenleim (rou'pen-līm), *n.* [G., < *raupe,* caterpillar, + *leim,* lime.] An adopted German name for a preparation from crude petroleum, of dark brown color and viscid consistence: used on the bark of trees to protect them from caterpillars and beetles.

From what has been said of the nature of the food of these beetles, it is evident that any method by which the entrance to their galleries in the bark can be closed will effectually put an end to the progress of their colonies. Perhaps the best means of accomplishing this is by coating the trunks with dendroline or *raupenleim.*
Yearbook U. S. Dept. Agri. 1896, p. 430.

raupo (rou'pọ̄), *n.* [Maori.] In New Zealand, the lesser cattail, *Typha angustifolia,* the leaves of which are used for thatching. The roots of the plant were formerly eaten and the pollen collected and made into bread. See ★*punga-punga, Typha,* and *reed-mace.*

rauque (râk), *a.* [See *raucous.*] Raucous; hoarse; harsh sounding. [Rare.]

The *rauque* bellow of the hippopotamus.
R. F. Burton, in Jour. Geog. Soc., XXIX. 214. *N. E. D.*

Rauracian (râ-rā'shian), *a.* and *n.* [L. *Rauracum,* a city of the *Rauraci,* a people of Gaul, dwelling near the Helvetians.] In *geol.,* noting a division of the Jurassic system in France and the Jura constituting the lower substage of the Sequanian which is equivalent to the upper half of the English Corallian series.

ravalement (rä-väl-moṅ'), *n.* [F., < *ravaler,* to swallow again, lower.] The finishing process of carving and tooling to which masonry is subjected after being completed in the rough; also the cleaning and scraping of discolored and weathered masonry.

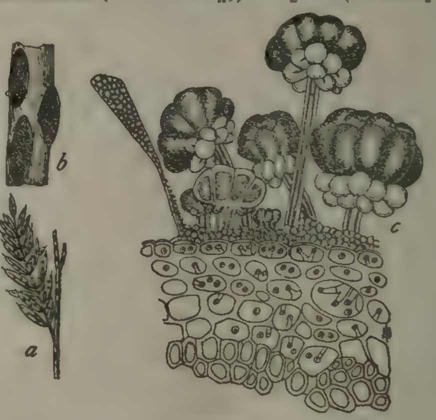
ravanastron (rav-a̤-nas'tron), *n.* A rude form of viol, common in India. Usually it has a cylindrical body of bamboo, about two inches in diameter and five inches long, the ends being covered with parchment or snake-skin. Through this from side to side is inserted a long stick to serve as the neck and head, the shape of the whole being like a mallet or gavel. One or two strings (occasionally four) are stretched from the lower end of this stick over one end of the body to tuning-pins at the upper end of the stick. Similar instruments are found in several countries where Buddhism has penetrated. Occasionally the name is loosely applied to other forms of Hindu viols, as to the *sarinda* or *serinda.*

ravel^1, *n.* 4. A snarl; a complication.

Nowadays the man who says that he knows the *ravel* of the inter-tribal complications across the Border is of . . . use.
R. Kipling, Wressley of the Foreign Office, in Indian [Tales, p. 671.

raven^1, *n.* 1. (*b*) Applied in Australia to one of the larger crows, *Corvus coronoides.*

Ravenelia (ra-ve-nē'li-ä̤), *n.* [NL. (Berkeley, 1853), < Henry W. *Ravenel,* an American mycologist.] A genus of rust-fungi of the order



Ravenelia.

a, stem of *Cassia nictitans* with teleutospores on the stem and uredospores on the leaves; *b,* stem and teleutospores enlarged; *c,* section showing the teleutospores.

Uredinales, having æcidia, uredospores, and teleutospores. The teleutospores are united into cushion-like bodies with a group of sterile cells or cysts beneath and are borne at the apex of a stem consisting of several separate or united hyphæ. About 50 species have been described. They are mostly parasitic on leguminous plants in subtropical regions. *R. cassiicola* occurs on *Cassia nictitans* in the southern United States.

ravier (räv-yā′), *n.* [F., < *rave*, a radish.] A radish-plate, usually of pottery or porcelain.

ravigote (räv-ẹ-gōt′), *n.* [F. *ravigote*, < *ravigoter*, revive, strengthen, appar. for OF. *ravigorer*, < L. *re-* + *ad* + *vigorare*, strengthen, < *vigor*, strength, vigor.] A piquant sauce made of civet, burnet, and tarragon pounded together. See ★*sauce*.

ravison (rav′i-son), *n.* [Appar. based on F. *rave*, turnip. See *rape*^{4}.] A trade-name of an inferior kind of colza or rape-seed, from an uncultivated plant.

> The cultivation of sunflower seed, rape seed, colza, poppy seed, sesamum, *ravison*, mustard seed, and many other exclusively oil-yielding seeds is a factor of considerable importance in the rural economy of many foreign countries. *Yearbook U. S. Dept. Agr.*, 1903, p. 412.

raw^1, *n.* **4.** An untrained mustang or cow-pony. [Slang.]

> The animals are mostly from the Texan and New Mexican mustang herds. They pay for a '*raw*' on an average fifty dollars, and find about one out of five useful.
> *Outing*, Aug., 1895, p. 389.

ray^1, *n.* **4.** In *geom.*: (*b*) The aggregate of all points of the straight *a* situated on one and the same side of a point O of *a*. (*c*) One of the two parts of a straightest (great circle) determined by a point of it O with its opposite O′.—**10.** See *obscure* ★*rays*, ★*radiation*, and ★*radioactivity*.—**11.** *pl.* Emblems of light and glory embroidered around monograms of the holy name and sacred personages.—**Actinic ray,** any ray capable of causing chemical reactions and of thus affecting a photographic plate. The violet and ultra-violet rays of the spectrum are of relatively high chemical activity and it is to them that the term *actinic rays* is commonly applied.—**Actinium rays.** See *obscure* ★*rays*.—**Alpha-rays.** See *obscure* ★*rays*.—**Anodic rays.** See ★*anodic*.—**Astral ray,** one of the many rays or fibrils of achromatic substance which form the astrosphere of the dividing cell.—**Becquerel rays.** See *obscure* ★*rays* and ★*radioactivity*.—**Beta-rays.** See *obscure* ★*rays*.—**Blondlot rays.** See *obscure* ★*rays*.—**Buddha's rays,** the streamers emanating from the sun when near the horizon, evidently formed by the shadows of distant mountains or clouds. They are compared to the artistic 'glory' in representations of Buddha, or the sun-god, or the symbol of the sun.—**Canal rays.** See *obscure* ★*rays*.—**Cathode rays,** in *elect.*, rays issuing from the cathode or negative terminal of a vacuum-tube having a very high vacuum (much higher than a Geissler tube), when excited by a high electric pressure or voltage. The cathode rays issue in straight lines from the negative terminal, irrespective of the positive terminal, and are supposed to consist of electrically charged particles moving from the cathode at extremely high velocities. Cathode rays produce fluorescence (see *fluorescence*) and X-rays where they strike an obstruction (see *X-*★*rays*). **Caudal ray.** See ★*caudal*.—**Chemical ray.** Same as *actinic* ★*ray*.—**Cold rays,** in *astron.* and *phys.*, interruptions or cooler interspaces in the infra-red, invisible portion of the solar spectrum observed by the bolometer. They correspond to the dark lines (missing rays) in the visible spectrum.—**Delta-rays,** rays of low penetrative power emitted by radium, polonium, uranium, and probably by other radioactive substances. They are easily deflected by a magnet. J. J. Thomson considers the δ-rays as consisting of a stream of negatively charged particles moving with relatively low velocities.—**Finsen ray,** ultra-violet light as applied to the cure of diseases, especially of the skin: named from Dr. Finsen of Denmark, who introduced the method. See *Finsen* ★*light treatment*.—**Gamma-rays.** See *obscure* ★*rays*.—**Goldstein rays.** See *obscure* ★*rays*.—**Hard rays,** in *elect.*, the X-rays of great penetrating power, such as are obtained from tubes of high vacuum.

> The "*hard*" *rays* correspond to thin pulses, the "soft" ones to thick ones.
> *J. J. Thomson*, Electricity and Matter, p. 69.

Infra-red rays. See ★*radiation*.—**Hittorf rays.** See *obscure* ★*rays*.—**Lavender rays,** in *photog.*, the faintly luminous rays at the extreme violet end of the spectrum.—**Lenard rays.** See *obscure* ★*rays*.—**Magneto-cathode rays,** a variety of cathode rays produced by a smaller potential difference within the vacuum-tube than that at which cathode rays of the usual type occur.—**Marconi rays.** Same as *Marconi* ★*waves*.—**N-rays.** See *obscure* ★*rays*.—**Obscure rays.** (*a*) See *obscure* and *spectrum*. (*b*) The cathode rays, the X- or Rontgen rays, and the various types of radiation discovered in the study of the electric discharge in gases (see *cathode* ★*rays*) and of radioactivity. See ★*radioactivity*. Obscure rays are detected by their action on the photographic plate, their heating effect, their power of exciting luminescence or of producing other rays, and their electrical effects. Owing to the recent and very rapid development of this branch of physics the nomenclature of obscure radiation is somewhat confused. The term *Hittorf rays* is applied indiscriminately to all rays observed when the electric discharge passes through a tube with two terminals, a Hittorf tube, at high vacuum. When in a vacuum-tube the cathode is perforated, or consists of a tube, portions of the stream of positively charged ions from the anode pass through the opening. These form rays which enter the tube behind the cathode and which are known as *canal rays* or, after their discoverer, as *Goldstein rays*. They differ from cathode rays in having smaller velocity, and greater mass of the moving particles, in bearing a positive electric charge, and in being deflected in the opposite direction by a magnetic or electrostatic field. If cathode rays are allowed to fall upon a window of aluminium that forms part of the wall of the vacuum-tube within which they are produced, those which penetrate the metal and enter the outer air are called *Lenard rays*. Lenard showed that such rays suffer diffusion in passing through the air, like light in a turbid medium, and that, like the cathode rays within the tube, they are deflected by a magnet. In 1896 Becquerel discovered the spontaneous emission of obscure rays of the corpuscular type in substances containing uranium, and the name *Becquerel rays* is now applied to such rays from any radioactive material. These rays are also called *uranium*, *thorium*, *radium*, *polonium*, or *actinium rays* respectively, according to the radioactive element to which they are due. See ★*radium*, ★*uranium*. It was later shown by Rutherford that there are at least three distinct types of such radiation which may be distinguished from each other by their power of penetrating layers of metal and by their behavior in the magnetic field. The first of these, *α-rays*, have the least power of penetration. They are capable of ionizing gases and thus imparting to them the power of conducting electricity. They are deflected by the magnetic and electrostatic fields, but in the opposite direction from cathode rays, and are supposed to consist of a stream of positively charged particles of comparatively large mass traveling with a speed of about one tenth as great as the velocity of light. The α-rays affect the photographic plate and are capable of producing fluorescence and phosphorescence. The second, the β-rays, have somewhat greater penetrating power and intense photographic action. They are deflected by the magnetic field in the same sense as cathode rays and are supposed to consist of a stream of negatively charged particles having a mass equal to $\frac{1}{1000}$ of an atom of hydrogen with velocities comparable to that of light. β-rays produce fluorescence and phosphorescence, ionize gases, and may be detected by their electrical action. The third type of rays discovered by Villard, the *γ-rays*, have extraordinary penetrating power, being able to pass through several centimeters of lead. They are not affected by the magnetic field, in which respect they resemble ordinary X-rays. The γ-rays are regarded as electromagnetic disturbances produced by the action of the β-rays, just as the X-rays are produced by the action of cathode rays. Like the other types they produce ionization of gases and fluorescence and phosphorescence. See ★*radioactivity*. When X-rays meet an obstacle, as a metal surface, reflection in the ordinary sense of the word does not occur, but rays differing in certain respects from the incident rays are diffusely emitted from the surfaces upon which the X-rays impinge. These rays were termed *secondary rays* by Sagnac, who investigated their properties. They are also occasionally called *Sagnac rays*, after their discoverer. In the same manner, bodies upon which secondary rays, or *S-rays*, fall emit a further modified type of radiation known as *tertiary rays*. Aside from the ordinary radiation from wires heated to incandescence by the electric current, rays similar to those emitted by radioactive bodies have been described. Tommasina claims to have distinguished three distinct types of rays, α-, β-, and γ-rays, having different powers of penetration and producing different effects upon a charged body. It is claimed that these so-called *pyro-rays* produce ionization of gases and excite fluorescence. In 1903, Blondlot announced the discovery of a new type of radiation originally obtained by filtering the rays from an X-ray tube through aluminium or black paper. These rays, which Blondlot terms *N-rays* (from Nancy, in France, where he discovered them), differ from X-rays in exhibiting the phenomena of polarization, refraction, and reflection. They were subsequently detected in various sources of light, properly screened, such as the Welsbach burner, an ordinary gas flame, a piece of metal heated to incandescence, and even sunlight. The N-rays are said to pass readily through wood, paper, and metal, but to be absorbed by rock-salt, fluorite, and glass, to increase the luminescence of fluorescent substances previously excited, but to be without effect on photographic plates. Their wave-length, according to Sagnac, is about 0.2 millimeters. In spite of the detailed description of the methods of obtaining N-rays and the definite reports concerning their properties, many physicists have failed altogether to reproduce Blondlot's results and the existence of the Blondlot rays is no longer credited.—**Optical length of a ray.** See ★*length*.—**Polar ray,** one of the streamers in the solar corona which radiate from the polar regions of the sun. Similar rays occur elsewhere but are veiled by the diffuse luminosity which is wanting near the poles.—**Polonium rays,** Becquerel rays emitted by the radioactive element polonium. See *obscure* ★*rays*, ★*polonium*, and ★*radium*.—**Pyro-rays.** See *obscure* ★*rays*.—**Ray telegraphy.** See ★*telegraphy*.—**Residual rays,** in *optics*, rays nearly monochromatic as to wave-length, which have been separated out from the remainder of the spectrum by multiple reflection from the surfaces of substances having strong selective reflection. The term is a translation of the German *Reststrahlen*, the name by which such rays were designated by the inventors of the method, Rubens and Nichols.—**Röntgen rays.** See *X-*★*rays*.—**Sagnac, secondary rays.** See *obscure* ★*rays*.—**Soft rays,** in *elect.*, rays of slight penetration, such as emanate from a tube of low vacuum.—**S-rays.** See *obscure* ★*rays*.—**Tertiary rays.** See *obscure* ★*rays*.—**Thorium rays.** See *obscure* ★*rays* and ★*thorium*. **Ultra-violet rays.** See ★*radiation*.—**Uranium rays.** See *obscure* ★*rays* and ★*uranium*.—**X-rays,** or **Röntgen rays,** a form of radiation having characteristic and distinctive properties, discovered by Professor Wilhelm Konrad Röntgen, of Würzburg (announced by him in December, 1895). He showed that the discharge of a large Ruhmkorff coil through a vacuum-tube produces a form of radiation external to the latter, which has the property of causing various substances to fluoresce; of affecting the ordinary photographic plate like light (though itself invisible); and of penetrating opaque bodies in various degrees, according to their density and relative thickness, platinum, lead, and silver being quite opaque, while aluminium, wood, and paper are quite transparent. He also found that these rays are not refracted by prisms of carbon disulphid; that powdered substances, opaque to white light, are quite as transparent to these rays as solid bodies of equal mass; and that bodies having rough surfaces act like those whose surfaces are polished. These facts forced him to conclude that refraction and regular reflection do not exist, but that such bodies behave to X-rays as turbid media to light. Other conclusions were that these rays pass through all substances at the same speed; that air absorbs a very much smaller part of them than of cathode rays; that they are not deflected by a magnet; that the spot on the wall of the tube which fluoresces most decidedly is to be regarded as the principal point of their radiation; that when the cathode rays are deflected within the tube, the spot is changed, thus producing a new source of radiation; that, therefore, cathode rays and X-rays are not identical; that X-rays are rectilinearly propagated; that no interference phenomena of X-rays were found to exist; that the above facts tend to show that they have properties not hitherto known in connection with ultra-violet, visible, and infra-red light. The source of X-rays has been shown to be the surface upon which the cathode rays first strike, whether that surface be the wall of the tube or an object placed within the tube: when this object within the tube is the anode itself, the radiations are most powerful. It has also been found that X-rays have the property, in common with ultra-violet light, of dispersing negative charges on insulated surfaces and the power of positively electrifying such surfaces. X-rays produce ionization in gases which they traverse and thus impart to them the power of conducting electricity. Hertz had previously shown that cathode rays penetrate opaque bodies, and Lenard that such rays may pass through aluminium forming a part of the wall of the tube and affect the photographic plate, but that their absorption is excessive beyond a few millimeters from the aluminium window.—**X-ray dermatitis.** Same as *Röntgen-light* ★*dermatitis*.—**X-ray tube.** Same as *Röntgen* ★*tube*.

X-ray photograph of a foot in a shoe.

ray^2, *n.*—**Electric ray,** any one of several species of elasmobranchiate fishes of the family *Narcobatidæ*, having an electric organ composed of many hexagonal tubes situated in the fleshy base of the pectoral fin. They inhabit most warm seas.—**Shovel-nosed ray.** Same as ★*horn-ray*.—**Thick-tailed ray,** any ray of the order *Sarcura*.—**Whip-tailed ray,** any ray of the order *Masticura*.

rayé (rä-yā′), *a.* [F.] Striped: said of textiles. *Dry Goods Economist*, June 13, 1908.

ray-filter (rā′fil″tėr), *n.* In *photog.*, a screen having selective absorption by means of which the character and intensity of the light reaching the sensitive film is regulated. See *bichromate ray* ★*filter*.

rayfiltergraph (rā′fil″tėr-gråf), *n.* A photograph taken through a ray-filter placed before the lens. It possesses true color value.

ray-fungus (rā′fung″gus), *n.* See *actinomyces*.

ray-hair (rā′hãr), *n.* One of the slender filaments that appear in the fin-fold of an embryo fish, and are the prototypes of the fin-rays: an Englishing of Ryder's term *actinotrichium*.

raying (rā′ing), *n.* [*ray*^{2} + *-ing*^{1}.] Exposure to the action of the Röntgen rays or other form of radioactivity.

> If the *raying* is supplemented by further measures which have for their object the elimination of the microbe and a general purification of the tainted tissues, the progress of the case will be more rapid.
> *Amer. X-Ray Jour.*, July, 1903, p. 200.

Rayless change. See ★*change*.

rayometer (rạ-om′e-tẹr), *n.* [*ray*^{2} + Gr. *μέτρον*, measure.] In *photog.*, a kind of actinometer used for testing sensitiveness to X-rays: usually a screen of aluminium of graduated thickness. *Wall*, Dict. of Photography, p. 550.

rayon, *n.* **2.** The radius of area of action (of a fort, a ship, an army, or a fleet).

> A fort is generally useless outside the *rayon* of its fire, and it may easily become a trap from which escape can be prevented. *Encyc. Brit.*, XXVIII. 453.

ray-path (rā′påth), *n.* The line of propagation of a wave-motion, normal, in isotropic media, to the wave-front; in the case of rays of the cathode-ray type, the line of propagation of the projected particles.

ray-pod (rā′pod), *n.* Same as *star-fruit*.

ray-point (rā′point), *n.* The point of convergence or divergence of a pencil of rays.

ray-print (rā′print), *n.* A photograph made by means of X-rays or other form of radioactivity; a radiograph.

ray-screen (rā′skrēn), *n.* A color-screen such as is used in orthochromatic photography. *Photo-miniature*, Dec., 1903, p. 413.

ray-spider (rā′spī″dėr), *n.* An epeirid spider, *Theridiosoma radiosum*, which spins a rayed orb-web furnished with a trap-line.

razor (rā′zọr), *v. t.* [*razor*, *n.*] To shave with a razor, as the face or chin; remove with a razor, as a beard.

razor-edge (rā′zọr-ej), *n.* A keen, razor-like edge; hence, any situation which is precarious and close to the verge of destruction: as, to stand on the *razor-edge* or razor's edge.

razor-grinder, *n.* 2. A name given in the British West Indies and Guiana to any cicada. —3. An Australian flycatcher, *Seisura inquieta*, so called from its peculiar whirring note: known also as the *dishwasher*.

razzle-dazzle (raz″l-daz′l), *v. t.* [A varied reduplication of *dazzle*.] To dazzle and confuse; daze in a sudden or humorous way; bewilder; intoxicate. [Colloq.]

razzle-dazzle (raz″l-daz′l), *n.* [*razzle-dazzle*, *v.*] 1. A state of dazed confusion or dizziness, as in intoxication. [Colloq.]—2. A revolving platform, with a swift, irregular, swerving motion, on which passengers are carried, for their amusement, at fairs and pleasure-resorts.

razzle-dazzler (raz″l-daz′lėr), *n.* One who or that which razzle-dazzles; something which astonishes with its glaring incongruities. [Colloq.]

R. B. An abbreviation of *Rifle Brigade*.

R. C. An abbreviation (*b*) of *Red Cross*; (*c*) [*l. c.*] of *right center*.

R. C. A. An abbreviation of *Reformed Church in America*.

R. Cath., Rom. Cath. Abbreviations of *Roman Catholic*.

R. C. P. An abbreviation of *Royal College of Physicians*.

rcpt., recpt., rec't., rect. Abbreviations of *receipt*.

R. C. S. An abbreviation of *Royal College of Surgeons*.

Rd. The chemical symbol of *radium*.

R. D. (*c*) In *electrotherap.*, an abbreviation of *reaction of degeneration*.

R. D. d. In *electrotherap.*, an abbreviation of *reaction of degeneration at a distance*.

R. E. An abbreviation (*c*) of *Reformed Episcopal*; (*d*) of *Right Excellent*; (*e*) [*l. c.*] of *right eye*.

r. 1 e., r. 2 e. Abbreviations of *right first entrance* and *right second entrance*.

rea (rā′ä̤), *n.* [Tahitian.] The turmeric, *Curcuma longa*. See *turmeric*, 1, and *Curcuma*, 2.

reacher, *n.* 3. One who reaches warp-threads to another (the drawer-in), to be drawn through the heddles and reed, in making ready for the loom. *R. Marsden*, Cotton Weaving, p. 428.

reaching (rē′ching), *n.* *Naut.*, sailing to windward; working to windward on alternate tacks; sailing on the wind.

reachless, *a.* 2. Having no reach: applied to a vehicle from which are omitted the tension-members under the body which keep the front and rear axles at a fixed distance from each other. In most large motor-cars the frame replaces the reaches used in constructing the horse-drawn vehicle with the body less solidly united with the springs and their suspension.

It is built on the popular *reachless* style, with bent angle steel frame, supported on four three-quarter elliptic springs 38 inches long, and is equipped with ball bearing artillery wood wheels fitted with 3-inch tires.
Automobile, April 11, 1903, p. 420.

reach-rod (rēch′rod), *n.* In a locomotive, a rod which connects the reverse-lever in the cab to the bell-crank on the reverse-shaft of the valve-gear. See cut under *passenger-engine*.

reactance (rẹ̄-ak′tans), *n.* In *elect.*, the apparent resistance of an alternating-current circuit due to self-induction, which consumes no power; the ratio of the wattless component of the alternating electromotive force divided by the current. See ★*impedance*.

Since sparking is due chiefly to the counter E.M.F. of inductance in the coil undergoing commutation, or more properly the *reactance* E.M.F. of the coil, good commutation depends primarily upon the strength of the field in the commutating zone near the tip of a field magnet pole. *Jour. Franklin Inst.*, Nov., 1903, p. 365.

Magnetic reactance, in an alternating-current circuit, the electromotive force in volts per ampere developed or consumed by the inductance of the circuit.—**Reactance factor**, in *elect.*, the ratio between the reactance of a conductor and its resistance.—**Reactance voltage**, the electromotive force of self-induction in the short-circuited coil of the armature of a generator or motor.—**Synchronous reactance**, in synchronous machines, as alternaters and motors, an effective or virtual reactance representing the joint or resultant effect of armature-reaction and self-induction.

reactance-regulator (rẹ̄-ak′tans-reg″ū-lā-tọr), *n.* In *wireless teleg.*, a choke-coil placed in the transmitting circuit to prevent the formation of an arc. *Sci. Amer.*, Jan. 16, 1904, p. 40.

reaction, *n.* 5. In *pathol.*, the response of a nerve or muscle to an applied stimulus.—6. In *serumtherapy*, the occurrence of an interaction between two substances, as between an agglutinin and an agglutinable substance, or between toxin and antitoxin.

The blood gave a feeble serum *reaction*. The heart blood contained colon bacilli, and that from the spleen and a mesenteric gland gave colon and typhoid bacilli.
Med. Record, Feb. 14, 1903, p. 264.

Abbreviated reaction, in *psychol.*, the motor or muscular form of the simple reaction, in which attention is directed upon the movement to be made. *E. B. Titchener*, Exper. Psychol., I. i. p. 123.—**Adamkiewicz's reaction**, a chemical reaction for the detection of proteid substances. Strong sulphuric acid is added to a solution of the substance in glacial acetic acid, producing a violet color if proteids are present. It has been shown that the effect depends upon the presence of glyoxylic acid, which usually occurs in traces in the acetic acid.—**Agglutinative reaction.** Same as ★*agglutination*, 4.—**Associative reaction**, in *psychophys.*, a form of reaction in which the movement of response is withheld until the presented stimulus has suggested an associated idea.

In the *associative reaction* he [the reactor] does not react to the given stimulus at all; he makes the movement of reaction only after the stimulus has suggested something else, has aroused in consciousness some associated idea. It is this associated idea to which the movement is the response.
E. B. Titchener, Exper. Psychol., II. i. p. 192.

Baumann-Schotten reaction, a reaction by which an acyl derivative is prepared from a hydroxyl or amino compound by shaking it with a solution of sodium hydroxid and benzoyl chlorid, acetic anhydrid, or some similar compound. The resulting compounds are often crystalline and well suited for purposes of identification.—**Beckmann's reaction**, a reaction by which ketoximes are changed into acid amides, or substituted acid amides, by the action of hydrochloric-acid gas dissolved in glacial acetic acid, or phosphorus pentachlorid dissolved in ether. Thus, benzophenone oxime, $C_6H_5.C:N(OH)C_6H_5$, yields benzanilide, $C_6H_5.CO.NH.C_6H_5$.—**Box reaction**, an application of powdered aluminium and Fe_2O_3, intimately mixed, and in atomic proportions, placed in the top part of a steel or iron casting.

Another application of the so-called "*box reaction*" is important for steel castings, and especially for casting large steel ingots, to prevent the familiar phenomenon of piping. In the heads of such blocks hollow spaces are found which mostly cause 30 to 40 per cent. of loss.
Jour. Franklin Inst., April, 1904, p. 253.

Central reaction, natural reaction, in *psychophys.*, a form of the simple reaction in which the reactor is allowed to divide his attention as he will between stimulus and responsive movement.—**Choice reaction.** See ★*choice-reaction*.—**Cognitive reaction**, in *psychophys.*, a form of reaction in which the movement of response is made upon the presentation of one of a number of possible stimuli, the character of which is known to the reactor only in general terms.

In the *cognitive reaction*, the stimuli are known only in a very general way. The observer is told, *e.g.*, that he will be shown a simple visual impression, a colour or a brightness; and he is not to react until he has 'cognised,' identified, apprehended the particular quality of the stimulus.
E. B. Titchener, Exper. Psychol., II. i. p. 187.

Complete reaction. See ★*complete*.—**Compound reaction**, in *psychophys.*, a form of reaction in which some complicating process or processes (such as discrimination, cognition, successive association) are introduced between the presentation of stimulus and the execution of the responsive movement, while the movement itself may be left simple, or selected from a prearranged group of movements, or performed or inhibited in obedience to instructions given beforehand: opposed to *simple* ★*reaction*.

'*Compound reactions*,' as they are termed, were first made by the Dutch oculist F. C. Donders (1818–1889) and his pupils, and have since been studied under very various forms.
E. B. Titchener, Exper. Psychol., II. i. p. 185.

Contact reaction. See ★*contact*1.—**Discriminative reaction**, in *psychophys.*, a form of reaction in which the movement of response is made upon the presentation of one or another of several known stimuli, and which therefore implies the discrimination of the presented stimulus (as regards quality, intensity, etc.) from the other possible stimuli.

In the *discriminative reaction*, the stimuli employed are always known beforehand to the observer; the colours are shown, the sounds presented, before the reactions are taken. *E. B. Titchener*, Exper. Psychol., II. i. p. 187.

Elastic reaction, the diminution in the volume of the bulb of a thermometer which proceeds gradually, in proportion to the lapse of time after it has been enlarged by heating. The bulb grows smaller and the thermometric indications higher as time elapses. In meteorology the standard size of the bulb and, therefore, the standard value of the scale-readings are those attained after the lapse of a long interval of time, when the changes proceed so slowly as to be inappreciable. In ordinary physical work this change, due to elastic reaction, is promptly and entirely annulled by exposing the thermometer-bulb to the standard freezing temperature immediately after observing the temperature that one desires to measure: in this way a purely thermal reaction is substituted for the elastic reaction.—**Flame-reaction.** Same as *flame-*★*test*.—**Gmelin's reaction**, a test for bile-pigment based upon the oxidation of bilirubin to biliverdin by nitric acid, with a coincident color play.—**Grignard's reaction**, a reaction much used in organic synthesis. When a solution of an organomagnesium halide is prepared by allowing an organic halide in ethereal solution to act upon magnesium this solution forms addition-products with alcohols, aldehydes, ketones, esters, metal halides, oxygen, sulphur, carbon dioxid, etc. When the addition-product is decomposed by dilute acids new compounds are obtained. Among them are saturated and unsaturated hydrocarbons; primary, secondary, and tertiary alcohols; glycols; acids; hydroxy acids; aldehydes; organometallic compounds; etc. *Nature*, Jan. 21, 1904, p. 287.—**Gruber-Widal reaction**, the application of the agglutination reaction to diagnostic purposes. See *serum* ★*diagnosis*.—**Method of reactions.** See ★*method*.—**Millon's reaction**, a color-reaction which is common to all those albuminous substances which on hydrolytic digestion yield tyrosin.—**Molisch reaction**, a test for carbohydrates by shaking the solution under examination with a little 10–20 per cent. solution of α-naphthol in alcohol or chloroform and adding an equal volume of concentrated sulphuric acid. The liquid should become violet.—**Motor reaction**, reflex movement in response to a stimulus of any kind. *Biol. Bulletin*, June, 1904, p. 29.—**Muscular reaction**, in *psychophys.*, the abbreviated or incomplete form of the simple reaction, in which attention is directed mainly or exclusively upon the reaction movement.

When, on the other hand, the preparatory expectation is directed toward the act to be executed in response to the motive, we have the so-called *muscular reaction*.
W. Wundt (trans.), Outlines of Psychol., p. 198.

Myotonic reaction, a condition in which the muscular contraction caused by an electric current persists for some time after the withdrawal of the stimulus.—**Natural reaction**, in *psychophysics*, the form of the simple reaction which is natural or normal to the untrained reactor; a reaction whose time lies, for the most part, between the times of the sensorial and the muscular reactions; the central reaction.—**Neutral reaction**, the absence of either acid or alkaline reaction.—**Pfeiffer-Bordet reaction**, bacteriolysis brought about by the action of immune serum.—**Pine slip reaction**, a reaction used in testing for indol and skatol.—**Reaction apparatus**, in *psychol.*, apparatus employed in the reaction experiment. Many forms of apparatus have been used: the classical arrangement is that of the Hipp chronoscope, telegraph reaction-key, and stimulator (sound-hammer, light-pendulum, etc.).—**Reaction breakwater**, a form of breakwater or jetty placed across the bar at the mouth of a navigable river or tidal estuary to aid the stream in eroding and maintaining a navigable channel across the bar. The jetty is placed on the side of the channel from which the prevailing winds and the littoral drift come, and, starting at the shore end nearly parallel with the natural channel, gently curves toward the channel side. The tidal ebb, including the fresh-water flow of the river, is forced by the centrifugal component of its inertia to follow the concave curve formed by the jetty and thus to erode and scour the bottom. The centrifugal pressure against the jetty also causes, as in streams flowing generally in curved lines, a downward motion of the water immediately in contact with the curved jetty or bank and a resulting reactionary or centripetal motion of the water at the bottom of the channel. As it is this bottom layer which contains the larger proportion of the eroded silt this material is thus removed from the channel into the shallow area on the side opposite the jetty. The jetty thus erodes a channel through the bar and at the same time protects this channel from encroachment by the littoral drift from the windward side.—**Reaction consciousness.** See ★*consciousness*.—**Reaction engine.** See ★*engine*.—**Reaction experiment**, in *psychophys.*, an experiment in which a movement is made in response, direct or indirect, to a prearranged stimulus, with the view (1) of securing an analysis of the various types of action-consciousness and (2) of measuring the rate of certain psychical and psychophysical processes.

We must limit ourselves to the observation of certain processes which can be easily influenced through external means and which terminate in external acts. The experiments which serve this purpose are the so-called *reaction-experiments*. They may be described in their essentials as follows. A simple or complex volitional process is incited by an external sense-stimulus and then, after the occurrence of certain psychical processes which serve in part as motives, the volition is brought to an end by a motor reaction.
W. Wundt (trans.), Outlines of Psychol., p. 197.

Recognition reaction, in *psychophys.*, same as *cognitive* ★*reaction*. *Baldwin*, Dict. of Philos. and Psychol., II. 418.—**Schotten-Baumann reaction.** Same as *Baumann-Schotten* ★*reaction*.—**Selective reaction**, in *psychophys.*, a form of compound reaction in which various movements of response are arbitrarily correlated with various sensory stimuli, all known beforehand to the reactor, any one of which may be presented by the experimenter (discriminative type); or in which various movements of response, such as those of articulate speech, are naturally correlated with the various members of a group of stimuli, known beforehand to the reactor only in a general way, any one of which may be presented by the experimenter (cognitive type). *E. B. Titchener*, Exper. Psychol., II. i. 188.—**Sensorial reaction**, in *psychophys.*, the complete form of the simple reaction; the form of reaction in which the preparatory attention of the reactor is directed, exclusively or predominantly, upon the coming sensory stimulus: opposed to *central* ★*reaction*, *muscular* ★*reaction*.

When the expectation is directed toward the stimulus.

which is to serve as the motive, the form of *reaction* known as *sensorial* results.

W. Wundt (trans.), Outlines of Psychol., p. 198.

Serum reaction. Same as ★*agglutination*, 4. See ★*agglutination test* and *serum* ★*diagnosis*.—**Simple reaction,** in *psychophys.*, a reaction in which the movement of response follows directly upon the presentation of the stimulus, without the interpolation of any complicating process (discrimination, association, etc.).

When the subject responds by a simple movement, such as lowering the jaw, blowing, or pressing the lips, the action is closely like that of a response with the finger; all these forms are termed '*simple reactions*.'

Scripture, Exper. Phonetics, p. 207.

Vocal reaction, in *psychophys.*, a reaction in which the movement of response consists of a vocal utterance (spoken word, syllable, vowel, etc.), while the stimulus reacted to may or may not be of the same kind.

When the subject responds . . . by a speech movement such as that of a vowel or a consonant, the action may be distinguished as a '*semi-vocal reaction*.' A '*complete vocal reaction*' may be measured with two voice keys.

Scripture, Exper. Phonetics, p. 208.

Volitional reaction, in *psychophys.*, a form of compound reaction in which the experimenter presents any one of a number of stimuli, known beforehand to the reactor, and the latter executes the movement of reaction in response to certain members of the group, allowing the rest to pass unregarded (discriminative type); or in which the experimenter presents any one of a number of stimuli, known to the reactor only in a general way, and the latter in certain cases executes, in certain others suppresses, the responsive movements naturally correlated with the stimuli (cognitive type). *E. B. Titchener*. Exper. Psychol., II. i. 190.—**Widal reaction** or **test,** the agglutination and arrest of motility of typhoid bacilli brought about by the action of agglutinins in the blood-serum of typhoid-fever patients. The reaction is extensively utilized in the diagnosis of typhoid fever. See ★*agglutination test* and *serum* ★*diagnosis*.—**Xanthoproteic reaction,** a color-reaction obtained with all true albumins by means of nitric acid, and supposedly dependent upon the presence in the albuminous molecule of a phenol or phenyl group.

reactional (rẹ̄-ak′shọn-al), *a.* [*reaction* + *-al*¹.] Of, pertaining to, or of the nature of, reaction.

reaction-key (rẹ̄-ak′shọn-kē), *n.* In *physiol.* and *psychophys.*, an instrument by means of which the movement of response in the reaction experiment is executed and the moment of this reaction marked upon the recording apparatus (chronograph or chronoscope). The reaction-keys in common use are so constructed that the movement of reaction (pressure or lift of a finger) makes or breaks an electric circuit. Other keys are arranged for air-transmission, or for direct mechanical transmission by means of levers. The electrical keys are also made for a large variety of responsive movements, as lip-keys, speech-keys, voice-keys, eyelid-keys, etc.

The *reaction-key* used in these measurements of the time of reaction to electric stimuli consisted of a frame for the support of an easily sliding rod, one end of which carried a cork disk and the other a platinum point by which the circuit was completed. The movement of the medusa against the disk when a stimulus was given, caused the rod to slip upward, thus breaking the chronoscope circuit. *Biol. Bulletin*, Jan., 1904, p. 85.

Telegraph reaction-key, a finger-key, modeled upon the ordinary telegraph-key, much used in reaction experiments with the Hipp chronoscope.

reactionless (rẹ̄-ak′shọn-les), *a.* Without reaction: said of certain alternating-current machines which are so designed that the armature currents neither strengthen nor weaken the magnetic circuit.

reaction-product (rẹ̄-ak′shọn-prod″ukt), *n.* Same as ★*adaptation-product*.

reaction-rim (rẹ̄-ak′shọn-rim), *n.* In *petrog.*, a shell surrounding any mineral in a rock formed of secondary minerals which have resulted from the chemical reaction of the surrounding minerals. Olivin in gabbro is sometimes surrounded by a zone of amphibole. The term is also applied to marginal zones in phenocrysts in porphyritic rocks which were produced by the action of the molten magma upon the crystal before the solidification of the rock. Porphyritic hornblende is often surrounded by a border of magnetite and pyroxene. *Kemp*, Handbook of Rocks, p. 160.

reaction-substance (rẹ̄-ak′shọn-sub″stạns), *n.* Same as ★*adaptation-product*.

reaction-telephone (rẹ̄-ak′shọn-tel″ẹ̄-fōn), *n.* See ★*telephone*.

reactivate (rẹ̄-ak′ti-vāt), *v. t.*; pret. and pp. *reactivated*, ppr. *reactivating*. [*re-* + *activate*.] To render active again: used specifically of the process of restoring the activity of an immune serum after the destruction of its complement. See ★*reactivation*.

The serum can be *reactivated* by a little fresh serum not only from a normal rabbit, but from the goat and the rat. *Med. Record*, Feb. 14, 1903, p. 251.

reactivation (rẹ̄-ak-ti-vā′shọn), *n.* [*reactivate* + *-ion*.] The act or process of reactivating; specifically, in *immunology*, the process of rendering an immune serum active again after its complement has been destroyed by age or by heating to 55° C. The amboceptor then remains, but is in itself inactive. If now some fresh blood-serum, from a suitable animal, which contains the necessary complement, is added, the activity of the serum is restored; it has been reactivated. *Med. Record*, Feb. 14, 1903, p. 251.

reactive, *a.* 2. In alternating-current circuits, same as ★*wattless*.—**Reactive circuit,** in *elect.*, a circuit the impedance of which is in part or wholly due to inductance or capacity or to both.—**Reactive coil,** in *elect.*, a wire coil, frequently with an iron core, used to produce *reactance*. See ★*reactance*.—**Reactive drop,** the fall of potential in a circuit due to reactance as opposed to ohmic drop, which is due to resistance.

II. *n.* A reagent. [Rare.]

Letter large
Label and label, then with solemn charge,
Reviewing learnedly the list complete
Of chemical *reactives*, from thy feet
Push down the same to me.

Browning, Parleyings with Charles Avison, ix.

reactor (rẹ̄-ak′tọr), *n.* One who or that which reacts; specifically: (*a*) In *elect.*, a reactive coil. (*b*) In *exper. psychol.*, the observer in a reaction experiment; the person who executes a movement in response to a prearranged sensory stimulus.

Such a modification may, indeed, be introduced even in the simple form of the experiment just described, by varying the way in which the *reactor* prepares, before the appearance of the stimulus, for the execution of the act. *W. Wundt* (trans.), Outlines of Psychol., p. 198.

'Observer' should be the general term for the person on whom an experiment is tried. 'Subject' should be used where this person is abnormal, and '*reactor*' where some movement is required.

Jour. Philos., Psychol. Sci. Methods, April 28, 1904, p. [239.

Reading beds. See ★*bed*¹.

reading-lens (rē′ding-lenz), *n.* A reading-glass.

reading-microscope (rē′ding-mī″krọ̄-skōp), *n.* A form of microscope used in instruments of precision to magnify the divisions of a scale: an accessory of a vernier.

reading-telescope (rē′ding-tel″e-skōp), *n.* 1. A telescope used in reading a scale placed at a distance or reflected in a mirror.—2. Specifically, a simple form of cathetometer. It consists of a telescope which has an object-lens and a negative eyepiece containing a spider-line or cross-wire. A level is attached to the top of the telescope, which may stand on a tripod or be movable about and up and down a vertical standard. *M. W. Travers*, Exper. Study of Gases, p. 57.

ready, *v. t.*—**To ready up,** to make ready or prepare for a special (generally underhand) purpose; 'fix.' [Australian.]

If you '*ready up*' a racehorse, you'are preparing to lose, or if you '*ready up*' a pack of cards, you prepare it for dealing certain suits.

The Age, Nov. 25, 1893, p. 13, quoted in E. E. Morris, [Austral English.

reagent, *n.* 4. In *exper. psychol.*: (*a*) The observer in any form of psychological experiment: opposed to *experimenter*. (*b*) Same as ★*reactor*.

The experimenter exposed, in irregular order, the stimuli that he had been using as comparisons, and asked each *reagent* to designate each shade as it was exposed.

F. Angell, in Philos. Studien, XIX. 14.

Barfoed's reagent, an 0.5–.4 per cent. solution of cupric acetate which contains 1 per cent. of acetic acid: used in testing for certain sugars. Dextrose reduces the reagent, maltose does not.—**Baudouin reagent,** in *chem.*, hydrochloric acid with a little cane-sugar, used to detect, by the appearance of a rose color, sesame-oil as an adulterant of olive-oil: a test of doubtful value.—**Erdmann's reagent,** a mixture of dilute nitric acid and concentrated sulphuric acid: a reagent for alkaloids.—**Fehling's reagent,** a mixed solution which contains in proper proportions cupric sulphate, an alkaline tartrate (usually Rochelle salt), and caustic soda. In the presence of certain kinds of sugar, especially the glucoses, this reagent gives, on heating, a precipitate of cuprous oxid, which exhibits a yellow, orange, or brick-red color as it varies in quantity and state of subdivision. The amount of precipitate obtained, or of the reagent solution of standard strength which has been decomposed to produce it, may be used to determine quantitatively the sugar present.—**Fröhde's reagent,** a solution of sodium molybdate or molybdic anhydrid in concentrated sulphuric acid which gives characteristic colors with alkaloids, glucosides, and proteins.—**Günzburg's reagent.** See *Günzburg's* ★*test*.—**Ilasvay's reagent,** a reagent employed in testing for nitrites.—**Millon's reagent,** in *chem.*, a solution made by dissolving one part of mercury in one part of nitric acid of specific gravity 1.42, diluting with twice its bulk of water, and filtering after 24 hours. It is used for the detection of proteid and albuminoid substances, which it colors red, as in distinguishing animal fibers from those of vegetable origin.—**Scheibler's reagent,** in *chem.*, phosphotungstic acid, obtained by mixing solutions of sodium tungstate and sodium phosphate with a little nitric acid: used to detect alkaloids, which it precipitates.—**Schultze's reagent,** in *chem.*, a saturated solution in water of sodium phosphate to which antimony pentachlorid has been added: used to detect alkaloids, which are precipitated by it.—**Schweitzer's reagent,** in *chem.*, a solution of cupric hydroxid in aqueous ammonia, forming a dark-blue liquid: used to detect and remove cellulose, which it dissolves, as in the examination of mixed fabrics in which cotton or linen may be present.—**Sonnenschein's reagent,** in *chem.*, a solution of phosphomolybdic acid, with addition of a little nitric acid; used to detect alkaloids, with which it gives yellow precipitates.—**Uffelmann's reagent,** three drops of a saturated aqueous solution of ferric chlorid mixed with three drops of a concentrated solution of pure carbolic acid, the whole diluted with water until a bright amethyst-blue color develops. The reagent is used in testing for lactic acid, which changes the blue color to a bright yellow.

real¹. **I.** *a.* 7. In *math.*, involving no unit for number but the primitive unit, 1.—8. In *geom.*, appearing in a finite figure. For instance, any two coplanar circles ⊙C(*r*) and ⊙A(*a*) are said to intersect, but their intersection-points are real only if $AC \leqq (r + a)$.—9. In *optics*, opposed to *virtual*: as, a *real* image, one formed by the actual convergence of waves brought to a focus by an optical system, as distinguished from the virtual image formed where the geometrical extensions of a group of rays meet.—**Real number.** See ★*number*.—**Real servitude, statutes, substitution, treaty.** See ★*servitude*, etc.—**The real thing,** the actual thing itself; the genuine article. [Colloq.]

Mr. . . . has *the real thing* in him, the stuff of which literature is fashioned. *Athenæum*, May 20, 1905, p. 619.

II. *n.* 3. In *math.*, a real number.—**Axis of reals,** in *geom.*, the axes of abscissas in the graphic representation of the complex variable $x + iy$.

real³, *n.*—**Real fuerte,** the Spanish silver real, equal to 12½ cents, as distinguished from the *real de vellon*, which is worth only five cents.

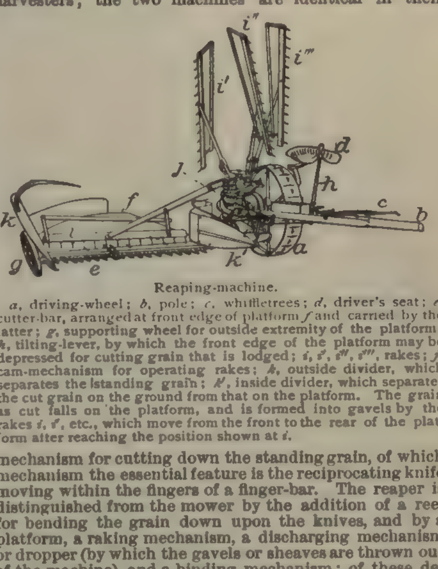
realize, *v. t.*—**A realizing sense,** an intuition of the exact meaning or character of a thing or person. [Colloq. U. S.]

Since he had no "*realising sense*" of men, how could he hold men? *H. Harland*, Comedies and Errors, p. 87.

realm, *n.*—**Holarctic realm.** See *Holarctic* ★*region*.

reamputation (rē-am-pū-tā′shọn), *n.* [*re-* + *amputation*.] Amputation performed a second time on a limb a part of which has previously been removed. *Buck*, Med. Handbook, I. 246.

reaping-machine (rē′ping-mạ-shēn″), *n.* A harvesting-machine for grain-crops; a mechanical reaper drawn over a field of standing grain by horses. The reaping-machine is a modified mowing-machine or mower, both mower and reaper being harvesters; the two machines are identical in their mechanism for cutting down the standing grain, of which mechanism the essential feature is the reciprocating knife moving within the fingers of a finger-bar. The reaper is distinguished from the mower by the addition of a reel for bending the grain down upon the knives, and by a platform, a raking mechanism, a discharging mechanism or dropper (by which the gavels or sheaves are thrown out of the machine), and a binding mechanism; of these devices any or all may be present in one machine. Reaping-machines are often distinguished according to their attachments: thus, a *dropper* is a reaping-machine that automatically throws out the cut grain at intervals; a *self-raker* or a *self-binder*, sometimes called a *harvester and binder*, is one with a raking or a binding attachment. The discharging mechanism or dropper is a device for causing the platform upon which the grain falls when cut to throw off its load. The raking attachment consists of a series of rakes moving over the platform to gather the grain into gavels and sweep it off upon the ground. The binding attachment consists essentially of an endless-belt elevator for lifting the cut grain, and a pair of curved arms for gathering and compressing it into a bundle and holding it while the binding mechanism proper draws wire or twine around it, twists the wire or loops and knots the twine, cuts the bundle from the wire or twine, and discharges the bound sheaf.



Reaping-machine.

a, driving-wheel; *b*, pole; *c*, whiffletrees; *d*, driver's seat; *e*, cutter-bar, arranged at front edge of platform *f* and carried by the latter; *g*, supporting wheel for outside extremity of the platform; *h*, tilting-lever, by which the front edge of the platform may be depressed for cutting grain that is lodged; *i*, *i′*, *i″*, *i‴*, rakes; *j*, cam-mechanism for operating rakes; *k*, outside divider, which separates the standing grain; *k′*, inside divider, which separates the cut grain on the ground from that on the platform. The grain as cut falls on the platform, and is formed into gavels by the rakes *i*, *i′*, etc., which move from the front to the rear of the platform after reaching the position shown at *i*.

rear³, *n.* 4. The up-stream end of a drive. The logs may be either stranded or floating: in the former case they are termed *dry rear*; in the latter *floating rear*.

Rear-Adm. An abbreviation of *Rear-admiral.*

rear-cut (rēr′kut), *a.* Having, as a mower, the cutting bar in the rear of the carriage. *Knight*, 1884.

rear-driven (rēr′driv″n), *a.* Driven by applying the power to the rear axle: said of motor-driven vehicles.

rearhorse, *n.*—**False rearhorse,** any member of the neuropterous family *Mantispidæ.* See *Mantispa* and *Mantispidæ.*

rearing-pond (rēr′ing-pond), *n.* A pond, connected with a fish-hatchery, in which the young are reared.

rear-man (rēr′man), *n.* 1. *Naut.*, see the extract.

The two men whose numbers place them farthest from the ship's side [in working a gun] are to be termed right and left *rear-men.* *F. A. Griffiths*, Artilleryman, p. 227.

2. *Mil.*, a rear-rank man.

reascensional (rē-a-sen′shon-al), *a.* [*reascension* + *-al*^{1}.] Pertaining to, or of the nature of, reascension; specifically, descriptive of or relating to the union of processes by which the coherence, the crystalline condition, and, in some measure, the complexity characteristic of original igneous rocks are restored in sediments and other clastics. The reascensional process is contrasted with the ★*descensional* process of disintegration, and includes all the phases of reconstructional work as applied to rocks. *Chamberlin and Salisbury*, Geol., I. 412.

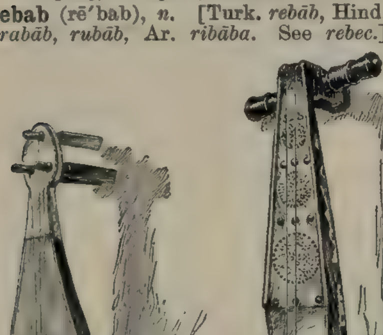
reassociate (rē-a-sō′shi-āt), *v. t.*; pret. and pp. *reassociated*, ppr. *reassociating.* [*re-* + *associate.*] To join or bring into association again.

reassort (rē-a-sôrt′), *v. t.* To assort again; to assort repeatedly. *Encyc. Brit.*, XXVIII. 395.

Reb. An abbreviation of *Rebel*, applied especially by the Unionists to the Confederates in the Civil War in the United States: often personified as *Johnnie Reb.*

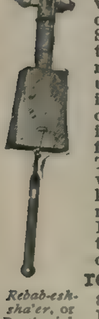
Then we got into the Colony [Orange-Free State], and the *rebs*—ministers mostly and schoolmasters—came round the cars with fruit and sympathy and texts.
R. Kipling, The Captive, in Traffics and Discoveries, p. 29.

rebab (rē′bab), *n.* [Turk. *rebāb*, Hind. Pers. *rabāb*, *rubāb*, Ar. *ribāba.* See *rebec.*] Any one of several varieties of viol common in Mohammedan countries, from which it is supposed that the European rebec was derived.



Forms of Rebab.
(Originals in the Stearns Collection, University of Michigan.)

Normally the rebab has a narrow oval body, shaped somewhat like a boat, slightly expanded at the lower and contracted at the upper end, which in some cases passes into a slightly definite neck with various devices for holding the tuning-pegs. The body is usually made of a solid piece of wood in which more or less of a resonance-cavity is scooped; its back is rounded. Sometimes slight indentations are made in the front edges of the body to facilitate reaching the strings with a bow. There are usually either two or three strings. In playing, the instrument is held vertically in front of the body by the left hand. The name *rebab* is loosely applied also to many instruments for which *kamanja* would be more suitable. The *rebab-esh-sha'er*, or poet's-viol, is a viol with one or two strings, a body shaped like a key-stone and flat in front and behind, a long neck of turned wood, and a long iron foot. It is rested on the ground in playing, while the player sits or squats behind it, as in the case of the kamanja, which it resembles.



Rebab-esh-sha'er, or Poet's-viol.

rebabbitt (rē-bab′it), *v. t.* To line again with babbitt a bearing which has been previously lined with the same material; to babbitt again.

rebat (re-bä′), *n.* [Local F., < *rebattre*, beat back, beat again: see *rebate*, *v.*] The day-wind or lake-breeze on Lake Geneva, Switzerland. It begins on the open lake about 10 A.M., spreads outward toward both shores, and ceases about 4 P.M. It is not quite as strong as the morget, or land-wind, of the night-time.

The lake breeze, le *rebat*, blows during the day from 10 A.M. till 4 P.M., but with less velocity than the morget. This lake breeze begins over the open surface of the lake, and advances toward the shore. The morget and the *rebat* are true land and lake breezes, according to Forel, and are not mountain winds.
J. Hann (trans.), Handbook of Climatol., p. 161.

rebellion, *n.*—**Proclamation of rebellion.** See ★*proclamation.*

rebellious, *a.* 4. Specifically, in *metal.*, difficult to reduce; requiring extra manipulation or extreme heat: said of ores from which it is difficult to separate the metal.

reblock (rē-blok′), *v. t.* To provide with a new block, or other suitable support, as a specimen in a museum collection. *Smithsonian Rep.* (Nat. Mus.), 1896, p. 83.

reboantic (reb-ō-an′tik), *a.* [L. *reboans*(*t-*), ppr. *reboare*, bellow back, re-echo, + *-ic.*] Resounding; reboant. [Rare.]

The Conchimarian horns
Of the *reboantic* Norns
Usher gentlemen and ladies
With new lights on Heaven and Hades.
R. Kipling, The Files, l. 74.

rebolting-machine (rē-bōl′ting-ma-shēn″), *n.* A sawing-machine for making cuts in a bolt or block which nearly, but not quite, cuts it into pieces. In this condition the bolt can easily be handled and can readily be broken by hand as it is desired to use the pieces.

rebunker (rē-bung′kėr), *v. i.* and *t.* [*re-* + *bunker.*] To refill the bunkers with coal; coal again.

But wood, as compared with coal, is bulky stuff to carry, and as the stowage capacity of these stern wheelers is small, they had to make frequent calls to *rebunker.*
Cutcliffe Hyne, A Master of Fortune, iii.

Rec. An abbreviation (*a*) of *recipe*; (*b*) of *record*, *recorded*, or *recorder.*

recalescence, *n.* Steel in cooling from a temperature of, say, 1,000° C. may exhibit recalescence or evolution of heat at three points, namely, at about 850°, 750°, and 650°. At the last of these the phenomenon is most marked.

recalescent (rē-ka-les′ent), *a.* [L. *recalescens* (*t-*), ppr. of *recalescere*, grow hot again.] Of or pertaining to recalescence.

The *recalescent* points of steel and copper.
Elect. World and Engin., April 18, 1903, p. 666.

recalibrate (rē-kal′i-brāt), *v. t.* and *i.*; pret. and pp. *recalibrated*, ppr. *recalibrating.* To calibrate anew.

recandescence (rē-kan-des′ens), *n.* [L. *recandescere.* See *candescence.*] A gradual process of growing brighter; renewed candescence.

recapitalize (rē-kap′i-tal-īz), *v. t.*; pret. and pp. *recapitalized*, ppr. *recapitalizing.* To capitalize anew; enlarge or otherwise modify the capitalization of.

But since that time the American steel industry has been *recapitalized* on an immensely expanded scale, and it was plain to every one that reversion to prices prevalent in the nineties would put an end to dividends.
The Forum, Jan.–March, 1904, p. 361.

recapitulate, *v. i.* 2. In *biol.*, to repeat ancestral evolutionary stages: said of young animals in their early development.

recapitulation, *n.* 3. In *biol.*, the appearance in a developing organism of stages that are considered to recapitulate, or repeat in brief stages, the life-history of ancestors, or to resemble adult ancestors. See ★*recapitulation doctrine.*

That no general doctrine of *recapitulation* could be maintained was perceived by Sir John Lubbock as early as 1873, but vertebrate embryologists did not permit their zeal to be dampened by even the most obvious facts of entomology. Indeed, one of our prominent investigators, finding that *recapitulation* is elusive by microscopical methods, now proposes to test it by breeding experiments, the results of which may be available in a future geologic epoch.
O. F. Cook, in Pop. Sci. Mo., July, 1903, p. 219.

4. In *music*, the third division of a movement in sonata form, in which the subjects are taken up afresh and both in the original key. Also called *reprise.*—**Law of recapitulation.** See ★*recapitulation*, 3.—**Meckel's law of recapitulation.** See ★*recapitulation*, 3.—**Recapitulation doctrine** or **theory,** the doctrine or opinion that the life-history of an individual modern organism recapitulates, as it were, the life-history of the race to which it belongs in such a way as to enable the naturalist who studies its systematic affinities, and uses evidences from other sources, to reconstruct an outline of its ancestral history. This outline, however, while it may be valuable and instructive, must be vague and incomplete. It must be remembered, in considering the value of a conclusion of this sort, that a vague or indefinite opinion may be fundamentally certain and true. Most naturalists regard the recapitulation theory as one of the most valuable results of modern biology, and one of the greatest stimulants to research.

No candid morphologist can deny that the responsibility for the present degradation of pure morphology . . . is the result of too exclusive and undiscriminating a faith in the . . . *recapitulation theory.*
E. B. Wilson, Biol. Lectures, 1895, p. 104.

recapitulationist (rē-ka-pit-ū-lā′shon-ist), *n.* In *biol.*, one who holds the recapitulation doctrine or theory (which see, under ★*recapitulation*).

If I had time to discuss the recapitulation theory, I should begin by granting much that the *recapitulationist* demands—for instance, that certain facts in the development of animals have an historical significance, and can not be explained by mere adaptation to present circumstances; further, that adaptations tend to be inherited at corresponding phases both in the ontogeny and the phylogeny. *L. C. Miall*, in Smithsonian Rep., 1897, p. 504.

recapitulative, *a.* 2. Of or pertaining to the biological doctrine of recapitulation. See ★*recapitulation doctrine.*

recapper (rē-kap′ėr), *n.* [*re-* + *cap*^{1}, *v.*, + *-er*^{1}.] A device for fixing new primers in the primer-seat of a cartridge-case.

recarbon (rē-kär′bon), *v. t.* To supply with new carbons, as an arc-lamp.

Open arc lamps are usually only able to work 8, 16, or 32 hours without *recarboning*, even when fitted with double carbons. *Encyc. Brit.*, XXVIII. 86.

recarburizer (rē-kär′bū-rī-zėr), *n.* In the manufacture of steel by the Bessemer process, a material rich in carbon (usually spiegeleisen) which is added to the still molten product from blowing air through fused cast-iron, in order to remove any traces of oxygen which the iron itself may have taken up. The result of this addition is practically not only the removal of oxygen but the reintroduction of a little carbon, producing the so-called mild steel, which differs little from wrought-iron rendered homogeneous by fusion. *Engin. Mag.*, XVI. 181.

rec'd, recd. Abbreviations of *received.*

recedent (rē-sē′dent), *a.* Retrograde; receding; specifically in *med.*, relapsing; retrocedent: as, "*recedent* gout."

receit, *n.* and *v. t.* A simplified spelling of *receipt.*

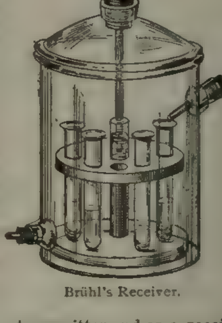
receiv, *v.* A simplified and former spelling of *receive.*

receival (rē-sē′val), *n.* [*receive* + *-al*^{1}.] Reception.

On the *receival* of the dispatches.
Southey, Hist. Penn. War, I. 152. *N. E. D.*

receive, *v. t.*—**Received text.** See *Textus Receptus.*

receiver, *n.* 7. In *mech.*: (*a*) A chamber in a compound engine into which the exhaust from one cylinder passes on its way to the next cylinder. (*b*) A chamber in a steam-line, close to the engine, in which water carried along by the steam is given a chance to separate from it before the steam enters the cylinder.—**Brühl's receiver,** a glass vessel which contains a revolving tray supporting cylinders and connected on the one side with a distilling apparatus and on the other with a vacuum-pump. It serves to collect the fractions of a distillation in vacuo.—**Double-pole receiver,** a telephone with an elongated horseshoe magnet instead of the straight-bar magnet sometimes used. In front of the two poles, which are close together, the diaphragm is mounted.—**Hot-wire receiver,** in *wireless teleg.*, a form of receiving instrument for electric waves, devised by R. A. Fessenden.—**Recording receiver,** in *teleg.*, any receiving instrument that registers in permanent form the signals transmitted to it.—**Transmitter-receiver,** in *teleg.* or *teleph.*, any device which is used both as a transmitter and as a receiving instrument.—**Wheatstone receiver,** the receiving instrument of a Wheatstone telegraph; a mechanical recording device, operated by reversals of the signaling current.



Brühl's Receiver.

receiving-box (rē-sē′ving-boks), *n.* In the pneumatic transmission of packages, a compartment or box at the receiving end of the pneumatic tube, arranged for the reception of the parcels. *Science Abstracts*, VI. sec. B, 192.

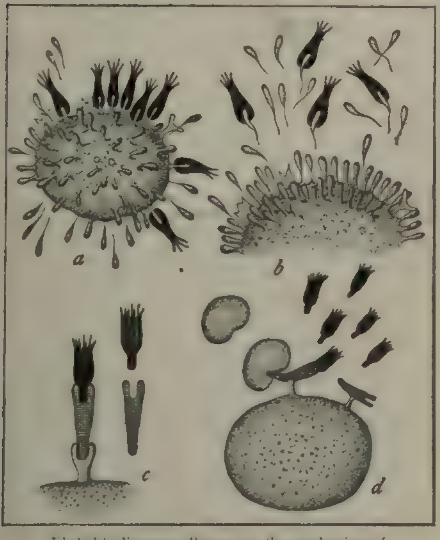
receiving-tank (rẹ̄-sē′ving-tangk), *n.* 1. A tank into which a pump discharges.—2. A drip-tank; a tank arranged to receive the water condensed in a line of steam-pipe.

receiving-yard (rẹ̄-sē′ving-yärd), *n.* See ★*drill-yard.*

receptacle, *n.*—**Salivary receptacle,** in *entom.*, an elongate thin-walled sac connected with each of the salivary glands of the cockroach and other insects.

receptaculum, *n.*—**Receptaculum ovorum,** in oligochætous worms, as the earthworm, one of the pair of sacs which communicate with the oviduct. *Proc. Zool. Soc. London*, 1897, p. 349.—**Receptaculum vitelli,** in platyhelminths, a reservoir for the vitelline matter or yolk. *Parker and Haswell*, Zoology, I. 255.

receptor (rẹ̄-sep′to̤r), *n.* [NL., < L. *receptor*, a receiver, < *recipere*, receive.] 1. A molecular complex of a cell through the union with which alien cell-products or cell-constituents can produce their specific effects upon the cell. These same receptors, owing to the presence of which the cell is open to attack, when cast off from the cell constitute its most effective defenses. Also called *side-chain.* See ★*immunity*, 5.



Ehrlich's diagrams illustrating the mechanism of immunity and cytolysis.

The figures in black indicate substances with toxic action. *a* and *b* illustrate the excessive production of receptors in response to the action of toxins, and their escape from the cells; in *b* they are seen to combine with toxin outside the cell, preventing its union with the cell; *c* shows the structure of the complement and intermediary body of bacteriolytic and cytolytic sera; *d* shows the amboceptor, while attached to the cell, uniting the complement to a large molecule.

(From Buck's Med. Handbook, App.)

Ehrlich's hypothesis to explain such facts is usually spoken of as the side-chain theory of immunity. He considers that the toxins are capable of uniting with the protoplasm of living cells by possessing groups of atoms like those by which nutritive proteids are united to cells during normal assimilation. He terms these haptophor groups, and the groups to which these are attached in the cells he terms *receptor* groups. The introduction of a toxin stimulates an excessive production of *receptors*, which are finally thrown out into the circulation, and constitute the antitoxin.
Rep. Brit. Ass'n Advancement of Sci., 1902, p. 778.

2. In *wireless teleg.*, a receiver.

It is easy to see that the reception depends upon the energy received by the antennæ; this is evident for thermic or other analogous receptors which integrate the energy received in unity of time, but is equally true for *receptors* of the coherer type, which are sensitive to electric shock received upon the arrival of each train of waves.
Elect. World and Engin., Jan. 2, 1904, p. 42.

3. The terminal expansion in skin or mucous membranes of a sensory nerve.

Thus, it [the animal body] has organs stimulated by the radiant energy of light and heat, others by chemical particles drifting from odorous objects, others mechanically by objects touching the skin, and so on. These organs specially adapted to environmental stimuli, are called *receptors.* Attached to them are nerves.
Nature, April 16, 1908, p. 570.

recess, *n.*—**Iliac recess,** a pocket-like cavity in the posterior portion of the ilium of many birds, particularly well marked in the owl and turkey. Also *iliac pocket.*—**Tympanic recess,** in *ornith.*, the rather irregular depression, or cavity, leading to the internal ear; the tympanic cavity.

recession[1], *n.*—**Angle of recession,** the angle at which the side of a recess cuts into a figure; the angle between the side of a recess and the line of that face of the figure which is cut by the recess.

recessive, *a.* 2. In *biol.*, opposed to ★*dominant*, 2. See ★*recessive*, *n.*

Cuénot experimented by making reciprocal crosses between albino, pink-eyed, fancy mice, and wild grey mice (M. musculus). He was careful to use wild mice in order to be sure that his coloured form was pure. As a result he obtained always and without exception grey mice. In Mendelian terms, grey is therefore dominant over albinism, which is called by contrast *recessive.*
Proc. Zool. Soc. London, 1903, p. 75.

Recessive character, one of the antagonistic or mutually incompatible characters of a cross-bred organism which, while it is not visibly manifested by the cross-bred organism, is transmitted to and manifested by some of its descendants. See *ancestral* ★*inheritance.*

II. *n.* In *biol.*, an organism that manifests and transmits to descendants the character which is antagonistic to a dominant, or a character which is antagonistic to a dominant character. See ★*dominant*, 2.

Mendel discovered that in this generation the numerical proportion of dominants to *reccssives* is on an average of cases approximately constant, being in fact as three to one. With very considerable regularity these numbers were approached in the case of each of his pairs of characters. *Bateson*, Mendel's Prin. of Heredity, p. 9.

Extracted recessive, a recessive of pure blood; one that does not transmit the antagonistic dominant character. See ★*dominant*, 2.

Recessus parietalis, one of the cavities of the cœloma from which are developed the pleural and part of the peritoneal cavities.—**Recessus subpinealis.** Same as *recessus infrapinealis.*—**Recessus vestibuli,** a chamber formed from a fold in the wall of the auditory vesicle from which the vestibule of the ear is developed.

recidivation, *n.* 2. Specifically, in *criminol.*, the relapse of a criminal into crime.

recidivism (rẹ̄-sid′i-vizm), *n.* [*recidiv*(*ous*) + *-ism.*] Relapse into crime; the conduct or condition of a recidivist.

The gravest feature of modern penology "is the vitality of '*recidivism*,'" a phrase [in Major Arthur Griffiths's Prison Discipline] the significance of which was anticipated in the once current phrase "Qui a bu boira."
N. and Q., 9th ser., XI. 78.

recidivity (rẹ̄-si-div′i-ti), *n.* Same as ★*recidivism.*

reciprocal. I. *a.* 4. In *geom.*, definitely dual, so that the dual of each element is fixed and constructible.—**Law of reciprocal action.** See ★*law*[1].—**Reciprocal crossing.** See ★*crossing.*—**Reciprocal curves.** Same as *reciprocal polars* (which see, under *reciprocal*).—**Reciprocal figures,** in *geom.*: (*b*) Dual figures.—**Reciprocal integration.** See ★*integration.*—**Reciprocal spiral,** $\rho\theta = a$. Same as *hyperbolic spiral.* See *spiral*, 1.

II. *n.* 3. In *geom.*, the dual.—**Polar reciprocal of a surface,** the envelop of the polar planes of all the points of the surface.

reciprocate, *v. t.* 4. In *math.*, to take the reciprocal of.

By *reciprocating* this theorem deduce the following.
J. Mulcahy, Modern Geom., p. 291.

reciprocation, *n.* 4. The process of taking the reciprocal (of a curve, proposition, or quantity).—5. In *geom.*, the correlation of two reciprocal figures. See ★*reciprocal*, *a.*, 4.

reciprocator (rẹ̄-sip′rọ-kā-to̤r), *n.* In *mech.*, a reciprocating engine, or one whose principal parts travel back and forth, as the piston in a cylinder.

reciprocitarian (res-i-pros-i-tā′ri-an), *a.* Of or pertaining to reciprocity; specifically, pertaining to or growing out of a reciprocity of commercial privileges between two governments.

To these he appeals on *reciprocitarian* lines by offering a reduction of our wine duties in return for a partial abolition of the French *surtaxe d'entrepôt.* No British Government will ever make so limited a proposal.
Athenæum, Feb. 3, 1906, p. 134.

recipro-unit, *n.* An abbreviation of *reciprocating unit*, that is, an electric generator driven by a reciprocating engine. [Rare.]

recirculation (rẹ̄-sėr-kụ-lā′sho̤n), *n.* [*re-* + *circulation.*] A new or renewed circulation.

recitalist (rẹ̄-sī′ta̤l-ist), *n.* [*recital* + *-ist.*] A musician, singer or player, who gives recitals.

recitando (rā-chẹ̄-tän′dō), *a.* [It., ppr. of *recitare*, recite.] In *music*, reciting; half spoken or declaimed, after the manner of a recitative.

recitative, *n.*—**Simple recitative,** in *music*, same as *recitativo secco.* See *recitative.*

reciting-tone (rẹ̄-sī′ting-tōn), *n.* Same as *reciting-note.*

reckoning, *n.*—**Prince's reckoning,** in *archery*, the method of scoring now commonly used, in which hits in the five concentric rings of the target count 9, 7, 5, 3, and 1 respectively. See ★*target*, 2.—**Reckoning method.** See ★*method.*

Reclamation law, the name given to an act of the United States Congress, passed in 1902, by which a fund was created for the purpose of providing for the irrigation of the desert lands in the western part of the United States.—**Reclamation Service.** See ★*service*[1].

réclame (rā-kläm′), *n.* [F. *réclamer*, entreat, call upon for aid. See *reclaim*, *v.* and *n.*] 1. The seeking or attaining of notoriety, as by advertising; method or means of attaining notoriety; notoriety.

Mr. J. —— owed his *réclame* to the divorce proceedings which ensued, as well as to his acting.
The Week (in *The Transcript*), Dec. 21, 1900.

2. The act of protesting; remonstrance; a protest. [Erroneous use.]

Such a *reclame* arose against the measure that it was quietly dropped. *Evening Telegram*, June 26, 1903.

recleaner (rē-klē′nėr), *n.* [*re-* + *clean*, *v.*, + *-er*[1].] A shaking- or screening-attachment to a bean-thresher or pea-huller for the final cleaning of the beans or peas before they are delivered to the bagger or bagging-machine. See ★*bean-thresher* and ★*pea-huller.*

recognition[1], *n.*—**Mediate recognition,** in *psychol.*, the recognition of an object, not by means of its own attributes, but by means of some accompanying mark or character which stands in accidental connection with it.

As a special form of this kind of process we have the phenomenon called *mediate recognition.* . . . As, for example, when a person is recognized because of his companion.
W. Wundt (trans.), Outlines of Psychol., p. 239.

Recognition color, a color displayed on an animal supposed to be of use to others of its species as a means of recognition.

For numerous examples of *recognition-colours* in birds, see Darwinism, pp. 217–226.
A. R. Wallace, Tropical Nature, p. 367, note. *N. E. D.*

Recognition reaction. See ★*reaction.*—**Recognition service,** a service held for the purpose of introducing a new pastor to his congregation. *N. E. D.*

The Baptist Church . . . where his *recognition service* was held last night.
Westminster Gazette, Nov. 9, 1897, p. 9.

Recognition time, in *psychophys.*: (*a*) The total time required for the process of recognition, that is, for the recognition reaction or cognitive reaction. (*b*) This time minus the time required for the simple reaction. *Amer. Jour. Psychol.*, XIII. 258.

recognitional (rek-o̤g-nish′o̤n-a̤l), *a.* [*recognition*[1] + *-al*[1].] Pertaining to, or of the nature of, recognition.

So many of our judgments are *recognitional* instead of being cognitional, that judgments usually appear to be instantaneous. *J. W. Powell*, Truth and Error, p. 281.

recognition-mark (rek-o̤g-nish′o̤n-märk), *n.* A mark which serves as a means of recognition or identification; specifically, a characteristic of animals which, when displayed, serves for the guidance of other individuals of the species; an episematic character. See ★*episematic.*

recoherence (rē-kọ-hēr′e̤ns), *n.* The spontaneous reduction in the resistance of a coherer without the application of the electric oscillations to which coherence is normally due.

On applying a small measured force the cohered surfaces separate. On bringing them in contact again at the same places, coherence will follow, but not always without the incidence of electric radiation. This can be repeated two or three times, but the power to cohere spontaneously soon vanishes. This spontaneous coherence is called *re-coherence.*
Elect. World and Engin., July 9, 1904, p. 72.

recoil-cylinder (rẹ̄-koil′sil″in-dėr), *n.* In *ordnance*, a cylinder fitted with a piston and piston-rod so arranged that when the gun recoils after firing the piston is forced through the length of the cylinder. A *hydraulic recoil-cylinder* contains a liquid which is forced to flow from one side of the piston to the other through small orifices in the piston or grooves in the walls of the cylinder, thus causing resistance to the recoil and bringing the gun to rest without shock. A *pneumatic recoil-cylinder* contains air under pressure which is further compressed by the recoil. A *spring recoil-cylinder* contains heavy coiled springs which are compressed by the recoil. See also ★*gun-mount.*

recoil-spring (rẹ̄-koil′spring), *n.* A spring used to check or stop a piece which recoils.

récolement (rā-kōl-moṅ′), *n.* [F., < *récoler*, reëxamine, < L. *recolare*, strain again, < *re-*, again, + *colare*, strain. See *colander.*] In *French law*, a reëxamination by a witness of a deposition made by him, and his confirmation of the same, with such alterations as his better recollection may lead him to make.

recollection, *n.*—**Testimonial recollection.** See ★*testimonial.*

recompose, *v. t.* 3. Specifically, in *optics*, to recombine, as the dispersed or scattered constituents of a complex beam of light.

recomposition, *n.* 2. Specifically, in *optics*, the reassembling or gathering together of the dispersed or scattered constituents of a complex beam of light, as in the formation of white light by the bringing together of the various rays of the spectrum.

reconcentrado (re-kon-sen-trä′dō, Sp. rā-kọn-thān-trä′dō), *n.* [Sp., < *reconcentrar*, concentrate.] In the Cuban rebellion of 1895–98, one of the Cubans who were forced by the Spanish military authorities to abandon their homes in the country and concentrate in the towns.

They were penned in like cattle, and were compelled to subsist under conditions which no cattle could have endured. Deprived of their homes and with little clothing, they lay upon the earth, with foul air, foul water and foul food, until, emaciated and diseased, they died like flies. In all, there were some 400,000 of these *reconcentrados*, and their condition excited at once the pity and the indignation of the world.
Bookman, Jan., 1906, p. 477.

reconcentrado (re-kon-sen-trä'dō, Sp. pron. rā-kọn-thān-trä'dō), *v. t.* [See *reconcentrado*, *n.*] To treat as a reconcentrado; make reconcentrados of. [Rare.]

When we came to a village like Modder River, where the Boers had been entertained and assisted in bridge-destroying and trench-digging, did we *reconcentrado* the little population?
Julian Ralph, War's Brighter Side, xix.

reconcentrate (rē-kọn-sen'trāt), *v. t.*; pret. and pp. *reconcentrated*, ppr. *reconcentrating*. 1. To concentrate; in military usage, bring forces together at some specified point.—2. To concentrate a second time; specifically, to further concentrate (ore, or matte) which has passed through one concentrating process.

The resulting matte runs 25 per cent. This is *reconcentrated* raw in hot-blast cupolas to 55 per cent., and blown directly into copper in converters.
Encyc. Brit., XXVII. 236.

3. To treat (people) as reconcentrados, by shutting (them) up in fortified towns. See ★*reconcentrado, n.*

reconcentration (rē-kon-sen-trā'shọn), *n.* The act of concentrating again; concentration; specifically, the concentrating of the Cuban insurgents in the towns. See ★*reconcentrado, n.*

The census also showed that the mortality due to the insurrection and the *reconcentration* had been less than had been ascribed. *Encyc. Brit.*, XXVII. 312.

The starvation and disease attributed to General Weyler's *reconcentration* policy caused the death of scores if not hundreds. *Rev. of Rev.*, XXI. 391.

Reconcilable circuits, in *math.*, circuits on the same surface, one of which can be converted into the other by continuous changes without leaving the surface.

reconnaissance, *n.*—**Topographic reconnaissance**, a preliminary hasty examination of the topography of a region, usually made without instruments, except those for rapid approximate measurements or observations.

reconquista (rā-kọn-kēs'tä), *n.* [Sp.] A reconquest; specifically, the regaining of Spain by the Spaniards from the Moors in the fifteenth century. See the extract.

When the "*Reconquista*" culminated in the conquest of Granada, the last Moorish kingdom in the Peninsula, by the Catholic sovereigns Ferdinand of Aragon and Isabella of Castille, the unity of Spain was realized at last, and her sovereigns, rid of foreign preoccupations, were able to turn their attention to the work of centralizing and consolidating all the powers of the State in their own hands. *Encyc. Brit.*, XXXII. 749.

reconstituent, *a.* 2. In *therap.*, building up; causing the formation of new tissue.

II. *n.* A drug or remedy that reconstitutes or rebuilds what has been wasted by disease.

As a *reconstituent*, cod-liver oil is a very useful remedy in certain chronic affections of the brain.
Bartholow, Mat. Med., p. 94. *N. E. D.*

reconstructor (rē-kọn-struk'tọr), *n.* One who constructs anew; one who restores again.

recooper (rē-kö'pėr), *v. t.* [*re-* + *cooper*, *v.*] To repair (a case, box, crate, barrel, or the like).

record, *v. t.*—**Recording galvanometer**, a galvanometer the deflections of which are registered, usually by photography, upon a revolving drum or moving strip.

record, *n.* 8. A cylinder or disk which bears a series of indentations originally made in wax, foil, or other plastic material by the vibrating stylus of a phonograph or similar instrument and which may be used in the reproduction of the original sounds. The name is applied both to the original impression in wax or other plastic material and to any cast or copy of this original in non-plastic material.—9. Also used attributively (*a*) in the sense of definition 6: as, "a *record* subscription list"; "a *record* output in steel," etc., meaning the largest on record.

A "*record* passage" for the season.
Geog. Jour. (R. G. S.), X. 50.

(*b*) In the sense of having a published record; being on record as having accomplished some particular feat. In fanciers' language a 'record homer' is a homing pigeon with an established record of having flown a certain distance within a specified time.—**Geological record**, the accessible solid part of the globe; the crust within reach of man; the whole series of rock formations which contain the data upon which geologic history is based. *Geikie*, Textbook of Geol., p. 3.—**Master record**, a principal or controlling record; an original or standard record to which all others must conform, or from which others are made, as in supplying 'records' for the graphophone, or for mechanical piano-players.

Should a sufficient demand arise, however, permanent *master records* could be provided.
Science, June 24, 1904, p. 961.

To make of record, to put on record; make a matter of record. *Smithsonian Rep.*, 1890, p. xv.

recordative (rẹ-kôr'dạ-tiv), *a.* [L. **recordativus*. See *recordation*.] Serving to record or keep in remembrance; commemorative.

recordatory (rẹ-kôr'dạ-tō-ri), *a.* [*record* + *-atory*.] Pertaining to the keeping of records.

How can we explain the use of this imperfect and difficult *recordatory* system?
Amer. Anthropologist, Oct.–Dec., 1900, p. 727.

record-breaker (rek'ọrd-brā"kėr), *n.* One who or that which breaks the record in any sense of that phrase. [Colloq.]

record-breaking (rek'ọrd-brā"king), *a.* Breaking the record; surpassing any recorded performance or production of its kind. [Colloq.]

Additional furnaces are getting ready to blow in, and there is a prospect of a *record-breaking* production [of Bessemer steel] in April and May.
N. Y. Com. Advertiser, April 11, 1901.

recorder, *n.*—**Atmospheric recorder**, an apparatus for recording atmospheric changes.—**Autograph recorder.** See ★*autograph*.—**Hensen recorder**, in *physiol.*, a recording device consisting of a diaphragm of gold-beaters' skin of conical shape, with a stylus which acts over a fulcrum and writes on a thinly smoked plate of glass. *Harvard Psychol. Stud.*, I. 434.

recording-drum (rẹ-kôr'ding-drum), *n.* In any electrical or mechanical recording-machine, such as a recording thermometer, wind- or steam-pressure gage, the moving drum which supports the ribbon or blank paper on which the stylus marks the variations of temperature, pressure, or other phenomena to be recorded.

recover², *v. t.* 11. In *manuf.*, to save; keep what had formerly been thrown away: as, to *recover* the by-products in a gas-plant.—**Recovered rubber, soda.** See ★*rubber*, ★*soda*.

recovery, *n.*—**Spheroidal recovery**, in *geol.*, the tendency of the earth to revert to a spheroidal shape after deformation, which is believed by some to develop periodically.

Geological history affords evidence of the alternation of periods of tetrahedral collapse and *spheroidal recovery*.
Geog. Jour. (R. G. S.), XIII. 249.

recpt. An abbreviation of *receipt*.

recrescence (rẹ-kres'ẹns), *n.* [*re-* + *crescence*.] Regrowth; specifically, the regeneration or replacement of lost parts by an organism.

Recrescence is, in fact, nothing but the effect of the same causes which condition growth in definite directions. *Eimer*, Organic Evol., p. 389.

recrudescence, *n.* 5. Figuratively, a return; a re-appearance: as "The *Recrudescence* of Imray," the original title of a story by Rudyard Kipling in "Mine Own People."

recrystallization (rẹ-kris"tạ-li-zā'shọn), *n.* Repeated crystallization of the same substance. This process, with separation at each repetition of the mother-liquor and re-solution of the crystals, is frequently resorted to by chemists as a valuable means of purifying the substance. *Van Hise*, U. S. Geol. Surv., Monographs, XLVII. 202.

recrystallize (rẹ-kris'tạ-līz), *v. t.*; pret. and pp. *recrystallized*, ppr. *recrystallizing*. [*re-* + *crystallize*.] To subject (a substance) to repeated crystallization. *Buck*, Med. Handbook, III. 844.

rect. An abbreviation (*c*) of *receipt*.

Rectal glands (*b*), **reflex, valves.** See ★*gland*, etc.

rectangle, *n.* 4†. A right-angled triangle.

rectangular, *a.* 2. Shaped like a rectangle; that is, having four sides and four right angles.—**Rectangular axes**, coördinate axes at right angles.—**Rectangular cone.** Same as *right cone*. See *cone*, 1 (*a*).—**Rectangular cylinder**, a cylinder whose elements are perpendicular to its bases.

rectangulate (rek-tang'gụ-lāt), *a.* [NL. *rectangulus*, rectangled, + *-ate*¹.] Rectangular.

rectangulate (rek-tang'gụ-lāt), *v. i.*; pret. and pp. *rectangulated*, ppr. *rectangulating*. To diverge in a rectangular net.

rectangulometer (rek-tang-gụ-lom'e-tėr), *n.* [NL. *rectangulus*, rectangle, + Gr. *μέτρον*, measure.] A cuboid for testing the inclination of planes; also, a turner's trial-bar.

recte e retro (rek'tē ē rē'trō). [L.] 'Right backward': in *music*, marking passages to be repeated backward. See *retrograde imitation*.

rectification, *n.* (*b*) In its specific use in relation to the increase of strength of alcoholic liquors by distillation, *rectification* signifies repeated fractional evaporation of the mixed liquid, *dephlegmation* repeated fractional condensation of the mixed vapor. Both words are simultaneously applied in the improved forms of still. (*d*) In *astrol.*, the ascertainment of the true time of birth by comparison of the directions deduced from the estimated time with the dates of events in the native's life.—**Mechanical rectification**, the operation of obtaining the length of a curve by the use of any mechanical contrivance.

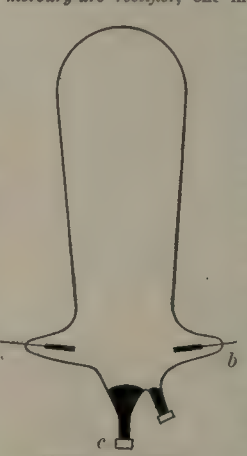
rectificative (rek'ti-fi-kā-tiv), *a.* Rectifying; serving to straighten out.

rectificator (rek"ti-fi-kā'tọr), *n.* [NL. *rectificator*, < ML. *rectificare*, rectify.] The part or parts of a modern still for alcoholic liquors in which rectification takes place. See ★*rectification* (*b*).

rectificatory† (rek'ti-fi-kạ-tọ-ri), *n.*; pl. *rectificatories* (-riz). [NL. **rectificatorium*, < ML. *rectificare*, rectify.] A mathematical instrument employed in the making of dials.

Rectified vitriol. See ★*vitriol*.

rectifier, *n.* (*e*) In *elect.*, an apparatus for changing an alternating electric current into a direct current directly, that is, without intermediary transformation of energy. The most common forms of rectifier are: (1) The *mechanical rectifier*, which consists of a synchronous motor (that is, a motor which keeps step with the alternations of the alternating current) driving a rectifying commutator which reverses the direction of successive impulses of current so as to send them in the same direction into the direct-current circuit. The main objection to this form is the destructive sparking of the commutator-brushes when rectifying large amounts of power. (2) The *electrolytic rectifier* which is based on the property of aluminium, in some salt or acid solutions, of passing current only when negative: a property due, probably, to the formation of a non-conducting film of oxid or basic salt on the aluminium by the oxygen produced on the aluminium when it is the positive terminal. Such a rectifier usually consists of an aluminium and a carbon or metal plate in a solution of some suitable salt. A combination of this sort passes only one half-wave of alternating current, from the carbon to the aluminium, but partly suppresses the reverse half-wave; and by using two such rectifiers, one half-wave of current is passed over the one, the other over the other rectifier, and then recombined and sent into the direct-current circuit. The disadvantage of the electrolytic rectifier is its low efficiency. (3) *Arc-rectifiers*, which are based on the property of arcs to be conducting in one direction, but not in the opposite. In the *mercury-arc rectifier*, one mercury and two graphite terminals are inclosed in the same glass tube, the two graphite terminals being connected to the terminal of the alternating-current supply, while the direct-current circuit connects between the mercury terminal of the rectifier and a neutral or midway point of the alternating-current circuit, derived from a three-wire transformer or compensator, or by reactances. One impulse of the alternating current then passes from one graphite electrode, the other from the other graphite electrode; but both issue, in the same direction, from the mercury electrode into the direct-current circuit. The mercury-arc rectifier has a very high efficiency, but is so far limited in the amount of current which it can rectify. It is used for charging storage batteries and for arc-lighting.—**Mercury-vapor rectifier**, a device for converting an alternating into a direct current which depends for its action upon the fact that a mercury arc is a good conductor in one direction and almost a non-conductor in the other. See *mercury-arc rectifier*, under ★*rectifier* (*e*).



Mercury-arc Rectifier.

a and *b*, terminals of a vacuum-tube connected to an alternating-current circuit; current will flow freely from *a* to *c* or from *b* to *c*, but not in the reverse direction; the current in an outside circuit attached to *c* will therefore always have the same direction.

rectify, *v. t.* 6. In *elect.*, to change (an alternating electric current) into a direct current by redirecting the successively opposite impulses of the alternating current so as to flow in the same direction. See ★*rectifier* (*e*). *Elect. World and Engin.*, Jan. 23, 1904, p. 181.—**Rectifying transformer.** See ★*transformer*.

rectigraph (rek'ti-gråf), *n.* [L. *rectus*, right, + Gr. *γράφειν*, write.] A device, such as the symmetrical doublet of lenses of a terrestrial eyepiece, introduced into the optical system of a telescope to give an erect instead of an inverted image. *M. W. Travers*, Exper. Study of Gases, p. 57.

Rectilinear vibration. See ★*vibration*.

rectophobia (rek-tọ-fō'bi-ạ), *n.* [NL., < NL. *rectum*, rectum, + Gr. *-φοβια*, < *φοβεῖν*, fear.] Causeless fear experienced occasionally by the subjects of disease of the rectum.

rector, *n.*—**Lord Rector**, the honorary title of the chief of a Scottish university, usually a prominent man, elected by the students of the university: as, the *Lord Rector* of St. Andrews.

rectorite (rek'tọr-īt), *n.* [Named after E. W. *Rector* of Hot Springs, Arkansas.] A hydrous aluminium silicate related to kaolinite, occurring in soft, flexible folia resembling mountain-leather: found in Garland county, Arkansas.

rectotome (rek'tọ̄-tōm), *n.* [NL. *rectum*, rectum, + Gr. *-τομος*, ‹ *ταμεῖν*, cut.] A cutting instrument employed in rectotomy.

recua (rā'köä), *n.* [Sp. *recua*, a train of pack-animals.] A mule-train or pack-train: generally used in Spanish America, also, for any loaded train or drove of animals. It was used by the early Spanish chroniclers, to designate the trains of indigenous dogs used by the prairie Indians of North America.

recuperative, *a.* **2.** In gas-burners, regenerative; having more than the common lighting power; having a heated air-supply.

recurrent, *a.* **5.** In *paleon.*, reappearing without essential change in organic composition: used of faunas which reappear after their first disappearance from a given geological section, or of a species which thus returns after departure. The conception of recurrent faunas implies the fact of migration and temporary absence from a given geographical province with subsequent return thereto.—**Recurrent series.** See *series.*

II. *n.* **2†.** A recurrent verse.

recurrer (rẹ̄-kėr'ėr), *n.* That which recurs; specifically, a recurring decimal. [Rare.]

Recurring curve, a curve which returns upon itself.

recurvirostrine (rẹ̄-kėr-vi-ros'trin), *a.* [*Recurvirostrinæ.*] Of or belonging to the *Recurvirostrinæ;* having the bill turned or bent upward; recurvirostral.

recuse (rē-kūz'), *n.* [*recuse, v.*] In *numis.*, a coin which, owing to the shifting of the die or dies, has been struck twice and thus bears a double impression.

recuver, *v.* and *n.* An amended spelling of *recover.*

red[1]. **I.** *a.*—**Red Book.** (*c*) A book of Welsh medieval tales, more fully known as "The Red Book of Hergest" (which see, in the Century Cyclopedia of Names). (*d*) A semi-official publication issued quarterly in China, and there called the "Complete Book of the Girdle-wearers,' containing lists of all the officials and gentry of the country, together with details of place of birth, etc.—**Red clay, disease.** See ★*clay*, etc.—**Red light district,** a portion of a city (especially of New York) in which low resorts, particularly houses of ill-fame, indicate their character to the public by a red light (or a light shining through a red pane of glass) over the door. [U. S.]

> Inspector . . . was placed in charge of the First Inspection District, which embraces the "*Red Light*" district east of the Bowery. *N. Y. Tribune*, May 5, 1901.

Red scale. See ★*scale*1.—**Red tongue fever.** Same as *typhoid fever.*

II. *n.* **7.** In *archery:* (*a*) The second and next to the innermost circle of the target, which is colored red. (*b*) An arrow which hits this circle; a hit in the red. Such a hit counts 7 by the present method of scoring. In old archery the innermost circle was sometimes colored red.—**Acid red.** See ★*acid-red.*—**Acridine red,** a basic dyestuff, prepared by the oxidation of pyronin, belonging to the xanthene group of coloring-matters. It is of no value for wool-dyeing, but dyes silk and tannin-mordanted cotton a rose-red.—**Alizarin red.** (*b*) The bright red produced by combining alizarin with an aluminium mordant: same as *Turkey red* and *madder-red.* See *alizarin.*—**Alizarin red S.** Same as *alizarin* ★*carmine.*—**Alkali fast red,** an acid dyestuff which dyes wool a bluish red. It is fast to alkalis.—**Alkali red,** a direct cotton color of the diazo type, related to benzidine.—**Alpha-naphthylamine red,** an ingrain color of the insoluble azo type. It is a dark-bluish red or claret color, and is largely used in the printing and dyeing of cotton goods. The cloth is first prepared with sodium β-naphtholate, and is then passed through or printed with a cold diazotized α-naphthylamine solution. Also known as *carminaph garnet, scarlet 2R,* and *naphthylamine Bordeaux.*—**Anisol red.** Same as *anisidine* ★*scarlet.*—**Anthracene red,** a mordant acid color, of the diazo-salicylic-acid type, which gives a comparatively fast red when combined with a chromium mordant. It is used in dyeing wool.—**Anthraquinone red,** a name by which alizarin red is sometimes designated.—**Apollo red,** an acid dyestuff of the monoazo type made by combining diazo-paranitraniline with α-naphthylamine-disulphonic acid. Also known as *archil substitute* and *naphthion red.*—**Atlas red,** a direct cotton color of the monoazo type prepared by combining diazotized primulin with meta-toluylene diamine. It dyes unmordanted cotton a terra-cotta red in an alkaline bath. The same red may be produced on the fiber as an ingrain color by first dyeing with primulin, diazotizing, and developing with meta-phenylene-diamine.—**Azo-benzene red.** Same as ★*ponceau 3RB.* See ★*ponceau B.*—**Azophor red,** a diazoparanitraniline chlorid sold in the form of a brownish-yellow powder. Its alkaline solution in water readily unites with β-naphthol to form paranitraniline red.—**Benzidine red,** a direct cotton coal-tar color similar to benzopurpurin. [Obsolete.]—**Brilliant red.** Same as *fast red.*—**Carmine red,** a dark-purplish amorphous substance, $C_{11}H_{12}O_7$, obtained when a solution of carminic acid is boiled with a dilute mineral acid. It forms color-lakes with different metals.—**Cerasin red.** Same as ★*Sudan III.*—**Cinchona red.** (*a*) A reddish-brown powder, $C_{28}H_{22}O_{14}$, obtained by the hydrolysis of quinotannic acid. It is a dibasic acid. Perhaps identical with the phlobaphene from the bark of the pine. (*b*) A chocolate-colored compound, $C_{12}H_{14}O_7$, found in cinchona-bark, and also formed when an ammoniacal solution of quinotannic acid stands exposed to the air.—**Clayton cloth red,** an acid coal-tar color of the monoazo type. It dyes wool and silk red in an acid bath.—**Cloth red B, 3B, 3G, O,** and **R,** names applied to a number of mordant-acid coal-tar colors of the diazo type derived from amido-azo-toluene. In an acid bath they dye wool various hues of red, which are rendered faster when after-chromed. They are also dyed upon chromium-mordanted wool.—**Cloth red G.** (*a*) Same as *cloth* ★*red B, 3B,* etc. (*b*) Same as ★*azococcine,* 1.—**Cochineal red A,** an acid coal-tar color of the monoazo type derived from naphthionic acid. In an acid bath it dyes wool a red which resembles cochineal. Also called *brilliant scarlet, new coccine,* and *crocein scarlet 4BX.*—**Cocoa red.** See ★*cocoa-red.*—**Columbia red,** a direct cotton coal-tar color which dyes unmordanted cotton bright-bluish red in a salt bath. It is well suited for the dyeing of cotton-and-wool union material.—**Cresol red,** an acid coal-tar color of the monoazo type prepared by combining diazotized amidocresol with β-naphthol-disulphonic acid. It dyes wool red in an acid bath.—**Cumidine red.** Same as *cumidine* ★*ponceau.*—**Diamine fast red,** a direct cotton coal-tar color of the diazo type derived from benzidine. It dyes unmordanted cotton red in an alkaline bath. An after-treatment with chromium fluoride renders the color faster. It dyes wool directly, and if after-treated with potassium bichromate or chromium fluoride the color becomes extremely fast to light.—**Diamine red B, 3B,** and **NO,** direct cotton coal-tar colors of the diazo type related to benzidine or toluidine. They dye unmordanted cotton red in an acid salt bath.—**Dianol red,** a direct cotton coal-tar color of the diazo type derived from dichlorbenzidine. It dyes unmordanted cotton red in a salt bath.—**Direct red,** a direct cotton coal-tar color of the diazo type derived from diamido-phenyl-tolyl. It dyes unmordanted cotton red in a salt bath.—**Eclipse red.** Same as *benzo* ★*purpurin 4B.*—**Emin red,** an acid coal-tar color of the monoazo type derived from thio-metaxylidine. It dyes wool crimson red in an acid bath, and is rendered faster when treated with chromium fluoride.—**Fast red.** (*b*) One of several acid dyestuffs produced by combining diazotized naphthionic acid with α- or β-naphthol. Also applied to two red acid dyestuffs produced by combining diazotized α-naphthylamine with β-naphthol-mono- or disulphonic acid. The fast reds all dye wool red from an acid bath.—**Fast red A, C, D, E,** and **EB,** acid coal-tar colors of the monoazo type produced by combining diazotized naphthionic acid with naphthol or one of its sulphonic acids. They all dye wool red from an acid bath.—**Fast red B** and **BT,** acid coal-tar colors of the monoazo type prepared by combining diazotized α-naphthylamine with one of the naphthol-sulphonic acids. Both dye wool from an acid bath.—**Fast red 7B,** an acid coal-tar color of the diazo type prepared by combining diazotized amidoazobenzene with α-naphthol-sulphonic acid. It dyes wool red from an acid bath.—**Filix red,** a brownish amorphous compound, $C_{26}H_{18}O_{12}$, which results from the breaking up of filitannic acid by means of dilute acids.—**Glycin red,** a direct cotton coal-tar color of the diazo type derived from benzidine. It dyes unmordanted cotton red in a soap bath.—**Guinea-red,** an acid coal-tar color. It dyes wool and silk bright red in an acid bath.—**Imperial red.** Same as *benzo* ★*purpurin 4B.*—**Janus red,** a Janus coal-tar color. It dyes tannin-mordanted cotton in a neutral bath and unmordanted cotton in an acid bath.—**Kresol red.** Same as *cresol* ★*red.*—**Mars red.** (*b*) An acid coal-tar color. It dyes wool red in an acid bath.—**Milling red,** a mordant-acid coal-tar color. It may be dyed upon unmordanted wool in an acid bath and then after-chromed, or it may be dyed upon chromium-mordanted wool.—**Naphthion red.** See *Apollo* ★*red.*—**Naphthol red.** Same as ★*amaranth,* 5.—**Naphthylamine red.** Same as *magdala red.*—**Naphthylene red,** a direct cotton coal-tar color of the diazo type, prepared by combining diazotized diamino naphthalene with two molecules of naphthionic acid.—**Neutral red,** a basic coal-tar color of the azin type, prepared by the action of nitroso-dimethyl aniline upon meta-tolylene-diamine. It dyes tannin-mordanted cotton a bluish red.—**New red.** (*b*) A direct cotton coal-tar color of the diazo type derived from benzidine. It dyes unmordanted cotton and chromium-mordanted wool. (*c*) Same as ★*ponceau 3RB.*—**Nitrosamine red,** a yellowish paste which gives diazotized paranitraniline when treated with hydrochloric acid. It is used in the production of para reds.—**Oak-bark red** (Oser's), the third anhydrid of quercitannic acid, with the formula $C_{34}H_{26}O_{15}$. Löwe's oak-bark red is the fourth anhydrid of the same acid, with the formula $C_{34}H_{24}O_{14}$. Both are constituents of oak-bark as used in tanning.—**Orchil red,** an acid dyestuff of the diazo-sulphonic-acid type.—**Oxamine red,** a direct cotton coal-tar color. It dyes unmordanted cotton red in a salt bath.—**Palatine red.** Same as ★*naphthorubin.*—**Para red,** a shortened name for *paranitraniline* ★*red.*—**Paranitraniline red,** an ingrain color of the insoluble azo type. It is of a bright red color, possesses excellent fastness, and resembles Turkey red, which it has largely replaced. It is formed when cotton material, prepared with sodium β-naphtholate, is passed through a cold solution of diazotized paranitraniline.—**Red technique,** in Greek vases, the painting of red figures on a black ground. See *red-figured.*—**St. Denis red.** Same as ★*dianthine.*—**Sudan red.** Same as *naphthalene red.*—**Sultan red 4B.** Same as *benzo* ★*purpurin 4B.*—**Toluylene red.** Same as *neutral* ★*red.*—**Trona red.** Same as ★*dianthine.*—**Turkey-red process.** See ★*process.*

redactional (rẹ̄-dak'shọn-ạl), *a.* [*redaction* + *-al*1.] Relating to or of the nature of a redaction.

redan, *n.*—**Double redan,** a redan having a reëntrant angle at its point.

red-and-black (red"ạnd-blak'), *n.* A banking game in which the cards are placed in a faro-box, face down, and the players bet on each card as drawn being red or black.

red-bass, *n.* **2.** A fish of Moreton Bay, *Lutianus superbus*, of the family *Lutianidæ. E. E. Morris*, Austral English.

red-betty (red'bet"i), *n.* The cardinal-flower, *Rapuntium cardinale.*

red-blind (red'blīnd), *a.* Unable to distinguish the color red. See ★*color-blindness. Stud. Yale Psychol. Lab.*, VIII. 1.

red-blindness (red'blīnd-nes), *n.* The state of being red-blind; a form of color-blindness in which there is inability to distinguish the color red. See ★*color-blindness.*

red-bream (red'brēm), *n.* A name given to the schnapper when one year old. See ★*schnapper. E. E. Morris*, Austral English.

red-brush (red'brush), *n.* Either the silky cornel, *Cornus Amomum*, or the red-osier dogwood, *C. stolonifera.*

red-bug, *n.* **2.** A larval mite of the spurious genus *Leptus*, *L. irritans*, found commonly in the southern United States: same as *jigger*2, 2.

Red-cap (red'kap), *n.* See the extract.

> Mr. Candler descants upon the splendid physique and martial qualities of the Bhutanese, but we do not find any mention of the fact that the ruling and military classes in this mountain territory are the descendants of the *Red Caps*, or old military caste of Lhasa, who were expelled from Tibet in the earlier part of the seventeenth century by the lamas. *Athenæum*, Feb. 4, 1905, p. 147.

red-cat (red'kat), *n.* A local English name for *Nereis cultrifera.*

redcoat, *n.* **2.** The bedbug. [Local, U. S.]

> Cimex lectularius, bedbug, known in different localities as chinches, chintzes, *redcoats*, mahogany flats, etc.
> *Buck*, Med. Handbook, V. 156.

reddle, *n.* **2.** A name applied by workmen to red-lead with oil when used to smear a surface which is being scraped to a fit. [Colloq.]

red-dog, *n.* **2.** A colloquial term for private bank-note currency in the United States about 1837. The name is said to be due to the bills with red edges put out by Jacob Barker in New York.

redemption, *n.* (*d*) See the extract.

> The only source of revenue left to the Cutlers themselves appears to have been derived from "*redemptions*," i.e., money paid for the right of entering the trade, or, again, money paid for some special privilege.
> *Athenæum*, Dec. 30, 1905, p. 888.

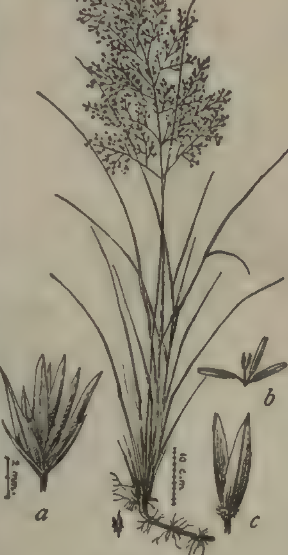
Order of African Redemption. See ★*order.*

redemptional (rẹ̄-demp'shọn-ạl), *a.* [*redemption* + *-al*1.] Pertaining to or of the nature of redemption.

Redesdale limestone. See ★*limestone.*

redeye, *n.* **6.** The blue-green sunfish, *Apomotio cyanellus.*—**7.** A species of European chubb, *Scardinius erythrophthalmus.*—**Little redeye.** Same as *redeye*, 2.

Redfieldia (red-fēl'di-ä), *n.* [NL. (Vasey, 1887), named in honor of John H. *Redfield* (1815–95), a botanist of Philadelphia.] A genus of grasses somewhat related to *Festuca*. It contains the single species *Redfieldia flexuosa*, one of the 'blow-out' grasses, found on sandy lands, chiefly sand-hills, in Nebraska, Kansas, and Colorado. It is a tall and striking grass with a diffusely spreading panicle and widely extended rootstocks which bind loose sands where sometimes it is almost the only grass. Often called *Redfield's grass.*



Redfieldia flexuosa.
a, spikelet; *b*, flower; *c*, glumes.

redfin, *n.* **5.** A cyprinoid fish, *Notropis umbratilis*, found in fresh waters of the eastern United States.—**6.** Same as ★*redfish*, 6.

redfish, *n.* **6.** An Australian holothurian, *Actinopyga obesa.*

—**Bull-redfish.** Same as *red-drum.*—**California redfish,** a name applied to *Pimelometopon pulcher*, a labroid found on the coast of southern California.—**Little redfish.** Same as *blue-back salmon.* See *salmon*, 2 (*e*).

red-hearted (red'här"ted), *a.* Having the heart-wood of a dark reddish-brown color, as in timber of conifers which is attacked by the fungus *Trametes Pini.*

The wood at first turns dark red-brown, and trees in this stage are known to the lumberman as "*red-hearted*" timber. *Yearbook U. S. Dept. Agr.*, 1900, p. 206.

red-horse, *n.*—**Short-headed red-horse,** a sucker, *Moxostoma breviceps*, abundant in the Great Lakes and the Ohio valley.—**Texas red-horse,** a sucker, *Moxostoma congestum*, which inhabits the streams of Texas.

redif (re-dẹ̄f'), *n.* [Turk.] In the Turkish army, the second line, corresponding to the German Landwehr. The soldier remains in it for nine years. It follows the first line, or active army (the *nizam*), service in which is for nine years, and is followed by the *mustafiz*, service in which is for two years.

red-Indians (red'in"di-ạnz), *n.* The scarlet painted-cup, *Castilleja coccinea.*

redintegrative (re-din'tẹ-grā-tiv), *a.* Pertaining to, or of the nature of, redintegration.

redintegrator (re-din'tẹ-grā-tọr), *n.* One who, or that which, redintegrates.

redislocation (rẹ̄-dis-lọ̄-kā'shọn), *n.* [*re-* + *dislocation.*] Repeated dislocation; in *surg.*, dislocation recurring after reduction. *Buck*, Med. Handbook, I. 63.

redistillate (rē-dis-til'āt), *n.* The condensed product of a second or repeated distillation.

redistillation (rē-dis-ti-lā'shọn), *n.* The process of distillation repeated with the previously condensed product. *Buck*, Med. Handbook, II. 656.

redistributive (rē-dis-trib'ụ̄-tiv), *a.* Distributing again; characterized by or of the nature of redistribution.

redistributory (rē-dis-trib'ụ̄-tō-ri), *a.* Same as ⋆*redistributive.*

red-leg (rẹd'leg), *n.* An infectious disease of frogs, usually prevalent in the fall, characterized by hemorrhagic congestion of the legs and abdomen: caused by the bacillus *Hydrophilus fuscus. Jour. Exper. Med.*, Feb. 25, 1905, p. 32.

redneck (red'nek), *n.* An uncouth countryman: as, the hill-billies come from the hills, and the *rednecks* from the swamps. The expression *rednecked hill-billy* also occurs. *Dialect Notes*, II. vi. [Local, U. S.]

redo^{2} (rē'dō), *n.* A trade-name for crystalline calcium hyposulphite (formerly called hydrosulphite), CaS_2O_4, used, along with calcium hydroxid, in sugar-refining.

Redonda phosphate. See ⋆*phosphate.*

redouble, *v. t.* 4. In *bridge*, to double again. After the dealer's side has declared, if either adversary doubles, the maker of the trump or his partner can redouble. See ⋆*bridge*^{2}.

redoublement (rē-dub'l-mẹnt), *n.* A redoubling: as, "a *redoublement* of agitation." *Auger.*

redout, *n.* A simplified and former spelling of *redoubt.*

redoutable, *a.* A simplified and former spelling of *redoubtable.*

redoute (rẹ-döt'), *n.* [F.: see *redoubt, ridotto.*] Same as *ridotto.*

redouted, *a.* A simplified spelling of *redoubted.*

redpoll, *n.* 3. *pl.* A modern breed of hornless cattle, originating in Norfolk and Suffolk, of good size, round, smooth, and small-boned. They are more highly prized as beef cattle than for dairy purposes. As indicated by the name the general color is red, but the bushy part of the tail and parts of the udder may be white. See *red-polled* ⋆*cattle.*

Red-polled cattle. See ⋆*cattle.*

redroot, *n.* 5. The bloodroot, *Sanguinaria Canadensis.*—6. The field-gromwell, *Lithospermum arvense.*—**Indian redroot.** Same as *redroot*, 2.

redshire, *v. i.* Same as *red-sear.* See also *red-short.*

red-spider, *n.* 2. Any one of several species of tetranychid mites common in greenhouses.—**Two-spotted red-spider,** *Tetranychus bimaculatus*, a mite closely allied to the common so-called 'red-spider' of greenhouses and having similar habits.

red-string (red'string), *n.* See the extract.

Instances of the vascular strings of the sugar-cane being coloured a deep red from the presence of a red gum in the large vessels have been recorded in connection with certain diseases, such as sereh, the sugar-cane disease of Massee, the pine-apple disease of the cane, and red smut (red rot), in all of which it has been denied that bacteria produce the gum. The cases of *red string* investigated by the author occurred in apparently healthy plants, and also in canes affected with gummosis. The gum was produced by Bacillus pseudarabinus, n. sp., and the crimson colour was imparted to it by a mould. The co-existence of the two is essential for the production of the colour in the vessels of the sugar-cane. *Nature*, Aug. 18, 1904, p. 392.

red-stripe (red'strīp), *n.* A diseased condition of timber due to an early stage in the development of the dry-rot fungus *Merulius lacrymans.*

redtop, *n.*—**Wild redtop.** Same as *switch-grass.*

reduce, *v. t.* 16. Same as ⋆*puer*^{2}.—**Reduced black.** See ⋆*black.*—**Reduced indigo.** Same as *indigo white* (which see, under *indigo*).—**Reducing agent,** a substance which takes away oxygen or other electronegative element or radical, or adds hydrogen or other electropositive radical. See ⋆*agent.* According to the electrolytic dissociation theory, such a body, when in solution, tends to take on new positive ionic charges. When silver bromide in a photographic plate is developed with ferrous oxalate, the developer contains (disregarding potassium oxalate) ions from the oxalic acid, each having two negative charges, and iron ions, each having two positive charges. The latter ions have a strong tendency each to assume one more positive ionic charge; but this can be done only with the concurrent formation of as many new negative ionic charges, for the sum of the positive ionic charges in a given volume must be numerically equal to the sum of the negative ionic charges. The bromine atoms of the exposed silver bromide are therefore solicited to assume the ionic condition. If a thousand ions of iron each take a third positive charge, a thousand ions of bromine must be formed, and they will leave a thousand atoms of silver in the metallic condition.—**To reduce an equation,** to make one or more of the coefficients in its general form zero.

reducend (rẹ̄-dū'send), *n.* [L. *reducendus*, gerundive of *reducere*, reduce.] In *arith.*, a number that is to be reduced.

reducer, *n.* 3. In *arith.*, a multiplier used to reduce to another denomination.—4. A device used in electric power-stations for lowering the voltage. It usually consists in alternating-current circuits of a step-down transformer and in direct-current circuits of a motor-generator.

reducing-furnace (rẹ̄-dū'sing-fėr"nās), *n.* A furnace in which ores are reduced from oxids or the metal is separated from other substances by a non-oxidizing heat or flame: usually a shaft-furnace.

reductase (rẹ̄-duk'tās), *n.* [*reduct*(*ion*) + *-ase.*] A reducing ferment.

reducteur (rā-duk-tėr'), *n.* [F.] In *elect.*, a coil placed in series with a galvanometer or voltmeter and serving to reduce its sensitiveness, and thus the value of its scale reading, by a predetermined amount depending on the ratio of the resistance of the coil to that of the instrument; a reducing-coil. [Rare.]

reduction, *n.* (*q*) In *linguistics*, the shortening of a word by apocope. (*r*) In *cytol.*, the halving of the number of somatic chromosomes during spermatogenesis and oögenesis.

While Mottier sees in the fusion of sexual nuclei the blending of two lines of descent, Miss Ferguson's researches lead her to believe that no fusion-nucleus, combining the paternal and maternal hereditary substances, is formed. Rather the processes of mitosis allow these to be kept apart during the life of the offspring, and the "*reduction*" or qualitative division occurring some time during the life-cycle secures that the gametes shall be "pure." *Nature*, Jan. 5, 1905, p. 218.

Cupric reduction. See ⋆*cupric.*—**Double reduction,** a term applied to the driving-gear of street-car wheels or wheels of motor-vehicles when an intermediate shaft with two gears is introduced whereby a greater reduction of speed is made by the use of the two steps between the motor and the driven axle.—**Reduction crucible.** See ⋆*crucible.*—**Reduction division,** in *cytol.*, the karyokinetic division by means of which the number of chromosomes in the primitive sex-cells (oögonia or spermatogonia) is reduced by one half.—**Reduction factor,** a numerical constant by which the results of physical measurements, or similar values, are multiplied to reduce them to some desired scale or to express them in terms of some unit or system. *Encyc. Brit.*, XXVI. 501.—**Single reduction,** a term applied to the driving-gear of street-car wheels or wheels of motor-vehicles, where the small pinion on the revolving armature shaft at high speed drives a large pinion directly on the driven axle, or without additional wheels in the train.

reductional (rẹ̄-duk'shọn-ạl), *a.* [*reduction* + *-al*^{1}.] Pertaining to or of the nature of reduction, in any sense.

There were two longitudinal splits of the chromosomes and hence two equational divisions, or a longitudinal split and a transverse split, hence an equational and a *reductional* division. *Biol. Bulletin*, Dec., 1904, p. 14.

reductionist (rẹ̄-duk'shọn-ist), *n.* [*reduction* + *-ist.*] One who advocates reduction; specifically, in England, one who advocates a reduction of the number of licenses of public-houses. *N. E. D.*

reduction-machine (rẹ̄-duk'shọn-mạ-shēn"), *n.* A machine for cutting a die or figure from a larger die or model; a pantograph-machine.

reduction-tube (rẹ̄-duk'shọn-tūb), *n.* A small tube of difficultly fusible glass, closed and expanded to a bulb at one end, in which, by heating with suitable reagents, such substances as mercury and arsenic may be reduced to the metallic state, volatilized, and condensed upon the surface of the colder part of the tube. The name is also applied to a hard glass tube open at both ends and having one or more bulbs blown in the middle of the length, in which oxid of copper, of iron, or other metal may be reduced to the metallic state by heating in a current of hydrogen carried through the tube.

reduction-valve (rẹ̄-duk'shọn-valv), *n.* A valve for diminishing the pressure of a liquid or gas so that without preventing circulation the pressure in the pipe in which the valve is placed is greater on the side from which the flow comes; a reducing-valve.

In the operation of the car, the air leaving the storage tank on the car passes through a *reduction valve*, where the pressure is reduced from 2,000 pounds to a working pressure of 150 pounds. *Sci. Amer.*, Dec. 13, 1902, p. 408.

reduction-works, *n. sing.* and *pl.* 2. A crematory for the disposal of the garbage and refuse of a city.

reductor (rẹ̄-duk'tọr), *n.* [L. *reductor*, one who brings back, < *reducere*, bring back.] An apparatus for the reduction of ferric to ferrous sulphate by means of zinc: used in the analysis of iron and steel.

redundant, *a.* 4. Noting a condition of the wing membrane in bats when it extends well down on the leg, and on the arm embraces the thumb beyond the first phalanx. *Harrison Allen*, Bats of North America, p. 5.

reduplication, *n.* 6. In *pathol.*, the repetition of the sequence of symptoms in a case of intermittent malarial fever of double type.—7. In *mech.*, the principle, in a cord-and-pulley, that the greater the number of turns of the rope in the pulleys, the greater the load that can be lifted by a given pull on the hauling-rope.

reduplicatory (rẹ̄-dū'pli-kạ̄-tō-ri), *a.* Reduplicating; reduplicative; effecting repetition.

Another instance of the *reduplicatory* emphasis in the Hebrew language. *M. Madan*, Thelyphthosa, II. 242. *N. E. D.*

reduvid (red'ụ̄-vid), *n.* and *a.* Same as ⋆*reduviid.*

reduviid (rẹ̄-dū'vi-id), *n.* and *a.* I. *n.* A member of the heteropterous family *Reduviidæ.*

II. *a.* Having the characters of or belonging to the family *Reduviidæ.*

redward (red'wärd), *adv.* [*red*^{1} + *-ward.*] In *spectroscopy*, toward the red end of the spectrum: said of a movement or displacement of spectral lines.

All showed a much smaller displacement *redward* than the dark lines. *A. M. Clerke*, Problems in Astrophysics, p. 234.

redwater, *n.*—**Rhodesian redwater, South African redwater.** Same as *African Coast* ⋆*fever.*

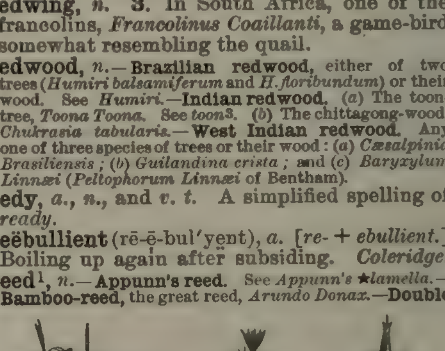
redwing, *n.* 3. In South Africa, one of the francolins, *Francolinus Coaillanti*, a game-bird somewhat resembling the quail.

redwood, *n.*—**Brazilian redwood,** either of two trees (*Humiri balsamiferum* and *H. floribundum*) or their wood. See *Humiri.*—**Indian redwood.** (*a*) The toon-tree, *Toona Toona.* See *toon*^{3}. (*b*) The chittagong-wood, *Chukrasia tabularis.*—**West Indian redwood.** Any one of three species of trees or their wood: (*a*) *Cæsalpinia Brasiliensis*; (*b*) *Guilandina crista*; and (*c*) *Baryxylum Linnæi* (*Peltophorum Linnæi* of Bentham).

redy, *a.*, *n.*, and *v. t.* A simplified spelling of *ready.*

reëbullient (rē-ẹ̄-bul'yẹnt), *a.* [*re-* + *ebullient.*] Boiling up again after subsiding. *Coleridge.*

reed^{1}, *n.*—**Appunn's reed.** See *Appunn's* ⋆*lamella.*—**Bamboo-reed,** the great reed, *Arundo Donax.*—**Double reed,** the mouthpiece of a musical instrument of the oboe class, consisting of two slips of cane in contact.



Bamboo-reed (*Arundo donax*).
a, panicle; *b*, flowering scale, clothed with silky hairs; *c*, spikelet.

reed^{1}, *v. t.* 3. To draw (warp-threads) through the reed of a loom. *T. W. Fox*, Mechanism of Weaving, p. 16.—4. To furnish with reeds, as an organ.—**Reeded top,** in *furniture*, a form of roll-top for a desk, made of narrow strips of different woods, as (alternately) satinwood and mahogany. *K. W. Clouston*, Chippendale Period in Eng. Furniture, p. 171.

reed-back (rēd'bak), *n.* The wooden rods of a loom reed.

reed-bent (rēd'bent), *n.* [Shortened from *reed bent-grass.*] 1. See *bent*^{2}.—2. Same as ★*reed-grass*, 4.—3. A stout perennial grass, *Arctagrostis arundinacea*, of northern North America and northeastern Asia.

reed-box (rēd'boks), *n.* In *exper. psychol.*, a wind-chest suitable for attachment to a bellows table, furnished with a set of metallic reeds for the demonstration of sensible discrimination, overtones, the musical intervals, etc. Appunn's tonometers are typical instruments of this sort. *Amer. Jour. Psychol.*, XI. 255.

reed-flute (rēd'flöt), *n.* In *organ-building*, a flute-stop having pipes closed with a stopper perforated by a hole. It is made in several pitches.

reed-grass, *n.* 3. See *Indian* ★*grass* (*a*).—4. Any grass of the genus *Calamagrostis*: often with a qualifier, as *Langsdorff's reed-grass.* See *bluejoint-*★*grass*, ★*sand-grass*, 4, and ★*yellow-top*, 2. Compare ★*reed-bent*, 2.—5. See ★*canary-grass.*

reed-hook (rēd'hůk), *n.* A small instrument for drawing warp-threads through the splits or dents of a reed.

reëdition (rē-ē-dish'on), *n.* [*re-* + *edition.*] A reëditing of a book; a second edition.

reed-marked (rēd'märkt), *a.* In *weaving*, noting warp-threads which run in pairs or are separated unequally. *T. W. Fox*, Mechanism of Weaving, p. 39.

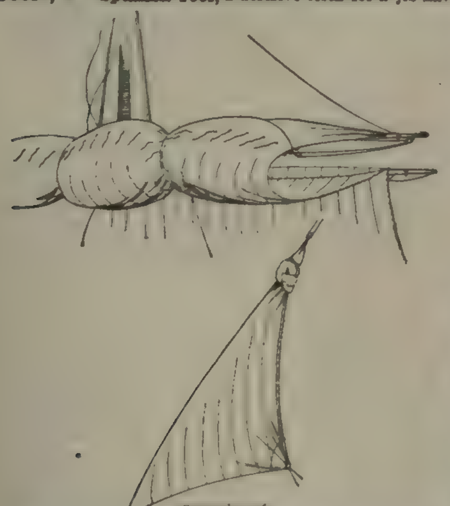
reed-wire (rēd'wīr), *n.* A flattened kind of wire used in musical instruments, as in the fastening of the mouthpieces of reeds.

Reedy nail. See ★*nail.*

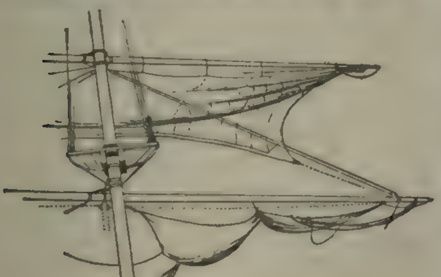
reef^1, *n.* 5. In the Tyrolese Alps, and especially in the region of the dolomites, "massive unstratified limestones and dolomites rising amid strikingly contrasted sediments." *Nature*, May 19, 1904, p. 50.—**Floating reef**, a name among the gold-miners of Victoria for displaced fragments of a reef found among the loose material of the surface. Compare the American term ★*float*, 16.—**Saddle reef**, a quartz-reef in which occur one or more humps; a reef in which the vein slopes downward both ways from a crest.

reef^1 (rēf), *v. i.* In *Australian mining*, to work at a reef. *E. E. Morris*, Austral English.

reef^2, *n.*—**Spanish reef**, a derisive term for a jib having a knot tied in its head, or for one of the square-sails whose yard has been lowered and left on the cap.



Spanish reef.



Monkey-reef.

reef^2, *v. t.*—**Monkey reefed**, said of a sail when the yard is on the cap and the reef-tackles are hauled out.

reef-eel (rēf'ēl), *n.* A murænoid eel, *Gymnothorax favagineus*, found in Australian waters.

reefer^1, *n.* 2. In *mining*, one who reefs; one who takes out ore-rock; a quartz-reefer.

reef-heron (rēf'her″on), *n.* One of the smaller herons of the genus *Demiegretta*, especially the Australian *D. jugularis.* These birds are among the herons having two distinct color phases when adult, being either white or gray.

reefing^1 (rē'fing), *n.* [Verbal n. of ★*reef*^{1}, *v.*] In *mining*, the process of taking out ore-rock.

reef-knoll (rēf'nōl), *n.* In *geol.*, a mound-like aggregation of limestone occurring intercalated in rock strata and known to be the result of organic growth on coral or coralline reefs. Such accumulations are found in many formations, in the Upper Silurian of Sweden (where they are known as Klinte), in rocks of the same age in New York, in the Carboniferous limestone of England, and in the Jurassic rocks of France and the Jura. *Rep. Brit. Ass'n Advancement of Sci.*, 1889, p. 600.

reef-knot (rēf'not), *v. t.* To tie in a reef-knot, as a line.

reefous (rē'fus), *a.* [*reef*^{1} + *-ous.*] Same as ★*reefy.* *N. E. D.*

reef-platform (rēf'plat″fôrm), *n.* That portion of the sea-bottom which extends outward from a coral reef. Near the reef it is covered by the coarse rubble of coral-rock broken off by the waves; farther out it has an even surface because the debris is finer. Everywhere it is covered by a growth of sedentary organisms. *Nature*, Feb. 18, 1904, p. 371.

reefy (rē'fi), *a.* Marked by reefs or rocks, as the entrance to a harbor; characterized by reefs, as a coast.

reek^1, *v.* I. *intrans.* 2. To emit an unpleasant or unhealthy smell; stink.

II. *trans.* 2. To cause to reek or smell offensively.

> The slaughter of lambs in offering *reeked* the forecourts of the Temple. *Lew Wallace*, Ben Hur, viii. 5.

reel^1, *n.*—**Automatic reel**, an angling reel having a coiled spring the expansion of which automatically reels in the line.—**Off the reel.** (*b*) As if reeled off; without any pause; spontaneously; unhesitatingly; without prompting. [Colloq.]

reel-brake (rēl'brāk), *n.* Same as *reel-check.*

reëlevate (rē-el'ẹ-vāt), *v. t.* [*re-* + *elevate.*] To elevate after a period of time on a lower level. *Worcester.*

reëlevation (rē-el-ẹ-vā'shọn), *n.* Elevation after a subsidence.

reel-foot (rēl'fůt), *n.* See ★*foot.*

reëmbody (rē-em-bod'i), *v. t.* and *i.*; pret. and pp. *reëmbodied*, ppr. *reëmbodying.* [*re-* + *embody.*] To embody again.

reëmbrace (rē-em-brās'), *v. t.* [*re-* + *embrace.*] To embrace again. *Florio.*

> Once again his love grown chill,
>   Mine may strive:
> Bitterly we *re-embrace*,
>   Single still.
>
> *Browning*, In a Year, st. 1.

reëmerge (rē-ẹ-mėrj'), *v. i.* [*re-* + *emerge.*] To emerge again.

reëmergence (rē-ẹ-mėr'jẹns), *n.* [*re-* + *emergence.*] The act or fact of emerging after being submerged or covered.

reëmergent (rē-ẹ-mėr'jẹnt), *a.* [*re-* + *emergent.*] Reëmerging.

reënaction (rē-e-nak'shọn), *n.* Same as *reënactment.*

reëncourage (rē-en-kur'ạj), *v. t.* [*re-* + *encourage.*] To encourage again.

reëncouragement (rē-en-kur'ạj-mẹnt), *n.* The act of reëncouraging.

reënergize (rē-en'ėr-jīz), *v. t.* [*re-* + *energize.*] To energize again; give new energy to.

rëengine (rē-en'jin), *v. t.* [*re-* + *engine.*] To provide with other engines.

reëngrave (rē-en-grāv'), *v. t.* [*re-* + *engrave.*] To engrave a second time.

reënjoy (rē-en-joi'), *v. t.* [*re-* + *enjoy.*] To enjoy a second time.

reënjoyment (rē-en-joi'mẹnt), *n.* The act of reënjoying.

reënkindle (rē-en-kin'dl), *n.* [*re-* + *enkindle.*] To enkindle again; rekindle.

reënlist (rē-en-list'), *v. t.* and *i.* [*re-* + *enlist.*] To enlist again or for an additional term.

reënlistment (rē-en-list'mẹnt), *n.* The act or fact of reënlisting.

reëntrancy (rē-en'tran-si), *n.* [*reëntran*(*t*) + *-cy.*] The property of returning upon itself, as in the case of the winding of a closed-coil armature.

> A few writers . . . take the *re-entrancy* as being the number of times we must go around the armature in tracing up the whole winding.
>
> *Robertson*, in Brit. Inst. of Elect. Engineers, 1901–02, [p. 933.

reëntrant, *a.* 2. In *elect.*, designating a form of armature-winding of dynamo-electric machines, consisting of two or more spirals arranged so that the end of the first spiral leads into the beginning of the second, etc., and the end of the last into the beginning of the first. *Jour. Brit. Inst. Elect. Engin.*, 1902–03, p. 450.

II. *n.* 1. A reëntering angle or part.—2. In *phys. geog.*, a concave or retreating surface or outline.

> The mountains and the plateau show two very different types of relief, the former being marked by knife-edged salients and angular *re-entrants.*
>
> *Geog. Jour.* (R. G. S.), XVI. 355.

reëntry, *n.*—**Card of reëntry.** See ★*card*^{1}.

ree-raw (rē-râ'), *a.* and *n.* [Appar. of imitative origin.] I. *a.* Noisy; turbulent; riotous. *N. E. D.*

II. *n.* A noisy time at romping or drinking. *N. E. D.*

reeve^3, *v. t.* 2. To run (a ship) through narrow channels in a shoal or through openings in an ice-pack, after the fashion of a rope through the hole in a block, etc.

reëxcitation (rē-ek-si-tā'shọn), *n.* [*re-* + *excitation.*] The act of reëxciting.

reëxcite (rē-ek-sīt'), *v. t.*; pret. and pp. *reëxcited*, ppr. *reëxciting.* [*re-* + *excite.*] To excite or rouse to action again.

reëxist (rē-eg-zist'), *v. i.* [*re-* + *exist.*] To exist again; revive; exist for the second time.

reëxistence (rē-eg-zis'tẹns), *n.* Second or restored existence.

reëxpand (rē-eks-pand'), *v. i.* and *t.* [*re-* + *expand.*] To expand again after contraction.

reëxpansion (rē-eks-pan'shọn), *n.* The act of reëxpanding.

ref. An abbreviation (*c*) of *referred*; (*d*) of *reflection* or *reflective*; (*e*) of *reflex*, *reflexive*, or *reflexively*; (*f*) [*cap.*] of *Reformation*; (*g*) of *reformer.*

reface (rē-fās'), *v. t.*; pret. and pp. *refaced*, ppr. *refacing.* [*re-* + *face.*] 1. To renew the face, façade, or front of, as of a building; resurface: as, to *reface* a cut stone.—2. To recolor (tea) for the market. See *facing*, 3.—3. In *dressmaking*, to put a new facing in (a garment).

Ref. Ch. An abbreviation of *Reformed Church.*

refdanskite (ref'dans-kīt), *n.* [*Refdansk* (see def.) + *-ite*^{2}.] A grayish-green earthy mineral from Refdansk in the Urals. It is an impure hydrous silicate of iron, nickel, and magnesium.

refectorial (rē-fek-tō'ri-al), *a.* [*refectory* + *-al*^{1}.] Pertaining to refection; used for refection.

refectorian (rē-fek-tō'ri-ạn), *n.* [*refectory* + *-an.*] Same as *refectioner.*

referee, *n.*—**Court of referees.** See ★*court.*—**Referee's hold.** See ★*hold*^{1}.

reference, *n.*—**Analytical reference.** See ★*analytical.*—**Planes of reference.** See ★*plane*^{1}.

reference (ref'ėr-ẹns), *v.*; pret. and pp. *referenced*, ppr. *referencing.* I. *trans.* 1†. To refer a thing to (something).—2. To assign proper references to, as to a phrase; look up and find by reference.—3. To schedule (property) to be taken for a proposed railway extension. *N. E. D.*

II. *intrans.* To make out a return of the number of people to be displaced by proposed railway extension. *N. E. D.*

referendary, *n.* II. *a.* Pertaining to or of the nature of a referendum.

> Direct Legislation consists of two things [the Referendum, and the Initiative]. . . . The Referendum alone is negative, preventative; the Initiative, with the *referendary* voting, is positive, constructive.
>
> *Outlook*, Feb. 16, 1895, p. 267.

referendaryship (ref-ẹ-ren'dạ-ri-ship), *n.* The office of referendary.

referent (ref'e-rent), *a.* and *n.* [L. *referens* (*-ent-*), ppr. of *referre*, refer: see *refer.*] I. *a.* Referring; containing a reference; noting one of two terms which have a certain relation to each other. The referent is the term from which the relation proceeds.

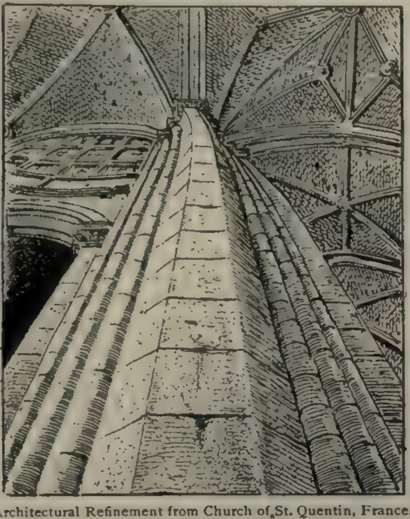
II. *n.* 1. One who is referred to; a referee.—2. A word which refers to another.

refill (rē-fil′), *n.* [*refill*, *v.*] Something used to refill a thing or place that has been emptied.

refined, *p. a.* **2.** Very exact or precise; perfect or correct in details.

One of the most *refined* estimations of longitude that have yet been attempted, is the series undertaken by the "K. K. topographische-militär Institut" of Vienna.
Geog. Jour. (R. G. S.), XIII. 242.

refinement, *n.*—**Architectural refinements**, deviations from the geometrical accuracy of purely structural lines, which have been found widely distributed in architecture before the most modern era. Peculiarities of this sort were first discovered in the Parthenon at Athens by Pennethorne in 1837. The Parthenon refinements were published tentatively by Hoffer in the "Allgemeine Bauzeitung" for 1838, and more elaborately by Penrose in "Principles of Athenian Architecture" in 1851. These investigations were taken up in 1870 by Professor W. H. Goodyear, Curator of Fine Arts in the Brooklyn Museum, and applied not only to classical architecture but to medieval and Renaissance architecture as well. The result has been a vast accumulation of data showing irregularities in structural lines which are undoubtedly intentional and the expression of artistic feeling working by free and unmechanical methods.



Architectural Refinement from Church of St. Quentin, France.
(From Catalogue of the Edinburgh Architectural Association.)

refire (rē-fīr′), *v.* [< *re-*, again, + *fire*, *v.*] To fire again; of tea, subject to a final drying.

It would not be practicable to *refire* all Ceylon teas.
Kingsford and Bamber, Report on Tea Industries of [Java, Formosa, and Japan.

Reflecting anemometer. See *Aimé's* ★*nephoscope.*

reflecting-slit (rẹ-flek′ting-slit″), *n.* A spectroscope slit in which the plates which form its jaws are highly polished and slightly inclined, so that the observer can see by the reflection whether the star-image falls exactly on the slit. *A. M. Clerke*, Problems in Astrophysics, p. 264.

reflection, *n.*—**Coefficient of diffuse reflection.** Same as ★*coefficient of diffusion.*—**Diffuse reflection**, reflection from a rough surface the elements of which are at every possible angle with the incident rays, so that the reflected light is sent out in every direction. Surfaces from which the diffusion is uniform are said to be *matte.* The reflection from such surfaces follows Lambert's law of cosines.—**Irregular reflection**, reflection from a broken or rough surface that scatters the light instead of reflecting it all in a single direction. See *diffuse* ★*reflection.*—**Metallic reflection.** See ★*optical properties of metals.*—**Reflection equations.** See ★*equation.*—**Regular reflection**, reflection from a smooth or polished surface the normal to which has everywhere the same direction, as in a plane mirror, or which varies gradually and continuously according to some simple law, as in convex or concave mirrors.—**Scattering reflection**, reflection from a rough surface the reflected light from which is sent in various directions: same as *irregular* ★*reflection.*—**Selective reflection**, optical reflection in which the incident and reflected rays differ in composition. Transparency and reflecting power are definitely related, opaque bodies such as the metals reflecting light much more strongly than such substances as glass or quartz. Many otherwise transparent bodies, however, have absorption-bands in their spectra, that is, there are certain groups of waves in the spectrum to which they are opaque. Waves to which the body is opaque are more freely reflected than others. The spectrum of the reflected light therefore has a bright region or so-called reflection-band corresponding in position to the absorption-band and the body is said to show *selective reflection.* Calcite, for example, is quite transparent to all the rays of the visible spectrum, but in the infra-red, just beyond 11 μ, it suddenly becomes opaque and in that region its reflecting power equals that of silver. Similar properties have been observed in the case of many other substances.—**Specular reflection**, regular reflection from the surface of a mirror, specifically from a polished metallic surface.

reflectional (rẹ-flek′shọn-ạl), *a.* [*reflection* + *-al*¹.] Pertaining to or of the nature of reflection, in any sense; due to reflection.

Things that have been and things to be are emblazoned on the panorama of *reflectional* concept.
J. W. Powell, Truth and Error, p. 126.

reflective, *a.* **6.** Produced by reflection.—**Reflective surface.** See ★*surface.*—**Reflective sympathy.** See ★*sympathy.*

reflectivity (rē-flek-tiv′ị-ti), *n.* [*reflective* + *-ity.*] Reflectiveness.

reflectometer (rē-flek-tom′e-tėr), *n.* [*reflect(ion)* + Gr. *μέτρον*, measure.] An instrument for the measurement of the reflecting power of surfaces.—**Total reflectometer**, an instrument for the measurement of the critical angle of total reflection. See *refractometer.*

Wollaston's original method has been embodied very skilfully by Pulfrich in his *total-reflectometer.*
Encyc. Brit., XXX. 240.

reflectometry (rē-flek-tom′e-tri), *n.* [*reflectometer* + *-y*³.] The measurement of angles of reflection or of the intensity of reflected light.

reflector, *n.*—**Crossley reflector**, a particular form of reflecting telescope.—**Perfect reflector**, in *optics*, an ideal substance which neither transmits nor absorbs any portion of the radiation which falls upon its surface, but reflects it all.

reflectoscope (rẹ-flek′tọ-skōp), *n.* [Irreg. < L. *reflectere*, reflect, + Gr. *σκοπεῖν*, view.] See *projecting-*★*lantern.*

reflex, *a.*—**Reflex arc.** See ★*arc*¹.—**Reflex tonus.** See ★*tonus.*

reflex, *n.*—**Babinski reflex.** Same as *Babinski* ★*phenomenon (a).*—**Cardiac reflex**, reduction in size of the area of percussion-dullness of the heart, caused by stimulation (as by friction) of the skin of the precordial region.—**Choked reflex**, in *sciascopy*, the absence of movement of the retinal illumination when the point of reversal is reached.—**Conjunctival reflex**, closure of the eyelids when the conjunctiva is touched.—**Crossed reflexes**, a condition in which a stimulus applied to one extremity excites a reflex in the limb on the opposite side.—**Motor reflex**, in *physiol.*, a reflex effect produced by peripheral stimulation upon the muscular mechanism: opposed to *vascular* ★*reflex.*—**Nasal reflex**, a functional disease in some more or less remote organ or part caused by a morbid condition in the nasal cavities.—**Palmar reflex**, flexion of the fingers when the skin of the palm is tickled.—**Rectal reflex**, stimulation to contraction of the muscles concerned in defecation, excited by the presence of feces in the rectum.—**Short spinal reflex**, a reflex path involving only one of the five essential divisions of the spinal cord, namely, those controlling the tail, the pelvic limb, the trunk, the brachial limb, and the neck.—**Triceps reflex**, extension of the forearm when the triceps tendon at the elbow is tapped while the arm rests over the back of a chair and the forearm hangs limp at right angles to it.—**Urinary reflex**, the impulse to urinate arising when the pressure of the accumulated urine in the bladder has reached a certain point.—**Vascular reflex**, in *physiol.*, arterial constriction reflexly set up by peripheral stimulation. *T. Ribot* (trans.), Psychol. of Emotions, p. 84.—**Visceral reflex**, a reflex in which both the afferent and efferent paths are along sympathetic nerve-fibers.

reflexal (rẹ-flek′sạl), *a.* [*reflexa* (see def.) + *-al*¹.] Of or pertaining to the decidua reflexa.

reflexivity (rē-flek-siv′ị-ti), *n.* [*reflexive* + *-ity.*] Same as *reflexiveness.*

reflex-multiplicator (rē″fleks-mul′ti-pli-kā-tọr), *n.* An instrument for recording a reflex, especially the patellar tendon reflex, and its attendant circumstances, such as the force of the blow, the time and force of the response, etc.

reflexness (rē′fleks-nes), *n.* The state or condition of being reflex.

When both forms have reached a high degree of *reflexness*, the motor form is probably somewhat faster.
Psychol. Rev., May, 1896, p. 251.

reflexogenous (re-flek-soj′e-nus), *a.* Same as *reflexogenic. N. E. D.*

reflexograph (rẹ-flek′sọ-gråf), *n.* [L. *reflexus*, reflex, + Gr. *γράφειν*, write.] An instrument similar in design to the reflex-multiplicator.

refloat (rē-flōt′), *v. t.* [*re-* + *float.*] To float again, in any sense.

refloatation (rē-flọ-tā′shọn), *n.* The act of refloating: as, the *refloatation* of loans.

reflorescent (rē-flọ-res′ẹnt), *a.* [L. *reflorescens* (*-ent-*), ppr. of *reflorescere*, flower again, < *re-*, again, + *florescere*, flower. See *flourish.*] Reflowering; coming into bloom again.

Reflux condenser. See ★*condenser.*

refocus (rē-fō′kus), *v. t.*; pret. and pp. *refocused* or *refocussed*, ppr. *refocusing* or *refocussing.* To focus again.

reformational (ref-ọr-mā′shọn-ạl), *a.* [*reformation* + *-al*¹.] Of or pertaining to reformation; productive of reform or of reforming; specifically, relating to the Reformation.

reformationary (ref-ọr-mā′shọn-ā-ri), *a.* [*reformation* + *-ary.*] Same as ★*reformational.*

reformed, *p. a.*—**Alliance of the Reformed Churches.** Same as ★*Presbyterian Alliance.*—**Christian Reformed Church.** See ★*Christian.*—**Reformed Church of France, Reformed German Church.** See ★*church.*—**Reformed Methodist Church.** See ★*church.*

reformulate (rē-fôr′mụ̄-lāt), *v. t.*; pret. and pp. *reformulated*, ppr. *reformulating.* [*re-* + *formulate.*] To formulate anew or differently.

reformulation (rē-fôr-mụ̄-lā′shọn), *n.* The act or result of reformulating; a putting into another form or shape.

refortification (rē-fôr″ti-fi-kā′shọn), *n.* The act or result of refortifying.

refracted, *a.* **2.** Bent sharply backward from the base, as the spines of some animals.

refracter (rẹ-frak′tėr), *n.* See *refractor.*

refractile (rẹ-frak′til), *a.* [*refract* + *-ile.*] Exhibiting the phenomenon of refraction; refractive.

refractility (rē-frak-til′ị-ti), *n.* [*refractile* + *-ity.*] The character of being refractile.

refraction, *n.*—**Anomalous double refraction**, double refraction due to local internal strains in substances, such as glass or the diamond, which are normally isotropic.—**Differential refraction**, the difference, caused by atmospheric refraction, between the true and apparent relative position of two bodies.—**Extraordinary index of refraction.** See ★*index.*—**Gradient of refraction.** See ★*gradient.*—**Mean refraction**, the refraction for various altitudes calculated for the barometer standing at 30 inches and the thermometer at 50° F.—**Molecular refraction**, the product of the molecular weight of a body and its specific refractivity (which see, under ★*refractivity*).—**Vental refraction**, in *acoustics*, the action of the wind in deflecting sound-waves downward when going with the wind but upward when going against the wind. *Smithsonian Rep.*, 1875, pp. 210, 212.

refractional (rẹ-frak′shọn-ạl), *a.* [*refraction* + *-al*¹.] Of or pertaining to refraction; of the nature of refraction.

refractionation (rē-frak-shọ-nā′shọn), *n.* [*re-* + *fractionation.*] Fractionation performed more than once.

This, by *refractionation*, gave 2 grams of isoamylbenzene, boiling at 190° to 195° (mostly at 193°).
Amer. Chem. Jour., June, 1903, p. 592.

refraction-circle (rẹ-frak′shọn-sėr″kl), *n.* An instrument with a graduated circle for determining indexes of refraction.

refractionist (rẹ-frak′shọn-ist), *n.* [*refraction* + *-ist.*] One who diagnoses and treats errors of refraction in the eye.

It may be well to mention that if the *refractionist* has an error of refraction in his own eye, so that his own visual acuity is impaired, he should wear his correction in using the retinoscope, otherwise he may fail to recognize what he sees. *Optical Jour.*, June, 1903, p. 726.

refractive, *a.* **2.** Capable of being refracted: as, the *refractive* violet rays.—**Molecular refractive power**, the quantity $\frac{n-1}{p} \times$ molecular weight, where n is the index of refraction of an organic substance and p is its density.

refractivity, *n.*—**Achromatic refractivity**, the quantity $(\mu_D - 1)\,(\mu_F - \mu_C)$, where μ_F, μ_D, and μ_C are the indexes of refraction of the substance whose achromatic refractivity is required for the Fraunhofer lines F, D, and C respectively.—**Molecular refractivity.** Same as *molecular* ★*refractive power.*—**Specific refractivity**, the quantity $\frac{n-1}{d}$, where n is the index of refraction of a substance and d is its density.

refractometer, *n.* In the case of transparent solids which can be had in the form of a prism of known angle, the index of refraction may be determined by the deviation of a ray of light passing through the prism, and the index of refraction of transparent liquids may be determined by placing the same within a hollow prism of glass, measurements in both cases being made with an ordinary spectrometer. Where this direct method is impracticable or inconvenient, refractometers based upon other optical principles are employed. For the determination of the index of refraction of transparent solids, with plane and parallel faces, or of liquids contained in a vessel with such faces, the interferometer is sometimes employed. One of the earliest forms of interferometer, known as *Jamin's refractometer*, was devised by that physicist for this purpose. (See ★*interferometer.*) Other refractometers are based upon the principle that the limiting angle of total reflection at the interface between two media depends upon the ratio of their indexes. In *Abbe's refractometer*, an instrument of this type which is used for the determination of the index of liquids, two right-angled prisms of glass, *ABC* and *DEF* (Fig. 1), are mounted with the faces *AC* and *EF* parallel. If a layer of liquid the index of refraction of which is less than that of the glass is placed between these surfaces, a beam of light from below will be totally reflected at the face *EF*, provided the angle *i* is less than the limiting angle. If *i* exceeds that value, the ray passes on through the liquid and the upper prism. The angle at which this change from transmission to total reflection occurs depends upon the ratio of the indexes of the glass and the liquid, and thus affords a measure of the index of refraction of the latter. Instruments similar in principle have

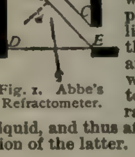


Fig. 1. Abbe's Refractometer.

been devised by Wiedemann, Terquem, Kohlrausch, Pulfrich, and others. For the measurement of the refracting power of crystals the method of total reflection is likewise employed. In *Czapski's refractometer*, a rim of glass is mounted upon the polished end of a cylinder of the same substance, and the specimen *S* (Fig. 2) is placed in a liquid of higher index, with its lower face parallel to the end of the cylinder. The limiting angle of total reflection at the interface between the crystal and the liquid is determined by observing the angle, *i*, at which a beam of light, *ac*, which reaches the face of the crystal at grazing incidence, emerges from the side of the cylinder below. In a similar instrument designed by Abbe for the determination of the indexes of refraction of crystals, the crystal is placed upon the horizontal plane face of a hemisphere of glass, *G* (Fig. 3), with an intervening layer of liquid the index of refraction of which equals or exceeds that of the glass. The beam of light *a* is totally reflected downward at the lower face of the crystal *C*, and its direction is determined by means of the position of a reading telescope which moves around a vertical circle (not shown in the diagram). By turning the specimen about a vertical axis its indexes in various azimuths may be determined.—**Interferential refractometer.** See ★*interferometer.*—**Jamin's refractometer.** See ★*interferometer.*—**Pulfrich refractometer,** an instrument for determining the refractive index of liquids: much used in the examination of oils.

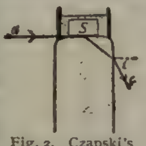

Fig. 2. Czapski's Refractometer.

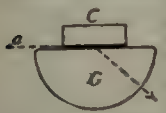

Fig. 3. Refractometer.

refractometric (rẹ̄-frak-tọ̄-met′rik), *a.* Involving the measurement of refractive indexes or the use of the refractometer.

A simple thermostat for use in connection with the *refractometric* examination of oils and fats.
Nature, Feb. 4, 1904, p. 334.

refractometry (rē-frak-tom′e-tri), *n.* In *optics*, the measurement of indexes of refraction; the use of the refractometer.

Refractometry by total reflection.
Encyc. Brit., XXX. 239.

refracture (rē-frak′tụ̄r), *v. t.*; pret. and pp. *refractured*, ppr. *refracturing*. [*re-* + *fracture.*] To fracture again (a badly set bone) in order to secure union in a better position.

refrangent (rẹ̄-fran′jẹnt), *a.* [See *refrangible.*] 1. Refracting.—2. Breaking again; rebreaking.

Refreshment car. See ★*car*¹.

refrigerant, *n.* 3. A refrigerating agent; a refrigerator.

refrigerate, *v.* II. *intrans.* To grow cold; become cold; freeze.

The lavas . . . either overflow the land above the sea, and *refrigerate* there, or . . . they *refrigerate* again within the volcanos.
Sullivan, View Nat., II. 142. *N. E. D.*

refrigerator, *n.* 2. (*a*) A feed-water heater, formerly used on ships, in which the boiler-feed was heated by the water or brine blown out of the boiler. (*b*) In heat-engines, a device or substance for absorbing the heat generated during the compression stage of the cycle. (*c*) In steam-engines, an obsolete device which was used for cooling the injection water for a marine condensing engine by cold sea-water. The surface-condenser renders this unnecessary.—3. A machine for cooling air or fluids, in which the fluid or gas is compressed, cooled, and then allowed to expand, lowering its temperature in this last stage, and withdrawing heat from objects warmer than itself.

refringence (rẹ̄-frin′jẹns), *n.* [*refringen*(*t*) + *-ce.*] Same as *refringency.*

refuge¹, *n.* 4. Same as ★*isle of safety.*

refugee, *n.* 4. A unionist in the southern United States who, during the civil war, fled to the Northern States.

refugee (ref-ụ̄-jē′), *v. i.*; pret. and pp. *refugeed*, ppr. *refugeeing.* [*refugee, n.*] To become a refugee; take refuge in another country; specifically, during the civil war in the United States, to take refuge in the Northern States: said of unionists in the Southern States.

refurnishment (rē-fėr′nish-mẹnt), *n.* [*refurnish* + *-ment.*] The act of refurnishing or the state of being refurnished.

refusal, *n.* 4. In *mech.*, the limiting resistance of a female screw or nut to further turning upon the male screw or bolt, and conversely.

refuse, *v. i.* 2. In *chess*, same as ★*decline*, 10. [Obsolete.]

refusive (rẹ̄-fū′siv), *a.* Refusing; not tolerant of.

Isolated spots *refusive* of carmine, the results of faulty preservation, have been supposed to indicate degeneration during life. *Lancet*, Feb. 2, 1901, p. 299.

refuzal, *n.* An amended spelling of *refusal.*

refuze, *v.* and *n.* An amended spelling of *refuse*¹.

reg. An abbreviation (*f*) of *regiment*; (*g*) of *registry.*

regalist (rē′gạl-ist), *n.* 1. A royalist.—2. An advocate of the principles of regalism.

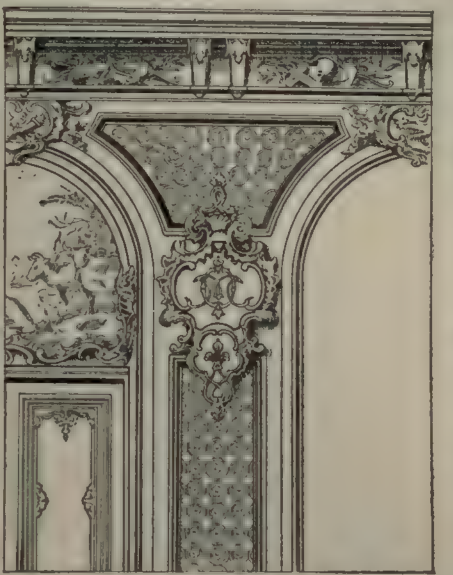
regarding (rẹ̄-gär′ding), *a.* In *her.*, same as *respectant.*

regather, *v.* I. *trans.* 2. To gather (a garment) again.

II. *intrans.* To meet again.

regatta-twill (rẹ̄-gat′ạ̈-twil), *n.* A three-harness twill. Also called *llama-twill.*

Regency style, in the history of the fine arts in France, a name given to work which corresponds to the Regency (1715–23) of Philip of Orléans during the minority of Louis XV.



Regency Style; motive from Hôtel Soubise, Paris.

The admirable "*Style Régence*," for example, owes much of its high quality to the fine constructive lines inherited from the preceding reign.
Lady Dilke, French Furniture and Decoration of the [XVIII Century, p. 2.

regenerate, *v.* II. *intrans.* To be formed again; come into existence again; be generated again.

That limbs may *regenerate* from a peripheral wound was shown by Herrick for the tips of the claws [of a crayfish] and by Morgan for large parts of the limb [of a crab].
Biol. Bulletin, Jan., 1904, p. 83.

regeneration, *n.* 3. In *biol.*: (*b*) The reproduction of a whole organism or of a part of an organism from a separated portion of the body of an organism. See the extract.

The word "*regeneration*" has come to mean, in general usage, not only the replacement of a lost part, but also the development of a new, whole organism, or even a part of an organism, from a piece of an adult, or of an embryo, or of an egg. *T. H. Morgan*, Regeneration, p. 23.

4. In *forestry*, same as ★*reproduction*, 6.—**Accidental regeneration,** the replacement or regeneration of a lost part in an organism that has been mutilated by accident, as contrasted with the replacement of parts that are lost in the course of normal life.—**Cœnogenetic regeneration,** the replacement of a lost part by a method which is different from that in which it was formed originally. See the quotation under *palingenetic* ★*regeneration.*—**Facultative regeneration,** the restoration of a complete organism from a part removed from the body.

We can understand why *facultative regeneration* only occurs in relatively simple organisms.
Weismann (trans.), Germ-Plasm, p. 130.

Palingenetic regeneration, the regeneration of a lost part by a series of changes like those by which the part was formed originally.

That form of *regeneration* which has been considered above may be described as *palingenetic*, for it pursues the course taken by the primary or embryonic development; but as soon as it leaves this course and takes a shorter one, it may be distinguished as cœnogenetic.
Weismann (trans.), Germ-Plasm, p. 108.

Pathologic regeneration, the regeneration or replacement of an organism from a portion which has become detached; restorative regeneration.—**Physiological regeneration,** the renewal or replacement of parts that have been lost in the course of normal life.

The term "*physiological regeneration*" I shall use in the ordinary sense to include such changes as the moulting and replacement of the feathers of birds, the replacement of teeth, etc.,—changes that are part of the life-cycle of the individual. *T. H. Morgan*, Regeneration, p. 25.

Polygenetic regeneration. Same as *facultative* ★*regeneration.*—**Regular regeneration.** Same as *physiological* ★*regeneration.*—**Restorative regeneration,** pathologic or accidental regeneration.

For what is known as pathological or accidental regeneration, I propose the term "*restorative regeneration.*"
T. H. Morgan, Regeneration, p. 25.

Regenerative accumulator. See ★*accumulator*, 3 (*c*).—**Regenerative cell,** in *elect.*, a voltaic cell the difference of potential of which can be restored or built up by the action of an electric current; a storage-cell or secondary battery. [Rare.]—**Regenerative kiln.** See ★*kiln.*

regenerator, *n.* 3. A lamp which generates formaldehyde by the oxidation of methyl alcohol. *Buck*, Med. Handbook, III. 502.

regeneratress (rẹ̄-jen′ẹ-rạ̄-tres), *n.* A woman who regenerates; a female regenerator.

There is only this one cardinal point of difference between such patients and the *regeneratress* of France.
E. M. Clerke, in Dublin Rev., Oct., 1894, p. 307.

regeneratrix (rẹ̄-jen′ẹ-rạ̄-triks), *n.* Same as ★*regeneratress.*

regent (rē′jẹnt), *v.* [*regent, n.*] I. *trans.* 1. To teach or superintend as a regent.—2. To direct or control (a person) as a regent.

II. *intrans.* To act as a regent of a university.

regianin (rē′ji-ạ-nin), *n.* Same as ★*juglone.*

régie (rā-zhē′), *n.* [F. *régie*, the administration of goods for the account of another, the direct collection of taxes, the revenue or excise department of the state, < *régir*, < L. *regere*, rule. See *regent.*] A revenue department, as in France and other countries, which controls, among other things, the purchase and sale of tobacco.

régime, *n.* 3. In *med.*, same as *regimen*, 2.—4. In *phys. geog.*, the dominant or controlling behavior of a river with respect to current, floods, etc.; by analogy, the controlling behavior of ocean currents, meteorological phenomena, etc.

The *régime* of the great northern river is strikingly unlike that of its still greater southern analogue on account of its course being from a warmer to a colder climate: hence ice-dams, obstructed discharge, and overflows.
Encyc. Brit., XXV. 361.

Régime of status, the stage of social evolution in which the social place of each person, family, and class is fixed by custom or by law. *L. F. Ward*, Outlines of Sociol., p. 134.

regimen, *n.* 5. In *phys. geog.*, the physical characteristics of a river, especially of a graded river; also, the condition of a river or current when it does not actively build up or wear down its course; in general, grade. See the extract.

The angle of the slope of the ridge of a shingle beach depends primarily on the materials of which it is chiefly composed, on their size, shape, and specific gravity. *Regimen* is attained when the assistance which gravity gives to transport with the back-wash makes the seaward equal to the shoreward transport. An individual pebble of equal size to those of which the beach is mainly composed, but of twice the specific gravity, if brought on to the *regimen* slope of such a beach will work its way down to the bottom, for its extra resistance to the back-wash is mainly that of greater inertia, whilst it resists the on-wash by diminished buoyancy also.
Geog. Jour. (R. G. S.), XI. 634.

regiment, *n.*—**Linked regiments,** regiments of the British army brigaded together. Also called *linked battalions.*

regimentally (rej-i-men′tạl-i), *adv.* Separately by or for each regiment. [Rare.]

Open terraces for use of horses in temperate weather are often built *regimentally.* *Encyc. Brit.*, XXVI. 157.

regimentary (rej-i-men′tạ̄-ri), *a.* Same as *regimental.*

reginal (rẹ̄-jī′nạl), *a.* [NL. **reginalis*, < *regina*, a queen, fem. of *rex* (*reg-*), king.] 1. Relating to a queen; resembling a queen; queenly.—2. Upholding or advocating the power and prerogatives of a queen. *N. E. D.*

region, *n.* 2. (*b*) In the plan of excavations at Pompeii, one of the primary divisions introduced by Fiorelli about 1860. The arrangement is based on a misconception but has nevertheless been retained. Each region contains several blocks or insulæ.—3. In *phytogeog.*: (*a*) A mountain belt marked by peculiar floral types; an altitudinal zone. Thus used by Humboldt, who for the equatorial district of the Andes distinguished nine such regions. Schimper also prefers this term to *zone* in treating of mountain belts. He distinguishes, on purely œcological grounds, *basal*, *montane*, and *alpine* mountain regions. (*b*) A comprehensive territorial unit with sufficient uniformity of conditions to secure uniformity in vegetation. A region will include several formations and will itself be included in some larger unit, as a *realm.* (*c*) For a special use, see *life* ★*zone.*—**Austral region.** See *life* ★*zone.*—**Boreal region.** See *life* ★*zone.*—**Extrapolar region,** in *electrotherapy*, all that part of the body which lies outside the polar region.—**Holarctic region,** or **realm,** a zoogeographical division which comprises North America (except portions of Mexico and Florida), Europe, northern Africa, and Asia (except southern Arabia and that portion which is bounded by a line drawn through the Himalayas and thence, with a northerly curve, eastward to the coast): the Arctogæal Realm of Lydekker. The North American portion is the Nearctic region or subregion; the rest constitutes the Palearctic region or subregion. The name was given by Professor Newton and is accepted as a substitute for the *Triarctic* of Heilprin.—**Motor region.** Same as *motor* ★*zone. T. Ziehen* (trans.), Introd. to Physiol. Psychol., p. 84.—**Peri-intestinal region.** See ★*peri-intestinal.*—**Region of convergence** of a power-series, the points within the circle of convergence supplemented by those points of the circle at which the series is convergent.—**Rolandic region,** the motor area of the brain, including the gyri on each side of the fissure of Rolando.—**Schumann's region,** in *optics*, that portion of the ultra-violet spectrum, lying between .1800 μ and .1000 μ, for which the air is opaque: so called from Victor Schumann, a German physicist who first detected the existence of these extremely short waves.—**Silent regions.** Same as *association* ★*areas.*—**Sonoran region,** a zoogeographical division of North America. As defined by Cope it included parts of Nevada, New Mexico, Arizona, and Sonora in Mexico; extended by Merriam to include the warmer portions of the United States, and nearly all of Mexico save the coastal plains and divided into Upper and Lower Sonoran.—**Tropical region.** See *life* ★*zone.*

regional, *a.* 3. Specifically, in *geol.*, descriptive of, pertaining to, or affecting an area of considerable extent, that is, a region: used in contrast with *local* and other terms of similar comparative significance.

> This may be termed *regional* metamorphism. The same sort of recrystallization has taken place in the lime rock along the copper-bearing veins, and we may term it vein metamorphism. *Science*, Nov. 22, 1901, p. 797.

regionalism (rē′jọn-ạl-izm), *n.* [*regional* + *-ism.*] Localism.

> That spirit of local individualism—in politics somewhat inharmoniously dubbed '*regionalism*'—has its roots deep in the traditional prejudices of the people.
> *Edinburgh Rev.*, Jan., 1887, p. 107.

Regionary catalogues, the name commonly given to two compilations of travelers' notes, the Notitia and Curiosum, which were made in the fourth century A.D. and have been preserved in several codices. They give detailed descriptions and statistics of the *regiones* or wards of the city of Rome.

register^1, *n.* 12. A float or buoy attached to a submarine cable while it is being paid out, to diminish the tension on the cable and the liability to injury from that cause.—**Register of writs,** in *Eng. law*, a book formerly kept in the Court of Chancery in which all the various forms of original writs were entered.—**Tidal register,** in *hydrog.*, a self-recording tide-gage; a marigraph; a limnometer.

register^1, *v. t.* 4. To enter (a letter) at a post-office as a registered letter (which see, under *letter*^{3}).

registering-beam (rej′is-tėr-ing-bēm″), *n.* A balance-beam, in weighing-scales of any type, fitted with a recording or registering device. The most common form is a simple printing attachment that prints upon a card or slip the weight of the coal, grain, or other material weighed upon the scale. Some scales give also the computed price of the thing weighed. Such scales are *computing-scales.* See ★*computing-scale.*

register-plate, *n.* 2. (*a*) A plate from which sectors have been cut out at intervals; a plate used as the valve for a register so that the sectors close openings in the plate behind the sectored one, when the latter is rotated through a small angle. (*b*) A valve formed like a gridiron with essentially rectangular openings which are closed by sliding a slotted plate over a similar one behind it.

register-tonnage (rej′is-tėr-tun″ạj), *n.* In common usage, the same as *net registered tonnage.* When the gross registered tonnage is referred to, it is always qualified by the word 'gross.' See ★*tonnage.*

registral (rej′is-trạl), *a.* [ML. *registrum*, register, + *-al*^{1}.] Preserved in, copied from, and authenticated by a register.

registrant (rej′is-trant), *n.* [ML. *registrans* (*-ant-*), ppr. of *registrare*, register.] One who registers; especially, in *patent law*, one who registers a trade-mark or patent.

regolith (reg′ō-lith), *n.* [Gr. ῥῆγος, a rug, a blanket, + λίθος, stone.] 'Blanket-rock': in *petrog.*, a term applied by Merrill (1897) to the covering of loose material resting upon the solid rocks of the globe. It is derived from the decay of rocks, accumulations of vegetation, talus, debris, and sediments of all kinds. *Science*, Feb. 6, 1903, p. 234.

Reg. Prof. An abbreviation of *Regius Professor.* Also *R. P.*

regradation (rē-grạ-dā′shọn), *n.* The process of adjustment of a land surface to a new level under the control of a newly established equilibrium between the degradational and aggradational forces of a stream.

regrass (rẹ-gràs′), *v. t.* [*re-* + *grass.*] To cause to produce grass again; bring back to the condition of good pasture-land.

> In order to obtain some information as to the possibility of restoring these overstocked lands, experiments in *regrassing* were undertaken at Tucson, Ariz.
> *Yearbook U. S. Dept. Agr.*, 1901, p. 30.

regression, *n.* 4. In *math.*, a discrete series which has a last element but no first.—5. In *statistics*, the tendency of one variable phenomenon that is correlated with another to revert to the general type and not to equal the amount of deviation of the particular phenomenon with which it is correlated. This tendency is measured by the coefficient of regression. An example of regression is furnished by the sons of a series of fathers having a certain stature which deviates from the typical stature of the people to which the fathers and sons belong. Then the statures of the sons will vary not around the stature of their fathers, but around another value which is nearer the typical stature of the people to which the series belongs. The proportion between the average deviation of the sons and the deviation of the fathers is the index of regression. In the same way an index of regression may be established between sizes of correlated parts of the same organism, or between any two correlated variables. See ★*correlation*, 5.

> Taking the boys, for example, with cephalic indices between 74 and 75, these boys had 78 brothers who were distributed according to the arrangement in the column headed 74 to 75. Brothers are not alike in cephalic index, but distributed with a considerable range of variation. We now take in the usual way the arithmetic mean of this array of brothers, and find it to be 77·45. The average brother of a boy with cephalic index = 74·5 has an index of 77·45. This is the phenomenon of *regression* towards the general population mean (78·9) as discovered by Francis Galton.
> *K. Pearson*, in Biometrika, March–July, 1904, p. 137.

6. In *breeding*, the decline toward mediocrity of offspring from the mean of the two parents. Sometimes called *filial regression.*

> Therefore the average *Regression* from the Parental to the Mid-Filial Stature must be the one half of two-thirds, or one-third. *Francis Galton*, Natural Inheritance, p. 98.

Coefficient of regression. See ★*correlation*, 5.—**Fraternal regression.** See ★*regression*, 5.—**Ratio of regression.** Same as *coefficient of regression.* See ★*correlation*, 5.

regressionist (rẹ-gresh′ọn-ist), *n.* [*regression* + *-ist.*] One who advocates a policy of regression or of returning to former conditions. [Rare.]

regression-line (rẹ-gresh′ọn-līn), *n.* A plotted line or diagram which expresses the average statistical regression of a mean second brother from a first brother, as regards any measured quality. See ★*regression*, 5. *K. Pearson*, in Biometrika, March–July, 1904, p. 139.

Regressive multiplication. See ★*multiplication.*

regressivity (rē-gre-siv′ị-ti), *n.* [*regressive* + *-ity.*] The quality of being regressive; a retrograde tendency or policy.

> Retarded development of an organ, . . . is an indication of *regressivity*, and many writers have collected cases showing that abbreviation and retardation of the different organs of a creature which is their bearer are ontogenetic processes that are constantly operative.
> *G. S. Hall*, Adolescence, I. 55.

Regular group, sequence, series, socket. See ★*group*^{1}, etc.

regularity, *n.*—**Law of regularity.** See ★*law*^{1}.

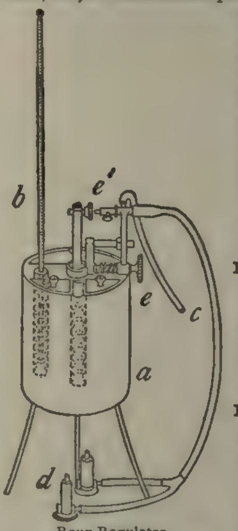
regulation, *n.* 4. In *biol.*, readjustment which restores the completeness of the whole in a part that has been removed from the body of an organism or in an organism that has lost part of its body. [Rare.]—**King's** or **Queen's regulations,** the regulations issued by the sovereign for the government of the British army.

regulationist (reg-ụ̄-lā′shọn-ist), *n.* [*regulation* + *-ist.*] One who favors regulation in a particular matter. Also used attributively.

regulator, *n.* 2. (*a*) (7) In *Cornish engines*, a cataract. (*e*) In *hydraulic* and *irrigation engin.*, a gate or a series of gates placed in a storage reservoir or dam, by opening or closing which the quantity of water discharged from the reservoir or dam can be regulated to meet any desired requirements.

> As the object of the Asyut barrage is to throw a higher level of water into the Ibrahimiyah canal, and as the latter enters the Nile just south of the dam, a new *regulator* and lock has been rendered necessary at the head of the canal, to control the supply entering therein, especially in years of high flood, and to insure the safety of its works in case of an accident. The work comprises a *regulator* pierced with nine openings each 16.4 feet wide, and a lock 27.8 feet wide. The *regulator* is made by means of two gates, one upper and one lower, each 11.5 feet in height. *Sci. Amer.*, Feb. 28, 1903, p. 152.

Roux regulator, an instrument for keeping a vessel of water, etc., at a constant temperature by automatic regulation of the height of a gas-flame which serves as the source of heat. The regulator is set for a certain temperature: if the flame becomes too high, the orifice through which the gas is supplied narrows, and the supply is correspondingly lessened; if the flame becomes too feeble, the orifice widens, and the gas-supply is correspondingly increased. *Amer. Jour. Psychol.*, XI. 260.



Roux Regulator.

a, copper vessel containing water; *b*, thermometer; *c*, tube to gas supply; *d*, gas-burners; *e*, *e′*, regulator.

régule (rā-gül′), *n.* [F.: see *regulus.*] A copper regulus from which most of the impurities have been removed by *liquation.*

regulus, *n.* 2. (*a*) The early alchemistic use of this term for a button or rounded mass of one of the inferior metals, obtained by fusion (involving an allusion to gold as rex or the king of metals), has been extended in a loose way in modern times so as to include such a button or fused globular mass if it is of metallic appearance, though carbon, silicon, or other non-metallic elements may be present in union with one or more metals. (*b*) In *metal.*: (1) The metallic mass which sinks to the bottom of a furnace or crucible, separating itself from the slag by gravity. (2) An intermediate product obtained in smelting ores, especially those of copper, lead, silver, and nickel, and consisting chiefly of metallic sulphids.—4. (*b*) One set of generators of a quadric surface; the system of straights that meet three non-incident straights.

> The joins of corresponding points on two non-intersecting lines form one set of generators of a quadric, that is, a *Regulus.*
> *C. M. Jessop*, A Treatise on the Line Complex, p. 6.

(*c*) A configuration of lines which satisfy three conditions, and therefore depend on only one parameter.—**Complementary regulus,** in *math.* One set of generators of a quadric surface being a regulus, the other set of generators is called, in reference to it, the *complementary regulus.*—**Director regulus.** Either of two complementary reguli is the *director regulus* of the other.—**Regulus of the second order,** one set of generators of a quadric surface.

regurgitating-stick (rẹ-gėr′ji-tā-ting-stik), *n.* A curved slender stick or twig used for bringing about vomiting by being inserted in the throat: used by primitive tribes that practise vomiting as part of religious purification. *Sci. Amer. Sup.*, June 25, 1904, p. 23813.

reh, *n.* II. *a.* Containing the mixture of sodium salts called *reh*: applied to land in the Northwest Provinces of India on the surface of which these salts appear as an efflorescence.

rehandling-plant (rē-han′dling-plant), *n.* An ore-storage and -rehandling plant: a trade-term applied to any large ore- and coal-storage plant in which the materials are transferred, by means of cranes, hoists, conveyers, reloaders, or other machinery, more than once, as from cars to bins and from bins to a storage-yard or to other cars or to furnaces. Such plants are also used to rehandle pig-iron. See ★*coal-storage* and ★*reloader.*

reharmonize (rē-här′mọ̄-nīz), *v. t.*; pret. and pp. *reharmonized*, ppr. *reharmonizing.* [*re-* + *harmonize.*] 1. In *music*, to provide (a melody or theme or passage) with a new harmony; rearrange harmonically.—2. To bring back into harmony or agreement.

rehearsal, *n.*—**Dress rehearsal,** in *theat.*, a full rehearsal of a play in which the costumes and properties are used which will be used in the public performance of the play.

rehearser, *n.* 2. A conductor of rehearsals; one who rehearses a choir, a chorus, etc.

reheater, *n.* (*b*) A heater for raising the temperature of steam which has been used once and is to be used again, as in the low-pressure cylinder of a compound engine, or which has been cooled by traveling a long distance. Reheating dries and possibly superheats the steam and so lessens the cylinder losses.

reherse, *v.* A simplified and former spelling of *rehearse*.

rehypothecator (rē-hī-poth′ẹ̄-kā-tọr), *n.* One who rehypothecates securities, etc.

Reichert's cartilage. See ★*cartilage.*

Reichmann's disease. See ★*disease.*

reichsland (rīchs′länt), *n.* [G., < *reichs*, gen. of *reich*, kingdom, empire, + *land*, land.] In Germany, a domain belonging to the crown; specifically, Alsace-Lorraine.

reichsmark (rīchs′märk), *n.* [G., < *reichs*, gen. of *reich*, kingdom, empire, + *mark*, mark.] The mark, current throughout the German empire.

reidentification (rē-ī-den″ti-fi-kā′shọn), *n.* [*re-* + *identification.*] A second identification.

reillume (rē-i-lūm′), *v. t.*; pret. and pp. *reillumed*, ppr. *reilluming.* [*re-* + *illume.*] To illumine again.

reincarnationist (rē-in-kär-nā′shọn-ist), *n.* [*reincarnation* + *-ist.*] A believer in reincarnation.

reincorporate (rē-in-kôr′pọ̄-rāt), *v. t.*; pret. and pp. *reincorporated*, ppr. *reincorporating.* [*re-* + *incorporate.*] To incorporate again.

reincorporation (rē-in-kôr-pọ̄-rā′shọn), *n.* The act of reincorporating; a renewed incorporation.

Reinforced concrete. See ★*concrete.*

reinforcement, *n.* **4.** Splints of rigid material built into a compound or sinew-backed bow.

Reinhardtius (rīn-här′ti-us), *n.* [NL., named after Professor Johann *Reinhardt*, who investigated the fishes of Greenland.] A genus of flounders found in the arctic parts of the Atlantic Ocean.

reintubation (rē″in-tū-bā′shọn), *n.* [*re-* + *intubation.*] Intubation of the larynx performed a second time owing to a return of the obstruction. *Med. Record*, Aug. 1, 1903, p. 161.

reinversion (rē-in-vėr′shọn), *n.* [*re-* + *inversion.*] Replacement of an inverted organ, especially the uterus.

Reinwardtia (rīn-wärt′i-ạ̈), *n.* [NL. (Dumortier, 1822), named in honor of Kaspar G. K. *Reinwardt* (1773–1854), a Dutch botanist.] A genus of plants of the family *Linaceæ*, sometimes referred to *Linum*, but distinguished from that genus by the yellow flowers, 3 or 4 styles, and glands unequal or wanting. *Reinwardtia trigyna*, the East Indian flax, the only species, is in cultivation as a greenhouse subshrub. A four-styled form is sometimes cultivated.

reis², *n.*—**Reis effendi**, the former title of the chancellor and minister of foreign affairs of the Turkish Empire.

Reischauer's bottle. See ★*bottle*².

reisner (rīs′nėr), *n.* [The name of a German artist in wood, of the time of Louis XIV.] A method of inlaying in wood of different colors: in full, reisner-work. *N. E. D.*

reitbok (rīt′bok), *n.* [D.] Same as *reedbuck.*

reject (rē′jekt), *n.* That which is rejected or thrown out; a cull; specifically, in *prehistoric archæol.*, an unfinished stone implement, spoiled or broken in the process of manufacture.

> Excavations into the quarry sites and workshops of the district have shown that the class of archæologic objects from this vicinity, which have hitherto been assumed to be palæolithic and to represent the rude implements of primitive man, are in fact nothing but the "*rejects*" of much more recent times. *Smithsonian Rep.* 1890, p. 42.

rejection, *n.* **2.** *pl.* Objects or parts rejected from a collection, as the coarse and least desirable fibers of a fiber-plant.

> "Cuttings" are the woody ends of the jute plant, and the fibres of the lowest class are known as "*rejections.*" *Hannan*, Textile Fibres of Commerce, p. 28.

rejuvenate, *v. t.* **2.** (*a*) Of a stream, to increase its gradient, and with this, its velocity and erosive power, so that its effectiveness and apparent youth are renewed. This result is produced by the uplifting of a region which has been notably reduced by the erosion of the streams which continue to occupy it. (*b*) Of a region, to again impress the characters of youthful topography upon (it) when it is well advanced in its erosion cycle. This effect is dependent upon rejuvenation of the streams. *Chamberlin and Salisbury*, Geol., I. 153.

rejuvenescence, *n.* **2.** (*b*) The renewal of vitality, which has been exhausted through repeated cell-division, by the sexual union of two cells into a cell of compound origin.

> A number of writers . . . have looked at the process of sexual reproduction as sort of renewal of youth, or *rejuvenescence* of the individuals. *T. H. Morgan*, Evolution and Adaptation, p. 414.

rel. An abbreviation (*a*) of *relative*; (*b*) of *relatively*; (*c*) of *religion*; (*d*) of *religious*; (*e*) of the Latin *reliquæ*, 'remains' or 'relics.'

relation, *n.*—**Converse of a relation**, the relation which must hold between *y* and *x* when the given relation holds between *x* and *y*.—**Definite relation.** (*b*) A character of an individual (especially an indesignate individual) object relatively to another object (or objects), in so far as it differs from any character of the same individual relative to any third individual. Thus, imagine a square. Its four corners are indesignate individual objects. Each of them has a relation to the corner diagonally opposite to it which is different from its relation to either of the adjacent corners. This is a definite relation. On the other hand, the four vertices of a tetrahedron are without definite relation to any vertices, though each is in a definite relation to the opposite face. A definite relation will not, in general, be an elementary relation, since all the corners of a square are in the same relation to their opposite corners; but it is, in the terminology of Peirce, an *infinitesimal relation.* An infinitesimal relation need not be definite.—**Faculty of relations**, in Hamilton's *psychol.*, the faculty of comparison, or of thought proper.

> [There is] a higher faculty which operates upon these materials, and which we may call the Elaborative or Discursive Faculty. This faculty has only one operation, it only compares,—it is Comparison,—the *faculty of Relations.* *Sir W. Hamilton*, Lect. on Metaphysics, II. 14.

Metric relation. See ★*metric*1.

relation (rẹ̄-lā′shọn), *v. t.* To relate; bring into relation. [Rare.]

> Thinking being *relationing*, no thought can ever express more than relations. *H. Spencer*, First Princ., iv.

relationship, *n.*—**Clang relationship.** See ★*clang affinity.*

Relative addition, adverb, number, product, velocity. See ★*addition*, etc.—**Relative threshold of difference**, in *psychophys.*, relative differential limen. *T. Ziehen* (trans.), Introd. to Physiol. Psychol., p. 52. See ★*difference limen.*

relativism (rel′ạ-tiv-izm), *n.* [*relative* + *-ism.*] The philosophical doctrine of the relativity of knowledge. See *relativity.*

relativity, *n.*—**Emotion of relativity**, in *psychol.*, an emotion whose objective cause is a purely relative circumstance. See the extract.

> To the rise of this emotion [of Wonder], it is not merely requisite that the mind should have been previously in a routine commonplace frame; it is further requisite that there should be some startling deviation from use and wont in the world without. . . . Hence to such states, we may apply, as a specific designation, the name, '*Emotions of Relativity.*' The chief examples are Novelty, Wonder, Power and Liberty. *A. Bain*, Emotions and Will, p. 83.

Principle of sensational relativity, in *psychol.*, the doctrine that our apprehension of a sensible quality or intensity is determined by the relations in which it stands to other intensities or qualities present in the consciousness of the time. See ★*law of relativity.* *W. Wundt* (trans.), Human and Animal Psychol., p. 118.

relaves (rā-lä′vās), *n. pl.* [Sp. *relave*, second washing of metals, in pl. washings or sweepings of a silversmith's or goldsmith's shop (see also def.), < *relavar*, lave, or purify, again.] The heavy constituents of the amalgam heap (torta) remaining at the bottom of the tanks and washed in bateas (which see). They are subsequently reground in arrastras and yield a certain amount of auriferous amalgam. See *patio process*, under *process.* *Phillips and Bauerman*, Elements of Metallurgy, p. 745.

relaxant, *n.* **II.** *a.* Relaxing; relieving tension.

Relaxation distance, the distance through which an electromagnetic disturbance must travel before its amplitude is reduced to $\frac{e}{}$ of its original amplitude, where e is the Naperian base.—**Relaxation time**, the time required for a quantity, the decadence of which is logarithmic, to diminish in the ratio of e (the Naperian base) to unity.

relay¹, *n.* **5.** In *teleg.*, the circuit operated by a relay.—**Differential relay**, in *teleg.*, a relay with differentially wound magnet-coils. Such relays are used on certain duplex and quadruplex circuits.—**Electrostatic relay**, a device for use in condenser circuits in which a continuous charge is be maintained.

> It is often necessary in experimental work to maintain a condenser continuously charged at a constant high potential for a considerable length of time, and various methods, none of them altogether satisfactory, have been proposed. An "*electrostatic relay*" suitable for this purpose is described by M. V. Crémieu in the Journal de Physique for September. *Nature*, Oct. 2, 1902, p. 556.

Neutral relay, in *teleg.*, a relay the armature of which is not permanently magnetized and the action of which is therefore independent of the direction of the current in the magnet-coils.—**Pilot-relay**, in *teleph.*, a relay controlling a group of circuits. *Elect. Rev.*, Aug. 27, 1904, p. 303.—**Telephonic relay**, an instrument having the same function in a telephone circuit as has the ordinary relay in telegraphy, namely, that of reproducing in one circuit a message received over another; a repeater.—**Time-element relay**, in *elect.*, a relay arranged so as to release clockwork which in turn opens or closes a circuit or performs some other operation, after the lapse of a predetermined time. Such relays are sometimes employed in the operation of circuit-breakers in a power-station.—**Tripping-relay**, in *elect.*, a relay arranged for the automatic release of a circuit-breaker or switch.

relay¹ (rē-lā′), *v. t.* and *i.* To transmit by means of a telegraphic or telephonic relay; make use of a relay.

> Have the telegraphone record his message and repeat it over another wire to St. Louis where another machine *relays* it to Denver. . . . The steel belt machine [telegraphone] will transmit a record over any number of wires simultaneously, and by *relaying*, to great distances. *The Marconigram*, June, 1904, p. 16.

relay-race (rẹ̄-lā′rās), *n.* A race in which the contestants run in turns, a number of them making up a team, and each running only a portion of the distance, when a comrade takes up the running, and so on till the completion of the full distance. As each runner completes his portion, he touches with his hand his mate who is about to take up the race.

relay-switch (rẹ̄-lā′swich), *n.* A switch operating an electric relay.

> All these *relay switches* operate electrically the real switches on the power-house floor. *H. W. Buck*, in Trans. Amer. Inst. Elect. Engin., 1902, [p. 540.

release¹, *n.* **7.** See ★*combination button.*

release-arm (rẹ̄-lēs′ärm), *n.* The arm that carries the releasing-cam on a Corliss valve-gear.

release-cock (rẹ̄-lēs′kok), *n.* A valve by which the brakes of a continuous train-brake may be released. In early forms the brakes were let off by releasing pressure in the train-pipe. In automatic brakes the pressure must be let off the brake-cylinder and the triple valve be thrown, or else the brakes go on again. See ★*air-brake* and *triple* ★*valve.*

release-nut (rẹ̄-lēs′nut), *n.* A split-nut; in a lathe, the nut which clasps the lead-screw. It can be thrown out of gear when desired, so as to release the screw from the work and wear of driving the carriage, or when hand operation of the feed-mechanism is preferred.

release-point (rẹ̄-lēs′point), *n.* In a steam-engine, the point of release; the place, in the stroke of the piston at which the exhaust-valve opens, releasing the steam which has been confined behind the piston to drive it for its working stroke.

releasing-bracket (rẹ̄-lēs′ing-brak″et), *n.* A device on a spinning-mule for releasing the counter-faller and restoring it to a position at which to recommence the operation of spinning. *Nasmith*, Cotton Spinning, p. 312.

relgharry, relgarry (rel′gar-i), *n.* [Anglo-Indian, < E. *rail*(*way*) + Hind. *gārī*, a cart, a carriage. See *gharry.*] A railway carriage.

relict, *a.* **2.** In *phytogeog.*, persisting in a limited area only: said of an endemic plant which at an earlier period had a much wider range.—**3.** In *phys. geog.*, left as a result of erosion; residual: said of mountains the form of which is due to the erosion of neighboring valleys, as mountains of circumdenudation, and especially isolated residual mountains or monadnocks.

> Two great divisions [of mountains] are recognized: (*a*) Original or tectonic mountains, . . . and (*b*) Subsequent or *relict* mountains. *Geog. Jour.* (R. G. S.), XIII. 308.

relief, *n.* **9.** (*b*) A portion that is elevated above the general surface; a ridge, hill, or mountain.

> In Volume XXXIV. of the "Smithsonian Contributions to Knowledge," Professor Shaler, of Harvard University, treats of the lunar features from the point of view of a geologist. He divides them into the broad classes of maria, vulcanoids (in which apt term he includes all cup-like formations from the greatest ring plains to the smallest crater bed), *reliefs* (mountains or ridges), valleys and rills, and rays. *Knowledge*, Jan., 1905, p. 13.

16. In *mineral.*, the character of the surface of a thin section of a mineral as shown under a microscope, depending on its refractive power relative to that of the substance in which it is embedded.—**Gelatin relief**, in *photog.*, an image composed of gelatin in relief. This may be a print on paper, in which case sensitized gelatin charged with pigment, such as lampblack, is exposed behind a negative. The soluble portions are next washed away, leaving a print which is treated with alum to harden it. Or, a film of sensitized gelatin is exposed behind a negative and then washed. The relief picture then serves to print from, as in some one of the photomechanical processes. *Woodbury*, Encyc. Dict. of Photog., p. 220.—**Relief photo-engraving.** See ★*photo-engraving.*

relief-plate (rẹ̄-lēf′plāt), *n.* **1.** A cover-plate; a plate that covers all or a part of a valve to relieve it of pressure, thus enabling it to be more easily moved. See ★*pressure-plate.*—**2.**

A cover-plate so arranged that if the pressure from underneath the valve exceeds the normal or desired limit, the plate will lift, thus relieving the excess pressure.

relief-ship (rẹ-lēf′ship), *n.* A ship that brings relief or aid, as to an expedition for arctic exploration; specifically, a government cutter or a large ship which periodically makes the rounds of lighthouses, light-ships, and other government stations with provisions, etc.

reliev, *v.* A simplified spelling of *relieve*.

reliever, *n.* 4. In *mech.*: (*a*) A release; a device for releasing some part of a mechanism at a certain time or position. (*b*) A device, such as a spring or elastic substance, for preventing shocks on a machine or part.

religate (rel′i-gāt), *v. t.*; pret. and pp. *religated*, ppr. *religating*. [L. *religat*(*um*), pp. of *religare*, bind up.] To bind up or together; unite; constrain. [Rare.]

> The religion of "the sufficiency of life"; with a debased worship appended to it for the ignorant, but with no *religating*, no binding power, between the educated man on the one side, and anything beyond the framework of the visible world on the other.
> *Gladstone*, Gleanings of Past Years, III. 130.

religiose (rẹ-lij′i-ōs), *a.* [L. *religiosus*, religious.] Excessively religious; unduly or morbidly occupied with religious ideas and emotions.

> Some of my companions are too much in the *religiose* vein to be always quite wholesome company.
> *Clough*, Let. in Poems, I. 196.

Religious association or **corporation law**, statutory enactments by which religious bodies may become incorporated without special application to the legislature.

reliquary^1, *n.* **II.** *a.* **1.** Of or pertaining to a reliquary. [Rare.]—**2.** Residual. [Rare.]

> The nucleus of the now full-grown parasite [coccidium] undergoes multiple division, the protoplasm arranges itself in individual masses about the many daughter nuclei, and there results a stage in which a rosette of young forms . . . encircles a central portion of protoplasm, known as the *reliquary* body or residual mass.
> *Buck*, Med. Handbook, VIII. 537.

reliquefy (rē-lik′wẹ-fī), *v.*; pret. and pp. *reliquefied*, ppr. *reliquefying*. **I.** *trans.* To render liquid again, as by fusion, after solidification has taken place. *Jour. Soc. Chem. Industry*, XII. 31.

II. *intrans.* To become liquid again, as by fusion or by absorption of moisture from the air, after solidification has taken place.

relish^1, *n.*—**Single relish**, in *music*, same as ★*cadent*.

Rellyan (rel′i-an), *a.* Of or pertaining to the teaching or the followers of James Relly, who organized a society of Universalists in London in 1750.

Rellyanism (rel′i-an-izm), *n.* The doctrine of James Relly, for a time a preacher in Whitefield's communion and later the founder of a Universalist society in London in 1750. His main tenets were a mystical union between Christ and human beings whereby their acts are made Christ's and Christ's theirs, thus working out a complete salvation; a spiritual baptism, an immersion of the mind in truth; and literal resurrection of the body.

relm, *n.* A simplified spelling of *realm*.

reloader (rē-lō′dėr), *n.* In *transportation*, a self-loading conveyer used to collect and transport coal from a coal-storage yard or pocket and to deliver it to railroad-cars or vessels or to place it in other near-by storage-places. In one form the conveyer is loaded by means of a self-filling bucket; in another a horizontal bucket-conveyer, supported by a swinging arm pivoted at one end, travels in a circle along the edge of a coal-heap, sweeping up and taking away the coal as fast as it slides down. See ★*coal-storage*.

reloading-tool (rē-lō′ding-töl), *n.* A combination tool for reloading cartridge-cases. It generally measures the proper powder-charge and inserts the bullet in its proper position.

relocator (rē-lō′kā-tọr), *n.* A device, used at sea-coast forts, by which the range and direction of an object, determined by instruments safely placed at a distance, may be converted into corresponding data for the gun itself.

rel. pron. An abbreviation of *relative pronoun*.

reluctance, *n.* **2.** In *elect.*, the resistance to magnetic flux: the reciprocal of permeance. The unit of reluctance is the oersted, which is the reluctance of a magnetic circuit in which a unit of magnetomotive force will produce unit flux.—**Unit magnetic reluctance**, the resistance offered to magnetic flux by a circuit of unit length and cross-section, and unit permeability.

reluctantism (rẹ-luk′tan-tizm), *n.* [*reluctant* + *-ism*.] The mental state of shrinking or withdrawal; 'drawing into one's shell'; a temporary incapacity or paralysis of the mental powers.

> The incisive coldness of Miss Lamb's demeanor . . . was sufficient to chill . . . her youthful admirers into a state of objectified *reluctantism*.
> *Cent. Mag.*, Feb., 1906, p. 552.

reluctivity (rē-luk-tiv′i-ti), *n.* [*reluct* + *-iv*(*e*) + *-ity*.] In *elect.*, the specific reluctance of a substance; the ratio of the reluctance of a magnetic substance to that of air: the reciprocal of permeability. *H. Du Bois*, The Magnetic Circuit, p. 20.

reluxation (rē-luk-sā′shọn), *n.* [*re-* + *luxation*.] Same as ★*redislocation*. *Buck*, Med. Handbook, I. 62.

rem. An abbreviation of *remark* or *remarks*.

remainder, *n.* **5.** The right to succeed to a title or position on the decease of the holder; especially the right of succession to a peerage expressly assigned to a certain person or line of descent in default of male issue in the direct line. *N. E. D.* [Great Britain.]—**Negative remainder**, what a dividend lacks to make a too great quotient exact: as, 4 goes into 5 twice, with the *negative remainder* 3.—**Positive remainder**, so much of a dividend as prevents a too small quotient from being exact: thus 4 goes into 11 twice with the *positive remainder* 3.

> What are the two *remainders*, *positive* and negative, which result from dividing the higher number, 74, by the lower number 40? Our English way of stating it is to say that 40 goes into 74 once and leaves a (*positive*) *remainder* of 34 over. *Smithsonian Rep.*, 1890, p. 340.

remancipate (rẹ-man′si-pāt), *v. t.*; pret. and pp. *remancipated*, ppr. *remancipating*. [L. *remancipat*(*um*), pp. of *remancipare*, remancipate. See *mancipate*.] In *Rom. law*, to transfer back again.

remancipation (rẹ-man-si-pā′shọn), *n.* [*remancipate*.] In *Rom. law*, the act of remancipating or retransferring. See *mancipation*.

remanence, *n.* **3.** Residual magnetism; the flux density remaining in a magnetic circuit after the magnetizing force has ceased.

> There are three properties desirable in material for permanent magnets. First, to minimize bulk, the material should have a high permeability in order that it may accept a large amount of magnetism. Second, after magnetization the material should retain as large a proportion of the flux created as possible. The quality of magnetic retentiveness, or the ability of a substance to retain and keep the flux impressed upon it, is termed *remanence*. *Elect. World and Engin.*, July 11, 1903, p. 63.

Remanent flux, residual magnetic flux.—**Remanent polarization.** See ★*polarization*.

remanié, *a.* **2.** Recemented, as a glacier formed by the falling of fragments of ice.

II. *n.* A characteristic portion of one formation occurring in another younger one; especially, a fossil found in a bed of more recent origin than that in which it was first buried. *J. Geikie*, The Great Ice Age, p. 160.

remanit (rem′a-nit), *n.* A trade-name of carbonized silk rags (in which any admixture of cotton or wool has been chemically destroyed) bound together with metal threads into the form of a small rope, braid, or mat, and used for insulating purposes, as for covering steam-pipes, etc. (Decision No. 5854, United States Board of General Appraisers.)

remark-book (rẹ-märk′bůk), *n.* A note-book kept by the navigating officer of a vessel, which contains his memoranda of hydrographical matters.

remex, *n.*—**Addigital remex.** See ★*addigital*.

remicle (rem′i-kl), *n.* [Dim. of *remex*.] The outermost predigital of a bird's wing; the outermost feather attached to the second phalanx of the middle finger.

> The distal predigital is always small, and is designated the *remicle*. *Proc. Zool. Soc. London*, 1887, p. 344.

remigiid (rẹ-mij′i-id), *n.* and *a.* **I.** *n.* A member of the lepidopterous family *Remigiidæ*.

II. *a.* Having the characters of or belonging to the family *Remigiidæ*.

remigrant (rem′i-grant), *n.* [L. *remigrans*, ppr. of *remigrare*, go back, ‹ *re-*, back, + *migrare*, travel, go.] A parthenogenetic insect which, while born upon a different kind of plant from that upon which its parent was born, afterward returns to a plant of the kind that was the home of its parent. See ★*emigrant*, 2.

> These alienocolæ in the following spring produce parthenogenetic winged females, . . . *remigrants* or sexupara, which return to Abies.
> *E. F. Phillips*, in Proc. Amer. Philos. Soc., Oct. 16, [1903, p. 298.

Remilegia (rem-i-lē′ji-ä), *n.* [NL., said to be a metathesis of L. *remeligo*, a delayer.] A genus of fishes of the family *Echeneididæ*, found in tropical seas.

reminisce (rem-i-nis′), *v. i.*; pret. and pp. *reminisced*, ppr. *reminiscing*. To indulge in reminiscences; relate past events; recollect. [Colloq.]

> He *reminisced* gently all through the long summer afternoon. *Back Country Letters*, July 8, 1853.

reminiscence, *n.* **4.** In *biol.*, the retention by a modern organism, during its development, of traces of the effect of past ancestral history.

> Similarities in development are here not only clear and striking, but obviously have some palingenetic meaning, since they give irresistible evidence of ancestral *reminiscence*. *E. B. Wilson*, Biol. Lect., 1895, p. 106.

Reminiscence Sunday. See ★*Sunday*.

remise, *n.* **4.** A carriage-house in which a remise is kept.

remissio (rẹ-mis̱′i-ō), *n.* [L.: see *remission*.] In *anc. music*, a passing from a higher to a lower pitch: opposed to *intentio*.

remittance-man (rẹ-mit′ans-man), *n.* An idle, and frequently dissolute, man who lives on remittances from his home. *E. E. Morris*, Austral English.

> *Remittance men*, as we call them here, are not so rare in my experience; and in such cases I act upon a system.
> *R. L. Stevenson*, The Wrecker, xxii.

remitter^1, *n.* **2.** In *postal service*, the person who fills out the application-blank for a money-order; the sender of such an order.

remittitur (rē-mit′i-tėr), *n.* [L., 'it is sent back' or remitted.] In *law*: (*a*) Relinquishment of a part of the damages found by a jury. (*b*) The return of a record from the court of review to the lower court for proceedings as specified, as for execution or a new trial. *Anderson*, Dict. of Law.

remnant, *n.* **3.** In *geol.*, an outlier.

> This belt is of very unequal width. Southeast of it Pensauken *remnants* again become more abundant, and still further in this direction the formation becomes continuous, and probably underlies the whole of the southeastern part of the State.
> *R. D. Salisbury*, in Geol. Surv. of New Jersey, 1895, [p. 10.

remnantal (rem-nan′tal), *a.* [*remnant* + *-al*^{1}.] Pertaining to, or of the nature of, a remnant.

> The elevated plain, southwest of Socorro, also appears to belong to the same class. Farther south at Paraje, at old Fort Selden and at El Paso, the same *remnantal* levels are noted. *Amer. Jour. Sci.*, Dec., 1907, p. 470.

remolade, *n.* See ★*rémoulade*.

remolino (rem-ō-lē′nō), *n.* [It. Sp. *remolino*, a whirlwind (cf. *remolo*, a whirlpool, vortex), ‹ It. *remolinare* = Sp. *remolinar* = OF. *remouliner*, ‹ ML. **remolinare*, grind as in a mill, ‹ *re-*, again, ‹ *molinare*, grind, ‹ *molina*, a mill: see *mill*^{1}, *n.*] In Italian use, a whirlwind, especially the smaller whirls such as the waterspout at sea and the sandspout or dust-whirl on land; figuratively, the spirit, witch, or demon imagined as animating the whirl.

remontado (rā-mon-tä′dō), *n.* [Sp., prop. pp. of *remontar* (reflex., flee to the hills, as slaves), elevate, etc. See *remount*.] A Christian native of the Philippine Islands who has left his village and lives in the mountains.

Remopleurides (rem-ọ-plö′ri-dēz), *n.* [NL., ‹ L. *remus*, an oar, + Gr. πλευρά, a rib.] A genus of opisthoparian trilobites having an expanded glabella, a wide axis, eleven to thirteen thoracic segments, and a small flat and elongated pygidium. It occurs in the early Silurian rocks.

remote, *a.* **2.** (*h*) Specifically (2) in *mycol.*, separated by a space, as the gills of certain fungi which do not extend quite to the stem.

rémoulade (rā-mọ̈-läd′), *n.* [F., also a veterinary medicine: ‹ It. *remolata*, of obscure origin.] A salad-dressing: a French dressing with the addition of hard-boiled eggs and mustard. Also *rémolade*.

rencontre (roṅ-kôṅtr′), *n.* [F., a meeting. See *rencounter*.] In *billiards*, that kiss-shot, so called, in which the cue-ball drives the first object-ball against the second and meets the latter on its return from cushion. *W. Broadfoot*, Billiards, p. 230.

rendement (rôṅd-moṅ′), *n.* [F., that which is rendered or produced, ‹ *rendre*, render.] The proportion of a valuable substance obtainable from a particular crude material, as of pure crystallizable sugar from a raw sugar.

rendition, *n.*—**Interstate rendition**, in *criminal law*, the act of delivering up a criminal, or a person charged with crime, by the executive of one state upon the requisition of the executive of another.

R. Eng. An abbreviation of *Royal Engineers*.

Rengeso clover. See ★*clover*.

rennet^{1}, *n.*—**Vegetable rennet.** Same as *cheese-maker.* See also *Withania.*

rennet-pepsin (ren′et-pep″sin), *n.* Pepsin obtained from the stomach of the calf.

rennet-stomach (ren′et-stum″ạk), *n.* The fourth stomach, or abomasum, of a ruminant.

rennin (ren′in), *n.* [*renn*(*et*) + *-in*^{2}.] Same as ★*chymosin.*

renninogen (re-nin′ọ-jen), *n.* Same as ★*chymosinogen.*

renominee (rē-nom-i-nē′), *n.* One who is renominated.

renommist (rā-no-mist′), *n.* [G., ‹ *renommee*, ‹ F. *renommée*, renown. See *renown, n.*] In German use, a boaster; a braggart; a swaggerer: applied in German universities to a leader in riotous drinking and fighting. See *renowner*, 2.

> There is a certain *Renommist*—as we call such roysterers—oh, a *Renommist* of the first water! . . . From him we have a new . . . beer ceremonial, also . . . a cunning sabre throw. He is the king of drinkers and a reckless duellist.
> *Egerton Castle*, The Renommist.

renovate, *v.* **I.** *trans.*—**Renovating crop.** See ★*crop.*

II. *intrans.* To revive; recover. [Rare.]

> O magic sleep! O comfortable bird,
> That broodest o'er the troubled sea of the mind
> Till it is hush'd and smooth! . . .
> who upfurl'd
> Beneath thy drowsy wing a triple hour,
> But *renovates* and lives?
> *Keats*, Endymion, Bk. i.

Rensselaeria (ren-se-lā′ri-ạ̈), *n.* [NL., ‹ Stephan Van *Rensselaer* (1765-1839).] A genus of telotrematous terebratuloid brachiopods, often of large size and elongate form, and having the branches of the loop united in front in an elongate triangular plate. It is characteristic of the Lower Devonian formations.

rent^{2}, *n.*—**Barren rent.** Same as *rent-seck.* See *rent*2, 2 (*c*).—**Competition rent.** See ★*competition.*—**Consumer's rent**, in recent *polit. econ.*, the net gain in personal satisfaction secured by a consumer through the acquisition of a commodity; the surplus over that amount of satisfaction which is just sufficient to compensate the sacrifice of acquisition. Thus, if one secures for a dollar a commodity that yields an amount of satisfaction for which he would have given two dollars, if that had been necessary, a consumer's rent valued at one dollar may be said to arise. The term is derived from a superficial resemblance of this form of surplus to the rent of land, both being capable of differential measurement.—**Cottier rent.** See ★*cottier.*—**Economic rent**, that part of the product of industry which is attributable to the land and which, under conditions of perfect competition, would be received by the owner of the land as contract rent.—**Fair rent**, a reasonable compensation for the use of land, as distinguished from rack-rent. See *rack-rent.*—**Fee and life-rent.** See ★*fee*2.—**Outstroke rent.** See ★*outstroke.*—**Rents and profits**, a legal phrase denoting, according to context, the gross or net income or the entire proceeds from land, including its sale.—**Sleeping rent**, a fixed rental, as distinguished from a rental that is proportioned to the amount of profit or of mineral mined.

rentability (ren-tạ-bil′ị-ti), *n.* [*rentable* (*-bil-*) + *-ity.*] **1.** The quality of being rentable. Specifically—**2.** The capacity of a piece of property to produce a net income, or surplus above cost of replacement and of up-keep.

renter^{1}, *n.* **3.** One who collects rents. [Eng.]

> As "*Renter*" for collecting the rents of the lands, he remained a resident within the hospital precincts, and was intimately acquainted with all details of the foundation and management of the house.
> *Athenæum*, June 17, 1905, p. 751.

4. A shareholder in a theater.—**5.** In *teleph.*, a subscriber.

renunciant (rē-nun′ṣiant), *n.* [L. *renuntiare*, renounce. See *renunciance.*] One who renounces, especially one who renounces the world.

> The *renunciant's* vow is accepted by these great souls.
> *Dowden*, Studies in Literature, p. 262.

renunciate (rē-nun′ṣi-āt), *v. t.*; pret. and pp. *renunciated*, ppr. *renunciating.* [See *renounce.*] To renounce.

renunciative (rẹ-nun′ṣi-ạ̄-tiv), *a.* [*renunciat*(*e*) + *-ive.*] Marked by renunciation; renunciatory.

reoxidation (rē-ok-si-dā′shọn), *n.* [*re-* + *oxidation.*] The taking up again of, or a second time combining with, oxygen: as in the case of the hemoglobin of the blood when, in passing through the pulmonary circulation, it renews the supply of oxygen from the air to be used up in combining with the carbon and hydrogen of the tissues of the body at large.

rep^{3} (rep), *n.* [Origin obscure.] **1.** A man or woman of loose character; a rip.—**2.** An inferior or worthless article. *N. E. D.*

rep^{4} (rep), *n.* In English school slang, an abbreviation of *repetition.*

rep. An abbreviation (*b*) of *report*; (*c*) of *reporter*; (*d*) [*cap.*] of *Representative*; (*e*) of *representing*; (*f*) of *republic*; (*g*) [*cap.*] of *Republican.*

repaint (rē-pānt′), *v. t.* **1.** To paint over (an already painted surface).

> It was necessary to *repaint* the pigeon-house once a year.
> *The Columbarium*, i.

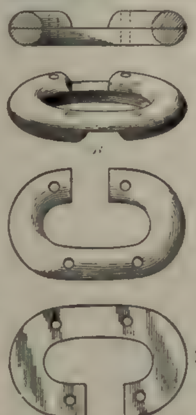
2. To paint again, as a picture or a part of a picture.

> The end of the long tasseled sleeve has been *repainted* over and over, . . . and the result is a patch where the light strikes across the picture.
> *Nineteenth Century*, July, 1888, p. 60.

repaint (rē-pānt′), *n.* [*repaint, v.*] In the *fine arts*, a portion of a picture which has been painted over or repainted; a patch.

> Unfortunately, his perception of quality was not so acute as that of Charles I., who could detect *repaints* and alterations with a professional eye.
> *Athenæum*, Dec. 2, 1905, p. 768.

repair-link (rẹ-pãr′lingk), *n.* In *mech.*, a chain-link so constructed that it can readily be substituted for a broken link. In round-link chains it is usually made of half-sections of a link formed by a plane which passes through its long and short axes, the link being open on the long side for a length equal to the thickness of the iron of which the links are made. These two halves are hooked to the adjoining links so that the opening of each half comes against the continuous side of the other, and when in place the two halves are riveted together. In flat or roller-chains, the two pins are riveted to one side or cheek, and the other cheek is held in position after the repair-link is in place by cotters or spring loops of wire.



Repair-link for round-link chain.

A, section by a meridian plane; *B*, perspective elevation showing the completed link with both halves in place; *C*, top view of one half-section; *D*, top view of the other half-section, showing the break of the joint. The interrupted side is open wide enough to pass the stock of the solid link adjacent to the repair-link on either side.

reparation, *n.* **4.** In *biol.*, the regeneration of a lost part out of the old tissue as contrasted with regeneration through the formation of new tissue. [Rare.]

reparatory (rẹ-par′ạ-tọ-ri), *a.* Same as *reparative.*

repeat, *v. i.* (*c*) In *faro*, to win or lose with a card in one deal in exactly the same way that it won or lost in the previous deal. (*d*) To regurgitate; be belched up: said of the taste of a food or drug which has been taken into the stomach but is not speedily digested or passed on into the intestine.

> Its [thiocol] taste is not disagreeable, it is unirritating to the stomach, and it does not "*repeat*" after ingestion.
> *Buck*, Med. Handbook, VII. 741.

repeater, *n.* **9.** In *teleph.*, an instrument for reproducing in one circuit a message received over another circuit and of so enhancing its intensity as to enable its transmission to a greater distance than would otherwise be practicable.

> A successful telephone *repeater* is the great need in telephony, and its inventor would be abundantly rewarded materially, which undoubtedly accounts for the scores of patents that have been issued on "telephone *repeaters*"; yet of all these we do not know of one that has been put to public test on a circuit of sufficient length to demonstrate its capabilities.
> *Elect. World and Engin.*, March 26, 1904, p. 593.

repeat-sign (rẹ-pēt′sīn), *n.* See *repeat, n.*, 3.

repeller, *n.* **2.** Specifically, in *obstet.*, an instrument used in difficult labor of animals to repel the fetus until the head and limbs can be made to present themselves normally for delivery. *U. S. Dept. Agri.*, Rep. on Diseases of the Horse, 1903, p. 177.

repercussion, *n.* **3.** In *obstet.*, the impinging of the fetus upon the examining finger in the test for pregnancy known as ballottement.—**4.** In *surg.*, the force causing a contrafissure.—**5.** In *med.*, the disappearance of an eruption or of a tumor as a result of an external application.

repetition, *n.*—**Law of repetition.** See ★*law*1.

rephlogisticate (rē-flọ-jis′ti-kāt), *v. t.*; pret. and pp. *rephlogisticated*, ppr. *rephlogisticating.* [*re-* + *phlogisticate.*] In the chemistry of the eighteenth century, to add again the imaginary essence of combustibility, phlogiston, to a substance which was supposed to have lost it by burning.

> Other substances, such as phosphorus and sulphur, gave solids or acid liquids to which phlogiston was not so easy to add; but even they could be *rephlogisticated.*
> *W. Ramsay*, in Smithsonian Rep., 1900, p. 234.

repkie (rep′ki), *n.* [Alaskan.] A kind of sea-urchin eaten by the Alaska Indians.

replacement, *n.*—**Wave of replacement.** See ★*wave*1.

replaning (rē-plā′ning), *n.* The process of planing a surface which has been previously planed; the process of planing over again.

replete, *a.* **II.** *n.* One who or that which is replete or full; specifically, a worker-ant which stores such large quantities of honey-dew or other liquid food in its crop that its gaster is greatly distended and assumes a spherical or subspherical form; also *plerergate.*

> In most cases, as McCook has shown, it is the major workers that most readily tend to become *repletes*, but this is not an invariable rule . . . Thoroughly hardened workers of the ordinary form, according to my observations, are no longer able to become *repletes.* It is probable, therefore, that McCook's failure to secure *repletes* from isolated major workers was due to his using individuals that were too old.
> *W. M. Wheeler*, in Bull. Amer. Mus. Nat. Hist., XXIV, 1908, p. 379.

repliant (rep′li-ạ̈nt), *n.* [AF. *repliant*, ppr. of *replier*, reply: see *reply, v.*] A pleader in a suit who files or makes a replication.

replica, *n.*—**Wallace-Thorpe replica**, a reproduction of a Rowland grating made with gelatin. *Science*, March 25, 1904, p. 483.

replicatory (rep′li-kạ̄-tō-ri), *a.* [*replicat*(*e*) + *-ory.*] Of the nature of replication; replying. [Rare.]

replot (rē-plot′), *v. t.* or *i.* [*re-* + *plot*^{1}, *v.*] To plot again; make use of the ★replotter (which see).

> A *replotting* arm for attachment to the Lewis position-finder.
> *Board of Ordnance and Fortification Rep.*, 1896, p. 18.

replotter (rē-plot′ėr), *n.* An attachment to the table of a position-finder by means of which the observer may quickly convert the measured range and direction into corresponding range and direction for a gun.

> A complete automatic *replotter* is carried on the table of each instrument [range-finders], by the use of which the observer can instantly convert the range and direction of the target as read from the instrument into the corresponding range and direction from the gun itself.
> *Encyc. Brit.*, XXXI. 367.

report, *v. i.* **4.** Specifically, in *music*, to answer and echo, as voices in a madrigal.

> One bird *reports* unto another
> In the fall of silver showers,
> Whilst the earth (our common mother)
> Hath her bosom deckt with flowers.
> *Sylvester*, Song of Spring.

report, *n.*—**Crop report.** See ★*crop.*

reportorially (rē-pọr-tō′ri-ạ̈l-i), *adv.* In a reporter's or a journalistic style; by the use or work of reporters. [Colloq.]

> But, unfortunately, the weather will not let the newspaper alone, and so, through government forecast and actual incident and accident, the newspaper must keep pegging away at it, editorially and '*reportorially*,' until the present anomalous state of things is developed, for which there is no excuse in the nature of science or in the intelligence of those who 'get out' the modern newspaper.
> *Pop. Sci. Mo.*, Feb., 1901, p. 382.

repose, *n.*—**Grade of repose.** See ★*grade*1.

repost, *n.* An Anglicized form of *riposte.*

reprecipitable (rē-prē-sip′i-tạ-bl), *a.* [*reprecipit*(*ate*) + *-able.*] Capable of being again thrown down in solid form from a solution, having previously undergone the same treatment and been redissolved.

reprecipitate (rē-prẹ-sip′i-tāt), *v. t.*; pret. and pp. *reprecipitated*, ppr. *reprecipitating.* [*re-* + *precipitate.*] To throw down again in solid form from a solution a substance which has previously undergone the same treatment and been redissolved. *Buck*, Med. Handbook, V. 209.

reprecipitation (rē-prẹ-sip-i-tā′shọn), *n.* The act or process of reprecipitating a substance. Partial or fractional reprecipitation is sometimes resorted to in order to purify a substance. *Buck*, Med. Handbook, IV. 128.

representation, *n.*—**Conform** or **conformal representation**, a representation which is isogonal, angle-true, and orthomorphic, so that an infinitesimal triangle is represented by one similar to it to within infinitesimals of a higher order.

representativity (rep-rẹ-zen-tạ-tiv′i-ti), *n.* Representativeness. *W. D. Howells*, in N. A. Review, April, 1901, p. 632. [Rare.]

repressment (rẹ-pres′mẹnt), *n.* [*repress, v.*, + *-ment.*] Repression; suppression. [Rare.]

> The Division of Botany, therefore, made a special effort to systematically collect information as to this newly arrived emigrant weed and to provide methods for its speedy *repressment* and eradication.
> *Yearbook U. S. Dept. Agr.*, 1894, p. 44.

reprisal, *n.*—**Extraordinary reprisal,** in *Eng. law,* a reprisal directing that satisfaction be taken from the offending state, not, as in ordinary reprisal, from its citizens. Such reprisals are under the Great Seal.—**General reprisal,** a reprisal in which officers and citizens of an aggrieved state are commissioned to take the persons and property of the offending state wherever found.—**Negative reprisal,** a reprisal which is accomplished by the refusal of an aggrieved state to perform an obligation to the offending state, or to permit the offending state to enjoy a right to which it is justly entitled.—**Special reprisal,** one in which an aggrieved citizen is commissioned by letters of marque to seize property belonging to an offending state or its citizens. This form of reprisal is a thing of the past, and the general reprisal, to be executed by the officer of the state, only tolerated.

reprise, *n.* 5. (*b*) It is especially used of the third section of a movement in sonata form.

reproduction, *n.* 6. In *forestry:* (*a*) The process by which a forest is renewed, whether natural or artificial. (*b*) Seedlings or saplings from sprouts or from self-sown seed.—**Method of multiple reproduction, method of single reproduction.** See ★*method.*

Reproductive selection. See ★*selection.*

rept. An abbreviation of the Latin *repetatur,* let it be repeated.

reptary (rep′tạ-ri), *a.* [Irreg. < L. *reptare,* creep.] Creeping; reptant; reptatory; repent.

Reptigrada (rep-tig′rạ-dä), *n. pl.* [NL., < L. *reptare,* crawl, creep, + *gradi,* walk.] A division, having the grade of a superfamily, of *Pinnipedia,* containing the earless seals: the seals in which the hind legs cannot be turned forward and used for locomotion. Contrasted with ★*Gressigrada.*

reptigrade (rep′ti-grād), *a.* [*Reptigrada.*] Adapted for locomotion by creeping without the aid of the hind limbs: specifically applied to the earless seals.

reptil, *a.* and *n.* A simplified spelling of *reptile.*

reptility (rep-til′i-ti), *n.* [*reptil(e), a.,* + *-ity.*] The character of being reptile; creeping habit; reptilian character.

repub. An abbreviation (*a*) of *republic;* (*b*) [*cap.*] of *Republican.*

republic, *n.*—**International Bureau of the American Republics.** See ★*bureau.*

republicism (rẹ-pub′lik-izm), *n.* [Also, as first coined, *republickism,* < *republic* + *-ism.*] A form of the state and a representative method of government: same as republicanism without partizan connotation. [Rare.]

> When national government is established on a territorial basis, democracy is overthrown and kingship with aristocracy takes its place, and monarchical society is organized. Monarchical society, in turn, gives place to a fourth stage, which we call *republickism.* We use the term in no partisan sense and select a new form of the word in order to avoid partisan implications.
>
> *J. W. Powell,* in An. Rep. Bur. Amer. Ethnol., 1898–99, [p. cxviii.

Repugnatorial foramen. Same as *repugnatorial pore.* See *repugnatorial pores.*—**Repugnatorial glands.** See *defensive* ★*glands.*

repullulative (rẹ-pul′ụ-lā-tiv), *a.* [*repullulat(e)* + *-ive.*] Having the property of sprouting or budding again.

repulsion, *n.* 3. In *biol.,* conspicuous unlikeness in the color or markings of allied species which inhabit the same locality.

repulsion-motor (rẹ-pul′shọn-mō″tọr), *n.* An alternating-current motor, for use on single-phase circuits, in which the stationary field is similar to that of a single-phase induction-motor and the armature is like that of an ordinary direct-current machine with commutator and brushes. The armature is short-circuited through the brushes and, after starting, the motor is commonly converted automatically into a single-phase induction-motor by some mechanical device that connects all the commutator-bars together.

reputative (rẹ-pū′tạ-tiv), *a.* Same as *putative.*

request, *n.*—**Court of requests.** (*c*) In India, a small-debt court composed of military officers, held in districts which are outside the jurisdiction of any ordinary court of this kind. *N. E. D.*—**General request.** See *special* ★*request.*—**Request to charge,** in *law,* an application made by either party to a suit, at the trial, that the court instruct the jury as to the law applicable to the case or to a certain phase of the case, in order that their verdict may be in accord with the law, for example, as to measure of damages. It may also include instructions as to facts in evidence.—**Special request,** in *law,* a request actually made at a stated time and place, and so set forth in a complaint: used in contradistinction to a *general request,* which does not necessarily state the time when and place where made.

Requienia (rek-wi-ē′ni-ạ̈), *n.* [NL.] A genus of teleodesmaceous *Pelecypoda,* belonging to the *Chamacea* and characterized by spirally twisted gastropod-like shells, the left valve being large and the right small and operculiform. It occurs in the Lower Cretaceous rocks.

Requisitions of title, in the *law of conveyancing,* formal inquiries on behalf of the proposed purchaser of real property as to the title. These the vendor is to satisfy.

rere² (rā′rā), *n.* [Polynesian *rere.*] Bast-fiber obtained from *Cypholophos macrocephalus,* a shrub or small tree of the nettle family growing without cultivation on many islands of the Pacific ocean. From it are made fine mats highly prized by the natives. In Samoa called *fau pata.*

reroll (rē-rōl′), *v. t.* [*re-* + *roll.*] To roll again; roll up what has been unrolled; roll backward.

reroll (rē-rōl′), *n.* In mechanical piano-players and similar machines, a device, usually controlled by a stop or lever, whereby the music-roll, after having been used, is automatically rewound so as to be ready for use again.

Res integra, a matter not yet acted on, or a point of law not yet adjudicated.—**Res inter alios,** ‘transactions between others,’ that is, third parties, or strangers to a proceeding: a phrase used, in the law of evidence, to denote matters not relevant to the case.—**Res ipsa loquitur,** ‘the thing itself speaks’: a phrase used, in the law of evidence, to denote the principle that, under certain circumstances, a presumption of negligence arises from the mere happening of an event.—**Res nullius,** ‘no one's property’: in *law,* a phrase denoting property without an assignable owner.—**Res publicæ,** ‘public property’: in *law,* designating any property public in its nature, as harbors and rivers.—**Res universitatis,** ‘things of the community’: in *law,* designating things of common access, as the churches, theaters, and parks of a city.

Res. An abbreviation (*a*) of *resigned;* (*b*) of *reserve.*

resaldol (rẹ-sal′dol), *n.* [*re(sorcinol)* + *sal(icylic)* + *-d-* + *-ol.*] A trade-name of a light-brown pulverulent compound of salicylic acid and resorcinol. It is used in medicine as an intestinal antiseptic and astringent.

resalgin (rẹ-sal′jin), *n.* [*re(sorcinol)* + *sal(icylic)* + *-g-* + *-in*².] The β-resorcylate of antipyrin, $C_{11}H_{12}ON_2.C_6H_3(OH)_2COOH$.

resaw (rē-sâ′), *n.* A resawing-machine using circular or band-saws; also, any circular saw used in a resawing-machine of this kind.

resazoin (rẹ-saz′ọ-in), *n.* [*res(orcinol)* + *azo-* + *-in*².] Same as ★*resazurin.*

resazurin (rẹ-sazh′ụ̈-rin), *n.* [*res(orcinol)* + *azure* + *-in*².] A dark-red crystalline substance,  $O.C_6H_3\left\langle\begin{matrix}O.O\\N\end{matrix}\right\rangle C_6H_3$, made by the action of nitrous acid or nitrogen peroxid on resorcinol. It decomposes when melted. Also called *resazoin.*

research-observatory (rẹ-sėrch′ọb-zėr″vạ-tọ̄-ri), *n.* An observatory or laboratory devoted to researches for the increase of knowledge, as distinguished from a mere observing station or an educational laboratory. The Mount Weather Research Observatory is maintained by the U. S. Weather Bureau for scientific research. Also *research-laboratory.*

research-school (rē-sėrch′sköl), *n.* A school in which the pupils are trained in original scientific research.

réseau, *n.* 2. A network of small squares formed by two sets of fine, parallel, equidistant lines, some millimeters apart, crossing each other at right angles, accurately ruled upon a glass plate. This is interposed in a photographic telescope immediately in front of the sensitive plate, so that its lines are impressed upon the negative and furnish reference-points from which the positions of star-images can be measured. Its use is not without some drawbacks, but presents some great advantages, and, on the whole, is favorable to accuracy.

> Prof. Turner showed specimens of photographic reproductions of *réseaux* for stellar photography made by M. H. Bourget. *Athenæum,* Jan. 27, 1906, p. 111.

3. A diffraction grating. See *grating*², 2 (*b*). *Amer. Jour. Sci.,* July, 1904, p. 85.—**Pentagonal réseau,** imaginary lines forming the edges of the pentagonal dodecahedron used by Élie de Beaumont in explaining the position and distribution of mountain-ranges.

> Prof. Suess dismisses all geometrical plans of the earth, such as Élie de Beaumont's famous *Pentagonal réseau,* as misleading Wills-o'-the-wisp.
>
> *Nature,* June 29, 1905, p. 193.

Réseau photosphérique [F., ‘photospheric network.’], a sort of network of regions alternately distinct and blurred, covering the sun's surface, according to the earlier photographs of Janssen made with wet plates. Later results, however, seem to indicate that the phenomenon was not solar but purely photographic.

> Super-eminent among them are the long series due to M. Janssen's skill; yet after twenty years the *réseau photosphérique,* a phenomenon of “blurring” manifested by their means, continues enigmatic as to its nature, and open to doubt even as to its solar origin.
>
> *F. M. Clerke,* Problems in Astrophysics, p. 17.

resedaceous (res-ẹ̄-dā′shius), *a.* Relating or pertaining to the *Resedaceæ.*

resegmentation (rē″seg-men-tā′shọn), *n.* [*re-* + *segmentation.*] Continued or repeated division into segments; division of segments into smaller segments.

resemblance, *n.*—**Cryptic resemblance,** in *biol.,* the resemblance of an organism to another or to an inorganic object for the purpose of concealment. *Encyc. Brit.,* XXVII. 149.—**General resemblance,** in *biol.,* any resemblance of an organism to its environment which is independent of its form and color-pattern, such as the whiteness of arctic animals and the transparency of pelagic ones. *Encyc. Brit.,* XXVII. 146.—**Mimetic resemblance,** in *biol.,* the copying, in one species, of a useful deceptive characteristic of another species, for the purpose of giving to its possessor the same advantage. *Encyc. Brit.,* XXVII. 149.—**Protective resemblance,** in *biol.,* any resemblance in color, markings, or form, which an animal or plant bears to other animals or plants or to the inorganic environment, for the purpose of hiding its possessor from enemies.—**Pseudallosematic, pseudaposematic, pseudepisematic, pseudosematic resemblance.** See ★*pseudallosematic,* etc.—**Special resemblance,** in *biol.,* the resemblance of an organism to some specific object, animate or inanimate, in its normal environment, as a means of concealment from enemies or of preventing its prey from discovering its presence. *Encyc. Brit.,* XXVII. 146.—**Synaposematic resemblance,** in *biol.,* the resemblance of a species to allied species in respect to aposematic or warning characters. *Encyc. Brit.,* XXVII. 148.—**Syncryptic resemblance,** in *biol.,* the resemblance between organisms that are concealed in the same way. *Encyc. Brit.,* XXVII. 147.—**Syntechnic resemblance,** in *biol.,* the sort of likeness between organisms that is due to functional similarity. *Encyc. Brit.,* XXVII. 147.

resequent (rẹ-sē′kwẹnt), *a.* [*re-* + *sequent.*] In *phys. geog.,* again following a consequent course: said of a stream which has spontaneously resumed a course similar to that of the initial consequent stream of the district. *W. M. Davis.*

reserv, *v. t.* and *n.* A simplified spelling of *reserve.*

reserve, *v. t.* 4. In *eccles.,* to retain or preserve (a portion of the consecrated elements) for certain purposes. *N. E. D.*

> A portion of the eucharist, under one kind alone, was always *reserved* in the church, from each mass to the other. *Rock,* Church of the Fathers, III. 41. *N. E. D.*

reserve, *n.* 12. In *postal service,* a fixed amount of cash retained at a money-order station to meet orders payable at that station.—**Federal forest reserve.** See *national forest* ★*reserve.*—**Gold reserve,** the gold held by the United States treasury for the redemption of United States notes. This fund was first accumulated for the resumption of specie payments, and at that date (Jan. 1, 1879) amounted to over $114,000,000. By the provisions of the act of July 12, 1882, it was practically fixed at $100,000,000. In April, 1893, it first fell below this sum as a result of the policy of the treasury (under the “parity” clause of the act of July 14, 1890) in paying the treasury notes of 1890, on demand, in gold; and by January, 1894, fell to $65,650,000. To replenish the fund the government sold bonds—$50,000,000 of 5 per cent. bonds in January, 1894; $50,000,000 of 5 per cent. bonds in November, 1894; about $62,000,000 of 4 per cent. bonds in February, 1895; and $100,000,000 of 4 per cent. bonds in January, 1896.—**Irrespective reserve,** in *postal service,* a maximum reserve allowed over and above the total reserve held against unpaid money-orders.—**National forest reserve,** a tract of land set apart from the public domain by proclamation of the President of the United States, under section 24 of the act of March 3, 1891, or created by special act of Congress, and administered under laws of the United States passed for that purpose, in order “to improve and protect the forest within the reservation or for the purpose of securing favorable conditions of waterflows and to furnish a continuous supply of timber for the use and necessities of citizens of the United States.” Also called *federal forest reserve.*—**Naval reserve,** an auxiliary naval force of officers and men under the direct control of the national government; in the United States, a body of State seamen, on the same legal footing as the State troops. The former class are now designated as *naval militia,* and are auxiliary to the regular naval forces of the nation.—**Reserve of buoyancy.** See ★*buoyancy.*—**Reserve pattern.** See ★*pattern.*—**Reserve seed method.** See ★*seed.*—**Reserve sprout forest.** See ★*forest.*—**Reserve style.** Same as *resist style* (which see, under *resist*).—**Water reserve,** a district, reserved from occupation, from which water drains into the various streams forming the water-supply of a district. [Australia.]

reservery (rẹ-zėr′vẹ̈-ri), *n.* [*reserve* + *-y*³.] The status of a reservist; service in the reserves. [Rare.]

> “*Reservery,*” said he, “seems a pretty mean way to spend one's autumn holiday.”
>
> *R. L. Stevenson,* Inland Voyage, p. 101. *N. E. D.*

reservoir, *n.* 5. In *organ-building,* same as *storage-bellows.* See ★*bellows,* 3, and *organ*¹, 6.—**Storage reservoir,** a reservoir for the purpose of storing or impounding water, as for the purpose of water-supply, water-power, or irrigation.

reset¹, *n.* 3. The act or practice of receiving stolen goods. *N. E. D.*

resetting-pin (rẹ-set′ing-pin), *n.* In computing-machines, a pin which acts in combination with other mechanism in bringing the figure-wheels simultaneously to the zero position before beginning an operation. *H. Goldman*, The Arithmachinist, p. 57.

resetting-wheel (rē-set'ing-hwēl), *n.* In an arithmometer, a small outside nurled wheel which is turned by the operator's fingers to bring the numeral-wheels to the zero position before performing an operation. *H. Goldman*, The Arithmachinist, p. 63.

resh³ (rāsh), *n.* [Heb. *rēsh*, connected with Heb. *rōsh*, Aram. *rēsh*, head.] The twentieth letter (ר) of the Hebrew alphabet, corresponding to the English *r*. Its numerical value is 200.

residence, *n.*—**Legal residence.** See *residence*, 5 (*b*).

residential, *a.* **2.** Of or belonging to a resident. *N. E. D.*

residual. I. *a.*—**Residual products.** See ★*product.*
II. *n.* **4.** In *math.*, the difference between a variate and the mean of the set or series.

residuary, *a.* **2.** In *geol.*, noting the insoluble portion of a series of rocks which have been long exposed to weathering. The soluble portion having been leached away, only the residuum remains, as, for example, clays from limestone.

residuum, *n.* **3.** In *geol.*, the insoluble remainder left behind during processes of rock-weathering by the removal of the soluble portion.

Resignation bond. See ★*bond*¹.

resile, *v. i.* **2.** To shrink, recoil, or retreat from something.—**3.** To recoil or rebound; return to its original form or position, as an elastic body.

resilifer (rē-sil'i-fėr), *n.* [NL. *resili*(*um*) + *-fer*.] In the pelecypod mollusks, a shelly spoon-shaped process within the beaks of the valves on which the resilium rests and to which it is attached by its ends; the chondrophore.

resiliometer (rē-sil-i-om'e-tėr), *n.* [Irreg. < *resili*(*ence*) + *-o-meter*.] An instrument for testing resilience.

resilium (rē-sil'i-um), *n.*; pl. *resilia* (-ä). [NL., < *resilire*, spring back. See *resile*.] In the pelecypod mollusks, an internal part of the ligament, lamellar in structure and composed of horny fibers, with a considerable intermixture of lime which may aggregate and form an accessory shelly plate (*ossiculum* or *lithodesma*). The resilium acts as a plug against which the valves, when closed, are brought into opposition, and its tendency therefore is to push the valves asunder.

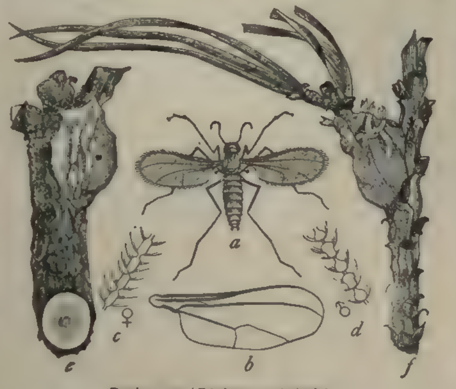
> Separation between ligament and *resilium*.
> *Science*, Nov. 27, 1896, p. 771.

resin, *n.*—**Agaric resin.** See ★*agaric.*—**Alpha-resin.** Same as ★*guaiaconic acid.*—**Angico resin,** a Brazilian gum obtained from *Acacia Angico*, and soluble in alcohol and in proof-spirit. It is used in chest complaints.—**Betula resin,** a resinous body contained in the outer corky layers of the white birch (*Betula alba*). **Boloretin resin,** a resin derived from the fossil fir-wood found in Danish peat-bogs. It is soluble in ether, but not in cold alcohol. It melts at 75-79° C.—**Bucurumanga resin,** a light-yellow, transparent resin found in auriferous alluvium near Bucurumanga, New Granada.—**Calaba resin.** Same as *Maynas* ★*resin.*—**Capsicum resin,** a resin found in *Capsicum fastigiatum* and *Capsicum annuum*, or Cayenne pepper. The acrid properties of the pepper were formerly ascribed to it.—**Galba resin.** Same as *Maynas* ★*resin.*—**Gomard resin,** an oleoresin from the West Indies exuded by *Bursera gummifera*. It has an odor somewhat resembling elemi and turpentine.—**Hemlock-spruce resin,** a reddish-brown resin, closely allied to Burgundy pitch, obtained from hemlock-spruce (*Pinus Canadensis*); Canada pitch. It is used medicinally.—**Hyawa resin.** Same as *Hyawa gum* (which see, under *gum*²).—**Incense-tree resin.** Same as *hyawa gum* (which see, under *gum*²).—**Indian-hemp resin,** a brown, amorphous, highly narcotic compound obtained from the common hemp (*Cannabis sativa*) when it is grown in India; cannabin. It is used as a nerve-sedative.—**Kamila resin,** a resinous, dark-red coloring-matter from kamila, which contains about 75 per cent. of it. The resin consists of several chemical compounds.—**Koussein resin.** Same as ★*kosin.*—**Luban mati resin,** an oleoresin derived from birdwood (*Boswellia Frereana*); elemi. It is white externally, amber-colored inside, and has an odor of lemon and turpentine and a mild terebinthinous taste. It was used in medicine until the seventeenth century. Also called *luban meqeti*. **Masopin resin.** Same as ★*masopin.*—**Maynas resin,** a resin, $C_{14}H_{18}O_4(?)$, obtained by incision from the tree *Calophyllum Calaba*, in the plains of San Martino and the Orinoco.—**Mezereon resin,** the acrid constituent of mezereon bark, from *Daphne Mezereon*, found in middle and southern Europe. It is used in cases of rheumatism and scrofula as an alterative and sometimes as a vesicant.—**Palisander resin,** a black, brittle resin, $C_{21}H_{21}O_6(?)$, which is contained in palisander wood. It melts at 95° C.—**Palm resin.** Same as ★*cerosiline.*—**Pellitory resin.** Same as ★*pyrethrin.*—**Pepper resin,** a resin found in pepper, and said to be the cause of its pungent taste.—**Resin of birch.** Same as *betulin.*—**Val d'Arno Superiore resin,** a fossil resin closely resembling the Weissenfels resin.—**Weissenfels lignite resin,** a mixture of resins obtained from the distillation-products of lignite found at Weissenfels.

resin-cyst (rez'in-sist), *n.* A cyst or sac, in wood, containing resin.

resineone (re-zin'ē-ōn), *n.* [*resin* + *-e-* + *-one*.] A compound, $C_{30}H_{48}O(?)$, formed by distilling colophony with lime.

resin-gnat (rez'in-nat), *n.* An American cecidomyiid fly, *Diplosis resinicola*, whose larvæ live in exuding lumps of resin on pine-trees and feed on the abraded bark. *Comstock*, Manual of Insects, p. 447.



Resin-gnat (*Diplosis resinicola*).

a, adult female; *b*, wing of same; *c*, cross-section of antenna of female; *d*, same of male; *e*, section of pine twig showing work of larvæ; *f*, same showing extruded pupa-cases: *a*, *e*, *f*, enlarged; *b*, *c*, *d*, still more enlarged. (After Comstock, U. S. D. A.)

resinic (re-zin'ik), *a.* [*resin* + *-ic*.] Pertaining to or resembling resin.

resinite (rez'in-īt), *n.* [*resin* + *-ite*.] Same as ★*retinasphalt*.

resin-oil (rez'in-oil), *n.* Same as *rosin-oil*.

resinone (rez'in-ōn), *n.* [*resin* + *-one*.] A compound, $C_{10}H_{18}O(?)$, formed by distilling colophony with lime.

resinosis (rez-i-nō'sis), *n.* [*resin* + *-osis*, denoting disease.] An abnormal outflow of resin from a coniferous tree. In some cases it is attributed to the fungus *Armillaria mellea*, while in others the cause is unknown.

> Outflows of resin — *Resinosis* — also come under this general heading [flux] but although some resin-fluxes are traced to the destructive action of Agaricus [Armillaria] melleus in Conifers, others, as well as certain forms of Gummosis, are still in need of explanation.
> *Encyc. Brit.*, XXXI. 578.

resinous, *a.* **2.** Noting the peculiar luster of certain glassy rocks, as the pitchstones, which gives to fractured surfaces the appearance of resin. *Geikie*, Text-book of Geol., p. 131.

resin-spirit (rez'in-spir"it), *n.* Same as ★*pinoline*.

resin-wash (rez'in-wosh), *n.* A standard insecticide mixture for use against scale-insects and plant-lice. One of the formulas is: resin, 20 pounds; caustic soda, 5 pounds; fish-oil, 2½ pints; water to make 100 gallons. *Yearbook U. S. Dept. Agr.*, 1900, p. 261.

resistance, *n.* **4.** In *naval arch.*, the reaction which a vessel opposes to an extraneous force by which it is dragged or driven through the water, and particularly to motion forward in the direction of the length of the vessel. Modern investigation and experimentation in model-basins have led to the division of this resistance into three principal parts. The whole resistance of the vessel as distinguished from its parts is called the *total resistance*. *Frictional resistance* is that part due to the fluid friction of the water flowing past the wetted surface of the vessel (see also ★*coefficient of friction* (*b*)). The *eddy-making resistance* is that part due to the formation of eddies in the water flowing past the vessel, particularly where the streams unite at the stern and around projections or abrupt breaks in the under-water surface or at the bows in very bluff-bowed vessels. In well-formed ships the eddy-making resistance is a very small part of the total resistance. The *wave-making resistance* is that part of the resistance caused by the absorption of energy in the formation and maintenance of the systems of waves accompanying a vessel in motion. This part of the resistance is small at low speeds, but at speeds in knots equal to or greater than the square root of the length of the vessel in feet usually forms the greater part of the total resistance. That part of the total resistance remaining after subtraction of the frictional resistance is called the *residuary resistance*. (See also *Froude's* ★*law*.)—**Apparent resistance,** in *elect.*, the resistance of a circuit, including not only the true or ohmic resistance of the conductors but also the false resistance due to counter-electromotive forces or to reactance. In circuits having reactance the apparent resistance is the same as the impedance.—**Asymmetrical resistance,** in *elect.*, a resistance greater to a flow of current in one direction than in another. *Houston*, Dict. Elect.—**Ballast resistance,** resistance placed in series with a Nernst lamp, arc-lamp, or mercury-lamp for the purpose of equalizing the flow of current in the circuit. See *Nernst* ★*lamp*. *Elect. World and Engin.*, March 28, 1903, p. 528.—**Bolstering resistance,** the compensating resistance or ballast of a Nernst lamp, arc-lamp, or mercury-lamp. See *Nernst* ★*lamp*. [Eng.] *Elect. World and Engin.*, March 28, 1903, p. 528.—**Center of lateral resistance,** in *naval arch.*, the resultant center of the water-pressures which oppose motion sidewise or to the lee of a vessel from pressure of the wind on the sails. The point is usually taken as the center of gravity of the immersed portion of the central longitudinal section of the vessel.—**Coefficient of direct resistance.** See ★*coefficient.*—**Coefficient of frictional resistance.** Same as ★*coefficient of friction* (*b*).—**Coefficient of resistance.** See ★*coefficient.*—**Contact resistance.** (*a*) See *contact*¹. (*b*) Resistance to the flow of current which occurs at the surface between conductors in contact, as in the coherer, or between the liquid and the terminal of an electrolytic cell, or between the heated gas in the electric arc and the carbon.—**Curve of resistance.** See ★*curve.*—**Curve resistance,** in *railroading*, the resistance to or retardation of the motion of a train encountered when traversing a curve in the road. It is caused by the combined slipping of the two rigidly joined wheels in each pair in the train, resulting from the unequal length of the two rails composing the curve, and the friction of the flanges of the forward outer wheels of each truck in guiding the train through the curve. Curve resistance implies increased power in the engine at this point because it must be added to the normal train resistance while passing the curve. See *train* ★*resistance.*—**Dielectric resistance.** (*a*) The power of a dielectric to resist the stresses to which it is subjected in an electrostatic field, as measured by the difference of potential necessary to produce a disruptive discharge through the medium. (*b*) The resistance offered by a dielectric to the passage of an electric current; the ohmic resistance of an insulating substance.—**Effective resistance,** in alternating-current circuits, the energy component of impedance, defined as the energy component of the alternating electromotive force divided by the current.—**Elastic resistance,** the resistance offered by any material, solid or liquid, to a change of form or size up to the point at which it would receive a permanent deformation from the stress.—**Equivalent resistance,** in *elect.*, a resistance the value of which is such that it may be substituted for another resistance or set of resistances (such as the various resistances of a complex or divided circuit) without affecting the intensity of the current.—**Essential resistance,** in *elect.*, the internal resistance of an electrolytic cell or of a generator or motor.—**External secondary resistance,** that part of the electric resistance of an electrolyte (specifically of animal or vegetable tissue) which is due to cataphoric action.—**Extraordinary resistance,** in *elect.*, the external resistance of a circuit containing a generator, motor, or battery.—**False resistance,** in *elect.*, that part of the apparent resistance of a circuit which is due to the presence of counter-electromotive force.—**Grade resistance,** in *railroading*, the resistance caused by the weight of a train moving upon an upgrade, where the weight tends to pull the train backward down the grade. A one per cent. grade offers a grade resistance that requires an extra tractive force in the locomotive (in excess of the tractive force required on a level track) that is estimated at 20 pounds per ton of train weight. Grades that exceed five per cent. require a cable to haul the train up the grade or a locomotive having geared wheels and a rack, as in a mountain road. See *cable-railroad*, *geared locomotive* (under *locomotive*), and *train* ★*resistance.*—**Inductionless resistance,** the resistance of a circuit devoid of inductance.—**Insulation resistance,** in *elect.*, the resistance which the insulation of a conductor, such as a cable, offers to the flow of current from the conductor to the earth or to any other conductor from which it is insulated.—**Jacobi's unit of resistance,** a practical unit of resistance equal to the resistance of a copper wire one millimeter in diameter and one meter in length.—**Lateral resistance,** in *naval arch.*, the resistance of a vessel to motion sideways through the water, or resistance to making leeway under sail.—**Matthiesen's unit of resistance,** a practical unit of electrical resistance equal to the resistance at 60° F. of a copper wire $^1/_{16}$ of an inch in diameter and one statute mile in length.—**Modulus of resistance.** See ★*modulus.*—**Molecular resistance,** in *phys. chem.*, the specific resistance of a dissolved electrolyte multiplied by the concentration: it is the same as the resistance of one gram-molecule of the electrolyte when dissolved and contained between two large electrodes one centimeter apart.—**Non-inductive resistance,** in *elect.*, resistance of a circuit which has no reactance and which, owing to the absence of inductance and capacity, has the same resistance for an alternating as for a direct current.—**Ohmic resistance,** in *elect.*, that portion of the apparent resistance or impedance of a circuit which depends only upon the dimensions of the conductors, their temperature, and the materials of which they are composed.—**Primary resistance.** See ★*primary.*—**Resistance factor,** in *phys.*, the coefficient or numerical factor which expresses the resistance due to friction, or to similar causes, in the movement of a projectile or of a revolving or oscillating body.—**Resistance rhythm.** See ★*rhythm.*—**Rotational resistance,** resistance to rotation due to journal friction or other influences.—**Selenium resistance,** in *elect.*, a resistance consisting of a strip, plate, or bar of vitreous selenium. Its characteristic feature is the reduction of resistance by exposure to light.—**Skin resistance,** in *elect.*, resistance of a conductor to oscillatory currents of very high frequency, as contrasted with its resistance to a steady current. In the former case only the layers nearest the surface conduct, whereas the resistance to a steady current is inversely as the cross-section of the conductor.

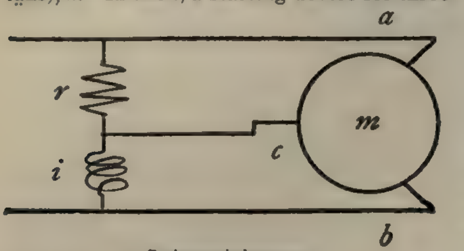
> The so-called third rail is also welded by these means. The *skin resistance* of copper bonds increases with time, and frequent repairs are necessitated thereby.
> *Jour. Franklin Inst.*, April, 1904, p. 248.

Slide resistance, a rheostat with sliding contacts. See ★*slide-wire.*—**Spurious resistance,** false resistance as distinguished from the true ohmic resistance of the conductors of a circuit. See *false* ★*resistance.*—**Thermal resistance,** resistance to the passage of heat: the reverse of thermal conductivity.—**Traction resistance,** the resistance due to friction, which must be overcome in drawing a load along a track or road.—**Train resistance,** in *railroading,* the sum of all the forces that tend to retard and stop a train when it is in motion. It is measured in terms of the power of the engine spent in starting the train and keeping it in motion on a level track. Engines for fast passenger-trains are usually capable of quickly overcoming the train resistance at starting, when the resistance is greatest, and maintaining the speed at the most economic rate when the resistance is least. The chief force in train resistance is friction of the wheels and flanges on the rails. Added to this are the friction of the journals and moving parts of the engine, the resistance of the air, the force and direction of the wind, the temperature and the weather, and the speed of the train. Sometimes called *rolling resistance.* See *grade* ★*resistance* and *curve* ★*resistance.*—**Transition resistance.** (*b*) In *elect.*, the resistance, to the passage of an electric current, which exists at the boundary between two media, as when a current flows from a solid into a liquid or gas, or vice versa.—**True resistance,** in *elect.*, the ohmic resistance of a conductor; that part of the impedance of a conductor which depends only on its material, size, and temperature.—**Varley's unit of resistance,** a practical unit of electrical resistance proposed by Varley and defined as equal to twenty-five Siemens's units. Varley's unit was approximately 23.5 ohms. Matthiesen's unit is also sometimes spoken of as Varley's unit. See *Matthiesen's unit of* ★*resistance.*

resistance-furnace (rẹ̄-zis′tans-fėr″nās), *n.* Same as *electric* ★*furnace.* *Elect. World and Engin.*, Jan. 23, 1904, p. 176.

resistance-head (rẹ̄-zis′tans-hed), *n.* The resistance offered by the air at the front of a moving train.

resistance-inductance (rẹ̄-zis′tans-in-duk″-tans), *n.* In *elect.*, a starting device for three-phase induction-motors. It consists of a resistance-coil *r* and a coil having suitable inductance *i* connected in series across the mains. The mains *a* and *b* are connected to two of the three terminals of the motor *m*, and the third terminal *c* is connected to a point between the two coils. *Steinmetz,* Elect. Engineering, p. 293.



Resistance-inductance.

resistance-tube (rẹ̄-zis′tans-tūb), *n.* A rheostat consisting of a tube of insulating material containing powdered carbon, the resistance of which is varied by means of pressure.

resistant, *a.* **2.** In *bot.*, able to resist the attacks of parasites: applied to those plants which, because of some inherent property, are able to resist the attack of those parasites to which they are usually subject.

> The advisability of renewed efforts in the introduction and cultivation of varieties of Vitis vinifera on *resistant* stocks in that region.
> *Yearbook U. S. Dept. Agr.*, 1898, p. 57.

resister, *n.* **2.** Specifically, in *elect.*, a body which offers resistance to the flow of current: said of the substances which transmit current within an electric furnace and become heated because of their resistance.

> The resistance medium or "*resistor*," when solid, usually consists of a core of carbon, coke, or graphite.
> *Sci. Amer. Sup.*, May 27, 1905, p. 24586.

resistive, *a.* **II.** *n.* In *elect.*, a resistance; that which offers resistance.

> A non-inductive *resistive* in the shape of a barrel of water was connected between the common bus-bar and ground. *Elect. World and Engin.*, April 11, 1903, p. 607.

resistiveness (rẹ̄-zis′tiv-nes), *n.* Power of resistance.

resistivity, *n.* **2.** In *elect.*, specific resistance; the resistance of a unit quantity of a substance, or of a sample of unit cross-section and unit length.

> Electric *Resistivity* may be defined as a quality of a substance in virtue of which a difference of potential can exist between different portions of the body when these are in contact with some constant source of electromotive force, in such a manner as to form part of an electric circuit. *Encyc. Brit.*, XXVIII. 4.

Magnetic resistivity, specific magnetic resistance; the reluctivity or opposition to magnetic flux of a material as compared to that of air.—**Mass resistivity,** in *elect.*, specific resistance expressed in terms of length and weight of the substance; the resistance in ohms of a wire one meter long and weighing one gram.

> We may express the resistivity [of a metal] by stating the resistance in ohms offered by a wire of the material of uniform cross-section, one metre in length, and one gramme in weight. This numerical measure of the resistivity is called the *Mass-Resistivity*.
> *Encyc. Brit.*, XXVIII. 5.

Volume resistivity, in *elect.*, specific resistance; a cubic centimeter is the unit of size.

resizer (rē-sī′zėr), *n.* [**resize* + *-er*¹.] A die for restoring a fired cartridge-case to its proper size: it is used before reloading in order that the cartridge-case may certainly fit the chamber of the gun.

resolute, *n.* **3.** In *math.*, the specifically directed component of a vector.

resolution, *n.* **13.** In *optics*: (*a*) The separation by means of an optical instrument, such as a telescope or spectroscope, of close-lying bodies such as the components of a double star or of a multiple line in the spectrum. (*b*) The rendition by means of a microscope of the minute details of structure of a substance. —**Resolution of a vector,** the determination, by the principle of the parallelogram or other method, of the components of a force or of any other vector quantity.

Resolutioner, *n.* **2.** [*l. c.*] One who joins in or subscribes to a resolution. *N. E. D.*

resolv, *v.* and *n.* A simplified spelling of *resolve.*

resolve, *v. t.* **18.** In *optics*, to make distinguishable, by means of an optical instrument, the details of structure of a body, or to separate by such means close-lying bodies, such as the stars in a cluster.

resonance, *n.* **4.** In *elect.*, the condition of an alternating electric circuit in which the capacity reactance equals or approximately equals the inductive reactance. These two reactances therefore neutralize each other more or less completely, and the current is limited by the resistance only, so that very large values of currents, with correspondingly high voltages, may appear in the circuit. The condition of resonance depends on the frequency of the alternating current; and, inversely, in any circuit containing capacity and self-inductance, a certain frequency exists where resonance occurs.

5. In *psychol.*: (*a*) A term applied, in the James-Lange theory of emotion, to the complex of bodily changes reflexly aroused by the object which excites emotion. "The changes are so indefinitely numerous and subtle that the entire organism may be called a sounding-board." *James.* Also termed *bodily reverberation.*

> That the corporeal *resonance* does form an essential ingredient in emotion is abundantly proved by a variety of facts. *J. Sully,* Human Mind, II. 58.

(*b*) By extension of meaning, the sympathetic arousal in oneself, as if by echo, of a state of feeling whose manifestations one is observing in another, or the course of which one is tracing in imagination, but of which one has had no direct and first-hand experience.

> Only genius, in which the highest powers of imagination are developed, is able, with little or no experience with woe, to feel what a recent writer makes its [sympathy's] chief characteristic,—the pathos of *resonance*.
> *Amer. Jour. Relig. Psychol. and Education*, May, 1904, [p. 34.

Electrical resonance, the property by virtue of which oscillations are set up in an electric circuit in response to oscillations in another circuit at a distance. The conditions are analogous to those of acoustic resonance in that the natural frequency of oscillation of the two circuits must be the same or one the multiple of the other. See also def. ★4.—**Helmholtz's resonance hypothesis,** in *physiol.* and *psychol.*, Helmholtz's theory of audition, according to which the fibers of the basilar membrane, with the structures resting upon them, form a delicately graduated series of minute resonators.—**Magnetic resonance,** electric resonance.

> The main problem of Tesla transformers is that of establishing *magnetic resonance* between a coil of a few turns attached to a capacity with a coil of many turns without terminal capacity.
> *Sci. Amer. Sup.*, March 14, 1903, p. 22745.

Multiple resonance, electromagnetic resonance simultaneously produced in resonators of various frequencies by waves from a single vibrator. It has been shown by Poincaré and by Hertz that this is possible when the amplitude of the exciting waves diminishes rapidly.—**Optical resonance,** the vibration of a particle of matter brought about by the action of ether-waves having a frequency approximating to the frequency of free vibration of the particle.—**Resonance transformer.** See ★*transformer.*

resonance-bottle (rez′ọ̄-nans-bot″l), *n.* A bottle or tube employed as a resonance-chamber. Also *resonance-tube.* See *resonance-box.*

> For the *Resonance Bottle* . . . any bottle may be used, and can be tuned to the right pitch by pouring in water, which raises the pitch; or, if the mouth is wide, by partially covering it with a card, which lowers the pitch.
> *E. C. Sanford,* Exper. Psychol., I. 383.

resonance-tone (rez′ọ̄-nans-tōn), *n.* In *phonetics*, the tone of one of the resonance cavities of the vocal apparatus (trachea, larynx, pharynx, mouth, nose): opposed to *chord-tone.* *E. W. Scripture,* Exper. Phonetics, p. 19.

resonance-tube (rez′ọ̄-nans-tūb), *n.* See ★*resonance-bottle.*

resonant, *a.* **3.** In *elect.*, capable of responding to electric oscillations of a given frequency on account of its capacity, inductance, and dimensions: said of an electrically tuned circuit.—**4.** In the *graphic arts*, noting brilliancy and power in technique or quality. [Rare.]

> His painting has ever become slighter, higher in tone and less full and *resonant* in color.
> *W. Armstrong,* in Portfolio, XVIII. 233.

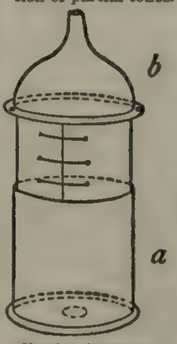
resonate, *v. i.* **2.** In *elect.*, to respond to electric oscillations of a given frequency. Used transitively in the extract.

> Having the radiating aërial *resonating* the primary circuit, it is now necessary to have a second primary circuit in tune with the first.
> *Physical Rev.*, April, 1904, p. 231.

resonator, *n.* **2.** In *elect.*: (*b*) A circuit the dimensions, inductance, and capacity of which are such that it is in syntonism with some similar circuit. Electric oscillations in the one will then set up oscillations of the same frequency in the other, even at a distance.—**3.** In *anat.*, the parts above the larynx which act as a resonance-box in voice-production.—**4.** A general name for such musical instruments as consist essentially of a hollow body or globe, the confined air of which is thrown into vibration by blowing upon the edge of a hole in its side, while the pitch is controlled by other holes stopped by the fingers, such as the clay whistles and ocarinas found in various parts of the world.—**Helmholtz resonators,** in *physiol.* and *psychophys.*, a series of spherical resonators of brass or glass, used for the intensification and detection of partial tones.—**Kœnig's resonator,** in *acoustics*, a cylindrical resonator of brass, capable of adjustment to a series of different pitches: introduced by R. Kœnig to replace the spherical or cylindrical resonator of Helmholtz.—**Resonator grating,** in *elect.*, an apparatus for the study of electric waves consisting of a series of parallel wires or metallic strips. Such a grating completely reflects electric waves when the distance between the wires is less than $\frac{1}{20}$ of a wave-length and transmits without loss by reflection when the spacing exceeds ½ of a wave-length.

> As Garbasso first showed, the *resonator gratings* here used possess selective properties for electric waves.
> *C. Schaefer,* in Phys. Rev., XXIV. [421.

Resonator system, the electrically tuned receiving-circuit of a wireless telegraph station.



Kœnig's Resonator.

a, outer cylinder, whose orifice is turned toward the source of sound; *b*, adjustable inner cylinder, held in the opening of the ear. The horizontal lines upon the inner cylinder indicate the setting of the resonator for determinate pitches.

resonatory (rez′ọ̄-nā-tō-ri), *a.* [*resonate* + *-ory.*] Resonating; resonant; producing resonance. *Sayce,* Science of Lang., I. 231. *N. E. D.*

resopyrin (rē-sọ̄-pī′rin), *n.* [*reso(rcinol-anti)pyrin.*] Same as ★*resorcinol-antipyrin.*

resorbence (rẹ̄-sôr′bens), *n.* [See *resorb.*] Reabsorption. [Rare.]

resorbin (rẹ̄-sôr′bin), *n.* A readily absorbable ointment base composed of expressed oil of almond, yellow wax, soap, gelatin, lanolin, and water.

resorcinol (rẹ̄-sôr′si-nol), *n.* [*resorcin* + *-ol.*] Same as *resorcin.*

resorcinol-antipyrin (rẹ̄-sôr′si-nol-an-ti-pī″-rin), *n.* A crystalline product, $C_6H_6O_2 + C_{11}H_{12}ON_2$, formed by intimately mixing resorcinol and antipyrin. It melts at 103–104° C. Also called *resopyrin.*

resorcylic (rẹ̄-sôr-sil′ik), *a.* [*resorc(inol)* + *-yl* + *-ic.*] Derived from resorcinol.—**Resorcylic acid,** a dihydroxybenzoic acid, $C_6H_3(OH)_2COOH$, in which the two hydroxyl groups are in the meta position to each other. Alpha-resorcylic acid, or 3,5-dihydroxybenzoic acid, is a crystalline acid, $C_6H_3(OH)_2COOH + 1\frac{1}{2}H_2O$. It is made synthetically, and melts at 232–233° C. Beta-resorcylic acid, or 2,4-dihydroxybenzoic acid, is made synthetically. It contains from one half to three molecules of water of crystallization, according to the conditions. The anhydrous acid melts at 204–206° C., yielding resorcinol and carbon dioxid.—**Resorcylic aldehyde,** a yellow crystalline compound, $C_6H_3(OH)_2$-CHO, or 2,4-dihydroxybenzoic aldehyde. It is formed when resorcinol is warmed with water, sodium hydroxid, and chloroform. It melts at 134–135° C.

resorption, *n.* **3.** In *petrog.*, the melting of a phenocryst in a porphyritic rock and its recrystallization in situ as other minerals. This results in the formation of a *resorption border* in many cases about the more or less resorbed phenocryst, as when hornblende is surrounded by a black border composed of pyroxene and magnetite.

resorufin (rē-sọ̄-rö′fin), *n.* [*res(azurin)* + L. *rufus*, red, + *-in*².] A dark-red crystalline substance, $C_{12}H_7NO_3$, formed by warming resazurin with concentrated sulphuric acid, or by treating it, in ammoniacal solution, with zinc-dust or sodium-acid sulphite. It forms carmine solutions in alkalis and is insoluble in water.

respiration, *n.*—**Anal respiration**, aquatic respiration by the rhythmical pulsations of a muscular rectum which takes in and expels the water, as in *Cyclops*. *Parker and Haswell*, Zoology, I. 550.—**Biot's respiration**, rapid and shallow breathing, occasionally interrupted.—**External respiration**, the absorption of oxygen by the blood from the inspired air and the giving out, at the same time, of carbon dioxid.—**Internal respiration**, the giving out by the blood to the tissues of oxygen and the absorption, at the same time, from them of carbon dioxid.—**Respiration calorimeter.** See ★*calorimeter*.

Respiratory blood, in annelids, the pseudohemal fluid.—**Respiratory food, heart, pigment, trumpet, tubule.** See ★*food*^{1}, ★*heart*, etc.—**Respiratory tube.** Specifically, a blind tube connected with the gill pouches and forming part of the respiratory apparatus of the lamprey.

respit, *n.* and *v. t.* A simplified spelling of *respite*.

respite, *n.*—**Forced respite**, in *civil law*, an act by which those creditors who refuse to accept a debtor's proposal for settlement are legally compelled to join with the other creditors who have accepted the proposal.—**Voluntary respite**, in *civil law*, an act by which all the creditors accept a debtor's proposal of settlement of claims.

respond, *v. i.* 5. In *biol.*, to react under a stimulus in such a way as to prepare for or escape from an event of which, in course of nature, the stimulus is the sign, signal, or constant antecedent; answer back to a stimulus by an action that commends itself to the human observer as prudent and judicious. See ★*response*, 3.

respondeat superior (rẹ̄-spon′dẹ̄-at sū-pē′ri-ộr). [L.] 'Let the principal answer': in *law*, a phrase used to express the doctrine that the principal is responsible for the acts of his agents or servants when done within the scope of their employment.

respondent, *n.* 4. A defendant in a lawsuit, now specifically in a divorce case. *N. E. D.*

responder (rẹ̄-spon′dėr), *n.* 1. One who or that which responds.—2. An electrolytic detector or receiver for wireless telegraphy.

> The principle of this receiver, or "*responder*," is based upon the fact that the Hertzian oscillations produce sudden electrolytic action in a cell containing certain electrodes and solutions. *Elect. Rev.*, Sept. 3, 1904, p. 330.

response, *n.* 3. In *biol.*, the reaction of a living being to a stimulus by a change that is brought about by its organic machinery and is fitted to prepare it for or protect it from some external change of which the stimulus is the sign, signal, or constant antecedent in that order of events which has prevailed in the ordinary or average environment of its species; the reaction of a living being to a stimulus by a change that, so far as we understand it, commends itself to our reason as prudent and judicious. Winking when a blow is threatened, considered as a means for protecting the eyeball from threatened danger, and the growth of the radicle of the germinating seedling toward moisture and soluble food under the stimulus of gravity, while the plumule grows toward the sunlight and the air under the same stimulus, are illustrations of response as an answer, as contrasted with 'reaction' in the ordinary meaning of the latter word. While a response may commend itself to the reason, it is not essential that it be understood by the being that exhibits it. The chick runs to its mother for protection from threatened danger when its auditory machinery is stimulated by her warning cry, although it may not know the source of danger nor even what danger and protection are. Since the stimulus that leads to a responsive act is a signal which may be misinterpreted, any living being may make blunders or be misled, as we may ourselves be deceived when we think we know more than the facts warrant. The study of the physical properties of stimuli and the study of the structure and functional activity of organisms are valuable aids in the study of response, but its essential characteristic—that which makes it an answer, its meaning—is not to be found in the living body. Its existence is in the relation between the living being or its ancestors and the average environment of the species.

4. In *physiol.*, the reaction of a living body or an organ or part of such a body to a stimulus, considered apart from any biological meaning that it may or may not have.—**Book of responses.** See ★*book*.—**Response movement**, in *physiol.*, an automatic movement. See the quotation.

> Those motor reactions that are not the invariable result of a definite stimulus, . . . but that are modified while in progress by the action of new intercurrent stimuli, we shall call automatic acts. . . . Goltz has termed the automatic movements *response-movements*.
> *T. Ziehen* (trans.), Introd. to Physiol. Psychol., p. 13.

responsivity (rē-spon-siv′i-ti), *n.* [*responsive*.] The character of being responsive; specifically, in *anthrop.*, mental responsiveness; that attribute of mind in virtue of which there is a relation of correspondence between modes of thought and physical surroundings, so that the human mind, for example, even in its more complex operations, reflects environment with striking fidelity.

> The cardinal principles of science may be reckoned as five: the indestructibility of matter . . . ; the persistence of motion . . . ; the development of species . . . ; the uniformity of nature . . . ; and the *responsivity* of mind.
> *Proc. Wash. Acad. Sci.*, II. 11.

> The general relation between thought and surroundings . . . finds most definite expression in the current scientific teaching that knowledge arises in experience, and it seemed desirable to formulate the relation as a principle of knowledge which may appropriately be styled the *responsivity* of mind. *Smithsonian Rep.*, 1900, p. 68.

rest^1, *n.* 10. (*b*) Any fixed period during which interest accrues and at the end of which a balance is struck, interest accruing from thence on the balance struck, thus giving the benefit of compound interest: a term in common use in computing interest on mortgages, trust funds, and the like.—**Breve rest**, in *musical notation*, a mark for a pause or silence equal in duration to a breve, —**Continued rest**, in *music*, a rest that includes several measures, the number being indicated by a numeral over the sign. See *rest*^{1}, 8, and *abbreviation*, 4.—**Weighted rest**, in *mech.*, a form of tool-carriage used on engine-lathes which is held to the inverted T-shaped rails on the ways by a heavy weight suspended beneath the carriage: used only for light machines at any time and now practically obsolete.—**Whole rest.** Same as *whole-note rest*. See *rest*^{1}, 8.

rest^2, *n.* 4. In *anat.*, a minute accessory suprarenal gland embedded in the kidney or the liver. *Buck*, Med. Handbook, I. 129.—**Adrenal rests.** See *Marchand's* ★*adrenals*.

restart (rē-stärt′), *v. i.* To start again after a stop or pause: specifically used of injectors for feeding-boilers, which adjust themselves to varying pressures of the steam, and, after breaking the continuous flow of water, will pick it up again without readjustment by hand; also of motors for vehicles, which, after being stopped, will start up again without the necessity of compressing and igniting the charge by turning the motor-shaft by hand.

rest-atom (rest′at″ọm), *n.* [*rest*^{2} + *atom*.] That portion, containing the positive ion, which remains when the negative ion is removed.

resterilize (rē-ster′il-īz), *v. t.*; pret. and pp. *resterilized*, ppr. *resterilizing*. [*re-* + *sterilize*.] To submit a second time to the process of sterilization. *Buck*, Med. Handbook, I. 568.

restiaceous (res-ti-ā′shius), *a.* Belonging to or resembling the *Baloskionaceæ*, a family of plants formerly called *Restiaceæ* and *Restionaceæ*. See *Restiaceæ* and ★*Baloskionaceæ*.

resting-bud (res′ting-bud), *n.* A bud in a resting or inactive state. See *resting-state*. *Nature*, Nov. 24, 1904, p. 76.

restis (res′tis), *n.* [NL., < L. *restis*, a cord, a rope.] Same as *restiform body* (which see, under *restiform*). *Buck*, Med. Handbook, II. 154.

restitution, *n.* 6. In *biol.*, the replacement of a lost tissue or organ, or the substitution for it of a different one: a term applied especially to the processes set up by a plant or other organism owing to the loss of a tissue or organ.

> *Restitution* . . . may include the replacement of the lost members by the development of new ones on adjacent parts of the body, or on the injured surface; the substitution of an organ of a different character arising on the injured surface, or the substitution of an organ of a different character on adjacent portions of the plant.
> *Science*, June 5, 1903, p. 905.

Residual restitution, in *mech.*, the gradual return from a state of strain after release from stress, observed in bodies that show elastic fatigue.

restiv, *a.* A simplified spelling of *restive*.

restock (rē-stok′), *v. t.* and *i.* [*re-* + *stock*.] To stock again; specifically, in *ichth.*, to furnish, by artificial means, with a species which is becoming exhausted.

> The important industry of artificial fertilization and the transportation of fish eggs, which has enabled man to *restock* exhausted localities and to stock new ones.
> *J. J. Stevenson*, in Smithsonian Rep., 1897, p. 331.

restoring-coil (rẹ̄-stōr′ing-koil), *n.* In *telephony*, the coil, in an annunciator or indicator, the attraction of whose core serves to restore to position the drop-shutter after a call has been answered.

restrainer, *n.* 2. Specifically, in *elect.*, a substance used in the manufacture of the electrodes of magnetite arc-lamps the function of which is to reduce the rate at which the terminals are consumed.

> A much better method of producing electrodes was found by not reducing the material, but adding a *restrainer*; that is, a substance which added to the electrode material in small quantities reduces the rate of consumption. *Elect. World and Engin.*, May 21, 1904, p. 975.

Restraining order. Same as *temporary injunction* (which see, under *injunction*).—**Restraining powers.** See ★*power*^{1}.—**Restraining statute.** See ★*statute*.

restraint, *n.*—**Chemical restraint.** See ★*chemical*.—**Law of restraint.** See ★*law*^{1}.—**Restraint of marriage.** See ★*marriage*.—**Restraint of princes and rulers**, a phrase used in bills of lading to denote a limitation upon the liability of a ship-owner when the ship carrying the cargo is detained by governmental authority against the will of the ship-owner.—**Restraint of trade**, in *law*, a term commonly applied to contracts held to be illegal and void by reason of their effect in preventing competition and encouraging monopolies.

restrike, *v.* II. *intrans.* To strike again: said of an electric arc which, after the current has momentarily ceased, forms again with metallic connection between the terminals.

restrike (rē-strīk′), *n.* [*re-* + *strike*.] In *numis.*, a modern, or at least more recent, impression from the original die. *W. C. Hazlitt*.

Resultant acceleration, force, vector, velocity. See *resultant* ★*vector*.

resultantometer (rẹ̄-zul-tạn-tom′e̤-tėr), *n.* [*resultant* + *-o-* + Gr. μέτρον, measure.] An apparatus for determining the general resultant direction of the atmospheric currents in any particular locality, for a definite space of time.

> The method adopted has been to work out, for each region of the earth's surface, the direction of the average monthly drift of the atmosphere at various heights with a "*resultantometer*" devised by Mr. Sandström. The results are set out in tables and diagrams, and in what follows attention will be directed to some of the most important points. *Nature*, Feb. 2, 1905, p. 330.

resumption, *n.* 3. In *Welsh prosody*, the practice of beginning every verse with the same letter, which is sustained throughout. *J. Williams*.

resuperheat (rē″sū-pėr-hēt′), *v. t.* [*re-* + *superheat*.] To superheat again. After steam has once been superheated and has cooled in doing mechanical work, it can be regenerated in a receiver between the cylinders of a multiple-cylinder engine, and the moisture removed if any has appeared.

resurface (rē-sėr′fās), *v. t.*; pret. and pp. *resurfaced*, ppr. *resurfacing*. To put a new surface on; renew the surface of.

> Subsequently, when the road was *resurfaced* with limestone, which was much softer than the trap, it became excellent. *Yearbook U. S. Dept. Agr.*, 1900, p. 352.

resurge, *v. i.* 2. To surge back; swing back or rebound: said specifically of that portion of an oscillation in which the movement is away from the position of maximum displacement and toward equilibrium.

> When a body which is capable of transmitting a disturbance, as a pulse, is disturbed at any part, a pulse is transmitted to the boundaries of the body, whence it *resurges*. The pulsation continues for a time, but ultimately dies out. If the disturbance be repeated at a short interval of time the second pulsation encounters the *resurging* of the first, and if this repetition of disturbance be kept up at regular intervals, the body presently attains a condition of persistent rhythmical vibration, being parcelled out into vibrating segments, whose boundaries are nodes.
> *Geog. Jour.* (R. G. S.), XI. 640.

resurgence, *n.* 2. The act of resurging or surging back, as a wave. See ★*resurge*, 2.

resurrectional (rez-u-rek′shọn-ạl), *a.* [*resurrection* + *-al*^{1}.] Of or pertaining to resurrection; of the nature of resurrection.

resurrectioner (rez-u-rek′shọn-ėr), *n.* [*resurrection* + *-er*.] A resurrectionist.

resurrection-fern (rez-u-rek′shọn-fėrn), *n.* See ★*fern*^{1}.

resurrection-flower (rez-u-rek′shọn-flou″ėr), *n.* Same as *resurrection-plant*.

resurrectionism (rez-u-rek′shọn-izm), *n.* The practices of the resurrectionists; body-snatching.

resurrection-pie (rez-u-rek′shọn-pī″), *n.* A pie made with the remnants of previous meals. *Stand. Dict.* [Slang.]

resurrective (rez-u-rek′tiv), *a.* [*resurrect* + *-ive*.] Causing resurrection; bringing the dead to life. [Rare.]

ret^1 (ret), *n.* [*ret*^{1}, *v.*] The process of retting; retting.

> If the stem then breaks freely, and the fibre leaves it easily, it will have got a good *ret*, as it is called.
> *Jour. Roy. Agr. Soc.*, X. 178.

Retaining valve. See ★*valve*.

retake, *v. t.* 3. In *chess*, to take (a hostile piece that has captured something). *Morphy*, Games of Chess, p. 443.

retaliation, *n.*—**Law of retaliation.** Same as *lex talionis* (which see, under *lex*).

retaliator (rẹ-tal′i-ạ-tọr), *n.* One who retaliates.

retama, *n.* 2. In Spanish America, a name applied to several leguminous plants more or less closely resembling plants of the genera *Spartium, Genista,* and *Cytisus:* in Porto Rico, *Cassia biflora* and *C. portoricensis;* in southern Mexico, *Cassia tomentosa;* in northern Mexico, *Parkinsonia aculeata* and *Cercidium texanum.*

retard, *v. t.*—**Retarding force.** See ★*accelerative force.*

retardance (rẹ-tär′dạns), *n.* [*retard* + *-ance.*] A numerical constant, proportional to the capacity and resistance of a telephone-line, which gives the maximum distance over which speech may be successfully transmitted.

retardation, *n.*—**Magnetic retardation,** the magnetic lag of a circuit containing iron in which magnetic flux is induced.

retardative, *a.* 2. Serving to express retardation: applied to certain verb-forms in some agglutinative languages. Compare the extract under ★*accelerative,* 2.

retarder, *n.* 2. An obstruction, usually in the form of a twisted piece of sheet-metal, placed in a boiler-flue to retard the hot gases and make them give up their heat to the water in the boiler.

> The water tube boilers could be kept clean and perfectly efficient, as they need only be used for driving the ship at high speeds, when economy of coal relatively is not so important. The cylindrical boilers should be fitted with *retarders* in the tubes and with special means for circulating the water while raising steam.
> *Sci. Amer. Sup.*, Jan. 24, 1903, p. 22625.

3. A device, such as a dash-pot, for checking the too rapid motion of any mechanism.

retardive (rẹ-tär′div), *a.* Same as *retardative.*

retching (rech′ing), *n.* [*retch*², *v. i.*] 1. An effort to vomit.—2†. Hawking, or clearing of the throat. *N. E. D.*

retd. A contraction of *returned.*

rete, *n.* 2. In certain astrolabes, a movable skeleton framework cut out of a circular sheet of metal, and lying between the planisphere and the diopter or alidade. It carries one or two pointers, also an eccentric ring marked with the signs of the zodiac, and several curved arms indicating the place of the pole of the ecliptic and of certain stars.

> Above the planisphere lies the neatly cut out and decorated "*rete*" carrying upon its circular interior the constellations of the ecliptic. The pole of the ecliptic and the positions of some of the stars are also given.
> *C. A. Brassler,* in Sci. Amer., Aug. 12, 1905, p. 127.

retene (ret′ēn), *n.* [Gr. ῥητ(ίνη), resin, + *-ene.*] A crystalline hydrocarbon, $C_{18}H_{18}$, found in resinous woods and certain fossil gums and resins: also made by distilling rosin-oil with sulphur. It is 8-methyl-5-isopropylphenanthrene. It melts at 98.5° C. and boils at 390° C.

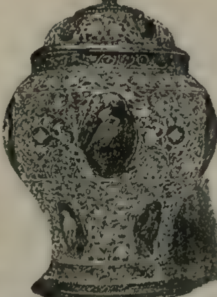
retention, *n.*—**Special retention,** in *Scots law,* a right to hold the property of another for a particular debt due from the owner by reason of money or labor expended on the property held.

rethe† (rēth), *a.* [Also *retht, reithe, reythe,* etc.; AS. *ređe.*] 1. Fierce, cruel, stern, zealous: said of persons.—2. Terrible; dreadful: said of things.

retheness (rēth′nes), *n.* [*rethe* + *-ness.*] The character of being rethe; fierceness; roughness; harshness; sternness. [Obs. or Scotch.]

retiarian (rē-shi-ā′ri-ạn), *a.* and *n.* [*retiari(us)* + *-an.*] Pertaining to or composed of retiarii; a retiarius.

reticulated, *p. a.* 2. In *ceram.*, perforated: noting a style of decoration in which the outer wall of a vase, cup, or other vessel is honeycombed or pierced in patterns, while the inner wall is solid and forms the vessel proper. It originated with the Chinese potters and was later imitated at some of the European potteries, particularly at Worcester, Berlin, Vienna, and Sèvres.—**Reticulated cirrus.** See ★*cirrus.*



Reticulated Vase, Royal Worcester, Modern. (In the Pennsylvania Museum, Philadelphia.)

reticulate-punctate (rẹ-tik′ụ-lāt-pungk″tāt), *a.* Having a reticulate punctation, as the elytra of certain beetles.

reticule, *n.* 4. [*cap.*] In *astron.*, same as *reticulum,* 6.—**Reticule wire,** a fine filament placed in an astronomical instrument at the common focus of object-glass and eyepiece. It may be fixed or movable, and observations consist in noting the time when star-images cross the wire, or the reading of micrometer and circles when the wire is made to bisect the image. The wires are usually spider-threads, but fine lines ruled on glass are also used. See *reticule,* 2.

reticulin (rẹ-tik′ụ-lin), *n.* [L. *reticul(um),* net, + *-in*².] An albuminoid, closely related to gelatin, found in the reticulated tissue which constitutes the fibrous framework of the lymph-glands and other structures.

reticulum, *n.* 5. In *bot.*: (*b*) The structure formed by the anastomosing strands of plasmodia which collect and fuse as in the genus *Fuligo* of the slime-molds.

> The strands of this *reticulum* anastomose in every direction with one another.
> *De Bary* (trans.), Fungi, p. 431.

7. The supporting network of glandular organs or soft tissues, such as the brain.

> Mall . . . has also proved that the interstitial tissue of many glands and organs has no connection with the connective-tissue cells, but consists of an interlacement of branching fibrils. This substance he calls *reticulum.*
> *Buck,* Med. Handbook, I. 128.

8. In the hexactinellid sponges, the supporting skeleton composed of reticulating or intersecting bundles of thread-like spicules.—9. The network of bone which more or less completely fills some of the long bones, such as the femur of the ostrich and elephant.

retina, *n.*—**Detachment of the retina,** a separation of the retina from the choroid, which causes loss of vision in the detached portion.—**Ganglion of the retina.** See ★*ganglion.*—**Lower retina,** the lower half of the retina.—**Nasal retina,** the nasal half of the retina.—**Temporal retina,** the outer half of the retina.—**Upper retina,** the upper half of the retina.

retinacular (ret-i-nak′ụ-lär), *a.* [*retinaculum* + *-ar*³.] Of or pertaining to a retinaculum.

retinaculum, *n.* 3. In *entom.*: (*b*) An arrangement of hooks, or of hooks and bristles, whereby the fore and hind wings of insects are interlocked when in flight. *N. E. D.*

retinaphtha (ret-i-naf′thạ̈), *n.* [Gr. ῥητί(νη), resin, + NL. *naphtha.*] A name at one time given to toluene, as obtained by destructive distillation from the resin of *Pinus maritima.*

retinasphalt (ret-in-as′falt), *n.* [Gr. ῥητίνη, resin, + ἄσφαλτος, asphalt.] A light-brown, yellow, or reddish mineral resin found in the Tertiary coal of Bovey, Devonshire. Alcohol separates from it a compound which has the composition $C_{21}H_{28}O_3$, to which the name *retinellite* has been given.

retinellite (ret-i-nel′īt), *n.* [Gr. ῥητίνη, resin, + L. dim. *-ellus* + *-ite*².] See ★*retinasphalt.*

retineum (rẹ-tin′ẹ̄-um), *n.*; pl. *retinea* (-ạ̈). [NL., < *retina.*] In invertebrates, the part of the eye that functions as a retina.

retinic (rē-tin′ik), *a.* [Gr. ῥητίνη, resin, + *-ic.*] Derived from retinellite.

retinite, *n.* 3. Same as ★*retinellite.*

Retinitis apoplectica, inflammation attended with extravasation of blood into the retina.—**Retinitis proliferans,** retinitis marked by projections of fibrous tissue into the vitreous.

retinocerebral (ret″i-nọ-ser′ẹ̄-brạl), *a.* Pertaining to or involving both the retina and the brain.

> It is a question . . . whether impromptu speaking and spontaneous writing are not essentially such processes as occur in reading or copying from a book before the eyes, except that the copy is mental (cerebro-cerebral) instead of what we call physical (*retino-cerebral*).
> *Psychol. Rev. Mon. Sup.*, III. xiv. 24.

retinochoroidal (ret″i-nọ-kō′roi-dạl), *a.* [NL. *retina,* retina, + *choroides,* choroid, + *-al*¹.] Relating to both the retina and the choroid. *Buck,* Med. Handbook, III. 64.

retinol (ret′i-nol), *n.* [Gr. ῥητίνη, resin, + *-ol.*] A liquid diterpene, $C_{20}H_{32}$, which is found in copaiba and is also formed by the distillation of rosin. It is occasionally used as a solvent in pharmacy, and as an ointment or liniment.

retinophoral (ret-i-nof′ọ-rạl), *a.* [*retinophora* + *-al*¹.] Pertaining to a retinophora.

retinoscope (ret′i-nọ-skōp), *n.* [NL. *retina,* retina, + Gr. σκοπεῖν, view.] An instrument employed in retinoscopy.

retinoscopic (ret″i-nọ-skop′ik), *a.* [*retinoscope* + *-ic.*] Of or pertaining to retinoscopy.

retinoscopist (ret-i-nos′kọ-pist), *n.* [*retinoscop(y)* + *-ist.*] One who practises retinoscopy.

> No matter what the defect, hyperopia, myopia, astigmatism, simple, compound or mixed, all give up the secrets to the skilled *retinoscopist;* whether willingly or not, all must yield to this method.
> *Optical Jour.*, June 2, 1904, p. 938.

retinulate (rẹ-tin′ụ-lāt), *a.* [NL. *retinula* + *-ate*¹.] Provided with, or characterized by the presence of, retinulæ.

Retiolites (rē-ti-ọ-lī′tēz), *n.* [NL., < **retiolum,* dim. of L. *rete* or *retium,* net, + *-ites,* E. *-ite*².] A genus of graptolites having a complicated polypary with two virgulas, one on each side of the peridermal network, one straight and the other zigzagged. It occurs in the Silurian rocks.

Retioloidea (rē″ti-ọ-loi′dẹ-ạ̈), *n. pl.* [NL., < **retiolum* (dim. of L. *rete* or *retium,* a net) + *-oidea.*] A suborder of the *Graptoloidea* or graptolites, characterized by a latticed periderm which consists of a network of chitinous filaments. They extend from the middle Lower Silurian to the middle Upper Silurian. The most typical genus is *Retiograptus.*

retire, *v. t.* 7. In the *law of negotiable instruments:* (*a*) To take up (a bill or note) from a prior transferee and thereafter hold (it) with all remedies intact: said of an indorser. (*b*) To retire (a bill or note) by taking (it) up at maturity, with all remedies on it extinguished: said of an acceptor.—**Retiring board,** a board of officers which ascertains and reports on the cause and degree of the physical incapacity of an officer preparatory to his retirement.

retistene (rē-tis′tēn), *n.* The name of a hydrocarbon, $C_{16}H_{14}$, from which the compound formerly called retistenequinone but now known to be retenequinone, $C_{18}H_{16}O_2$, was supposed to be derived.

retitrate (rē-tit′rāt), *v. t.*; pret. and pp. *retitrated,* ppr. *retitrating.* [*re-* + *titrate.*] In *chem.*, to titrate (a solution) again after it has undergone, or may be supposed to have undergone, some change, as in the case of a solution which may have altered in strength by exposure to the air.

retonation (rē-tọ-nā′shọn), *n.* [*re-* + *(de)tonation* (?).] Backward impulse of an explosion. See ★*retonation-wave.*

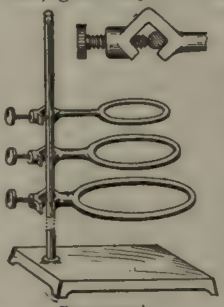
retonation-wave (rē-tọ-nā′shọn-wāv), *n.* A backward wave of compression observed when an explosive mixture of gases is ignited within a glass tube.

retorted² (rẹ-tôr′ted), *p. a.* [*retort*², *v.*] Refined or purified in a retort. *N. E. D.*

retorter² (rẹ-tôr′tėr), *n.* [*retort*², *v.*, + *-er.*] One who retorts metals. *Raymond,* Statistics of Mines and Mining, p. 415. *N. E. D.*

retort-scurf (rẹ-tôrt′skėrf), *n.* Same as *gas-carbon* (which see, under *carbon*).

retort-stand (rẹ-tôrt′stand), *n.* A vertical rod, generally of iron, with a heavy metallic foot, and a number of metallic rings, of different sizes, each at the end of a horizontal arm and capable of sliding up and down the rod and of being fixed at any desired height by a pinch-screw: the whole serves to support a retort or other vessel, properly adjusted as to height, over a lamp-flame. Also known as *retort-holder* or *retort-support.*



Retort-stand.

retouching-varnish (rē-tuch′ing-vär″nish), *n.* Alcohol-shellac varnish, used in retouching oil-paintings.

retour (re-tör′), *v.* [*retour, n.*] I†. *intrans.* 1. To revert (to a person).—2. To return (to a place).

II. *trans.* 1. To return (a person) as heir. *N. E. D.*—2. To make a return to Chancery of or relative to (lands, etc.); state the value of, in a retour. *N. E. D.*—3. To return or send in (the breve or verdict, etc.) to Chancery. [Scotch, in all uses.] *N. E. D.*

retractation, *n.* 2. *pl.* [*cap.*] The title of a work by St. Augustine containing corrections and other modifications of his earlier writings; hence, some similar book.

Retractile disk. See ★*disk.*

Retraction ring, a ring-like constriction of the uterus just above the internal os, observed during labor. Also called *Bandl's ring.* *Lancet,* June 18, 1904, p. 1719.

retradition (rē-trạ-dish′ọn), *n.* [From L. *retradere,* give back.] The act of giving or handing back. *Poste,* Gaius, III. 384. *N. E. D.*

retrally (rē′trạl-i), *adv.* In a retral manner; posteriorly.

retreat^1, *n.*—**To beat a retreat.** See ★*beat*^{1}, *v. t.*

retreat^1, *v. t.* **2.** In *chess*, to move (a piece) backward.

> Black would have simply *retreated* Q to K's 2nd.
> *Morphy*, Games of Chess, p. 49.

retreatal (rẹ-trē'ta̤l), *a.* and *n.* [*retreat* + *-al*^{1}.] **I.** *a.* Of or relating to retreat; in *geol.*, relating to something that has retreated; recessional: applied particularly to moraines deposited during the halts of a retreating glacier.

II. *n.* The act of retreating; a retreat.

retreatant (rẹ-trē'ta̤nt), *n.* [*retreat*^{1}, *v.*] One who retreats; specifically, one who takes part in a religious retreat.

> The *retreatants* were all cared for in the ample building of St. Agnes' School. *Outlook*, Sept. 25, 1897, p. 244.

retreating (rẹ-trē'ting), *n.* **1.** The act denoted by the verb *retreat*^{1}.—**2.** Specifically, in *mining*, a process by which a vein is untouched until after all the gangways, etc., are driven, when the mineral extraction begins at the boundary and progresses toward the shaft. *Coal and Metal Miners' Pocket-Book.*

retriev, *v.* A simplified spelling of *retrieve.*

retro (rē'trō), *adv.* [L.] Backward.

retrobronchial (rē-trọ-brong'ki-a̤l), *a.* [L. *retro*, back, behind, + NL. *bronchia* + *-al*^{1}.] Situated or occurring behind the bronchi. *Buck*, Med. Handbook, VII. 750.

retrocæcal (rē-trọ-sē'ka̤l), *a.* [L. *retro*, back, behind, + NL. *cæcum* + *-al*^{1}.] Situated or occurring behind the cæcum. *Med. Record*, June 27, 1903, p. 1056.

retrocalcarine (rē-trọ-kal'ka̤-rin), *a.* [L. *retro*, back, behind, + E. *calcarine.*] See ★*calcarine complex.*

retrocardiac (rē-trọ-kär'di-ak), *a.* [L. *retro*, back, behind, + Gr. *καρδία*, heart, + *-ac.*] Situated behind the heart.

retrocentral (rē-trọ-sen'tra̤l), *a.* [L. *retro*, back, behind, + *centrum*, center, + *-al*^{1}.] Situated behind the center. *Amer. Anthropologist*, July-Sept., 1901, p. 469.—**Retrocentral sulcus.** See ★*sulcus.*

retrocervical (rē-trọ-sėr'vi-ka̤l), *a.* [L. *retro*, back, behind, + *cervix* (*cervic-*), neck, + *-al*^{1}.] Situated behind a cervix, especially the cervix uteri. *Buck*, Med. Handbook, VIII. 96.

retrocession, *n.* **4.** (*b*) In *civil law*, a reconveyance of heritable rights to the original grantor.

retrocessive (rē-trọ-ses'iv), *a.* [L. *retrocessus*, pp. of *retrocedere*, go backward, + *-ive.*] **1.** Moving backward; retrograde.—**2.** Of the nature of, or marked by, retrocession, as of territory.

retroclavicular (rē"trọ-kla-vik'ū-lä̤r), *a.* [L. *retro*, back, behind, + NL. *clavicula*, clavicle, + *-ar*^{3}.] Situated or occurring behind the clavicle. *Buck*, Med. Handbook, VII. 542.

retrocognition (rē-trọ-kog-nish'ọn), *n.* [L. *retro*, back, behind, + E. *cognition.*] A supposed supernormal faculty, the possessors of which are able to describe past events, actions, etc., without having recourse to any of the ordinary means of information.

> Our *retrocognitions* seem often a recovery of isolated fragments of thought and feeling.
> *Myers*, Human Personality, I. 31. *N. E. D.*

retrocoient (rē-trọ-kō'i-e̤nt), *a.* [L. *retro*, backward, + *coiens*(*t-*), ppr. of *coire*, copulate.] Same as *retrocopulant.*

retrocolic (rē-trọ-kol'ik), *a.* [L. *retro*, back, behind, + NL. *colon*, colon, + *-ic.*] Situated or occurring behind the colon.

retrodeflect (rē"trọ-dẹ-flekt'), *v. t.* To bend or twist downward and backward.

retrodisplaced (rē"trō-dis-plāst'), *a.* [L. *retro*, back, behind, + E. *displaced.*] Displaced backward. *Med. Record*, Oct. 19, 1907, p. 658.

retrodisplacement (rē"trọ-dis-plās'me̤nt), *n.* Displacement backward: referring, in pathology, chiefly to a malposition of the uterus. *Med. Record*, June 27, 1903, p. 1059.

retrodural (rē-trọ-dū'ra̤l), *a.* [L. *retro*, back, behind, + NL. *dura* + *-al*^{1}.] Situated or occurring behind the dura mater. *Buck*, Med. Handbook, VII. 352.

retroesophageal (rē-trō-ē-sọ-faj'ẹ-a̤l), *a.* [L. *retro*, back, behind, + NL. *œsophagus* + *-e-al*^{1}.] Situated behind the esophagus. *Buck*, Med. Handbook, IV. 384.

retroflect (rē'trọ-flekt), *v. t.* [L. *retro*, back, behind, + *flectere*, bend.] To place in a position of retroflexion: said of a manipulation of the uterus.

retroflex (rē'trọ-fleks), *v. t.* Same as ★*retroflect.*

retrograde, *a.* **II.** *n.* In *billiards*, the pull-back, draw, or recoil. *W. Broadfoot*, Billiards, p. 196.

retrogress (rē'trọ-gress), *v. i.* [L. *retrogress*(*us*), pp. of *retrogradi*, go backward.] To move backward; retrograde.

Retrogressive variation. See ★*variation.*

retromalleolar (rē-trọ-mal'ẹ-ō-lä̤r), *a.* [L. *retro*, back, behind, + NL. *malleolus* + *-ar*^{3}.] Situated behind a malleolus: noting a fossa on either side of the tendo Achillis.

retromote (rē'trọ-mōt), *v. t.* [L. *retro*, back, + *movere*, move. Cf. *promote.*] To move backward or downward, as to a lower grade or rank. [Rare.]

retronasal (rē-trọ-nā'za̤l), *a.* [L. *retro*, back, behind, + *nasus*, nose, + *-al*^{1}.] Relating to the posterior nares.

> The nasal and *retro-nasal* secretion of the mucous membrane. *Buck*, Med. Handbook, II. 480.

retroposed (rē'trọ-pōzd), *a.* [L. *retro*, back, behind, + E. *pose*^{2} + *-ed*^{2}.] Displaced backward.

retropulsion, *n.* **3.** Transference of an external disease to some internal part or organ. *N. E. D.*

retrorectal (rē-trō-rek'ta̤l), *a.* [L. *retro*, back, behind, + NL. *rectum* + *-al*^{1}.] Situated behind the rectum.

retrorsion (rẹ-trôr'shọn), *n.* [A nominal contraction of *retroversion*, after *retrorse.*] A turning or twisting back; the state or condition of being turned or twisted backward.

retrosection (rē-trọ-sek'shọn), *n.* [L. *retro*, back, behind, + *sectio*(*n-*), cutting.] Same as ★*loop-cut.*

retrospectant (ret-rọ- or rē-trọ-spek'ta̤nt), *a.* Same as *retrospective.*—**Retrospectant evidence**, the testimony as to a present fact from which a past fact is inferred, as that the possession of stolen goods argues the possessor guilty. *Wigmore*, Evidence, § 148.

retrosymphyseal (rē"trọ-sim-fiz'ẹ-a̤l), *a.* [L. *retro*, back, behind, + NL. *symphysis* + *-e-al*^{1}.] Situated behind a symphysis. *Buck*, Med. Handbook, I. 784.

retrotensive (rē-trọ-ten'siv), *a.* [L. *retro*, back, behind, + E. *tensive.*] Pulling or stretching backward.

retrotensively (rē-trọ-ten'siv-li), *adv.* In a manner which exerts tension backward.

> At each point on it [academic life] we can see and feel both ways—protensively toward the future and *retrotensively* toward the past—as at no other stage of life.
> *G. S. Hall*, Adolescence, II. 402.

retroverse (rē'trọ-vėrs), *a.* [L. *retroversus.* See *retroversion.*] Turned backward; reversed in action or direction.

retroverted (rē-trọ-vėr'ted), *a.* In *bot.*, turned back or inverted.

retrusible (rẹ-trö'si-bl), *a.* [L. *retrusus*, pp. of *retrudere*, thrust back, + *-ible.* See *retrude.*] Capable of being retracted.

> The Cydippidea are generally spherical or ovoid, with two long *retrusible* pinnate tentacles.
> *Encyc. Brit.*, XXVII. 301.

retting, *n.*—**Hot-water retting**, a method of retting flax by treating it with hot water in a closed chamber at a temperature of 300° F. and then exposing it to the action of dry steam of the same temperature.—**Mixed retting**, a method of retting flax in which the fermentation is begun in water and completed on grass.—**Steam retting.** See *hot-water* ★*retting.*—**Warm-water retting**, an artificial process of retting flax, similar to ordinary water-retting, except that it is carried on in tanks with the water heated by steam to about 95° F.

retuch, *v. t.* and *n.* A simplified spelling of *retouch.*

return^1, *n.* **10.** In *elect.*, a wire or conductor which completes an electric circuit so that the current may be returned to the generator.

> The word *returns* is sometimes used in a system of distribution by parallel circuits, to distinguish between the conductor by which the current goes back or returns from the receptive devices to the dynamo, and the conductor that leads it to the receptive devices. The term leads is, however, often applied to both conductors.
> *Houston*, Dict. Elect.

11. A return-bend; a pipe-fitting for connecting two parallel pipes; a 180° elbow.—**Ground return**, in *elect.*, a return circuit for electric currents through the earth: opposed to *metallic* ★*return.* *Elect. World and Engin.*, March 28, 1903, p. 525.—**Law of diminishing returns**, in *polit. econ.*, the principle that, when distinguishable forms of economic agency coöperate in the production of a commodity or service, an increase in one of the forms without a corresponding increase in the others will result in an increase in product less than proportionate with the increase in the varying form. Thus, if a certain number of units of land, labor, and capital coöperate in the production of a commodity, an increase in the number of units of labor alone will result in less than a proportionate increase in production. Likewise, an increase in the number of units of land, capital and labor remaining stationary, would result in less than a proportionate increase in production. The same principle holds of an increase in skilled labor, if unskilled labor, etc., remains stationary, or of one form of capital, other forms not varying in quantity. The validity of the principle rests upon the assumption that the original combination of the various forms of economic agency was rational and effective. Labor and capital may conceivably be applied to land in such minute quantities as to produce practically nothing, and in this case an increase in those agents might result in more than a proportionate return. Such a condition is excluded by the assumption that the original combination was rationally made. Furthermore, the principle requires for its validity the assumption that no technical change alters the proportions in which the forms of economic agency are normally combined. The principle was first discovered in a study of the effects of increase of labor and capital in the cultivation of a field or the exploitation of a mine; hence the extractive industries are often, though improperly, distinguished from manufactures, etc., as industries operating under the law of diminishing returns.—**Law of increasing return**, in *polit. econ.*, the principle that, through the improvement in organization and the elimination of waste made possible by large-scale industry, an increase in the size of a business unit increases the efficiency of the labor and capital employed.

> While the part which Nature plays in production conforms to the law of diminishing return, the part which man plays conforms to the *Law of Increasing Return.*
> *Alfred Marshall*, Principles of Economics (3d ed.), I. 397.

Metallic return, in *elect.*, a return circuit for electric currents consisting of metallic conductors usually insulated from the ground.—**Sale or return**, in *law*, a contract whereby a sale is perfected only after a reasonable time has elapsed without the return of the goods.

return-crank (rẹ-tėrn'krangk), *n.* **1.** An opposed crank; a crank which makes an angle of 180° with an adjacent crank.—**2.** A crank formed by bending a shaft to form the crank and then bending it back to its former line.

return-screw (rẹ-tėrn'skrö), *n.* A screw used to bring back, or return to its original position, a piece which has been moved.

return-stroke (rẹ-tėrn'strōk), *n.* A term sometimes applied to the induction effects of lightning. Since lightning is frequently oscillatory, violent surgings of current are induced in conductors near the path of the discharge.

> As there are no signs whatever on the fence of the direct effect of lightning, it must be supposed that the cows killed fell victims to the so-called *return stroke.*
> *Sci. Amer.*, Feb. 7, 1903, p. 98.

return-tube (rẹ-tėrn'tūb), *n.* **1.** A tube or flue used to return a fluid to the source from which it was taken.—**2.** A tube or flue used to convey the hot gases from the back end of a boiler to the front end.

retzian (ret'si-a̤n), *n.* [Named (1895) after A. J. *Retzius.*] A basic arseniate of manganese, calcium, and some undetermined rare metals, found at Nordmark, Sweden.

reuniol (rẹ-ū'ni-ōl), *n.* [*Réunion*, the name of an island, + *-ol.* So called as occurring in geranium-oil from Réunion.] Same as ★*citronellol.*

reussin (roi'sin), *n.* [*Reuss*, name of its describer, + *-ite*^{2}.] Native Glauber salt (mirabilite) which occurs as a deposit about the mineral springs of Saidschitz and Sedlitz.

rev. An abbreviation (*h*) of *revise;* (*i*) of *revision.*

revaccinate (rē-vak'si-nāt), *v. t.*; pret. and pp. *revaccinated*, ppr. *revaccinating.* [*re-* + *vaccinate.*] To vaccinate (one already vaccinated).

revaccination (rē-vak-si-nā'shọn), *n.* The practice of vaccinating again, after the lapse of a number of years, those in whom the first vaccination was successful.

revegetate (rē-vej'ẹ-tāt), *v. i.*; pret. and pp. *revegetated*, ppr. *revegetating.* To become green again. [Rare.]

revegetation (rē-vej-ẹ-tā'shọn), *n.* [*revegetate* + *-ion.*] The process of again becoming green and covered with vegetation.

> A series of photographs beginning just in front of the ice-mass and extending some hundreds of yards down the valley of the Illicillewaet shows at a glance how *revegetation* has proceeded, as the glacier has slowly and regularly retreated. *Pop. Sci. Mo.*, Jan., 1902, p. 197.

revelant (rev'ẹ-la̤nt), *a.* [L. *revelans*(*t-*), ppr. of *revelare*, reveal.] Revealing; capable of being clearly understood. [Rare.]

> Why not avoid, if we can, those loose habits of reasoning, those looser habits of expression, which so easily do beset us? Let us learn *revelant*, clear-cut, and well-ordered expression.
> *N. Y. Times*, Sat. Rev., July 15, 1905, p. 471.

revelationist, *n.* **2.** One who makes a revelation; especially, the author of the Apocalypse. *N. E. D.*

revelative (rev'ẹ-lā-tiv), *a.* [*revelate* + *-ive.*] Conveying a revelation. *N. E. D*

revelator, *n.* 2. In *photog.*, a developing agent for dry plates. *Stand. Dict.*

revellent, *a.* II. *n.* Something which causes revulsion.

reverberation, *n.* 5. In *psychol.*, same as ★*resonance*, 5 (*a*). *W. James*, Prin. of Psychol., II. 450.—**Bodily reverberation.** See ★*resonance*, 5 (*a*).

reverberator, *n.* 2. A reverberating or reverberatory furnace.

reverberatory, *a.* II. *n.* A reverberating or reverberatory furnace; a reverberator in which the heat and flame is reflected from a curved roof downward upon the material to be heated on the furnace bottom.

reverie, *n.*—**Induced reverie**, a state of hypnosis induced by fixation of attention. [Obsolete.]

> *Induced Reverie*, or Electro-Biology. . . . This state may be superinduced in certain susceptible or "sensitive" individuals, upon the ordinary waking state, without a previous passage through the stage of insensibility; it being often sufficient for its induction, that the attention should be fixed for a few minutes, or even for a few seconds, upon any object whatever.
> *W. B. Carpenter*, Prin. Mental Physiol., p. 548.

reversal, *n.* 5. In *international law:* (*a*) A promise by a sovereign power that a certain order, or certain conditions, promulgated or established, will be observed, notwithstanding changes that may occur to cause deviation therefrom. For instance, when France recognized Russia as an imperial government, a reversal was required that Russia would not cause any derogation from the rank which France had held toward her. (*b*) A declaration by a sovereign that by a given act he means no prejudice to another power.—6. In *elect.*, the process of changing the direction of the current in a circuit. In *telegraphy* the term is applied to the sending of signals over the line by means of rapidly reversed or alternating currents.—**Double reversal**, in *spectroscopy*, the return of a portion of a reversed line in the spectrum to its original condition, that of a bright line. The phenomenon is most frequently observed in the spectrum of the electric arc.—**Multiple reversal**, in *spectroscopy*, the simultaneous reversal of various parts of a bright line of the spectrum. Multiple reversal occurs chiefly in the spectrum of the electric arc, and it is to the abrupt variations of pressure and temperature in the arc that the phenomenon is ascribed.—**Reversal by solarization.** See ★*solarization.*

reverse, *n.* 8. Same as *reverse* ★*twist.*

Reversed variety. See ★*variety.*

reversing-cell (rẹ-vėr'sing-sel), *n.* A voltaic cell in which the form of the vessel containing the electrolyte is such that the terminals can be immersed or removed from the liquid, respectively, by tipping or inverting the cell.

reversing-cylinder, *n.* 2. A small cylinder connected to the head of the steam-cylinder of the air-compressor for an air-brake system.—3. A cylinder to aid in the reversing of the bed of a printing-press. A piston attached to the bed compresses air in the reversing-cylinder near the end of the stroke. This assists in stopping the bed and the force of the compressed air helps to start it in the other direction.

reversing-layer, *n.* The existence of any thin absorbing stratum of the solar atmosphere was vigorously denied by many authorities until, at the total eclipse of 1896, the photograph of Shackelton brought out the beautiful flash-spectrum, from the visual observation of which in 1870 its existence had been inferred. The photographs made at the eclipses of 1898, 1900, and 1901 all concur in confirmation. See ★*flash-spectrum.*

reversing-link (rẹ-vėr'sing-lingk), *n.* The link or guides in which the link-block of a reversing-valve gear slides.

reversing-rolls (rẹ-vėr'sing-rōlz), *n. pl.* The rolls of a rolling-mill which can be run in either direction to allow the billet or stock which is being rolled to be passed through the rolls from either side.

reversing-switch (rē-vėr'sing-swich), *n.* In *elect.*, a switch for changing the direction of the current flowing in a circuit. *Jour. Brit. Inst. Elect. Engin.*, 1899–1900, p. 410.

reversion, *n.*—**Pithecoid reversion**, the occurrence in a human being of some trait of difference from ordinary men which is also a trait of resemblance to apes, considered as reversion to or inheritance from an apelike ancestor.

> Heredity is believed to present itself in another aspect, which has excited much attention. I refer to that form of it called "atavism" or "ancestral reversion," or "retrogression," in which a child "takes after," not his immediate parents, but some remote ancestor; even, as has been often claimed, so remote as beyond the limits of our own species. Such traits have been called "*pithecoid*" (ape-like) *reversions*, as they are alleged to be derived from some four-footed precursor of man, an ape, or even a lemur. *Brinton*, Basis of Social Relations, p. 151.

reversional (rẹ-vėr'shọn-a̤l), *a.* [*reversion* + *-al*^{1}.] Pertaining to, or of the nature of, reversion; reversionary: specifically, relating to the appearance in any organism, plant or animal, of some character shown by its progenitors or presumably possessed by the ancestral form from which it is descended.

> A curious *reversional* condition is seen in many high bred domestic dogs in which a functionless hallux is present without skeletal connection with the rest of the pes. *Amer. Nat.*, Jan., 1904, p. 3.

reversor, *n.* 2. In *Scots law*, a debtor to whom the right of reversion is given upon his making a wadset, that is, giving a mortgage.

reverter, *n.* 3. An automatic by-pass, used in a self-intensifying burner, which has heavy valves. It permits gas from the mains to flow to the Bunsen burner until the heat generated operates the intensifying contrivance.

revertose (rē-vėr'tōs), *n.* [*revert* + *-ose.*] A biose formed synthetically from glucose by an extract of certain yeast: said to be different from all known sugars.

revet-crag (rē-vet'krag), *n.* In *geol.*, tilted strata which form the foot-hills or outliers of a mountain and suggest revetment in engineering structures.

revindication, *n.* 2. Specifically, the recovery by the seller of goods sold and delivered but not paid for. They must be unchanged and separable from the buyer's stock. This was a right under Roman law and in continental Europe, though now modified.

Revinian (rẹ-vin'i-a̤n), *a.* Of or pertaining to Revin, a town of France, in the department of Ardennes: in *geol.*, a term introduced by Dumont (*Système Revinien*) to designate the second division of the Terrain Ardennais in France and Belgium. This consists of quartzites and black slates with *Dictyonema flabelliforme*, which in other regions is an index fossil of the Upper Cambrian.

Revival of contracts, the act or agreement by virtue of which the obligation of contracts, which has ceased to exist by reason of the statute of limitations or other causes, is renewed and made of legal force again.

revivalist, *n.* 2. In general, one who revives anything, as an old custom, trade, or word.

> The medal is also popular in Switzerland. Here Bovy is the leader of the French tradition, and Hans Frei of a more national sentiment. The last-named, however, is more remarkable as a *revivalist* than as an original artist.
> *Encyc. Brit.*, XXXI. 294.

revivatory (rẹ-vī'va̤-tọ-ri), *a.* Serving to revive, refresh, or bring back the use of something; reviving.

> The sensation was not unpleasant, for I had reached a stage when *revivatory* methods were desirable.
> *Daily Chronicle*, Aug. 30, 1900.

revive, *v. t.* 9. In *phys. geog.*, to rejuvenate; give renewed erosive action to by regional uplift: said of streams and rivers.

revivification, *n.* 4. The restoration to an effective condition (in which it can again be used to decolorize syrup in sugar-refining) of spent animal charcoal by reheating it in char-kilns, or by washing with hydrochloric acid, submitting to a kind of fermentation, and finally heating in the char-kiln.

> Char is the great sugar refiner and much care is bestowed on its manipulation. With repeated *revivification*, even in the best kilns, it gradually losses its decolorizing power, and after a year or two's use has to be turned out. The cost of renewing it is a serious item in the upkeep of a refinery.
> *Sci. Amer. Sup.*, Feb. 28, 1903, p. 22707.

revize, *v. t.* and *n.* An amended spelling of *revise.*

revolute, *a.* II. *n.* The solid geometrical figure generated by the revolution of a plane figure about a straight line in its plane as axis.

revolution, *n.* 10. In *astrol.*, the annual return of the sun to the place he occupied at one's birth, from which, according as he may be aspected, an augury is derived regarding the complexion of the ensuing year of life.—**Diurnal revolution**, the revolution of the earth or any celestial body about its axis; its axial rotation.—**Spheroid of revolution**, a spheroid generated by the revolution of an ellipse about its major or minor axis.

revolv, *v.* A simplified spelling of *revolve.*

revolver, *n.*—**Astronomical revolver**, an apparatus devised by Janssen in the hope of securing greater accuracy in the determination of the moment of contact at the transit of Venus in 1874. It consisted of a circular sensitized plate made to revolve in the focal plane of a telescope, and exposed for an instant, at short regular intervals, by electric connection with a chronometer, thus furnishing a series of photographs at known instants.

> Janssen's *astronomical revolver*, invented by that astronomer in 1873 in order to show successive positions of the planet Venus near the limb of the sun at her transits.
> *J. Marey* (trans.), in Smithsonian Rep., 1901, p. 317.

Revolving-flat card. See ★*card*^{2}.—**Revolving furnace.** (*b*) Same as *rotary* ★*furnace.*—**Revolving mirror.** See ★*mirror.*

revolving-box (rẹ-vol'ving-boks), *n.* Same as *circular* ★*box.*

revulsant (rẹ-vul'sa̤nt), *a.* and *n.* Same as *revulsent.*

revulsor, *n.* 2. A disk set with needles for producing counter-irritation.

reward-claim (rẹ-wârd'klām″), *n.* In Australia, a large area granted to the miner who first discovers gold in remunerative quantities in an unworked district and reports it to the authorities. *E. E. Morris*, Austral English.

rewarewa (rā-wä-rā'wä), *n.* [Polynesian *rewa*, *lewa*, or *levaleva*, to float.] In New Zealand, a name applied to *Rymandra excelsa*, a tree belonging to the *Proteaceæ*. It has boat-like seed-pods, and yields a handsome wood, mottled red and brown, highly prized for cabinet-work and furniture. In other island groups names of the same origin are applied to other trees having seeds which float on the water.

rezai (re-zī'), *n.* [Urdu *razai.*] A coverlet quilted with cotton. *Yule and Burnell.* Also *resai*, *rezy.* [Anglo-Indian.]

rez-de-chaussée (rā-dẹ-shō-sā'), *n.* [F., 'level of the street.'] The ground floor of a building; the floor in which are the principal entrances, even if it is two or three feet above the level of the site.

r. f. An abbreviation (*a*) of *rapid fire*; (*b*) in *mineral.*, of *reducing flame*; (*c*) [*cap.*] of *République Française*, French Republic; (*d*) [*cap.*] of *Rex Francorum*, King of the Franks (French).

R. F. A. An abbreviation of *Royal Field Artillery.*

R. G. A. An abbreviation of *Royal Garrison Artillery.*

R. G. G. An abbreviation of *Royal Grenadier Guards.*

R. G. S. An abbreviation of *Royal Geographical Society.*

r. h. An abbreviation (*a*) of *right hand*; (*b*) [*cap.*] of *Royal Highness.*

R. H. A. An abbreviation of *Royal Horse Artillery.*

rhab (rab), *n.* A false form of *rhabd.*

rhabdal (rab'da̤l), *a.* [*rhabdus* + *-al*^{1}.] Pertaining to, or of the nature of, a rhabdus.

rhabditiform (rab-dit'i-fôrm), *a.* [*Rhabditis* + *-form.*] Having the shape of or resembling *Rhabditis.*

> In the same year Grassi (1883) emphasized the interesting fact that filariform larvæ, identical with those into which the primarily rhabditiform embryos of the free living generation develop, may arise by direct transformation from the *rhabditiform* embryos of the parasitic mother worm, namely, the embryos found ordinarily in the dejecta.
> *Jour. Exper. Med.*, Nov. 29, 1901, p. 81.

Rhabditis form, a free-swimming sexual stage in the development of certain parasitic nematodes, as *Ascaris nigrovenosa.*

rhabdoclon (rab'dọ-klōn), *n.* [Gr. ῥάβδος, a rod, + κλών, a twig.] In the spicules of sponges, an element of relatively large size having an irregularly curved rhabd or main rod with numerous irregular branches.

rhabdocœlian (rab-dọ-sē'li-a̤n), *a.* Same as *rhabdocœlous.*

rhabdocyst (rab'dọ-sist), *n.* [Gr. ῥάβδος, a rod, + κύστις, bag.] A rod-like cell. *N. E. D.*

rhabdodrax (rab'dọ-draks), *n.* [Gr. ῥάβδος, a rod, + δράξ, a small measure, a handful.] In the spicules of sponges, a bundle of minute rod-shaped spicules (rhabds or rhaphids).

rhabdomyochondroma (rab″dọ-mī″ọ-kon-drō'mä), *n.*; pl. *rhabdomyochondromata* (-ma̤-tä̤). [NL., < *rhabdomyo*(*ma*) + *chondroma.*] A mixed chondroma and rhabdomyoma.

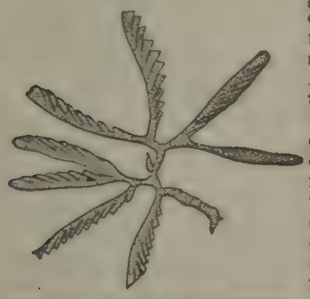
rhabdomyomyxoma (rab″dọ-mī″ọ-mik-sō'mä̤), *n.*; pl. *rhabdomyomyxomata* (-ma̤-tä̤). [NL., < *rhabdomyo*(*ma*) + *myxoma.*] A mixed rhabdomyoma and myxoma.

rhabdomyosarcoma (rab″dọ-mī″ọ-sär-kō'mä̤), *n.*; pl. *rhabdomyosarcomata* (ma̤-tä̤). [NL., < *rhabdomyo*(*ma*) + *sarcoma.*] A tumor having the characteristics of a sarcoma and of a rhabdomyoma.

rhabdophanite (rab-dof'a̤-nīt), *n.* [*rhabdophane* + *-ite*^{2}.] Same as *rhabdophane.*

rhabdopod (rab'dọ-pod), *n.* [Gr. ῥάβδος, a rod, + πούς (ποδ-), foot.] One of the genital claspers of certain insects.

rhabdosome (rab′dō-sōm), *n.* [Gr. *ῥάβδος*, a rod, + *σῶμα*, body.] The colonial stock of a graptolite produced by gemmation from a sicula. In the *Dendroidea* and the axonolipous *Graptoloidea* each colony consists of one rhabdosome; in the axonophorous *Graptoloidea* and the *Retioloidea* many rhabdosomes are united into a colony of a higher order.



Rhabdosome (*Dichograptus octobrachiatus*, Hall, sp.).
Young rhabdosome with sicula: twice natural size.

rhachi-, rhachio-. For words so beginning, see compounds under **rachi-*, **rachio-*.

rhachis, *n.* See *rachis.*

Rhacochilus (rak-ọ-kī′lus), *n.* [NL., < Gr. *ῥάκος*, rag, + *χεῖλος*, lip.] A genus of fishes, of the family *Embiotocidæ*, containing a single species: found on the coast of California. See *alfiona*, with cut.

rhæbocrania (rē-bọ-krā′ni-ä), *n.* [NL., < Gr. *ῥαιβόκρανος*, with crooked head, < *ῥαιβός*, crooked, + *κραν-*, head, in *κρανίον*, skull.] Torticollis.

rhæbosis, rhebosis (rē-bō′sis), *n.* [NL., < Gr. *ῥαίβωσις*, < *ῥαιβοῦν*, make crooked, < *ῥαιβός*, crooked.] In *pathol.*, crookedness of a normally straight part.

rhamnal (ram′nal), *a.* [NL. *Rhamnal(es)*.] Belonging or pertaining to the *Rhamnales*, an order of dicotyledonous plants. See **Rhamnales.*

Rhamnales (ram-nā′lēz), *n. pl.* [NL. (Lindley, 1833), < *Rhamn(us)* + *-ales*.] An order of dicotyledonous choripetalous plants, now restricted to the two families *Rhamnaceæ* and *Vitaceæ*. So limited, it is chiefly characterized by having the stamens of the same number as the petals and opposite to them.

rhamnase (ram′nās), *n.* [L. *rhamnus*, buckthorn, + *-ase*.] A ferment found in the Avignon berry, *Rhamnus infectoria*, which causes the cleavage of xanthorhamnin (a glucoside) into dextrose and rhamnin.

rhamnazin (ram-naz′in), *n.* [L. *rhamnus*, buckthorn, + E. *azin*.] A yellow crystalline glucoside, $C_{17}H_{14}O_7$, found in yellow berries. It is the dimethyl ether of quercitin. It melts at 214–215° C.

rhamneous (ram′nē-us), *a.* [*Rhamn(us)* + *-eous*.] Of or belonging to the genus *Rhamnus* (including the buckthorn).

rhamnite (ram′nīt), *n.* [*rhamn(in)* + *-ite*².] A crystalline pentacid alcohol, $CH_3(CH.OH)_4.CH_2(OH)$, formed by reducing rhamnose with sodium amalgam. It melts at 121° C.

rhamnonic (ram-non′ik), *a.* [*rhamn(ose)* + *-on-* + *-ic*.] Derived from rhamnose.—**Rhamnonic acid**, an acid, $C_6H_{12}O_6$, which is known only by its salts and anhydrid. It is formed by the action of bromine and water on rhamnose (or isodulcite).—**Rhamnonic anhydrid**, the anhydrid, $C_6H_{10}O_5$, of rhamnonic acid. It is formed as soon as the acid is set free from its salts. It is finely crystalline and melts at 150–151° C.

rhamnose (ram′nōs), *n.* [*rhamn(in)* + *-ose*.] A crystalline substance, $CH_3(CH.OH)_4.CHO + H_2O$, made by boiling quercitin, etc., with dilute sulphuric acid. It melts at 92–93° C. Also called *isodulcite*.

rhamnoside (ram′nọ-sid), *n.* [*rhamnose* + *-ide*.] A compound analogous to a glucoside, but containing rhamnose instead of glucose.

Rhamphus, *n.* **2.** [*l. c.*] A curved beak.

rhaphid (raf′id), *n.* [Gr. *ῥαφίς* (*ῥαφιδ-*), a needle, < *ῥάπτειν*, sew.] In the spicules of sponges, a diminutive rhabd or rod-like spicule.

rhaponticin (rā-pon′ti-sin), *n.* [*rhapontic* + *-in*².] Same as *chrysophanic acid*.

rhapsodical, *a.* **2.** Repeated at intervals of greater or less regularity: said of volcanic eruptions, as at Vesuvius. *Geikie*, Text-book of Geol., p. 33.

rhatania-tannic, *a.* A misspelling of **ratanhia-tannic.*

rhax (raks), *n.* [Gr. *ῥάξ*, a grape, a berry.] In the nomenclature of the sponge-spicules, an element in which the numerous rays have fused together, making a spherical or bean-shaped form.

rhea², *n.*—**Ban rhea,** a small tree or large bush of the nettle family, *Villebrunea integrifolia*, native to India and yielding a very strong fiber resembling ramie.—**Wild rhea.** Same as *ban* **rhea*.

Rhegnopteri (reg-nop′tẹ-rī), *n. pl.* [NL., irreg. < Gr. *ῥηγνύναι*, break, + *πτερόν*, wing, fin.] A suborder of fishes including the single family *Polynemidæ*. They have the pectoral fin divided into two parts, the lower part consisting of several filiform appendages free from each other.

rheim, *n.* Same as *riem.*

rhematology (rē-mạ-tol′ọ-ji), *n.* [Gr. *ῥῆμα* (*-τ-*), a saying, + *-ology*.] The science of rhemes. See **rheme*. [Rare.]

> Prof. Postgate's preface and his inaugural lecture on what he proposes to call '*rhematology*,' i.e., the department of 'semantics' or 'semasiology' concerned with the study of separate rhemes, are full of interest, and actually amusing here and there. *Athenæum*, Feb. 16, 1901, p. 203.

rheme (rēm), *n.* [Gr. *ῥῆμα*, a saying.] See the extract.

> A "*rheme*" is "the expression of a single idea or notion," and we may "distinguish the expressions or qualifications and connections of such *rhemes* by calling them epirhemes, though, as a general term, *rhemes* may serve for both."
> *Athenæum*, Feb. 16, 1901, p. 203.

Rhenan beds. See **bed*¹.

Rhenish furnace. Same as *Belgian-Silesian* **furnace.*

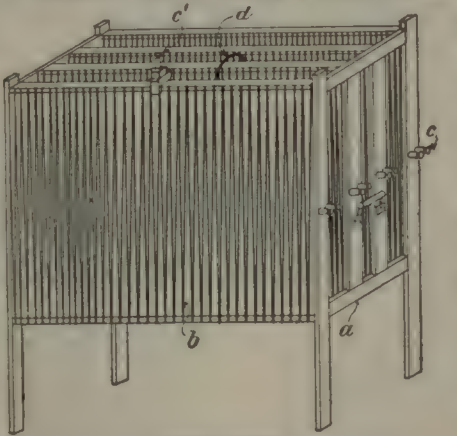
rheograph (rē′ọ-graf), *n.* [Gr. *ῥεῖν*, flow, + *γράφειν*, write.] A type of instrument for the study of rapidly fluctuating currents. It is distinguished from the oscillograph and from other vibration-galvanometers by its large moment of inertia and slow natural period of oscillation. *Jour. Brit. Inst. Elect. Engin.*, 1903–04, p. 75.

rheometer, *n.* **3.** In *elect.*, a resistance-box with bridge-coils; a combined Wheatstone bridge and rheostat.

rheonome (rē′ọ-nōm), *n.* [Gr. *ῥέος*, a stream (< *ῥεῖν*, flow), + *νόμος*, law.] An apparatus, resembling a rheochord, used in physiological experiments to determine the mode of electrical stimulation of a nerve.

rheoscope, *n.*—**Physiological rheoscope.** Same as *rheoscopic limb.*

rheostat, *n.*—**Liquid rheostat,** a rheostat in which the resistance is that of a column of water or of some other liquid electrolyte.—**Multiple rheostat,** a rheostat the parts of which may be grouped in parallel or multiple circuit.—**Multiple-series rheostat,** a rheostat so constructed that its parts may be used either in multiple or multiple-series circuit, or in series.—**Nichols rheostat,** in *physics*, a cheap rheostat constructed from sheets of tinned iron cut into zigzag strips: useful for the distribution of current in laboratories, for use with the projection-lantern, etc.



Nichols Rheostat.

a, wooden frame; *b*, tinned iron strip; *c*, stationary, and *c′*, movable binding-posts; *d*, copper strip for short-circuiting.

rheostat-indicator (rē′ọ-stat-in″di-kā-tọr), *n.* A device for indicating the portion of the resistance of a rheostat that is in circuit and the portion that is cut out. Sometimes it takes the form of a pointer moving around a divided circle.

rheostat-solenoid (rē′ọ-stat-sō-lē″noid), *n.* In *elect.*, a resistance-coil or set of coils, with sliding contacts, used as a rheostat. *Elect. World and Engin.*, June 18, 1904, p. 1167.

rheotactic (rē-ọ-tak′tik), *a.* [*rheotaxis* (*-tact-*) + *-ic*.] Of or pertaining to the movements of organisms in relation to currents of liquid; exhibiting *rheotaxis*. *Science*, April 3, 1903, p. 531.

rheotan (rē′ọ-tan), *n.* An alloy composed of 84 per cent. of copper, 4 per cent. of zinc, and 12 per cent. of manganese. It is used for electric resistances. *Jour. Brit. Inst. Elect. Engin.*, 1902–03, p. 384.

rheotaxis (rē-ọ-tak′sis), *n.* [NL., < *ῥέος*, a stream (< *ῥεῖν*, flow), + *τάξις*, disposition.] The locomotion of a cell or of an organism in respect to currents of water: applied both to the movements of a myxomycete upon filter-paper over which water is flowing and to the movements of fish stemming a current. *Amer. Nat.*, March, 1903, p. 201.

rhesis (rē′sis), *n.* [NL., < Gr. *ῥῆσις*, a saying, a passage in a literary work.] **1.** A saying; a speech; a passage in a play, poem, or book.

> Both were probably inspired by a *rhesis* of Euripides.
> *T. Ely*, in Jour. Hellenic Studies, XVI. 152.

2. A set speech or discourse. *N. E. D.*

> Any who could speak
> A chorus to the end, or prologize,
> Roll out a *rhesis*, wield some golden length
> Stiffened by wisdom out into a line.
> *Browning*, Balaustion's Adventure, l. 167.

rhet. An abbreviation of *rhetoric.*

rhetoric (rẹ-tor′ik), *a.* [F. *rhétorique*, < L. *rhetori(cus)*, rhetorical. See *rhetoric*, *n.*] Rhetorical; formerly, eloquent.

rhetorical, *a.* **II.** *n. pl.* In some colleges in the United States, rhetorical exercises (declamations, etc.) held publicly before all the students of the college.

rheumatic, *a.* **7**†. Pathetic; affecting; bringing a flow of tears from the eyes.

> Perhaps you have heard
> The *rheumatic* story of some loving chandler now,
> Or some such melting fellow, that you talk
> So prodigal of men's kindness.
> *Beau. and Fl.*, The Nice Valour, ii. 1.

rheumatism-weed (rö′mạ-tizm-wēd), *n.* **1.** Either the spreading dogbane, *Apocynum androsæmifolium*, or the Indian hemp, *A. cannabinum*.—**2.** The pipsissewa or prince's-pine, *Chimaphila umbellata.*

rhexis (rek′sis), *n.* [NL., < Gr. *ῥῆξις*, breaking, rupture, < *ῥηγνύναι*, break.] In *pathol.*, rupture of a blood-vessel or of any organ.

> It is difficult to determine whether the hemorrhages result from diapedesis or from *rhexis*.
> *Buck*, Med. Handbook, II. 93.

R. H. G. An abbreviation of *Royal Horse Guards.*

rhinacanthin (rī-na-kan′thin), *n.* [*Rhinacanthus* (see def.) + *-in*².] A tasteless viscous resin, $C_{14}H_{18}O_4$, found in the root of *Rhinacanthus communis.*

rhinanthin (rī-nan′thin), *n.* [*Rhinanthus* (see def.) + *-in*².] A bitter-sweet crystalline glucoside, $C_{29}H_{52}O_{20}$, found in the seeds of *Rhinanthus major*. It is easily hydrolyzed to rhinanthogen and a sugar.

rhinanthogen (rī-nan′thọ-jen), *n.* [*rhinanth(in)* + *-gen*.] A brown amorphous substance formed by the hydrolysis of rhinanthin.

rhinarium, *n.* **2.** The area of bare skin around the nostrils of ruminants; the muffle.

rhinhuka (rē-nyö′kä), *n.* [S. Amer. (Chilean).] The name given in Chile to a predatory bug, probably of the family *Reduviidæ*, which enters human dwellings and is greatly feared.

> Many species in this family [*Belostomatidæ*] occur in tropical America and frequently prove troublesome, among them a species related to the "wheel-bug," which occurs in Chili and is called the "winhuka" or "*rhinhuka*." It is said to be greatly feared, and, if numerous, to drive people for a time from their dwellings.
> *Buck*, Med. Handbook, V. 162.

rhinion (rin′i-on), *n.*; pl. *rhinia* (-ạ̈). [NL., < Gr. *ῥινίον*, nostril, dim. of *ῥίς* (*ῥιν-*), nose.] In *craniom.*, the lowest point of the suture between the nasal bones on their facial side. *Von Török.*

rhinitis, *n.*—**Atrophic rhinitis,** chronic inflammation resulting in atrophy of the nasal mucous membrane.—**Hypertrophic rhinitis,** inflammation with swelling of the mucous membrane of the nasal cavities, usually followed by the atrophic form.

rhino² (rī′nọ), *n.* An abbreviation of *rhinoceros*. *Geog. Jour.* (R. G. S.), XI. 393.

rhinocarcinoma (rī-nọ-kär-si-nō′mạ̈), *n.*; pl. *rhinocarcinomata* (-mạ-tạ̈). [NL., < Gr. *ῥίς* (*ῥιν-*), nose, + *καρκίνωμα*, cancer.] Cancer of the nose.

Rhinocaris (rī-nok′a-ris), *n.* [NL., < Gr. *ῥίς* (*ῥιν-*), nose, + *καρίς*, shrimp.] A genus of Devonian phyllocarid *Crustacea* with a bivalved carapace, the parts of which interlock at a single point only. They have accessory rostral and median plates, the abdomen protrudes from the carapace, and the tail is three-spined.

rhinoceros, *n.*—**Square-mouthed rhinoceros.** See *kobaoba.* **White rhinoceros.** See *kobaoba.*

rhinocœlian (rī-nọ̄-sē′li-ạn), *a.* [*rhinocœlia* + *-an.*] Of or pertaining to the rhinocœlia, or cavity of the rhinencephalon.

rhinocœlic (rī-nọ̄-sē′lik), *a.* Same as ★*rhinocœlian.*

rhinogenous (rī-noj′e-nus), *a.* [Gr. ῥίς (ῥιν-), nose, + *-gen* + *-ous.*] Of nasal origin.

> The existence of cerebral disease of *rhinogenous* origin has received scant or no attention from writers on general medicine and surgery. *Med. Record*, Nov. 9, 1907, p. 767.

rhinolaryngology (rī-nọ̄-lar-ing-gol′ọ̄-ji), *n.* [Gr. ῥίς (ῥιν-), nose, + λάρυγξ (λαρυγγ-), larynx, + -λογια, < λέγειν, speak.] The medical specialty dealing with diseases of the nose and larynx. *Med. Record*, Jan. 24, 1903, p. 153.

Rhinoliparis (rī-nō-lip′a-ris), *n.* [NL., < Gr. ῥίς (ῥιν-), nose, + NL. *Liparis.*] A genus of deep-sea fishes, of the family *Liparididæ*, found in northern seas.

rhinolithic (rī-nọ̄-lith′ik), *a.* [*rhinolith* + *-ic.*] Pertaining to, or of the nature of, a rhinolith.

rhinomacerid (rī-nọ̄-mas′ẹ-rid), *n.* and *a.* **I.** *n.* A member of the family *Rhinomaceridæ.*

II. *a.* Having the characters of or belonging to the coleopterous family *Rhinomaceridæ.*

rhinonecrosis (rī″nọ̄-nek-rō′sis), *n.* [NL., < Gr. ῥίς (ῥιν-), nose, + νέκρωσις, deadness. See *necrosis.*] Necrosis of the nasal bones or cartilages.

rhinopharyngeal (rī″nọ̄-fạ̄-rin′jẹ̄-ạl), *a.* [Gr. ῥίς (ῥιν-), nose, + E. *pharyngeal.*] Of or pertaining to the nose and the pharynx.

rhinopharynx (rī-nọ̄-far′ingks), *n.* [NL., < Gr. ῥίς (ῥιν-), nose, + φάρυγξ, pharynx.] Same as *nasopharynx.*

rhinophymatous (rī-nō-fī′mạ-tus), *a.* [*rhinophyma(t-)* + *-ous.*] Relating to or affected with rhinophyma.

rhinorrhaphy (rī-nor′ạ-fi), *n.* [Gr. ῥίς (ῥιν-), nose, + -ραφια, < ῥαφή, sewing.] A surgical operation for the removal of an epicanthis.

Rhinoscopelus (rī-nọ̄-skop′e-lus), *n.* [NL., < Gr. ῥίς (ῥιν-), nose, + NL. *Scopelus.*] A genus of deep-sea fishes of the family *Myctophidæ.* Most of the species are found in the Atlantic.

rhinosphenal (rī-nọ̄-sfē′nạl), *n.* [Gr. ῥίς (ῥιν-), nose, + σφήν, wedge, + *-al*[1].] The anterior unpaired bone of the lower surface of the cranium in fishes. It often bears teeth. See *vomer*, 1. *Starks*, Synonymy of the Fish Skeleton, p. 509.

Rhinotriacis (rī-nō-trī′ạ-sis), *n.* [NL., < Gr. ῥίς (ῥιν-), nose, + NL. *Triacis, Triakis*, a related genus.] A genus of sharks known from the coast of California and belonging to the family *Galeidæ.*

rhipicerid (rī-pis′ẹ-rid), *n.* and *a.* **I.** *n.* A member of the coleopterous family *Rhipiceridæ.*

II. *a.* Having the characters of or belonging to the family *Rhipiceridæ.*

rhipidoglossal (rip″i-dọ̄-glos′ạl), *a.* Same as *rhipidoglossate.*

rhipiphorid (rī-pif′ọ̄-rid), *n.* and *a.* **I.** *n.* A member of the coleopterous family *Rhipiphoridæ.*

II. *a.* Having the characters of or belonging to the family *Rhipiphoridæ.*

rhizina, *n.* **2.** [*cap.*] [NL. (Fries, 1815).] A genus of discomycetous fungi having fleshy, flat, spreading ascocarps frequently becoming irregular and provided with cylindrical root-like strands of mycelium below. The spores are unicellular and colorless. Eight species have been described. *R. inflata* occurs on burned places in woods and is suspected of being the cause of certain root diseases of forest trees, especially pines. It is widely distributed in Europe, Asia, and North America.

Rhizinaceæ (rī-zi-nā′sẹ-ē), *n. pl.* [NL., < *Rhizina* (see ★*rhizina*, 2) + *-aceæ.*] A small family of discomycetous fungi, so named from the genus *Rhizina.*

rhizobia (rī-zō′bi-ạ̈), *n. pl.* [NL., < Gr. ῥίζα, root, + βίος, life.] Same as *nodule-bacteria* (which see, under ★*bacterium*).

rhizobic (rī-zō′bik), *a.* Of or pertaining to the rhizobia, or nodule-forming bacteria.

rhizoclon (rī′zọ̄-klōn), *n.* [Gr. ῥίζα, a root, + κλών, a twig.] In the spicular elements of the sponges, a delicate curved and irregularly branched spicule.

Rhizoctonia (rī-zok-tō′ni-ạ̈), *n.* [NL. (De Candolle, 1815), < Gr. ῥίζα, root, + κτείνειν, kill.] A genus of fungi consisting of sterile mycelia which produce root-rot in various plants. The hyphæ are rather stout and dark-colored. *R. violacea* attacks the roots of clover and alfalfa, producing a violet coating at first and later black sclerotia. *R. Solani* attacks potatoes. *Corticium vagum Solani* is said to be the fruiting condition of this species.

rhizodontropy (rī-zọ̄-don′trọ̄-pi), *n.* [Gr. ῥίζα, root, + ὀδούς (ὀδοντ-), tooth, + -τροπια, < τρέπειν, turn.] The joining of an artificial crown to the root of a tooth by means of pegs.

rhizodontrypy (rī-zọ̄-don′tri-pi), *n.* [Gr. ῥίζα, root, + ὀδούς (ὀδοντ-), tooth, + τρυπᾶν, bore, + *-y*[3].] The operation of boring into the root of a tooth to let out retained morbid matter.

rhizomatic (rī-zọ̄-mat′ik), *a.* [Gr. ῥίζωμα(τ-). See *rhizome.*] Pertaining to rhizomes; having the nature or appearance of a rhizome; rhizomalous.

rhizomatous (rī-zō′mạ-tus), *a.* [Gr. ῥίζωμα(τ-), root, + *-ous.* See *rhizome.*] Pertaining to, or of the nature of, a rhizome; having rhizomes; rhizomatic.

> It is interesting to note further how the monocotylous type has developed so largely upon restricted lines in the way of short *rhizomatous*, often tuberous, growth.
> *I. B. Balfour*, in Rep. Brit. Ass'n Advancement of Sci., [1901, p. 828.

rhizomic (rī-zom′ik), *a.* [*rhizome* + *-ic.*] Belonging to or consisting of rhizomes.

> The examination of *rhizomic* material of the unique fern Matonia pectinata collected by Mr. Tansley on Mount Ophir forms the subject of some notes by Miss G. Wigglesworth. *Nature*, Aug. 21, 1902, p. 399.

rhizomorin (rī-zọ̄-mō′rin), *n.* [See ★*Rhizomorina.*] In the spicular skeletons of the lithistid sponges, one of the small radiciform branching elements.

Rhizomorina (rī″zō-mō-rī′nạ̈), *n. pl.* [NL., < Gr. ῥίζα, root, + *μόρος for μέρος, a part, + *-ina*[2].] A suborder of the lithistid sponges in which the skeletal elements are small, constituted of four or three principal rays, and of a great variety of irregular forms. The species are chiefly Jurassic, Cretaceous, and recent.

rhizophilous (rī-zof′i-lus), *a.* [Gr. ῥίζα, root, + φιλεῖν, love.] Root-loving; growing or parasitic upon roots.

rhizophoraceous (rī″zọ̄-fọ̄-rā′shius), *a.* Belonging to or resembling the *Rhizophoraceæ*, or mangrove family of plants.

rhizopodist (rī-zop′ọ̄-dist), *n.* [*rhizopod* + *-ist.*] A student of the *Rhizopoda.*

> This handsome species was for a long time . . . almost unknown to *rhizopodists.*
> *Proc. Zool. Soc. London*, 1902, p. 231.

Rhizopogon (rī-zop′ọ̄-gon), *n.* [NL. (Fries, 1818), < Gr. ῥίζα, root, + πώγων, a beard: in allusion to the beard-like strands of mycelium arising from the peridium.] A genus of subterranean gasteromycetous fungi. The plants are tuber-like and have a membranous or somewhat leathery peridium not easily separable from the gleba, which is compact and divided into small irregular chambers. About 15 species are known. *R. rubescens* is a widely distributed species growing just beneath the surface of soil in old pine woods and sometimes reaching the size of a walnut.

Rhizopus (rī′zọ̄-pus), *n.* [NL. (Ehrenburg, 1821), < Gr. ῥίζα, root, + πούς, foot.] A genus of zygomycetous fungi having conidial sporophores arising from rhizoids developed at the ends of aërial hyphæ. *R. stolonifer* is a very common mold, occurring on decaying fruits and vegetables.

rhizotic (rī-zot′ik), *a.* Same as *rhizote.*

rhizotomist (rī-zot′ọ̄-mist), *n.* [Gr. ῥιζοτόμος, cutting roots, + *-ist.*] A collector of roots for medicinal purposes. *N. E. D.*

rho (rō), *n.* [Gr. ῥῶ, from the Phen. form cognate with Heb. *rōsh*, head, *rēsh*, name of the letter.] The Greek letter ρ, corresponding to the English *r.*

rhodalite (rō′dạ-līt), *n.* [Gr. ῥοδαλός, of roses (< ῥόδον, rose), + *-ite*[2].] A soft earthy mineral of a rose-red color occurring in the amygdaloid of Antrim, Ireland. It is allied to the clays.

rhodamine (rō-dam′in), *n.* [Gr. ῥόδον, rose, + E. *amine.*] A phthalein formed from metaminophenol or one of its derivatives. The simplest rhodamine, $C_{20}H_{13}O_3(NH_2)_2$, is formed from metaminophenol and phthalic anhydrid. The rhodamines, especially those which are alkylated, are strongly colored. They are usually red, and in solution show greenish fluorescence.—**Rhodamine S**, an artificial dyestuff, a condensation-product of diethyl-meta-amidophenol with succinic instead of phthalic anhydrid. It gives about the same effects in dyeing as rhodamine itself.—**Rhodamine 3 B.** See ★*anisoline.*

rhodan (rō′dan), *n.* [Gr. ῥόδον, rose, + *-an.*] Same as ★*thiocyanogen.*

rhodanate (rō′dạ-nāt), *n.* [*rhodan* + *-ate.*] Same as ★*thiocyanate.* Also called *rhodanide.*

Rhodanian (rọ̄-dā′ni-ạn), *n.* [L. *Rhodanus*, the river Rhone, + *-ian.*] In *geol.*, a term employed by the French geologists as practically equivalent to *Urgonian* (which see).

rhodanide (rō′dạ-nid), *n.* [*rhodan* + *-ide*[1].] Same as ★*thiocyanate.* Also called *rhodanate.*

rhodate (rō′dāt), *n.* [*rhod(ic)* + *-ate*[1].] The salt of a hypothetical rhodic acid. Potassium rhodate perhaps exists in a blue-violet liquid obtained by passing chlorin into an alkaline solution of the rhodium hydroxid, $Rh_2(HO)_6$.

Rhode Island bent. See ★*bent*[2].

Rhodesian (rọ̄-dē′ziạn), *a.* and *n.* **I.** *a.* Of or pertaining to Rhodesia.

> In November 1897 the *Rhodesian* Railway, forming a continuation of the Cape trunk line to Vryburg, in Bechuanaland, had reached Bulawayo.
> *Encyc. Brit.*, XXXII. 232.

Rhodesian fever. See ★*fever*[1].—**Rhodesian red-water.** Same as *African Coast* ★*fever.*—**Rhodesian tick-fever.** Same as *African Coast* ★*fever.*

II. *n.* **1.** A native or an inhabitant of Rhodesia of European ancestry.

> No one could fail to be impressed by the magnificence of the mighty river, much less a *Rhodesian*, used to a country in which, during the greater portion of the year, running water is the exception.
> *Geog. Jour.* (R. G. S.), XVIII. 64.

2. One of the 'Rhodes Scholars' entered at Oxford University under the terms of the will of Cecil Rhodes, who died in South Africa in 1903.

> The 79 Rhodes Scholars who remain to us from last year have been reinforced by another 67. This brings the number in residence to something like 30 short of the total for whom provision is made under the terms of the will. . . . The *Rhodesians* are well spread out amongst the Colleges. Of the present year Christ Church takes 7; Balliol and Oriel, 5; Exeter, St. John's, Queen's and Magdalen, 4; and the other Colleges 3 or less.
> *Athenæum*, Dec. 16, 1905, p. 837.

rhodic (rō′dik), *a.* In *chem.*, noting rhodic acid. See ★*rhodate.*—**Rhodic oxid** and **rhodic salt**, compounds of rhodium with oxygen and with an acid radical respectively, in which rhodium presents apparently triad valence.

rhodiene (rō′di-ēn), *n.* [Gr. ῥόδον, rose, + *-i-* + *-ene.*] A sesquiterpene, $C_{15}H_{24}$, obtained from the oil of rosewood.

rhodinal (rō′di-nạl), *n.* [*rhodin-ol* + *-al*[3].] An unsaturated aldehyde, $(CH_3)_2C:CHCH_2CH_2CH(CH_3)CH_2CHO$, prepared by the oxidation of rhodinol. Also called 2,6-*dimethyloctene-2-al*-8.

rhodinol (rō′di-nol), *n.* [Gr. ῥόδινος, of roses, + *-ol.*] An alcohol, $(CH_3)_2C:CHCH_2CH_2CH(CH_3)CH_2OH$, having the odor of roses. It is found in Turkish rose-oil and in geranium- and pelargonium-oils. It boils at 211–212° C. The name rhodinol has also been given sometimes to geraniol and to mixtures consisting chiefly of geraniol.

rhodite (rō′dīt), *n.* [Gr. ῥόδον, rose, + *-ite*[2].] Rhodium-gold.

rhodium-platinum (rō′di-um-plat″i-num), *n.* An alloy of rhodium and platinum, generally made with 10 per cent. of rhodium and 90 per cent. of platinum. A thermo-electric couple of this alloy and pure platinum is often used in the measurement of high temperatures.

rhodizonic (rō-di-zon′ik), *a.* Noting an acid, a substance formed from inosite when Scherer's test is applied.

Rhodobacteria (rō″dọ̄-bak-tē′ri-ạ̈), *n. pl.* [NL., < Gr. ῥόδον, rose, + NL. *bacteria*, pl. of *bacterium.*] A group of bacteria, of wide distribution, remarkable for having the cell-contents usually colored various shades of red or purple by the presence of bacteriopurpurin. *Nature*, Nov. 21, 1907, p. 53.

Rhodobacteriaceæ (rō″dọ̄-bak-tē″ri-ā′sẹ̄-ē), *n. pl.* [NL., < Gr. ῥόδον, rose (red), + NL. *bacterium* + *-aceæ.*] A family of bacteria in which the cell-contents are colored red or violet and contain sulphur granules. Many species have been described by Winogradsky, most of which are little known at present.

rhodochroisite (rō-dọ-krō'i-sīt), *n.* Same as *rhodochrosite.*

rhodocyte (rō'dọ-sīt), *n.* [Gr. ῥόδον, rose, + κύτος, a hollow (a cell).] A red blood-corpuscle.

rhodolite (rō'dọ-līt), *n.* [Gr. ῥόδον, rose, + λίθος, stone.] A variety of garnet of rose-red color and brilliant luster, sometimes used as a gem: found in Macon county, North Carolina.

Rhodophyceæ (rō-dọ-fī'sē̤-ē), *n. pl.* [NL., < Gr. ῥόδον, rose (red), + φῦκος, seaweed, + *-eæ.*] One of the principal classes of the algæ. It contains most of those forms that are red in color, practically all of which are marine.

rhodophyceous (rō-dọ-fī'shius), *a.* Of or pertaining to the red algæ or *Rhodophyceæ.*

rhodoplast (rō'dọ-plȧst), *n.* [Gr. ῥόδον, rose (red), + πλαστός, formed.] In *cytol.*, one of the chromatophores which bear the red coloring matter in the cells of the red algæ (*Rhodophyceæ*).

rhodospermous (rō-dọ-spėr'mus), *a.* Of or belonging to the *Rhodospermeæ* or red algæ.

Rhodotypos (rō-dọ-tī'pos), *n.* [NL. (Siebold and Zuccarini, 1835), < Gr. ῥόδον, the rose, + τύπος, type, pattern, because this genus elucidates the morphology of the rosaceous flower.] A monotypic genus of plants of the family *Rosaceæ*, allied to *Kerria. R. kerrioides*, from Japan, is a handsome and hardy shrub, with ovate-acuminate leaves, pure white flowers more than an inch across, and attractive shining black persistent drupelets.

rhodusite (rō'dus-īt), *n.* [Irreg. < L. *Rhodus*, Rhodes, + *-ite*².] A variety of glaucophane of a lavender-blue color which resembles asbestos in structure: found on the island of Rhodes.

rhombed (rombd), *a.* [*rhomb* + *-ed.*] Rhomboid.

rhombencephalon (rom-ben-sef'a̤-lon), *n.* [NL., < Gr. ῥόμβος, rhomb, + ἐγκέφαλος, brain.] The area of brain-substance which surrounds the fourth ventricle.

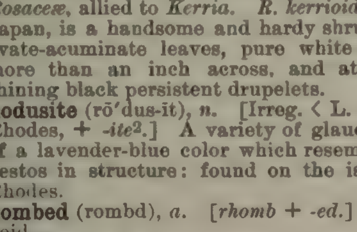
Rhombohedral class. See ★*symmetry*, 6.

rhomboid, *n.* 4. In *anthrop.*, a cranium the norma verticalis of which has a rhomboid form. *S. Sergi* (trans.), Var. of the Human Species, p. 30.—**Sacral rhomboid,** a flattened area of irregular rhomboidal shape just above and between the diverging masses of the nates.

rhomboidal, *a.* 2. Specifically, in *anat.*, said of muscles whose fibers run obliquely from the point of origin to the point of insertion, as in the so-called 'penniform muscles' in which a large number of fibers are attached to a long tendon-like barrel on the side of a feather. Correlative with ★*pyramidal*, 3, or *triangular*, and ★*prismatic*, 3.

rhomboid-ovate (rom-boid-ō'vāt), *a.* Resembling a rhomboid and an oval.

Rhomboplites (rom-bop-lī'tēz), *n.* [NL., < Gr. ῥόμβος, rhomb, + ὁπλίτης, armed.] A genus of lutianoid fishes found in the West Indies.



Rhomboplites aurorubens.
(From Bulletin 47, U. S. Nat. Museum.)

Rhombopteria (rom-bop-tē'ri-ä̤), *n.* [NL., < Gr. ῥόμβος, rhomb, + πτερόν, wing.] A primitive genus of prionodesmaceous pelecypods allied to *Pterinea* and presenting the earliest expression of the hinge-structure peculiar to the *Pterineidæ.* It occurs in the Upper Silurian rocks.

rhopalium (rọ-pā'li-um), *n.*; pl. *rhopalia* (-ä̤). [NL., < Gr. ῥοπάλιον, dim. of ῥόπαλον, a club, a stick.] A kind of sense-organ, or marginal body, as in *Scyphomedusæ.*

> Sense organs when present are modified tentacles, variously designated as tentaculocysts, *rhopalia*, etc.
> *Amer. Nat.*, May, 1903, p. 331.

rhopography (rọ-pog'ra̤-fi), *n.* [Gr. ῥωπογραφία, < ῥῶπος, small wares, + γράφειν, write.] Painting in still life. *N. E. D.* [Rare.]

Rhotomagian, *n.* See ★*Rotomagian.*

rhubarb-curculio (rö''bärb-kėr-kū'li-ō), *n.* An American curculionid beetle, *Lixus concavus*, which lays its eggs in the stems of rhubarb, in which its larvæ subsequently develop.

rhumb-track (rumb'trak), *n.* Same as *rhumb-line.*

> The *rhumb track*, the great circle, and the polar track.
> *Encyc. Brit.*, XXXI. 110.

rhyacophilid (rī-a̤-kof'i-lid), *n.* and *a.* **I.** *n.* A member of the trichopterous family *Rhyacophilidæ.*

II. *a.* Having the characters of or belonging to the family *Rhyacophilidæ.*

Rhynchias (ring'ki-as), *n.* [NL., < Gr. ῥύγχος, a snout, muzzle.] A genus of fishes known only from an old description. No specimens of it are in the collections. It is supposed to be related to *Ammodytes.*

rhynchitid (ring'ki-tid), *n.* and *a.* **I.** *n.* A member of the coleopterous family *Rhynchitidæ.*

II. *a.* Having the characters of or belonging to the family *Rhynchitidæ.*

rhynchocephalic (ring''kō-se-fal'ik), *a.* Same as *rhynchocephalian. Proc. Zool. Soc. London*, 1901, p. 97.

rhynchocephaloid (rin-kō-sef'a̤-loid), *a.* [*Rhynchocephali(a)* + *-oid.*] Pertaining to, having the characters of, or resembling, the reptiles of the order *Rhynchocephalia.* Applied to various extinct reptiles.

rhynchocœle, *a.* **II.** *n.* In nemerteans, a closed tubular cavity with muscular walls lying above the enteron and containing a corpusculated fluid; a proboscis-sheath. When in a state of introversion the proboscis is inclosed in this cavity. Also *rhynchocœl. Encyc. Brit.*, XXXI. 121.

rhynchocœlic (ring-kọ-sē'lik), *a.* [*rhynchocœle* + *-ic.*] Of or pertaining to a rhynchocœle. *Encyc. Brit.*, XXXI. 121.

rhynchocœlom (ring-kọ-sē'lom), *n.* [Gr. ῥύγχος, snout, + NL. *cœlom(a).*] Same as *rhynchocœlum*, *rhynchocœle. Proc. Zool. Soc. London*, 1901, p. 93.

rhynchocœlomic (ring-kọ-sẹ-lom'ik), *a.* [*rhynchocœlom* + *-ic.*] Same as *rhynchocœlic.*

rhynchocœlum (ring-kọ-sē'lum), *n.*; pl. *rhynchocœla* (-lä̤). [Gr. ῥύγχος, snout, + κοῖλον, cavity.] See the extract and ★*rhynchocœle.*

> The cavity into which the proboscis is retracted [in *Nemertina*], the *rhynchocœlum*, is formed by a split which appears in the mesoblast surrounding the epiblastic pit, which is the forerunner of the proboscis.
> *Encyc. Brit.*, XXXI. 121.

rhynchodæum (ring-kō-dē'um), *n.*; pl. *rhynchodæa* (-ä̤). [NL., < Gr. ῥύγχος, snout, + ὁδός, path.] In nemerteans, a cavity in the precerebral region extending from the rhynchocœle to the rhynchostome.

> The alimentary canal [in nemerteans] presents no peculiar features. . . . The œsophagus opens into the *rhynchodæum* about halfway between the tip of the snout and the commencement of the brain.
> *Proc. Zool. Soc. London*, 1901, p. 92.

Rhynchosauria (ring-kọ-sâ'ri-ä̤), *n. pl.* [NL., < Gr. ῥύγχος, snout, + σαῦρος, lizard.] A group of extinct reptiles, regarded as an order or suborder, of small or moderate size, having toothless jaws and palatines furnished with small pavement-teeth. The skull is short and broad in some genera, long and narrow in others. The vertebræ are biconcave (amphicœlous) and not perforated by the notochord. Some of the species bear a superficial resemblance to the living *Hatteria.*

rhynchosporous (ring-kos'pọ-rus), *a.* [*Rhynchospor(a)* + *-ous.*] Having a beaked fruit or seed.

rhynchostome (ring'kọ-stōm), *n.* [Gr. ῥύγχος, snout, + στόμα, mouth.] In nemerteans, the proboscis-pore.

rhynchotal (ring-kō'ta̤l), *a.* [*Rhynchot(a)* + *-al*¹.] Same as *rhynchotous. Nature*, Oct. 23, 1903, p. 616.

rhynchote, *a.* **II.** *n.* A member of the *Rhynchota.*

Rhynsburger (rīnz'bėr-gėr), *n.* Same as *Collegiant*, which see: so called from the name of the city where the sect held its meeting, Rhynsburg (Rijnsburg), near Leyden, Holland.

rhyocrystal (rī-ọ-kris'ta̤l), *n.* [Irreg., < Gr. ῥύαξ, a stream, + E. *crystal.*] A phenocryst which grows in a molten magma while floating in the moving current during an eruption. *Amer. Geol.*, Feb., 1905, p. 70.

Rhyolitic structure. Same as *fluidal structure.*

rhyparia (rī-pā'ri-ä̤), *n.* [NL., < Gr. ῥυπαρία, filthiness, < ῥυπαρός, filthy, dirty, < ῥύπος, filth, dirt.] Sordes; rupia.

rhyparographer (rip-a̤-rog'ra̤-fėr), *n.* [See *rhyparography.*] One who practises rhyparography or the painting of mean, low, or trivial subjects.

rhyparographist (rip-a̤-rog'ra̤-fist), *n.* Same as ★*rhyparographer.*

rhyphid (rī'fid), *n.* and *a.* **I.** *n.* A member of the dipterous family *Rhyphidæ.*

II. *a.* Having the characters of or belonging to the family *Rhyphidæ.*

rhypography (rī-pog'ra̤-fi), *n.* Same as *rhyparography.*

rhypophagy (rī-pof'a̤-ji), *n.* [Gr. ῥυπαρός, foul, filthy, + -φαγια, < φάγειν, eat.] The eating of filth.

rhyssodid (ri-sod'id), *n.* and *a.* **I.** *n.* A member of the coleopterous family *Rhyssodidæ.*

II. *a.* Having the characters of or belonging to the family *Rhyssodidæ.*

rhythm, *n.*—**Cantering rhythm,** a disturbance of the normal rhythm of the heart-sounds in which a third is interjected between the two normal sounds.—**Cheyne-Stokes rhythm.** Same as *Cheyne-Stokes respiration* (which see, under *respiration*).—**Coupled rhythm,** a disturbance of the normal relation of pulse- and heart-beats in which every second pulsation of the heart is so feeble that it produces no pulse at the wrist. *Lancet*, Aug. 22, 1903, p. 523.—**Gallop rhythm.** See ★*gallop.*—**Intensity-rhythm,** a rhythm which depends wholly upon differences of intensity in the recurrent stimuli; a rhythm in which the quality and duration of the stimuli are the same throughout. *Scripture*, Exper. Phonetics, p. 517.—**Motor rhythm,** in *psychol.*, rhythmic action; a rhythm couched in motor or kinesthetic terms: opposed to *auditory rhythm. Scripture*, Exper. Phonetics, p. 523.—**Organic rhythm,** in *psychol.*, a rhythm based upon the periodic recurrence of sensation-complexes or of motor adjustments in the organism.

> The effect of this accent of attention can be increased (*a*) by *organic rhythms*, sensations vibrating in unison with the attention rhythm; (*b*) by a rhythm in the affective tone.
> *C. R. Squire*, in Amer. Jour. Psychol., XII. 560.

Primary rhythm, an objectively conditioned rhythm, simple in character, which forms the basis of the perception of rhythm and the material for the development of more definite and complex secondary rhythms. See the extract.

> If equal or simply-proportionate intervals of time be marked off to any of our senses by any recurrent series of similar events, we may be said to perceive a *primary rhythm* through that sense.
> *S. Lanier*, Sci. of Eng. Verse, p. 62.

Quality rhythm, in *psychol.* and *phonet.*: (*a*) A rhythm produced by alternation of pitches—in the simplest case, by tones alike in all attributes save that of pitch. (*b*) A rhythm produced by alternations of clang-tint—in the simplest case, by compound tones alike in duration, pitch, and energy, but different in tint (as proceeding from different instruments, or sung by different voices). *Scripture*, Exper. Phonetics, p. 517.—**Resistance rhythm,** in *psychol.*, a subjective rhythm produced by the attempt to inhibit the involuntary movements accompanying the perception of an objectively rhythmical series. *C. R. Squire*, in Amer. Jour. Psychol., XII. 560.—**Rhythm consciousness,** in *psychol.*, the group of mental processes constituting the perception and the feeling of rhythm, and forming by their nature and disposition a specific consciousness. *E. B. Titchener*, Exper. Psychol., I. i. 177.—**Septuple rhythm** or **time,** in *music*, a rhythm with seven beats to the measure.—**Simple rhythm** or **time.** (*a*) See *simple time.* (*b*) In *music*: (1) Same as *duple rhythm.* (2) A rhythm with only two or three beats to the measure: opposed to *compound rhythm* or *time.* See *compound measure.*—**Waltz rhythm.** Same as *triple rhythm.* See *rhythm*, 2 (*b*).

Rhythmical pattern. Same as *rhythm*, 2 (*b*). See also ★*metric pattern.*—**Rhythmical accent.** See ★*accent.*

rhythmicity (rith-mis'i̤-ti), *n.* Rhythmical character; rhythmicality.

> Ordinarily the pulse rate presents more or less regular and extensive variations in the course of a day, which are sometimes designated "diurnal." They are hardly the expression of an inherent *rhythmicity*, . . . but rather the result of the complex and ever-changing activities which characterize the successive periods of a complete day.
> *Buck*, Med. Handbook, III. 109.

rhythmizable (rith'mī-za̤-bl), *a.* Capable of being rhythmically treated. [Rare.] *Yale Psychol. Studies*, 1901, p. 70.

rhythmization (rith-mi-zā'sho̤n), *n.* [*rhythmize* + *-ation.*] The throwing or bringing of successive impressions into rhythmical form; or, the taking on of the rhythmical form by such a succession.

> We have now to differentiate our series of clicks, and so to study the various objective factors in *rhythmisation.*
> *E. B. Titchener*, Exper. Psychol., I. i. 176.

rhytidosis (rī-ti-dō'sis), *n.* [NL., < ῥυτίς (ῥυτιδ-), a wrinkle, pucker, + *-osis.*] Wrinkling, especially a wrinkling and collapse of the cornea.

Rhytisma (rī-tis'mä̤), *n.* [NL. (Fries, 1823), < Gr. ῥυτίς, a wrinkle: from the wrinkled appearance of the surface of the fungus.] A genus of parasitic discomycetous fungi having black ascocarps formed beneath the epidermis of the host. The pycnidial condition has been called

Melasmia. The ascospores develop after the leaves have fallen. The spores are long, slender, and hyaline. Many species have been described. *R. Acerinum* is frequently found on maple-leaves forming black elevated wrinkled blotches. *R. Salicinum* is common on willow-leaves.

ri, *n.* 2. A Japanese unit of area, equal to 15.5 square kilometers.

R. I. An abbreviation of *Rhode Island.*

ria (rē'ä), *n.* [Sp. *ria*, the mouth of a river, < *rio*, < L. *rivus*, a river.] In *phys. geog.*, a drowned valley: distinguished from a fiord by the absence of all forms due to glacial erosion. Also written *rias.*

The opposite form, an inlet of the sea, is known when wide as a gulf, bay, or bight, according to size and degree of inflexion, or as a fjord or *ria* when long and narrow.
Encyc. Brit., XXVIII. 622.

R. I. A. An abbreviation of *Royal Irish Academy.*

ria-coast (rē'ä-kōst), *n.* In *phys. geog.*, a coast the bays and headlands of which result from the partial submergence or drowning of a normally sculptured land-surface. See ★*ria.*

A further subdivision depends on the character of the interrelation of land and sea along the shore producing such types as a fjord-coast, *ria-coast*, or lagoon-coast.
Encyc. Brit., XXVIII. 623.

rib^1, *n.* 6. In *ceram.*, a small piece of wood, leather, or calabash with a straight or curved profile, and usually having a hole in the center for the thumb and finger, used to smooth the surface of a vessel while it is revolving on the wheel. Also called *profile* or *smoother.*

R. I. B. A. An abbreviation of *Royal Institute of British Architects.*

rib-band, *n.*—**Floor rib-band**, in *ship-building*, a rib-band supporting the outer end of the floors while the frames are being erected on the building-slip. See cut under *harping*, 2. Also called *floor-ribbon.*

ribber (rib'ėr), *n.* A mechanism applied to a knitting-machine for producing ribbed knit goods.

ribbon, *n.* 15. The banding in slates due to the preservation of the original bedding, which may be related to the cleavage at any angle.

The normal product of roofing slates is called No. 1 stock, and this is entirely free from *ribbons.* In addition to the first quality there is a small proportion of the product manufactured into No. 1 *Ribbon* and No. 2 *Ribbon*, the former containing *ribbons* near one end only, so that when laid on the roof the exposed parts are free from them. *Rep. U. S. Geol. Surv.*, 1897–98, vi. 257.

Blue ribbon. (*e*) The mark of the first prize at horse, cattle, or dog shows, etc.—**Lustering ribbon**, a plain glossy silk ribbon used for binding and trimming.—**Picot ribbon**, a ribbon with an ornamental edging of purls or small loops.—**Taffeta ribbon**, a plain or very finely corded silk ribbon.

ribbon, *v.* II. *intrans.* To stretch into long strips like ribbons: sometimes with *out*, as soap at one stage of its manufacture.

ribbon-back (rib'ọn-bak), *n.* In furniture, especially chairs, a back decorated in a ribbon design carved in wood.

ribboner (rib'ọn-ėr), *n.* [*ribbon* + *-er^2*.] One who wears a ribbon as a badge: usually qualified.—**Blue ribboner**, a member of a society pledged to total abstinence from intoxicating drink.—**White ribboner**, a member of a society which is pledged to promote social and personal purity of life.

American Medicine pokes some fun at the *White Ribboners* for their inconsistencies in the matter of alcohol.
Amer. Physician, Jan., 1903, p. 35.

ribbon-fern (rib'ọn-fėrn), *n.* See ★*fern^1.*

ribbon-fish, *n.* 2. A fish of the genus *Eques*, especially *E. lanceolatus.*

ribbon-gum (rib'ọn-gum), *n.* See ★*gum^2.*

ribbon-lapper (rib'ọn-lap"ėr), *n.* Same as ★*ribbon-machine.*

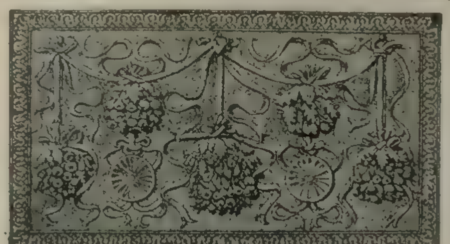
ribbon-machine (rib'ọn-ma-shēn"), *n.* A machine for preparing cotton, in the form of laps, for the Heilmann cotton-combing machine. Also called *ribbon-lapper* and *lap-machine.*

ribbon-movement (rib'ọn-möv"mẹnt), *n.* In a type-writer, the mechanism employed to feed the inking-ribbon under the carriage from side to side of the machine in such a way that a fresh surface of the ribbon shall be placed at the point where the next letter is to be stamped on the paper. This feeding mechanism varies greatly in different machines, the aim in all being to wind the ribbon from one ribbon-reel to the other, to change its direction when the reel is full, and to change its lateral motion at each traverse of the ribbon. When the ribbon is charged with two inks of different colors, there is also a feed mechanism to bring either half of the bichrome ribbon to the printing point on the cylinder at the will of the operator.

ribbon-rock (rib'ọn-rok), *n.* In *mining*, vein-quartz or any form of rock which occurs in veins.

ribbonry (rib'ọn-ri), *n.* Ribbons or decorations collectively.

ribbon-work (rib'ọn-wėrk), *n.* In decorative design, a motive largely composed of ribbons, tied in knots, festooned or flowing, often used in the Italian Renaissance.



Ribbon-work.

rib-faced, *a.* Specifically, noting a deer, the muntjac, *Cervulus aureus*, so called from the two raised ridges running down the front of the head, one from the base of each antler.

ribonic (ri-bon'ik), *a.* Related to ribose.—**Ribonic acid**, a liquid, $CH_2(OH)(CH.OH)_3.COOH$, formed from the stereo-isomeric arabonic acid by heating with pyridine and water. It yields ribose when reduced with sodium amalgam.

ribose (rī'bōs), *n.* A syrupy pentose, $C_5H_{10}O_5$, formed by reducing ribonic acid with sodium amalgam and very dilute sulphuric acid.

rib-plowing (rib'plou"ing), *n.* Same as *ribbing*, 2.

rib-roast, *n.*—**Chuck rib-roast.** See *prime* ★*rib-roast.*—**Prime rib-roast**, a butchers' term for the large rib-piece cut from the fore quarter. It contains the six prime ribs and the three chuck ribs; also a single piece, including one or two of the prime ribs, cut for roasting. A roasting-piece cut from the chuck ribs is called a *chuck rib-roast.* Both cuts are called *prime beef.*

rib-twist (rib'twist), *n.* In glassware, a twist formed by cutting a stem and then twisting it so as to form spiral grooves.

rib-twisted (rib'twis-ted), *a.* Formed with a ★rib-twist (which see).

The incised or *rib-twisted* stem is a feature seldom noticed. *W. Penny*, in Burlington Mag., III. 60.

Ricardianism (ri-kär'di-ạn-izm), *n.* The economic doctrines or methods of David Ricardo.

rice^1, *n.* 2. Since 1884 rice-growing in the United States has made up in the west what it had lost on the Atlantic coast. Settlers upon the extensive plains of southwestern Louisiana and southeastern Texas applied successfully the machinery and methods employed in wheat farming on the northern prairies, securing irrigation water at first by storing the rainfall (see *providence* ★*rice*), and later by pumping from the inexhaustible supply in the gravelly substratum of the region. Extensive systems of canals fed from this source have been constructed. At the same time a better variety of rice has been introduced by the United States government. See *Japan* ★*rice.*—**American rice**, the Indian rice, *Zizania aquatica.* Also locally called *marsh rice, prolific rice*, and by many other names. *An. Rep. Bur. Amer. Ethnol.*, 1897–98, p. 1022.—**Brewers' rice**, the lowest grade of milled rice, consisting of that which is most finely broken up: so called because it is sold to brewers.—**French rice**, the amel-corn or emmer wheat, *Triticum dicoccum.*—**Gold-seed rice**, the variety chiefly grown in the Atlantic United States, thus named from the yellowish color of the ripe husk. It is esteemed among the best rices of the world in quality and yield. It has two subvarieties, a 'long-grain' and a 'short-grain.' It has mostly superseded 'white ★rice' (which see, below).—**Grains of rice.** See ★*grain^1.*—**Head rice, straight-head rice**, milled rice which has escaped breaking, hence forming the highest commercial grade, though not of a greater nutritive value than broken rice. See *Japan* ★*rice.*—**Honduras rice**, a variety much grown in the Louisiana-Texas area. It is very prolific and has a large grain, but does not bear milling as well as the Japan ★rice (which see).—**Hottentot rice**, African termites which formerly were eaten greedily, both boiled and raw, by the Hottentots.—**Japan rice, Kiusiu rice**, a type of rice introduced by the United States government from the Island of Kiusiu in Japan, where the best Japanese rice is grown. The grain is short and thick, smaller than that of Honduras rice. It excels especially by its resistance to breakage, which results in an unusually high percentage of head rice, and in its thin cuticle, and high percentage of fats, while it is also extremely prolific.—**Jungle rice**, an annual grass, *Echinochloa colona*, widely distributed in the warmer parts of the Old World, introduced in wet places southward in the United States. It has erect or ascending stems from one to two feet high, with a panicle of from five to ten densely flowered one-sided spreading spikes. It has been successfully tested as a hay grass in Texas. In India its seeds form a minor commercial cereal. Also called *millet-rice, rice-grass*, and *Shama millet.*—**Marsh rice.** See *American* ★*rice.*—**Prolific rice.** See *American* ★*rice.*—**Providence rice**, a sobriquet for rice irrigated with the unreliable surface water as opposed to water obtained by pumping from subterranean sources. See ★*rice^1*, 2. [Louisiana, Texas.]—**Red rice**, a natural variety, *rufipogon*, of *Oryza sativa*, the common rice. Either the whole or part of the substance of the grain or only the cuticle may be reddened. This is a strong-growing variety and a great pest in rice-fields, as the presence of its seeds in the crop reduces or destroys its market value.—**Rice stalk-borer.** See ★*stalk-borer.*—**Tuscarora rice.** Same as *Indian rice* (*a*) (which see, under *rice^1*).—**White rice**, a variety with the mature husk white, formerly much grown on the Atlantic coast, still used in late seedings on account of its quick maturity.—**Wild rice.** (*b*) Same as *jungle* ★*rice.*

rice^3 (rīs), *n.* [Prob. a particular use of *rice^2* = *rise^2*, a branch, a stick, etc.] A collapsible hexagonal reel upon which a hank of yarn is placed for winding on a bobbin. *R. Marsden*, Cotton Weaving, p. 272.

rice-bird, *n.* 3. In Texas, the crow-blackbird, *Quiscalus quiscula*; in the Sandwich Islands, a subspecies of the Mexican purple finch, *Carpodacus mexicanus obscurus.*

rice-blight (rīs'blīt), *n.* See ★*blight.*

rice-bran (rīs'bran), *n.* The removed cuticle of the rice grain. See ★*rice-milling.*

rice-chaff (rīs'chåf), *n.* The debris of the husks of rice. See ★*rice-milling.*

rice-creel (rīs'krēl), *n.* [*rice^3* + *creel.*] On a hank-winding machine, a frame for the very light reels called *rices*, for holding hanks of yarn. *R. Marsden*, Cotton Weaving, p. 272.

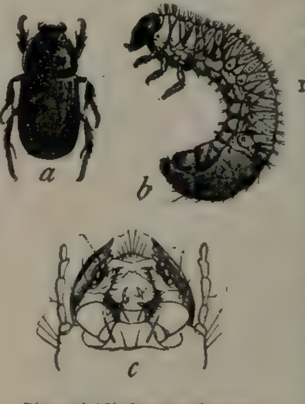
rice-eel (rīs'ēl), *n.* Same as *symbranchoid* ★*eel.*

rice-flour, *n.* 2. The layer of the rice kernel next the cuticle, rubbed off as a powder in the processes of hulling and polishing. Its food-value is many times greater than that of the polished grain, since it includes nearly all the fats. Not being by itself palatable the flour is used only as stock food. Also called *rice-meal* and *rice-dust.*

Rice-grain decoration. See *rice^1.*

rice-grass (rīs'gràs), *n.* A rough grass, *Homalocenchrus hexandrus*, growing spontaneously along watercourses in many warm countries. In the Philippine Islands it is cultivated like rice, under the name of *zacate*, for forage. It is much relished by animals. An allied species, *H. oryzoides*, is sometimes called *rice cut-grass* (which see, under *cut-grass*).

rice-grub (rīs'grub), *n.* The larva of a scarabæid beetle, *Chalepus trachypygus.* It damages the roots of upland rice in the southern United States.



Rice-grub (*Chalepus trachypygus*).
a, beetle; *b*, larva, natural size; *c*, under side of larva with head details enlarged.
(Riley, U. S. D. A.)

rice-milling (rīs'mil"ing), *n.* The operation of removing the hard, rough, and brittle husk which incloses the rice grain, and the cuticle immediately investing the kernel. This is accomplished primitively by pounding and winnowing, or in improved practice by passing the rough rice between millstones and the separated grain through a special machine called a 'huller.' The grain thus treated is said to be *cleaned.*

rice-polish (rīs'pol"ish), *n.* Rice-flour so far as produced by the polishing process.

rice-polishing (rīs'pol"ish-ing), *n.* The operation by which the pearly luster is given to commercial rice. It consists in rubbing the cleaned grain with soft moose-hide or sheepskin within a wire-gauze cylinder and giving it at the same time a thin coating of paraffin by inclosing with it lumps of that substance. See ★*rice-flour*, 2.

rice-sapper (rīs'sap"ėr), *n.* An East Indian capsid bug, *Leptocorisa acuta*, which punctures the ripening kernels of autumn rice.

rice-shell, *n.* 2. In Australia, any one of various species of *Truncatella*, a small marine mollusk. The shell is used for necklaces and derives its name from its resemblance to grains of rice. *E. E. Morris*, Austral English.

rice-smut (rīs'smut), *n.* See ★*smut.*

rice-weevil, *n.* 2. Same as *water-weevil.*

Richardson's actinometer. See ★*actinometer.*

Richelieu sauce. See ★*sauce.*

rich-leaf (rich'lēf), *n.* Same as *richweed*, 1.

richmondite (rich'mọnd-īt), *n.* [*Richmond* (see def.) + *-ite^2*.] A sulphantimonite of lead, copper, iron, and zinc occurring in black metallic masses at Richmond Hill, New Zealand.

Richmond stage. See ★*stage.*

Richthofenia (richt-hō-fē′ni-ä), *n.* [NL., named after Von *Richthofen.*] A genus of protrematous brachiopods from the Permo-Carboniferous rocks of India. It has the essential characters of the *Strophomenacea*, but these are veiled by the superabundant growth of cellular shell-tissue which gives it a form and structure similar to that of the cyathophylloid corals or that of rudistid pelecypods, such as *Radiolites* and *Hippurites.*

richweed, *n.* **3.** The great ragweed, *Ambrosia trifida;* also, less properly, the common ragweed or hogweed, *A. artemisiæfolia.*—**4.** The white snakeroot or white sanicle, *Eupatorium ageratoides.*

ricin (rī′sin), *n.* [*Ric*(*inus*) + *-in*².] An albuminoid substance of poisonous character obtained in small quantity from the seeds of the castor-oil plant, *Ricinus communis.*

ricinic (ri-sin′ik), *a.* [*Ricin*(*us*) + *-ic.*] Derived from ricinolic acid.—**Ricinic acid,** a crystalline acid, $C_{18}H_{34}O_3$, made by heating barium ricinoleate in a vacuum. It melts at 81° C.

ricinine (ris′i-nin), *n.* [*Ricin*(*us*) + *-ine*².] A crystalline alkaloid, $C_{16}H_{16}O_4N_4$, found in castor beans. It crystallizes in prisms which melt at 193° C.

ricininic (ri-si-nin′ik), *a.* [*ricinine* + *-ic.*] Derived from ricinine.—**Ricininic acid,** an acid, $C_6H_5N_2.COOH$(?), which is formed from ricinine by saponification. It appears to be carboximinomethyl-pyridine.

ricinoleate (ris-i-nō′lẹ̄-āt), *n.* [*ricinol*(*eic*) + *-ate*².] A salt of ricinolic acid.

rick¹, *n.* **1.** In parts of the United States, applied only to an oblong-shaped pile.

> Farmers often, instead of making conical stacks, put the entire crop into a long roof-shaped *rick.*
> *J. B. Killebrew*, Grasses of Tennessee, p. 283.

2. A pile of brushwood used in the concentration of weak brine from salt-wells, the brine being allowed to trickle over the pile with free exposure to the air. *Dialect Notes*, II. vi.—**3.** Along the coast from New England to Delaware, a mass of salt-marsh hay supported upon piles.

rickardite (rik′ärd-īt), *n.* [Named after T. A. *Rickard*, editor of a mining journal.] A copper telluride, Cu_4Te_3, occurring in small masses of metallic luster and bright purple color: found in Colorado.

rickey (rik′i), *n.* [Named after a Colonel *Rickey.*] A cooling drink consisting of spirits, usually gin, a wineglassful of which is put in a glass with cracked ice, a lime, and club soda.

Rictus palpebrarum, the space between the eyelids when they are widely open.

riddle², *n.* **5.** In *minting.* See the extract.

> The next process is to put the blanks through a bath of sulphuric acid, after which they are washed and dried in a barrel-shaped revolving machine, known as a "*riddle.*" They are then taken to the coining press.
> *Sci. Amer.*, Nov. 5, 1904, p. 313.

riddle-seal (rid′l-sēl), *n.* See ★*seal*².

riddling-machine (rid′ling-mạ-shēn″), *n.* See ★*sand-crusher*, 2.

ride, *v.* **I.** *intrans.*—**To ride hawse-full,** said of a vessel when it pitches bows under while at anchor. **To ride to hawse,** said of a vessel when both bow anchors are down.

II. *trans.* **7.** In *lawn-bowls*, to roll (the ball) with great force.—**To ride herd** or **to ride herd on,** in the western United States, to guard cattle by riding on the outer edge of the herd of feeding animals, keeping them from straying and also keeping off wild animals: also used, by extension, of guarding or protecting anything.

> Blacknell was *riding herd on* a small bunch of calves who with heels mostly in the air were making life a burden to him and to his wiry cow-pony.
> *J. Bronson*, The Lost River, i.
>
> Which I see a gent as was *riding herd on* them two big boxes all the afternoon, an' I ain't allowin' for accidents neither. *Western World*, II. 230.
>
> I 'm romancin' leisurely along the street when I encounters a party who 's *ridin' herd on* one of these yere telescopes. *A. H. Lewis*, Wolfville Nights, xviii.

To ride the goat, to be initiated into a secret society by riding a goat as part of the ceremony, as is jocularly asserted. [Slang.]

ride, *n.* **7.** See ★*compartment line.*—**8.** The side of a log upon which it rests when being dragged.—**Major ride, minor ride.** See ★*compartment line.*—**To give a free ride,** in *poker*, to put up for all the others in a jack-pot, usually as a penalty for drawing to false openers. Sometimes the kitty gives the players a free ride.

rider, *n.* **10.** (*b*) A gold coin of Henry VI. of England, of the value of four shillings.—**Despatch rider,** one who carries despatches on horseback.

> There was no option, the telegrams must be sent through Kimberley and by *despatch riders* . . . to ride a hundred miles across the veldt against time.
> *P. Landon*, in War's Brighter Side, vi.

ridered, *a.* **2.** In *mining*, said of the rock in a vein when it is impregnated by vein-materials in strings or narrow strata.

rider-pipe (rī′dėr-pīp), *n.* An auxiliary pipe; specifically, a pipe used for distributing any fluid to consumers along a pipe-line to lessen the number of connections to the main and to permit of shutting off the fluid while repairs are being made.

rider-plate (rī′dėr-plāt), *n.* In *naval arch.*, a heavy horizontal plate which is fitted on the upper angles of the middle line keelson in order to give it additional strength.

ridge, *n.*—**Barometric ridge,** the high pressure between two areas of low pressure; the summit of a barometric wave.—**Gastrocnemial ridge,** a ridge on the posterior face of the femur to which the gastrocnemius is attached.—**Hemal ridge,** one of the paired cartilaginous ridges which in embryo fishes extend out from either side of the perichordal tube into the lateral musculature of the trunk and unite in the midventral line in the caudal region to inclose the hemal canal.—**Lambdoid ridge** or **crest,** a ridge or crest arising at the junction of the parietal and supraoccipital bones and forming the boundary of the upper posterior part of the cranium: named from the lambdoid suture in man, which has something the shape of the Greek letter lambda (Λ). The lambdoid crest develops with age, and is particularly prominent in old anthropoid apes.—**Subatrial ridge,** a ridge which develops on the mesial surface of one of the metapleural folds in the larval *Amphioxus* and eventually fuses with its fellow of the opposite side to form the floor of the atrial cavity.—**Supraforaminal ridge,** in *ornith.*, the ridge on the back of the cranium just above the foramen magnum, often or usually forking ventrally like an inverted Y.—**Supra-orbital ridge.** Same as *superciliary ridge.*—**Tentorial ridge,** the ridge on the superior inner surface of the cranium, marking the attachment of the tentorium, or division between the cerebrum and cerebellum. *Proc. Zool. Soc. London*, 1903, p. 265.—**Wolffian ridge,** the longitudinal welt or fold on either side of the body in certain vertebrate embryos, like the chick, from which the rudiments of the fore and hind limbs arise.

ridge-band, *n.* **2.** In *weaving*, a band for keeping the heddle loops in a loom in their proper positions: an old contrivance that greatly facilitated weaving. *T. W. Fox*, Mechanism of Weaving, p. 5.

ridge-line (rij′līn), *n.* The crest-line of a ridge of any kind.

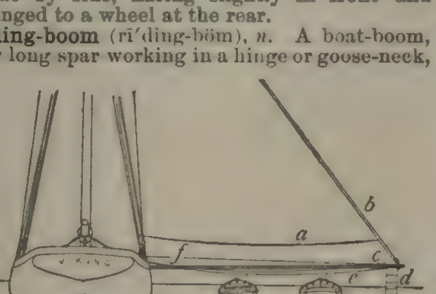
> Another magnetic *ridge-line* runs from near Reading and enters the Channel near Chichester.
> *Geog. Jour.* (R. G. S.), XI. 527.

ridge-myrtle (rij′mėr″tl), *n.* See ★*myrtle.*

ridge-planting (rij′plan″ting), *n.* Same as ★*mound-planting.*

ridger, *n.* **3.** In *agri.*, a tool, drawn by a horse, for gathering and heaping up the loose soil against young plants planted in rows. It consists essentially of two mold-boards placed side by side, flaring slightly in front and hinged to a wheel at the rear.

riding-boom (rī′ding-böm), *n.* A boat-boom, or long spar working in a hinge or goose-neck, designed to be lowered from abreast the fore-rigging to a horizontal position at right angles with the keel of the vessel. To this boom, which is supported by halyards and maintained in position by fore-and-aft guys, the small boats make fast when the vessel is at anchor.



Riding-boom.

a, life-line; *b*, lift; *c*, riding-boom; *d*, rope ladder; *e*, outhaul; *f*, after-boom guy.

riding-mask (rī′ding-mȧsk), *n.* A mask used by ladies to protect the face in riding.

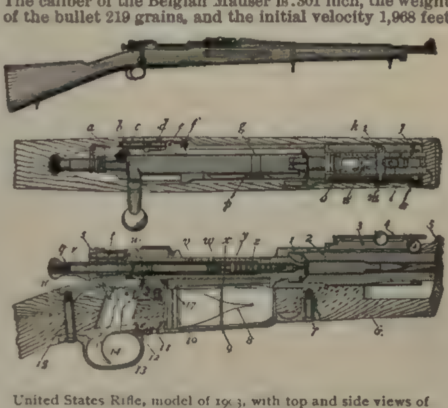
Riemannian (rē-män′i-ạn), *a.* Pertaining to Georg Friedrich Bernhard Riemann (1826–66), a noted German mathematician. Also written *Riemannean.*—**Riemannian geometry, space.** See ★*geometry*, ★*space.*

Riemann's measure of curvature. See ★*measure.*

riffle², *n.*—**To make the riffle,** to overcome circumstances, as if fording a riffle in a stream when the current is strong. [Colloq.]

riffle³ (rif′l), *v. i.*; pret. and pp. *riffled*, ppr. *riffling.* [Perhaps < *riffle*¹, *n.*] To shuffle a pack of cards by butting the two parts of the pack into each other and then bending them so that they slip together.

rifle², *n.*—**Berthier rifle,** a rifle (carbine) invented by M. Berthier, adopted for the French cavalry in 1890. It is a bolt-gun with a box-magazine, capable of containing three cartridges, which is filled by means of clips or chargers, which are then thrown away. The caliber of the carbine is 8 millimeters (.315 inch), the weight of the bullet 208 grains, and the muzzle velocity about 2,000 feet per second.—**Krag-Jorgensen rifle,** the military arm used by Denmark and Norway and, in an improved form, by the United States up to 1904. See *United States* ★*rifle* (of 1903).—**Lebel rifle,** the rifle adopted for the French infantry in 1886. It is a bolt-gun with a tubular magazine holding eight cartridges under the barrel. The caliber is 8 millimeters (.315 inch), the weight of the bullet 208 grains, and the initial velocity 2,073 feet per second. The ammunition supply for each man is 120 rounds.—**Lee-Metford rifle,** the magazine-gun adopted in 1889 for use in the English army. It is also known as the Lee-Speed, and is nearly identical with the Remington-Lee. It is a bolt-gun, and has a detachable box-magazine, which, however, is not entirely separated from the gun, but when withdrawn from its seat is secured to the guard-swivel by a short chain. The magazine has a cut-off, so that the gun may be used as a single-loader and the magazine held in reserve. The magazine of the Mark I gun holds eight cartridges, and that of the Mark II ten cartridges. The caliber of the Lee-Metford is .303 inch, the weight of the bullet 216 grains, and the muzzle velocity 2,100 feet per second.—**Lee straight-pull rifle.** See *United States navy* ★*rifle.*—**Match-rifle,** a fine, well-made arm used for match-shooting.—**Mauser rifle,** a military rifle adopted first by Belgium and later by Spain, Germany, and the Argentine Republic. It is a bolt-gun, and the magazine-box, having a capacity of five cartridges, is underneath the receiver and in front of the trigger-guard. The magazine is of the fixed type, but so arranged that it can readily be removed for cleaning. It can be charged through the receiver with single cartridges, or the five can be stripped at once from a metal clip. The clip is pushed out to the right as the bolt is closed, and does not form any part of the magazine mechanism. The gun has no cut-off, but a single-loading fire can be maintained, retaining four cartridges in the magazine, by replacing the top cartridge after each discharge. The caliber of the Belgian Mauser is .301 inch, the weight of the bullet 219 grains, and the initial velocity 1,968 feet per second.—**United States rifle,** model of 1903, chambered for model of 1906 ammunition, the rifle of the United States army. It is a compromise between the old rifle and the carbine. The total length is 43.212 inches and the barrel, which is incased in wood to within a short distance of the muzzle, is 24.006 inches long. The operating parts consist principally of the bolt and magazine mechanisms. The bolt mechanism is similar to that of the model 1892 rifle but strengthened against the bore pressure by additional lugs. The magazine mechanism consists of the floor plate, magazine spring, follower, and cut-off. The magazine is of the fixed type underneath the receiver and in front of the trigger-guard; it is filled from a clip holding five cartridges; when empty the follower holds the bolt open and calls the attention of the soldier to the necessity of refilling; it may be cut off if desired and the rifle used as a single-loader, in which case any cartridges in the magazine are held in reserve. The caliber is .30 of an inch, the weight of the bullet 150 grains, the weight of the powder charge 50 grains, and the muzzle velocity 2,700 feet per second. Twenty-five aimed shots may be fired in one minute. The maximum range is about 5,465 yards, for which the time of flight is 31.359 seconds. The penetration in white pine at 500 yards is about 24 inches and a low steel plate .3843 of an inch thick is penetrated at 100 yards. The point-blank danger



United States Rifle, model of 1903, with top and side views of the operating parts.

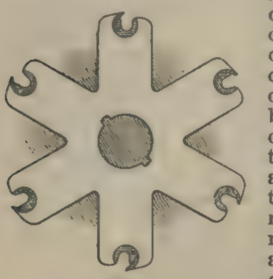
a, sleeve-lock spring; *b*, cut-off spindle; *c*, sleeve-lock; *d*, cut-off; *e*, ejector-pin; *f*, ejector; *g*, extractor-collar; *h*, slide and slide-cap; *i*, slide-cap screw; *j*, windage-screw; *k*, windage-screw knob; *l*, windage-screw bushing; *m*, slide screw; *n*, drift-slide; *o*, fixed base; *p*, extractor; *q*, cocking-piece; *r*, firing-pin; *s*, safety-lock thumb-piece; *t*, safety-lock spindle; *u*, sleeve; *v*, mainspring; *w*, firing-pin sleeve; *x*, follower; *y*, bolt; *z*, striker; 1, receiver; 2, barrel; 3, movable base; 4, leaf; 5, hand-guard; 6, stock; 7, front guard-screw; 8, magazine-spring; 9, floor-plate; 10, sear-spring; 11, floor-plate catch; 12, floor-plate catch-spring; 13, guard; 14, trigger; 15, guard-screw bushing; 16, rear guard-screw; 17, bolt-stop spring.

space is about 650 yards. The rifle is furnished with a long knife bayonet and the total weight is about 10 pounds. —**United States navy rifle**, the rifle adopted for the United States navy in 1895, but later abandoned: also known as the *Lee straight-pull rifle*. It was a bolt-gun with the peculiarity that the bolt was drawn directly to the rear in loading without being turned. The magazine was of the fixed type, and was placed in front of the guard under the receiver. The magazine was charged from a clip holding five cartridges, and there was no cut-off. The gun was therefore rather a repeating than a magazine arm. If the magazine was not charged the gun could be used as a single-loader. The caliber of the rifle was 6 millimeters (.236 inch), the weight of the bullet 135 grains, and the velocity at 60 feet from the muzzle 2,460 feet per second.

rifleite (rī′fl-īt), *n.* [*rifle* + *-ite*2.] A trade-name for an explosive, a kind of smokeless powder for use in the Lee-Metford rifle.

rifraf, *n.* A simplified spelling of *riffraff*.

rift1, *n.* 3. In *wood-working*, a saw in which the cutting-teeth are placed at the ends of radial arms instead of upon the rim of a disk.—4. In *geol.*, one of the principal cleavages or planes of weakness in building-stone, as quarried, of which the quarrymen take advantage. The two others, commonly occurring at right angles with it and with one another, are called the *cut-off* and the *lift*.



Rift.

In gneisses the parallel arrangement of the minerals usually coincides with a direction of easy cleavage, known to quarrymen as the "*rift*." *Encyc. Brit.*, XXXII. 102.

rift-sawed (rift′sâd), *a.* Sawed in such a way that the surfaces of the boards are nearly those which would come from natural splitting or riving. Compare *quarter-sawed* and *silver-grain*.

rift-system (rift′sis″tem), *n.* A series of related or neighboring fault-valleys constituting a system.

The East African *Rift-system.*—Dr. Carl Uhlig, whose researches in East Africa have been frequently referred to in the Journal, has summed up the results of his observations regarding the East African rift-valley and associated fault-scarps, in the Geographische Zeitschrift for September, 1907.
Geog. Jour. (R. G. S.), Feb., 1908, p. 217.

rift-valley (rift′val″i), *n.* A valley formed by the down-faulting of its floor; a graben.

The author speaks of the valleys, not as due to rifts, but as themselves rifts, which seems to imply a much smaller width in proportion to the height of the sides than is found in the African *rift-valleys*.
Geog. Jour. (R. G. S.), XVIII. 212, note.

rig2, *n.* 5. The apparatus in a cultivator which carries the shovels; a cultivator gang. —**Fore-and-aft rig.** See *fore-and-aft sails.*—**Goose-neck rig**, a rig with the bars to which the shovels are attached curved over like a hook.

Riga's disease. See ★*disease*.

rigging2, *n.*—**Fore-topgallant rigging**, the shrouds, etc., of the fore-topgallant-mast.—**To man the rigging**, to 'stand in' the shrouds, or to command the men to mount the rigging on and above the sheer-poles.

rigging-mat (rig′ing-mat), *n.* *Naut.*, a rope mat which is seized to the standing rigging to prevent chafe. Small chafing-mats are made of thrumb-work.

rigging-sled (rig′ing-sled), *n.* In *lumbering*, a sled used to haul hooks and blocks on a skid road. Also called *dog-boat* and *pig*.

rigging-slinger (rig′ing-sling″ėr), *n.* In *lumbering*: (*a*) A member of a yarding-crew whose chief duty is to place chokers or grabs on logs. (*b*) One who attaches the rigging to trees in steam-skidding.

rigging-stopper (rig′ing-stop″ėr), *n.* *Naut.*, a short length of rope made fast near a piece of running-gear so that the latter's motion may be arrested by taking turns about it with this stopper.

right. I. *a.*—**Right by file.** See ★*file*3.

II. *n.*—**Confusion of rights**, in *law*, the union in one person of the qualities of debtor and creditor.—**Miner's right**, in Australia, the license to dig or mine for gold.

A *miner's right*, a wonderful document, printed and written on parchment.
Rolf Boldrewood, The Miner's Right, p. 1, quoted in E.
[E. Morris, Austral English.

Right of visitation and search, in *international law*, the right of an armed vessel of a nation at war to visit merchant vessels of neutral nations for the purpose of ascertaining that they are such and to search them for contraband goods which may be confiscated, in some cases absolutely, sometimes with payment, if intended for the enemy.—**Substantial right**, in *law*, a right existing in favor of a party to an action the denial of which by a trial court will, irrespective of technicalities, cause a reversal by an appellate court of any judgment or order obtained in proceedings in which the right was denied.—**Water right**, in *U. S. law*, the right to use water from a canal or other stream or body of water for irrigating purposes, either in definite quantities or upon a certain area. Water rights are recognized by State and federal laws, in some localities as real property, in others as personal. The term also has the meaning of *riparian rights* (which see).

right, *adv.*—**Stage right** or **left.** See ★*stage-positions*.

right-and-left (rīt-and-left′), *a.* 1. Made in pairs one member of which is adapted to the right and the other to the left side, as boots, shoes, gloves, etc.—2. Symmetrical with regard to a central plane: as, *right-and-left* engines.—3. Having both a right-hand and a left-hand thread: said of screws. Bolts and screws for certain purposes are sometimes made with both threads cut on one piece.

right-eared (rīt′ērd), *a.* Using (as a habit) the right ear more than the left in hearing. *G. M. Gould*, in Science, Nov. 1, 1907, p. 594.

right-eyed (rīt′īd), *a.* Using (as a habit) the right eye more than the left in seeing. *G. M. Gould*, in Science, Nov. 1, 1907, p. 594.

right-footed (rīt′fu̇t″ed), *a.* Using the right foot as the guide and base of action, as in beginning to march, in spading, etc. *G. M. Gould*, in Science, Nov. 1, 1907, p. 594.

right-hand, *a.* 4. Noting an engine in which the shaft that carries the fly-wheel is at the right hand of the observer as he stands at the head end of the cylinder looking toward the shaft: the reverse of *left-hand*. Also, one in which the observer, looking along the axis of the shaft from the crank end, finds the cylinder and its mechanism on his right.

righting-moment (rī′ting-mō″ment), *n.* In *naval arch.*, the moment of the righting couple which tends to restore a vessel to the upright position when it has been inclined from that position. *White*, Manual of Naval Arch., p. 127.

right-sailing (rīt′sā″ling), *n.* In *navigation*, the running of a course due east or west, or north or south; the confining of the course to a meridian or a parallel, so that the vessel makes all latitude or all longitude.

right-sidedness (rīt′sī″ded-nes), *n.* The condition, normal in the majority of persons, in which the parts on the right side (upper and lower extremities, eye, and ear) are more naturally employed for most purposes than those on the left side.

Rigi beds. Same as ★*Ligurian*, 2.

rigidity, *n.*—**Coefficient of rigidity.** See ★*coefficient*.—**Molecular rigidity**, the resistance of the molecules of a substance to translational or rotational displacement.

rigodon, *n.* See *rigadoon*.

rigor, *n.*—**Heat rigor**, rigidity of the muscles, referable to coagulation of the myosin, induced by heat: analogous to rigor mortis.

rigoroso (rig-ō-rō′sō), *a.* [It. = E. *rigorous*.] In *music*, in strict or exact time or rhythm.

rigsbank-skilling (rēgz′bängk-skil″ing), *n.* A 'royal bank shilling': a subsidiary coin of Denmark, one ninety-sixth of a rigsdaler, equivalent to fifty-six hundredths of a United States cent.

Riksdag (riks′däg), *n.* [Dan., = G. *reichstag*, 'parliament of the kingdom.'] The Swedish parliament, consisting of two elected houses.

riksdaler, *n.* See *rix-dollar*.

ril, *n.* and *v. i.* A simplified spelling of *rill*.

rillettes (rē-yet′), *n. pl.* [F., prob. dim. of OF. *rille*, a piece cut off.] A potted delicacy made of minced chicken, ham, truffles, etc., used in sandwiches or with a salad.

rill-mark, *n.* 2. Specifically, in *geol.*, one of the marks left by the rills formed by the retreating waters of a wave which breaks against a shore. Such rills often cut furrows in the sand which, if the sand hardens into rock, may be preserved with great fidelity.

rill-pit (ril′pit), *n.* One of the fissures which cut the moon's surface and which often taper toward either end but not downward. They often have flat bottoms. *G. K. Gilbert*, in Bulletin Philos. Soc. Washington, XII. 283.

rily (rī′li), *a.* Same as *roily*. [Dialectal.]

Water looks *rily*. . . . Goin' to be a change o' weather.
L. E. Richards, Mrs. Tree, vi.

rim1, *n.* 3. The pawl-race or ratchet-ring of a capstan.

R. I. M. An abbreviation of *Royal Indian Marine*.

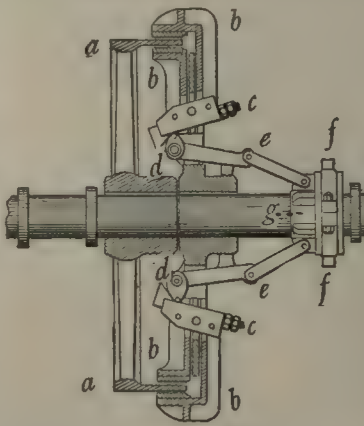
Rima palpebrarum, the cleft between the eyelids.

rimal (rī′mal), *a.* [*rima* + *-al*1.] Of or pertaining to a rima, in any sense. *Buck*, Med. Handbook, II. 174.

rimation (rī-mā′shon), *n.* [L. *rima* + *-ation*.] A narrow, fissure-like opening or cleft. Practically the same as *rima*.

rim-band (rim′band), *n.* Any band used on the rim of a pulley or wheel; a belt; a transmission-rope. *Nasmith*, Cotton Spinning, p. 253.

rim-clutch (rim′kluch), *n.* A form of friction-clutch in which one of the elements is fitted with a ring or cylindrical surface and on the other are segments of two similar rings which are brought by levers, wedges, or screws to grip the solid ring on the other.



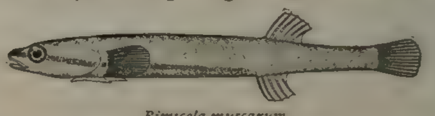
Rim-clutch.

a a, rim; *b b b b*, clutching segments, movable radially by the levers *c c*; *d d*, cams throwing and locking the levers *c c*, *e e*, toggle levers throwing cams *d d*; *f f*, fork of lever moving the collar *g* lengthwise on shaft to operate the clutch. (From Scientific American Supplement.)

rime1, *n.*—**Double rime, triple rime**, a rime extending to two or three syllables.

rime-cloud (rīm′kloud), *n.* A cloud composed of frozen particles of water which adhere to objects when the cloud passes over them, or to a balloon when it enters into such a cloud.

Rimicola (rī-mik′ō-lạ̈), *n.* [L. *rima*, a chink, + *colere*, inhabit.] A genus of fishes of the family *Gobiesocidæ*, found on the Pacific coast of North America.



Rimicola muscarum.
(From Bulletin 47, U. S. Nat. Museum.)

Rimini pottery. See ★*pottery*.

rim-machine (rim′ma-shēn″), *n.* In *sheet-metal work*, a hand-power machine for rolling strips of tin into rims for tinware.

rim-shaft (rim′shȧft) *n.* A drum-shaft; a shaft large enough to serve as a pulley: usually made hollow. *Nasmith*, Cotton Spinning, p. 247.

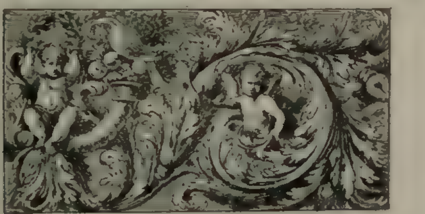
rim-speed (rim′spēd), *n.* The linear velocity of a point on the rim or outer circumference of a rotating body; the speed in linear dimensions, per unit of time, of a point on the rim of a rotating body

rimuic (rim′ö-ik), *a.* [*rimu* + *-ic*.] Found in the rimu-tree, *Dacridium cupressinum*.—**Rimuic acid**, a crystalline acid, $C_{16}H_{20}O_3$, which is the chief constituent of rimu resin. It melts at 192-193° C.

Rimula, *n.* 2. [*l. c.*] A small rima or fissure, especially of the spinal cord or brain. *Buck*, Med. Handbook, II. 162.

Rinascimento (rē-nä-shē-men′tō), *n.* [It., revival, new birth. See *Renaissance*.] In general, the beginnings of modern civilization in Italy in the fourteenth and fifteenth centuries; more especially, this commencement as influenced by the revival of interest in classic literature and art. In the fine arts (painting, sculpture, architecture), *Rinascimento* means definitely the reappearance of classic motives and methods. It does not include the art of the primitives, which is still medieval, or the fully developed classicism of the sixteenth century. The French derived word, *Renaissance*, is much broader in its application, and the German and English usages are still more comprehensive. See *Renaissance.*

rinceau (rań-sō′), *n.*; pl. *rinceaux* (-sō′). [F.] A running ornament based on a continuous scroll which is usually elaborated with acanthus-leaves. It is a distinctly classic type, but has passed over into Byzantine and Gothic decoration.



Rinceau (from Jean Lepautre).

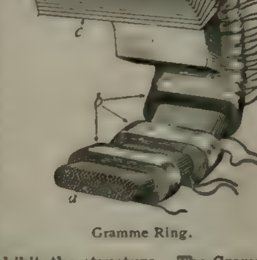
rincon (rin-kōn′), *n.*; pl. *rincones* (-kō′nāz). [Sp. *rincón*, OSp. *rencon, rancon*, Cat. *racó*, a reëntrant corner.] In *phys. geog.*, a reëntrant corner in an escarpment; an alcove. [Southwestern U. S.]

rind¹, *n.* **4.** A strip of cloth placed under the leather on the handle of a golf-club to thicken the grip.

rinderpest, *n.*—**Parrots' rinderpest.** See *parrots'* ★*plague.*

rind-fungus (rīnd′fung″gus), *n.* A disease of sugar-cane due to *Trichosphæria sacchari.*

ring¹, *n.* **14.** In *salt-making*, a fire-brick arch of varying length, placed under the evaporating-pans to temper the heat and so prevent the salt from being burned.—**15.** A circular device, with a lip or flange upon which an elliptical clip called a *traveler* runs, for twisting and winding the yarn on a bobbin, on a ring-spinning machine.—**16.** A section of tan-bark, usually 4 feet long.—**17.** In *cricket*, the boundary; the limits of the field of play: so called because in some cases the cricket-field is oval or round. *Hutchinson*, Cricket, p. 67.—**18.** In *chem.*, same as *closed* ★*chain.*—**Adamson ring,** a ring for stiffening a tube or flue which is subjected to external pressure which tends to make it collapse. It is of rectangular cross-section and is riveted between two flanges on adjacent sections of the flue. *Engin. Mag.*, May, 1904, p. 238.—**Alliance ring,** a ring made of two parts so joined together as to have no point of juncture visible. When the two parts are laid together they fit perfectly, making a complete ring. Inscriptions are engraved on the inner sides of the two parts and are invisible when the ring is closed.—**Bandl's ring.** Same as ★*retraction-ring.*—**Benzene ring.** See ★*benzene.*—**Bishop's ring** (*b*) or **Bishop's circle,** a ring of light about the sun from 12 to 18 degrees in radius, first observed by the Rev. Sereno Bishop daily in September, 1883, at Honolulu, Sandwich Islands, and afterward explained as a diffraction-ring caused by the same vapor or dust from the eruption of Krakatoa that also caused the red sunset skies a few months later. *Nature*, Oct. 29, 1903, p. 623.—**Cut-off ring.** See ★*cut-off.*—**De la Rive's ring,** an apparatus for demonstrating the action of magnets upon currents. It consists of plates of zinc and copper inserted in dilute sulphuric acid contained in a glass vessel weighted with mercury to keep it upright while floating freely on water. The plates can be connected with circular or rectangular wires, coils, or solenoids. These are then traversed by a current, and can be subjected to the action either of magnets or of currents.—**Engagement ring,** a ring given, as the sign of betrothal, by either of the betrothed to the other.—**False ring,** the layer of wood which is formed whenever the diameter growth of a tree is interrupted and begins again during the same growing season.—**Galvanic ring,** a name formerly given to a voltaic circuit.—**Gauze ring,** the semitransparent ring of Saturn, lying between the planet and its first bright ring. Sometimes called *crape-ring.*—**Genital ring,** in echinoids, a circular canal that appears to be connected with a series of hemal vessels or lacunæ which surround the dorsal organ.—**Gramme ring,** an early form of armature-winding for direct-current generators invented by Gramme in 1870 and forming the characteristic feature of the Gramme dynamo-machine. The core consists of a ring made up of a bundle (*a*) of soft iron wires. About this a series of coils (*b*) of insulated copper wire is wound. The end of each coil is joined to the beginning of the one lying next to it, and each of these junctions is attached to one of the bars of the commutator (*c*). The figure shows a Gramme ring in process of construction, a portion of the core being cut away to exhibit the structure. The Gramme ring is a development or modification, independently rediscovered, of the Pacinotti ring constructed in Florence in 1860.

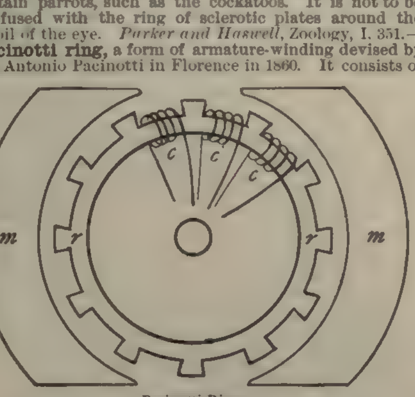


Gramme Ring.

—**Harlequin ring,** a ring in which various colored stones are set around the band or arranged in the ring.—**Idiophanic rings,** rings observed when pleochroitic crystals cut normal to an optic axis are placed in convergent light and viewed by means of the polariscope.

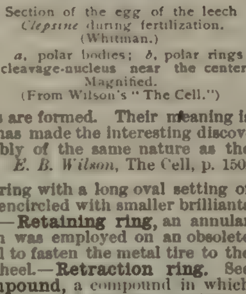
> The *idiophanic rings* are most distinct when the plane of incident polarisation is parallel to one of the directions of polarisation. *Science Abstracts*, VI., Sec. A, p. 73.

Intravertebral ring, the ring of tissue surrounding a vertebra in young amphibia; the vertebral cartilage of Wiedersheim. *H. Gadow.*—**Kekule ring,** the structural formula, , devised by Kekule to express the constitution of benzene and those of its derivatives which contain an aromatic nucleus.—**Marquise ring,** a finger-ring having either one gem (as a diamond, ruby, emerald, sapphire, etc.) or a number of stones placed in a long, pointed setting.—**Oral ring,** in echinoderms, the ring which surrounds the mouth-opening.—**Oral ring-vessel,** in some echinoderms, as starfishes, a vessel surrounding the mouth-opening and divided into two by a septum, the inner division communicating with the cœloma and the outer with the axial sinus.—**Orbital ring,** in *ornith.*, the bony ring surrounding the eye, which is formed by the frontal above and the union of the prefrontal and postfrontal below. This condition is found in certain parrots, such as the cockatoos. It is not to be confused with the ring of sclerotic plates around the pupil of the eye. *Parker and Haswell*, Zoology, I. 351.—**Pacinotti ring,** a form of armature-winding devised by Dr. Antonio Pacinotti in Florence in 1860. It consists of a toothed ring of iron, *rr*, the successive segments of which are wound with coils of wire, *ccc*. The ends of these coils, of which only three are shown in the diagram, are joined together and attached to commutator-bars at the center. The ring thus wound was mounted between the pole-pieces, *mm*, of an electromagnet as shown diagrammatically in the figure and served as the armature of a direct-current generator. Pacinotti's invention, a model of which exists in the cabinet of physical apparatus at the University of Pisa, was entirely overlooked by electrical engineers and it reappeared in modified form as an independent discovery in the ring-armature of Gramme (1870). It is now recognized as the earliest type of armature for the production of the direct current.



Pacinotti Ring.

—**Polar ring,** in *embryol.*, a ring-shaped accumulation of differentiated cytoplasmic substance at the animal and vegetative poles of certain ova.



Section of the egg of the leech *Clepsine* during fertilization. (Whitman.)

a, polar bodies; *b*, polar rings; cleavage-nucleus near the center. Magnified.

(From Wilson's "The Cell.")

> A remarkable phenomenon, described by Whitman in the leech ('78), and later by Foot in the earthworm ('94), is the formation of the "*polar rings,*" a process which follows the entrance of the spermatozoön and accompanies the formation of the polar bodies. These are two ring-shaped cytoplasmic masses which form at the periphery of the egg near either pole and advance thence towards the poles, the upper one surrounding the point at which the polar bodies are formed. Their meaning is unknown, but Foot ('96) has made the interesting discovery that they are probably of the same nature as the yolk-nuclei. *E. B. Wilson*, The Cell, p. 150.

Princess ring, a finger-ring with a long oval setting of three, four, or five gems encircled with smaller brilliants worn across the fingers.—**Retaining ring,** an annular wrought-iron ring, which was employed on an obsolete form of railway car-wheel to fasten the metal tire to the wooden body of the wheel.—**Retraction ring.** See ★*retraction.*—**Ring compound,** a compound in which several atoms are united in such a manner as to form a ring. Also called *cyclic compound* and *closed-chain compound.*—**Ring connection, ring current.** See ★*polyphase.*—**Ring discharge,** a form of electric discharge observed in vacuum-tubes without electrodes when the conditions are such that the path of the induced currents is circular and an annular portion of the gas is rendered luminous. *J. J. Thomson*, Discharge of Elect. through Gases, p. 174.—**Ring method,** in *elect.*, a method of testing the permeability of iron or steel in which the sample has the form of a ring. About the ring two coils are wound, the primary or magnetizing coil and the secondary or exploring coil. The ring is magnetized step by step by increasing currents in the primary coil and the corresponding throws of a ballistic galvanometer connected with the secondary coil are noted.—**Ring micrometer.** See ★*micrometer.*—**Tendinous ring of Arnold.** Same as *annulus tendinosus.*—**To run rings round,** to beat, in any contest, so easily as to reach the goal first, though running round and round the competitors. See ★*ring*¹, *v. t.*, 7.—**Vocal ring,** a chitinous ring supporting a vibrating membrane in the thoracic spiracles of certain dipterous insects.—**Waldeyer's tonsillar ring,** an incomplete circle of adenoid tissue, in the throat, formed by the lingual, the pharyngeal, and the faucial tonsils.

ring¹, *v.* **I.** *trans.* **7.** To circle around (the game) in order to catch the scent: said of a field-dog.

> Any dog that "*rings*" game, or from any cause breaks his point to take up another, may be trained to report.
> *Forest and Stream*, Jan. 24, 1903, p. 63.

8. In *printing*, to draw a ring around, as an unmarked change in type, on a proof.

II. *intrans.* **3.** To make the best score in shearing sheep. See ★*ringer*¹, 3. [Australia.]

ring², *v. t.*—**To ring the changes,** a method by which counterfeit coin is uttered, the counterfeiter pretending to test a coin paid him, and handing back a false coin demanding a good one in its place.

ring-ampere (ring′am-pãr″), *n.* In *elect.*, a coil of wire the current through which causes attraction or repulsion of other circuits carrying current, as in Ampère's experiment or in electric balances for the measurement of currents.

ring-around (ring′a-round″), *n.* **1.** Same as ★*run-around.*—**2.** A girdle of dead tissue formed about the stem of a grape-cluster by the anthracnose, *Sphaceloma Ampelinum.*

> But one peculiarity of anthracnose is that it generally attacks the veins of the leaves, as well as the leaf-stems, and so its identification is not always difficult. The stems of the clusters are also injured, and it frequently occurs that a part is completely girdled, causing a "*ring-around,*" as it is commonly called. The berries below the ring do not ripen, but remain green, and gradually shrivel. *E. G. Lodeman*, The Spraying of Plants, p. 295.

ring-bone, *n.*—**False ring-bone,** a bony enlargement on the long pastern of the horse which does not involve the joint and produces no lameness.

ring-bottle (ring′bot″l), *n.* A bottle or jug of earthenware made in the form of a hollow ring, to be filled with water or cider and carried on the arm of a laborer in the harvest-field.

ring-burner (ring′bėr″nėr), *n.* **1.** In a gas or oil lamp, a burner giving an annular flame or having a tubular wick, as in the Argand or any other lamp where air is supplied to the center of a ring-like flame.—**2.** A gas chandelier formed of a ring of burners placed side by side and suspended from the ceiling.

ring-clamp (ring′klamp), *n.* A clamp for holding a ring in position in order to facilitate working. It consists of two pieces of wood hinged together at the middle, the ring being secured between two ends by a wedge placed between the other ends. Also *ring-clasp.*

ring-clutch (ring′kluch), *n.* A form of clutch used in some arc-lamps for lifting the positive carbon when the arc is struck and for holding the carbon in position so long as the proper current flows through the feeding-coil. It consists of a metal ring through which the carbon slips freely so long as the axes of ring and carbon coincide but which, when tilted into an oblique position, clutches the carbon.

ringer¹, *n.* **2.** (*a*) In *athletics*, one who competes in some way under deception, concealing his identity, ability, or standing. (*b*) In *racing*, a horse entered in a race with intent to deceive.

> "We have reason to believe that the Lukens horse is a '*ringer,*' Mr. Carleton," he began. "We have been a trifle suspicious that this was the case, all along, though superficial evidence that the animal is the gray racer, Wraith, which was seen on the Western tracks last season, was not altogether lacking."
> *C. S. Pearson*, Romance of the Race Course, iv.

3. In *sheep-shearing*, one who rings or tops the score. See ★*ring*¹. [Australia.]

> They call him the *ringer* of the shed. That means the fastest shearer,—the man who runs rings round the rest, eh? *E. W. Hornung*, Boss of Taroomba, p. 101.

4. In general, one who excels others, as if able to run rings around his competitors and still keep ahead. See ★*ring*¹. [Australia.]

> Another favorite [school] phrase is a 'regular *ringer.*' Great excellence is implied by this expression.
> *Geelong Grammar School Quarterly*, April, 1894, p. 26: [quoted in E. E. Morris, Austral English.

ringer², *n.* **4.** A supplementary enthusiastic cheer. [Slang.]

> When the result had been announced the air was rent with cheers. Auctioneer Judy called for a tiger for Mr.

Joseph, and then a *ringer* for . . . who had sold the highest-priced beef steer in the world.
Rep. Kansas State Board Agr., 1901–02, p. 360.

5. In *telephony*, an electric call-bell.—**Polarized ringer**, in *telephony*, a call-bell with permanent magnets. *G. W. Wilder*, Telephone Prin. and Practice, p. 155.

ringer-magnet (ring′ėr-mag″net), *n.* One of the field-magnets of a call-bell used in telephony.

ringing-key (ring′ing-kē), *n.* In *telephony*, a switching device by which the current for ringing call-bells is put into circuit.

ring-jointer (ring′join″tėr), *n.* A tool used by jewelers for cutting finger-rings which are to be enlarged or reduced.

ring-kiln (ring′kil), *n.* A kiln of the Hoffman type, which is built in a circle around a central stack. The burning-chamber thus forms an annular tunnel. It belongs to a comparatively numerous group of continuous-burning kilns, and is used for burning bricks and other varieties of clay ware, and even lime and cement.

ring-lead (ring′lēd), *v. t.* To lead in some special enterprise; especially, lead a ring or group of others in some mischievous or illegal enterprise. [Rare.]

ring-machine (ring′ma̤-shēn″), *n.* A bench machine, operated by hand- or foot-power, for forming wire into small rings. It straightens, cuts to measure, and shapes the wire into rings or segments of rings.

ring-main (ring′mān), *n.* A main-pipe in which the two ends are brought around and connected together into a ring or closed loop, so that any two points on the line of pipe may have direct connection with each other by two independent routes which occupy a different part of the closed loop.

The four batteries of boilers constituting each section of the boiler plant are interconnected by a 10-in. main and a 4-in. auxiliary line, both in the form of a *ring main.* No pipe bends are used except on this *ring main*, the necessary flexibility of the piping system being secured partly by this means and partly by the method of support.
Elect. World and Engin., Feb. 27, 1904, p. 396.

ring-mountain (ring′moun″ta̤n), *n.* 1. As much of a volcano as remains after the formation of a caldera, whose rim is like a ring. *W. M. Davis*, Elem. Phys. Geography.—2. One of the large crater-like formations on the moon, inferior in size to the bulwark plains.

ringneck, *n.* 3. In Australia, a jackaroo. The name is given in allusion to the white collar which the new arrival is apt to wear, until home training has been supplanted by bush customs. *E. E. Morris*, Austral English.—**Ringneck snake**, same as *ring-snake*; also applied to the East Indian cobra, and to one of the South African vipers, *Sepedon hæmachates*.

ring-off (ring′ôf), *n.* In *telephony*, the signal for the close of communication over a line.

When the conversation is finished a ring upon the call-bell ("*ring off*") causes the drop to fall and the operator thus notified of the fact removes the plugs and discontinues the connexion. *Encyc. Brit.*, XXXIII. 237.

ring-oiler (ring′oi″lėr), *n.* An oiling device consisting of a ring which rests on a bearing with its lower edge dipping into a reservoir of oil. As the shaft turns it drives the ring which carries oil to the top of the shaft, whence the oil flows through the bearing.

ring-oiling (ring′oi″ling), *a.* Having a ring to carry oil for continuous lubrication. The ring has an internal diameter larger than the journal and rests upon its upper element. The lower part of the ring dips into an oil-well or -reservoir below the bearing. As the journal revolves the ring turns with it, and the lower elements are continually brought to the top, bringing oil as the ring turns and leaving some of it on the bearing.

The journal bearings are of the *ring-oiling*, self-aligning type, of such proportions as to ensure cool running, and the shaft is of a special grade of hammered steel of great tensile strength and wear-resisting qualities.
Elect. Rev., Sept. 10, 1904, p. 410.

ring-pigeon (ring′pij″o̤n), *n.* Same as *ring-dove*.

ring-plate (ring′plāt), *n.* In steam-boilers, a plate from which a ring is made; a plate forming a zone or belt and thus making a part of the cylindrical shell of a steam-boiler.

ring-rail (ring′rāl), *n.* An oscillating bar on a ring-spinning machine which holds the rings. See ★*ring*¹, 15.

ring-scale (ring′skāl), *n.* Same as ★*dry-rot*, 1, as applied to pine.

rings-giving (ringz′giv″ing), *n.* A former custom in accordance with which gold rings were given by a newly created sergeant-at-law to every person of rank at court. They were given to all, from the princes of the blood down to the lowest clerk, to each according to his dignity.

ring-shake (ring′shāk), *n.* A crack in timber, usually produced primarily by frost, the extremes of contraction and expansion tearing apart the annular growth-rings. Such checks are afterward kept open by the action of the wind upon the tree.

The defect known as cupshake, *ringshake*, . . . is frequently met with in many kinds of wood. It consists in a partial or entire separation of two consecutive annual rings, and appears on a cross section as one or more splits running concentrically around the log.
Sci. Amer. Sup., March 25, 1905, p. 24433.

ringsider (ring′sī″dėr), *n.* A rail-bird; one who leans over the fence or railing of the ring and watches the judging, as at a fair. [Colloq.]

In a large ring there are sure to be several different types of cattle. Sometimes it is not a hard matter to place them right; other times there may be a "topper" of each type in the class, each having many friends among the *ringsiders* for premier honors.
Rep. Kansas State Board Agr., 1901–02, p. 173.

ring-spinning (ring′spin″ing), *n.* A system of continuous spinning in which a fixed ring (concentric with the spindle) and a traveling-guide for the yarn are the chief features. *Webb*, Indust. Democracy, I. 424.

ring-splice (ring′splīs), *n.* See *splice*.

ring-spot (ring′spot), *n.* A spot in the shape of a ring such as is frequently seen on lepidopterous larvæ. *W. Bateson*, Study of Variation, p. 305.

ring-stream (ring′strēm), *n.* A stream of fluid in the form of a ring; a stream from a nozle formed of an annular ring. *The Engineer* (London), Dec. 25, 1903, p. 611.

ring-taw (ring′tâ), *n.* Same as *taw*³, 1.

ringworm, *n.*—**Giant ringworm**, an extensive and intractable form of ringworm encountered sometimes in the tropics.—**Tokelau ringworm**, tinea imbricata.

ring-yarn (ring′yärn), *n.* Cotton yarn spun on a ring-spinning machine. *Nasmith*, Cotton Spinning, p. 348.

rink², *n.* 6. In *lawn-bowls*, a division of the green, about 20 feet in width, the center of which is marked on the bank at each end by a pin or other device.—7. A side in a match. In curling, a rink consists of 4 players (called the *leader*, *second player*, *third player*, and *skip* or *driver*), each playing 2 bowls.

rinking (ring′king), *n.* The act of skating in a rink. [Rare.]

Why should we not go mad for china? It is as sensible as going mad over *rinking*.
Besant and Rice, Golden Butterfly, xvi.

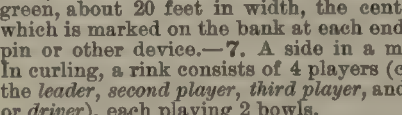
Riolan's bones. See ★*bone*¹.

riolite (rē′ō̤-līt), *n.* [Named after a Mexican mineralogist, A. M. del *Rio*.] A supposed sulphoselenide of mercury from Culebra, Mexico.

riot, *n.*—**To read the Riot Act.** See *Riot Act*, under *riot*. Hence, to reprove sharply. [Humorous.]—**Nika riots**, a great popular insurrection (originating in a quarrel in the amphitheater between the Green and the Blue factions) which occurred in Constantinople in 532 A.D., the fifth year of the reign of Justinian. It endangered the stability of the Eastern Empire and destroyed the imperial quarter of the city.

rip-cord (rip′kôrd), *n.* A lace or cord fastened in the bag of a balloon in such a way that a sharp pull upon it will rip the bag and let the gas escape.

Ripon cart. A village-cart.



Ripon Cart.

riposte (ri-pōst′), *v. i.*; pret. and pp. *riposted*, ppr. *riposting*. [*riposte*, *n.*] To make a quick, smart reply or repartee.

ripper¹, *n.* 1. (*d*) A rip-saw. 4. A double-ripper.

ripping (rip′ing), *a.* [*rip*¹, *v.*] Splendid; very good; 'stunning': also used adverbially. [Slang.]

She did look *ripping* in that white frock.
Anthony Hope, Dolly Dialogues, ix.

Winifred made a dash at . . . [the rope], but it slipped through her fingers and vanished. . . . "You made a *ripping* good try," said Bobby.
A. R. Conder, Seal of Silence, xi.

rippingly (rip′ing-li), *adv.* Splendidly; 'stunningly.' [Slang.]

"You dance *rippingly*," declared her cousin.
E. W. Hornung, Peccavi, xxiv.

ripple³, *n.* 3. In *math.*, a wave whose length is less than that for which the velocity of propagation is a minimum.

Sir W. Thomson proposes to distinguish by the name of *ripples* those waves whose length is less than the above critical value of n (Phil. Mag. (4) xlii.). *Amer. Jour. Math.*, IX. 67.

Ripple drift. See ★*drift*.

rippling-comb (rip′ling-kōm), *n.* A group or series of rows of long iron pins fixed in a wooden frame or plank for rippling flax.

riprapping (rip′rap-ing), *n.* Same as *riprap*.

riproaring (rip′rōr-ing), *a.* Lively; uproarious; boisterous; slam bang. [Slang.]

riproarious (rip-rōr′i-us), *a.* Riproaring; uproarious. [Slang.]

risco (rēs′kō), *n.* [Sp. *risco*, a steep rock. See *risk*¹, *n.*] A sharp and precipitous rock; amorphous quartz found in veins or outcrops. *Coal and Metal Miners' Pocketbook.*

rise¹, *n.* 17. In *base-ball*, a peculiar delivery of the ball which makes it rise so that the tendency of the batsman is to strike under it.—**18.** The difference in diameter, or taper, between two points in a log.

riser, *n.* (*g*) A riser pipe; any pipe which conveys a supply of hot or cold water, steam, gas, etc., from the source of supply upward, as through a building to bathrooms, radiators, or gas-fixtures. (*h*) In *bee-keeping*, a portion of a hive inserted under another hive to make more room. (*i*) In *elect.*, a wire connecting the various floors of a building and serving for the transmission of currents for electric lighting or power.

The grouping of *risers* has been made, however, so that the average current demand on each pair of lighting bars will be about equal. *Engin. Record*, XXXVIII. 566.

rising, *n.*—**Rising of the lights**, extreme shortness of breath. [Slang.]

rising-box (rī′zing-boks), *n.* A movable shuttle-box at one end of a loom. Also called *drop-box*. *C. Vickerman*, Woollen Spinning, p. 12.

risk¹, *n.*—**Port risk**, in *marine insurance*, a risk upon a vessel while in port.—**Risk note.** See ★*note*¹.—**Superstandard risk**, insurance on the life of one whose habits or heredity or the state of whose health increases his expectancy of life.

Risorgimento (rē̤-sōr-ji-men′tō), *n.* Same as ★*Rinascimento*.

risotto (rē̤-sot′tō), *n.* [It., < *riso*, rice. See *rice*¹.] An Italian dish of rice and cheese.

risqué (ris-kā′), *a.* [Fem. *risquée*: F., pp. of *risquer*, risk, hazard.] Audacious; on the edge of indecency; of doubtful morality; intentionally suggestive of impropriety.

Rissola (ris′ō̤-lä̤), *n.* [NL.] A genus of ophidioid fishes found chiefly in the Mediterranean Sea.

rit., ritard. Abbreviations of *ritardando*.

rite, *n.*—**Scotch**, or **Scottish, rite**, in *freemasonry*, the ceremonial of the Scotch freemasons; masonry as governed by Scottish customs.—**York rite**, masonic ceremonial as originally practised at York, England.

riten. An abbreviation of *ritenuto*.

Ritschlian (rich′li-a̤n), *a.* and *n.* **I.** *a.* Of or pertaining to the doctrines of Ritschl and his school.

II. *n.* A follower of Ritschl. See ★*Ritschlianism*. *Athenæum*, Feb. 6, 1904.

Ritschlianism (rich′li-a̤n-izm), *n.* The system of doctrine taught by Albrecht Ritschl (1822–89) and his school. Ritschl was professor of theology in the universities of Bonn and Göttingen. He reconstructed theology on the basis of his definition of Christianity, which is given in the extract.

Christianity is the monotheistic, completely spiritual and ethical religion, which, based on the life of its author as Redeemer and as founder of the kingdom of God, consists in the freedom of the children of God, involves the impulse to conduct from the motive of love, aims at the moral organization of mankind, and grounds blessedness on the relation of sonship to God, as well as on the kingdom of God. *Athenæum*, Feb. 6, 1904.

ritualize (rit̬′ṳ̄-a̤l-īz), *v. t.*; pret. and pp. *ritualized*, ppr. *ritualizing*. To arrange and supply a ritual for; hamper with external forms and ceremonies; harden and deaden by ritual.

He adds that the 'Tribe' in France has completely lost its ancient traditions since the pernicious Concordat which tended to *ritualise* and catholicise the synagogue.
Daily Chronicle, May 29, 1901.

Riv. An abbreviation of *river*.

rivalry, *n.*—**Binocular rivalry, retinal rivalry,** in *psychophys.*, the alternation of sensations or perceptions which occurs when disparate impressions are presented simultaneously to the two eyes.

> If corresponding points of the retinae are separately stimulated with two incongruous fields, the phenomenon of *binocular rivalry* appears.
> *B. B. Breese*, On Inhibition, p. 18.

Monocular rivalry, in *psychol. optics*, a rivalry or alternation of the colors or boundary-lines of diverse stimuli applied to the same area of the same retina. *Psychol. Rev. Mon. Sup.*, xi. 42.

river², *n.*—**Adolescent river,** a river which is in the second stage of its threefold development, when it has destroyed the greater number of obstructions to its course, has reached a comparatively uniform gradient, and has well-adjusted tributaries.—**Beheaded river.** See ★*behead.*—**Lost river,** a river which sinks into a cavern and proceeds by a subterranean course often inaccessible to an explorer. *J. D. Dana*, Manual of Geol. (4th ed.), p. 207.—**River drift, terrace.** See ★*drift*, ★*terrace*¹.—**Mature river,** a river that has reached its stage of maximum development as to extent of its system, effectiveness in its work, variety of its activities, and attendant phenomena. A mature river is associated with maximum topographic relief.—**Senile river,** a river that has long passed its maximum stage of development and work. It is characterized by a graded bed, a comparatively slow and uniform current, a meandering course, a tendency to aggrade its channel, a broad uniform valley or flood plain, and a tributary country reduced to very low relief by its own work. See *young* ★*river* and *mature* ★*river.*—**Superposed rivers.** See *inherited* ★*drainage.*—**Young river,** a river that has not reached its maximum development in areal extent, and has not yet produced its maximum relief. The name comes from the conception of a river as having a life history, from its inception on a structural plain to the completion of its erosional activity. Its history may then be divided into the stages of youth, maturity, and old age. The young river is more particularly characterized by narrow gorges, V-shaped valleys, occasional rapids or waterfalls (if the geologic structure varies), ungraded channel, and a tendency to extend farther its own drainage-system.

river-basin (riv′ėr-bā″sn), *n.* The area drained by a river and its branches.

river-boss (riv′ėr-bos), *n.* In *lumbering*, the foreman in charge of a drive.

river-capture (riv′ėr-kap″tūr), *n.* In *phys. geog.*, the process by which a stream, lengthening its valley by headward erosion and thus encroaching upon a neighboring drainage-basin of greater altitude, eventually taps another stream or river, the upper waters of which are thus diverted and its lower waters beheaded.

> On examples taken from various parts of Italy of alteration in the direction of valleys due to *river-capture*, etc.
> *Geog. Jour.* (R. G. S.), XVIII. 227.

river-cow (riv′ėr-kou), *n.* The manatee, *Trichecus americanus.*

river-gage (riv′ėr-gāj), *n.* A gage or scale so arranged that the height of the surface of a river may be read from it. The zero of the scale is usually at some arbitrary distance below the lowest water. Self-registering river-gages have been devised, operated either mechanically or electrically. The registering apparatus may be at any distance from the gage proper, since all such gages are very liable to get out of order. The preference is given to plain divided scales fastened vertically to piers or slanting along the slope of the river-bank, especially in rivers which are subject to great fluctuations and carry down much debris. See ★*limnometer*, *marigraph*, and ★*tide-register.*

river-grass (riv′ėr-gràs), *n.* Same as *Texas* ★*millet.*

river-gravel (riv′ėr-grav″el), *n.* Gravel deposited by a river. The term is useful in the interpretation of this type of gravel as contrasted with the shingle of a beach or a glacial moraine.

river-hog, *n.* 3. A sailors' name for the sturgeon because of its habit of rooting at the bottom of rivers.

river-man, *n.* 2. In Guiana, a peasant; especially, a negro or half-caste employed along the rivers below the timber-lands.

river-mangrove (riv′ėr-man″grōv), *n.* See ★*mangrove.*

river-maple (riv′ėr-mā″pl), *n.* See ★*maple*¹.

River-perch of New York, a percoid fish, *Morone americana*, found in rivers of the Atlantic coast of the United States.

river-portion (riv′ėr-pôr″shon), *n.* The older or lower portion of a river valley characterized by U-shape and flood ground. The term as used by Dana is in contrast to ★*torrent-portion*, which is characterized by V-shaped section. *J. D. Dana*, Manual of Geol. (4th ed.), p. 181.

river-prophet (riv′ėr-prof″et), *n.* One who has acquired local celebrity by prophesying the occurrence of high or low water in a river.

river-rat (riv′ėr-rat), *n.* A log-driver whose work is chiefly on rivers: contrasted with ★*laker*¹, 4.

riverscape (riv′ėr-skāp), *n.* [Cf. *landscape.*] A scene on a river, or a picture representing such a scene. [Rare.]

> *Riverscapes* more alluring, and a ruined château said to be of Queen Blanche, mother of St. Louis.
> *C. S. Smith*, Barbizon Days, p. 17.

river-valley (riv′ėr-val-i), *n.* A valley eroded or followed by a river: used especially in contrast to *tectonic valley*, a valley produced by deformation, such as a synclinal fold or a rift-valley.

rivet¹, *n.*—**Pan-head rivet,** a rivet having a head shaped like the frustum of a cone or an inverted pan.

rivet-bar (riv′et-bär), *n.* A round bar of wrought-iron or steel from which to make rivets. *D. K. Clark*, Steam Engine, II. 657.

riveter, *n.* 2. Specifically, a machine for driving rivets.—**Hydraulic riveter,** a riveting-machine in which the rivet is headed by squeezing, the necessary force being applied by hydraulic pressure; a riveter worked by hydraulic power.—**Mud-ring riveter,** a machine for driving the rivets of the mud-ring for a locomotive boiler. *Encyc. Brit.*, XXXI. 803.

rivet-forge (riv′et-fōrj), *n.* Same as *riveting-forge.*

rivet-hole (riv′et-hōl), *n.* The drilled, punched, or reamed hole in a metal plate in which a rivet is to be inserted. Since rivets are usually driven while hot, the rivet-hole is made $\frac{1}{16}$ of an inch larger in diameter than the rivet. The rivet is upset in driving and hence fills the hole.

riveting, *n.*—**Chain-riveting.** See ★*chain-riveting.*—**Cross-riveting,** riveting in which a rivet in one row is placed across or behind the opening between two rivets in the adjacent row; staggered riveting.—**Double riveting,** riveting in which two rows of rivets are used to connect a plate to the adjacent plate or strap: hence, in a butt-joint having double riveting, four rows of rivets are required. See ★*double-riveted.*—**Lap-riveting.** See ★*lap-riveting.*—**Single riveting,** riveting in which only one row of rivets is used to fasten two adjacent plates or a plate and strap. A butt-joint in which single-riveting is used requires two rows of rivets.—**Staggered riveting,** such an arrangement of the two or more rows of rivets parallel to the edge of the plate, in a double or multiple riveted joint, that the rivet in each even row is in line with the space between the rivets on the odd rows. When there are two rows only, the passage from hole to hole is oblique, or as though the holes had been laid out by one who staggered as he walked. The line of least resistance in the plate is lengthened for any length of the joint as a whole by staggering the rivets, but where the riveted joint is to be tight against internal pressure, as in boilers, the rivets do not come near enough to each other and chain-riveting is more usual.—**Triple riveting,** riveting in which three rows of rivets connect a plate to an adjacent plate or strap.—**Zigzag riveting,** riveting in which the rivets are not behind one another but are in zigzag lines; staggered riveting; cross-riveting.

riveting-die (riv′et-ing-dī), *n.* A rivet-set; a dolly; a set swage or die for forming heads of uniform size and shape on rivets; a cup-set; a snap.

riveting-pot (riv′et-ing-pot), *n.* A riveting-forge; a pot or bucket in which there is a fire for heating rivets. The fire is blown by a blast from a bellows or fan.

riveting-tower (riv′et-ing-tou″ėr), *n.* A high shed or shop-roof built over a riveting-machine to give vertical head-room for lifting boiler-shells and -flues over the jaws of the riveting-machine.

rivet-rod (riv′et-rod), *n.* A metal rod from which rivets (larger than wire sizes) are made.

rivet-set (riv′et-set), *n.* Same as *riveting-set.*

rivet-steel (riv′et-stēl), *n.* 1. Steel of a soft and tough grade particularly adapted for making rivets.—2. Steel in the form of round rods from which rivets can be made.

rivet-tongs (riv′et-tongz), *n. pl.* Tongs having long, narrow jaws for handling red-hot rivets and inserting them in the holes they are to fill. The jaws are so shaped as to hold the rivet at their end.

rivet-wire (riv′et-wīr), *n.* Metal wire suitable for making small rivets.

Rivinian fissure. Same as *notch of Rivini.*

rivotite (riv′ō-tīt), *n.* [Named after Prof. *Rivot*, of the School of Mines in Paris.] A mineral substance from the province of Lérida, Spain, containing the oxid of antimony and copper with carbon dioxid, but of doubtful homogeneity.

rivulation (riv-ū-lā′shon), *n.* [L. *rivulus*, a rivulet, + *-ation.*] In certain fishes, as *Cirrhites rivulatus*, a color-marking which separates patches of a different color.

Rivulus (riv′ū-lus), *n.* [NL.] A genus of fishes, of the family *Pœciliidæ*, found in brooks of tropical America.

rix-dollar, *n.* 2. An English colonial coin and money of account, derived from the Dutch, in Ceylon, Cape Colony, and Malacca.—**Rix-dollar banco,** a Swedish silver coin, of the value of 1s. 8d.

rize, *v.* and *n.* An amended and former spelling of *rise.*

rizn, *pp.* of *rize.* A simplified spelling of *risen.*

rm. An abbreviation of *ream.*

R. M. A. An abbreviation (*a*) of *Royal Marine Artillery*; (*b*) of *Royal Military Academy* (Woolwich, England); (*c*) of *Royal Military* (or *Marine*) *Asylum.*

R. M. C. An abbreviation of *Royal Military College* (Sandhurst, England).

R. M. L. I. An abbreviation of *Royal Marine Light Infantry.*

R. M. S. An abbreviation (*a*) of *Royal Mail Service*; (*b*) of *Royal Mail Steamer*; (*c*) of *Royal Microscopical Society.*

R. N. A. V. An abbreviation of *Royal Naval Artillery Volunteers.*

R. N. R. An abbreviation of *Royal Naval Reserve.*

R. O. An abbreviation of *Receiving Office.*

roa (rō′ä), *n.* [Maori.] The Maori name for the large apteryx or kiwi, *Apteryx mantelli*, of the North Island, New Zealand. Also *roa-roa.*

roach¹, *n.* 3. The redfin, *Rutilus rutilus*, a common European shiner or minnow of the family *Cyprinidæ.*

roach², *n.* 3. In England, a shell limestone occurring at the top of the Portland Stone or Portlandian on the Isle of Portland.

roachback (rōch′bak), *n.* [See *roach-backed.*] The grizzly bear of the Bitter Root mountains and vicinity.

> The *roachbacks*, as the Bitter Root grizzlies are called, are a cunning and desperate race.
> *E. Thompson Seton*, The Biography of a Grizzly, p. 135.

road, *n.* 6. The tour or route of a theatrical company. See *on the road.*

> A comedian who has seen so much of the unlovely side of "*road*" life that he might well be the writer of tragedies.
> *N. Y. Times*, Dec. 28, 1902.

Fore-and-aft road, in *lumbering*, a skid-road made of logs placed parallel to its direction, making the road resemble a chute.—**Go-back road,** a road upon which unloaded logging-sleds can return to the skidways for reloading without meeting the loaded sleds on the way to the landing.—**Short road.** Same as *go-back* ★*road.*—**Skid-road.** (*a*) A road or trail which leads from the stump to the skidway or landing. (*b*) A road over which logs are dragged, having heavy transverse skids, partially sunk in the ground, usually at intervals of about five feet.—**Steel road.** Same as *steel* ★*roadway.*—**To brush a road,** in *lumbering*, to cover with brush the mud-holes and swampy places in a logging-road to make it solid.—**Township road.** See ★*township.*

road-gage (rōd′gāj), *n.* In *mech.*, a device attached to a vehicle to show the grade of the road over which the vehicle is traveling.

road-goose (rōd′gös), *n.* See ★*goose.*

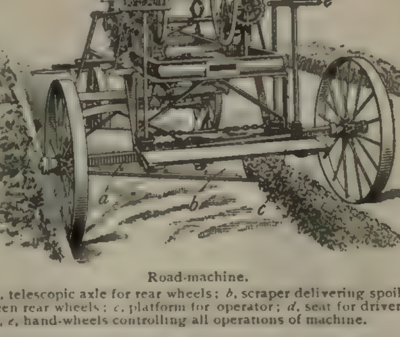
road-grader (rōd′grā″dėr), *n.* Same as *road-leveler* and ★*road-machine.*

road-horse (rōd′hôrs), *n.* A horse used for driving, in distinction from one used for drawing loads; a roadster.

road-house (rōd′hous), *n.* An inn or tavern on the roadside, used as a place of refreshment by those driving along the road.

> The revival of road coaching as a popular amusement, . . . the habit of well-known persons to make use of the better class of *road houses* and now Col. . . .'s decision to erect a suburban inn on a much-used boulevard seem to point to the revival of a spring season.
> *N. Y. Com. Advertiser*, May 11, 1901.

road-machine, *n.* (*b*) Specifically, a large steel frame mounted on four wheels and carrying a large steel scraper beneath, between the two pairs of wheels. By means of



Road-machine.

a, telescopic axle for rear wheels; *b*, scraper delivering spoil between rear wheels; *c*, platform for operator; *d*, seat for driver; *e*, *e*, *e*, *e*, hand-wheels controlling all operations of machine.

various appliances, under the control of the operator, the scraper can be used as a plow in breaking up a road-bed, or as a scraper, evener, or grader. It can also be turned in any direction and presented to the work at any angle or any level to trim the road-bed to any required slope. The rear axle of the machine is telescopic and can be extended in either direction to bring the scraper outside the line of the forward wheels in cutting the outside of the road-bed and turning the material toward the crown of the road. All the changes in the position and duty of the tool can be made while the machine is in motion.

road-monkey (rōd′mung″ki), *n.* See ★*monkey.*

road-pen (rōd′pen), *n.* A steel pen having two points, used in making two parallel lines to represent a road in map-making.

roadster, *n.* **1.** The typical roadster stands from 15.1 to 15.3 hands high, and weighs from 950 to 1150 pounds. It should stand high on the legs, be deep of chest, but lack the heavy form of a draft horse.

road-wagon (rōd′wag″o̤n), *n.* A top-wagon swung on side-bars.

roadway, *n.*—**Steel roadway,** a road or highway in which parallel lines of steel plates or channels, supported on proper foundations, are provided as wheel tracks, for the purpose of diminishing the tractive power necessary to move vehicles.

Roanoke-bell (rō-a̤-nōk′bel″), *n.* The Virginian cowslip or lungwort, *Mertensia Virginica.*

roarer, *n.* **2.** Same as *bull-roarer.*

> At night, when the tribe dances in glee, this mortar or tub for soaking skins becomes a drum. A wild gourd holding pebbles becomes a timbrel. A staff cut with notches is played upon with another and smaller one with rhythmic rasping thrum, and becomes a viol. A reed, or a section of bark, or the hollow bone of a bird, makes a flute. A tablet two fingers wide and a span in length, suspended from a staff with sinew, becomes a *roarer* which is whipped through the air—the first trumpet of primitive man.
>
> *An. Rep. Bur. Amer. Ethnol.*, 1897–98, p. lxxiii.

3. A gas-well from which a large quantity of gas flows noisily. *Dialect Notes,* II. vi.

roast, *v. t.* **6.** In *agri.*, in the process of bare-fallowing, to subject (the soil) to the full force of the sun in order to kill the weeds.

> Besides, the great object in working a fallow is the "*roasting*" of the weeds by means of the midsummer sun. *J. Wrightson,* Farm Crops, p. 31.

roaster, *n.* **4.** A muffle or furnace used for roasting ore, usually of the reverberatory type; specifically, the furnace in which blister-copper is produced. *Phillips and Bauerman,* Elements of Metallurgy, p. 460.—**Roaster acid,** in the manufacture of carbonate of soda by the Leblanc process, the aqueous hydrochloric acid obtained by condensation in water of roaster gas.

roasting (rōs′ting), *n.* The act denoted by the verb *roast.*—**Sweet roasting,** in *metal.*, roasting carried on until sulphurous and arsenious fumes cease to be given off. Also known as *good* or *dead roasting.*

roasting-dish (rōs′ting-dish), *n.* In *assaying,* a round shallow dish of fire-clay ware, about 2–6 inches in diameter, used to roast a sample of pulverized ore (burning off sulphur, etc.) preparatory to assaying.

roasting-tray (rōs′ting-trā), *n.* A shallow basket used by some American Indian tribes to roast or parch corn or seeds by shaking them with hot stones or coals.

rob^1, *v. t.* **8.** In spoil-five, when the trump card turned up is an ace, the dealer may rob it by discarding a card from his own hand in its place. If the trump card is not an ace, any player holding the ace of trumps may, when it is his turn to play to the first trick, pass a card to the dealer and receive the turned trump in its place.

robber, *n.* **2.** In *bee-keeping,* a bee which takes honey from a strange hive.

robber-frog (rob′ėr-frog), *n.* A rather large frog, *Lithodytes latrans,* found in Texas among the rocks on the borders of rivers. It has a cry which suggests the bark of a dog.

robin^1, *n.* **3.** The name is given locally by English colonists to a number of very different birds, which are reddish or chestnut below: in Jamaica to one of the todies, *Todus viridis;* in South Africa to a coly, *Pressinornis phœnicurus;* in India to a warbler, *Thamnobia fulicata;* and in Australia to a flycatcher, *Erythrodryas,* and more commonly to *Petrœca.*—**New-Zealand robin,** a small bird of the genus *Miro* which bears little resemblance to the robin of England.

robin^4 (rō′bin), *n.* [*Rob*(*inia*) + *-in*^{2}.] A toxin obtained from the *Robinia Pseudacacia,* a locust-tree of North America.

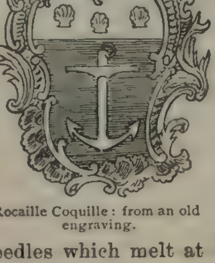
robinin (rō′bi-nin), *n.* [*robin* + *-in*^{2}.] A yellow crystalline glucoside, $C_{33}H_{44}O_{20} + 8H_2O$ (?), found in the flowers of the locust-tree, *Robinia Pseudacacia.* It yields quercitin and a sugar, probably isodulcite, when hydrolyzed. It melts at 195° C.

roburite (rō′bėr-īt), *n.* [L. *robur,* strength, + *-ite*^{2}.] A trade-name for an explosive, consisting essentially of ammonium nitrate and chlordinitrobenzene, varied sometimes by the substitution or addition of other ingredients. It is claimed that this material is safer in use than many other explosives, and particularly well adapted to coal-mining and quarrying; but the deliquescent character of ammonium nitrate requires protection from contact with the air.

rocaille, *n.* **2.** In *gardening,* rockwork; especially rockwork that does not attempt to imitate the natural formation of rocks, but combines pebbles, shells, etc., into conventional figures of sea-gods, dolphins, or marine and rustic ornaments for the decoration of grottoes, fountains, etc.

> Of all the groves with their delicate trellis-work, their *cabinets de verdure* of clipped trees, and elaborate fountains in basins decorated with frail work in *rocaille,* but two remain in anything like their old completeness and elegance. *Scribner's Mag.,* July, 1905, p. 49.

Rocaille coquille, book-plate ornamentation in varying forms of the scallop-shell upon rockwork.



Rocaille Coquille: from an old engraving.

Roccellaceæ (rok-se-lā′sẹ-ē), *n. pl.* [NL., < *Roccella* + *-aceæ.*] A family of gymnocarpous lichens named from the genus *Roccella.*

roccellinin (rok-sel′i-nin), *n.* [*Roccella* + *-in* + *-in*^{2}.] A crystalline substance, $C_{18}H_{16}O_7$, found in the lichen *Roccella tinctoria.* It crystallizes in needles which melt at 182° C.

Rochester shale. See ★*shale*^{2}.

rochet^1 (roch′et), *v. t.*; pret. and pp. *rocheted,* ppr. *rocheting.* To invest with a rochet.

> What, still at work so gray and obsolete?
> Still *rocheted* and mitered more or less?
> Don't you feel all that out of fashion now?
> I find out when the day of things is done!
>
> *Browning,* Ring and Book, vi. l. 1243.

rock^1, *n.*—**Complementary rocks.** See ★*complementary.*—**Copper rock.** See ★*copper*^{1}.—**Coral rock,** rock composed of fossil corals, the comminuted parts of corals, or of coral sand which has undergone, by the process of diagenesis, an alteration to a dolomite or magnesian limestone.—**Crystalline rocks,** in *geol.*, a term commonly employed to describe both metamorphic and igneous rocks, in contrast to sedimentary or clastic rocks.—**Effusive rock,** igneous rock erupted upon the surface of the earth. See *the* ★*effusive period.*—**Flour of rocks.** See ★*rock-flour,* 2.—**Gluing rock,** a seam of clay so tightly adherent to a coal-seam that the two must be mined together. [Colloq.]—**Hybrid rocks,** according to the theory of Durocher (1857), igneous rocks of intermediate composition, as syenites, trachytes, and (?) andesites, formed by the mixture of a persilicic and a subsilicic magma; according to Harker (1904), igneous rocks formed by the mixture of any two magmas.—**Igneous rocks,** those rocks which have cooled and consolidated from a state of fusion. They are set off from the sedimentary and æolian on the one side, and the metamorphic on the other. They appear as dikes, surface-flows, intruded sheets, laccoliths, stocks, necks, and batholiths. According to their relations to the surface at the time of consolidation they have been subdivided into the deep-seated or plutonic, and the surface-flows or volcanic. *Intrusive* is a synonym of the former and *extrusive* or *effusive* of the latter. The texture varies from glassy through felsitic and porphyritic to granitoid, as we pass from the surface to interior conditions of consolidation.—**Intermediate rocks,** igneous rocks intermediate in composition between those that are high (persilicic) and those that are low in silica (subsilicic), as diorites and syenites.—**Live rock,** rock that is unaltered, or as yet undisturbed by mining.

> Deposits of this sort, which occur invariably inclosed in undecomposed or "*live*" *rock,* are regarded as original ores.
>
> *Contrib. to Econ. Geol.,* U. S. Geol. Surv., Bulletin 213, [1902, p. 160.

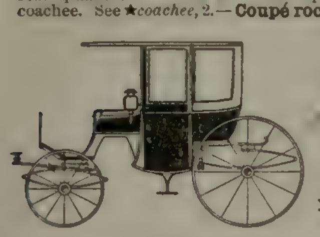
Melbourn rock, in *Eng. geol.,* a name given to a band of hard yellow and white nodular chalk 8 or 10 feet thick, locally known in Cambridgeshire as 'rag.' It lies at the base of the Middle Chalk or Turonian, near the middle of the Upper Cretaceous.—**Moor rock,** in *geol.*, a local name given to the millstone-grit in Lanarkshire.—**Perched rock,** in *geol.*, an erratic, usually large rock, left perched upon a ledge or other conspicuous place.—**Rock dammar.** See ★*dammar.*—**Rock scarlet.** Same as ★*dianthine.*—**The quantitative system of classification of igneous rocks,** a system of classification suggested by Cross, Iddings, Pirsson, and Washington in 1902. It classifies rocks primarily on the basis of their chemical composition and secondarily on that of their mineral composition and texture. Igneous rocks that are chemically alike are grouped together. The chemical composition is expressed in terms of standard minerals which may crystallize from any given molten magma. All pyrogenetic minerals are arranged in three groups, two of which are chosen as standard minerals. The first group contains the distinctly aluminous minerals—feldspars, leucite, nephelite, sodalites, and corundum, together with quartz and zircon. For this group the term *salic* (mnemonic of *s*ilica and *al*umina) is used. The second group contains all other pyrogenetic minerals which are free from alumina—orthorhombic pyroxenes and diopside, wollastonite, acmite, olivin, akermanite (representing melilite), magnetite, ilmenite, titanite, apatite, etc. This group is called *femic* (mnemonic of *fe*rro*m*agnesian, the predominant character of the group). The third group contains aluminous ferromagnesian minerals—augites, amphiboles, micas, garnets, etc., and is called *alferric* (mnemonic of *al*umina and *ferric* oxid). The salic and femic minerals are the standard minerals, and it is possible to express the chemical composition of all igneous rocks in terms of these minerals, without taking into account the possible alferric minerals. The composition of an igneous rock expressed quantitatively in terms of standard minerals is called its *norm.* The actual mineral composition of the rock expressed quantitatively is called its *mode.* The system of subdivision of the classification is dichotomous, successive pairs of factors (groups of standard minerals or of chemical constituents) being compared quantitatively. The same proportional limits are employed in each set of divisions based on a pair of factors. Thus the possible mixtures of A and B are divided into 5 parts: (1) $A / B > 7 / 1$, A is extreme; (2) $A / B < 7 / 1 > 5 / 3$, A dominates over B; (3) $A / B < 5 / 3 > 3 / 5$, A and B are equal or nearly equal; (4) $A / B < 3 / 5 > 1 / 7$, B dominates over A; (5) $A / B < 1 / 7$, B is extreme. Names or terms applicable to (1) and (5) are formed with the prefix *per-*; those applicable to (2) and (4) are formed with the prefix *do*(*m*)-; terms applied to (3) combine two syllables mnemonic of the two factors compared. All igneous rocks fall into five classes, according to the proportions of the salic and femic groups of standard minerals expressing their chemical composition, that is, according to the proportions of the salic and femic minerals in their norms. These minerals are calculated from a chemical analysis of the rock, which may have been obtained by the usual chemical methods, or by calculation from the mineral composition of the rock determined by optical methods. The five classes are: (1) *persalane,* extremely salic, including rocks high in quartz, feldspar or feldspathoids, corundum or zircon; (2) *dosalane,* dominantly salic, including rocks in which the minerals just mentioned dominate over the femic minerals; (3) *salfemane,* equally, or nearly equally, salic and femic; (4) *dofemane,* dominantly femic; (5) *perfemane,* extremely femic, including such rocks as peridotites and pyroxenites. Each class is divided into five subclasses on the proportions of two subgroups of the predominant group of standard minerals. For salic minerals the subgroups are: (1) quartz, feldspars, feldspathoids; (2) corundum, zircon. For femic minerals the subgroups are: (1) pyroxenes, olivin, akermanite, magnetite, hematite, titanite, ilmenite, perofskite, rutile; (2) apatite, fluorite, pyrite, etc. Almost all igneous rocks belong to the first subclass in each class. Few are rich in corundum, or zircon, or apatite. *Orders* are based on the proportions of mineral subdivisions of the preponderant subgroup making a subclass. Thus of the first subgroup of salic minerals, quartz and feldspars are compared with each other, and feldspars and feldspathoids, yielding nine orders in classes 1, 2, 3, as: (1) *perquaric,* (2) *doquaric,* etc. The orders are further divided into sections by comparing the proportions of normative pyroxene with olivin and akermanite, and the proportions of normative minerals having ferric iron with those containing titanium oxid. *Rangs* are formed on the character of the chemical basis in the groups of standard minerals forming orders. Thus in the first three classes the five rangs are based on the proportions of $K_2O + Na_2O$ to CaO in the salic minerals, making: (1) *peralkalic,* (2) *domalkalic,* (3) *alkalicalcic,* (4) *docalcic,* (5) *percalcic.* In the last two classes the rangs are based on the proportions of $CaO + MgO + FeO$ to $K_2O + Na_2O$ in the femic minerals, giving: (1) *permirlic,* (2) *domirlic,* (3) *alkalimirlic,* (4) *domalkalic,* (5) *peralkalic.* *Subrangs* are based on the proportions of the chemical components within the dominant group of oxids. Thus when the alkalis are dominant the subrangs are: (1) *perpotassic,* (2) *dopotassic,* (3) *sodipotassic,* (4) *dosodic,* (5) *persodic.* In rangs in which $CaO + MgO + FeO$ dominate sections of rangs are based on the proportions of $MgO + FeO$ compared with CaO, giving: (1) *permiric,* (2) *domiric,* (3) *calcimiric,* (4) *docalcic,* (5) *percalcic.* Subrangs of these are based on the proportions of MgO and FeO, and are: (1) *permagnesic,* (2) *domagnesic,* (3) *magnesiferrous,* (4) *doferrous,* (5) *perferrous.* *Grads,* the next taxonomic divisions, are based on the proportions of subdivisions of the subordinate group of standard minerals in a manner analogous to the formation of orders; *subgrads* are based on the chemical characters of these minerals in a manner similar to that followed in forming rangs. The names of other divisions of the system are constructed from geographical names with suffixes peculiar to the different ranks of the system as follows: *-ane,* class; *-one,* subclass; *-are,* order; *-ore,* suborder; *-ase,* rang; *-ose,* subrang; *-ate,* grad; *-ote,* subgrad. The termination for the name of a section of any of these is formed by inserting *i* before the proper suffix.—**Transition rocks,** in *geol.*, Werner's name for the old and more or less metamorphosed sediments, which rest upon the primitive gneiss, and which are now chiefly placed in the early Paleozoic.

rock^2, *v. t.*—**To rock in,** in *forestry,* to plant, as young trees, in openings in the ground made by prying or rocking a spade back and forth.

rockallite (rok′âl-īt), *n.* [*Rockall,* a small reef in the North Atlantic, 240 miles northwest of Ireland, + *-ite*^{2}.] In *petrog.*, a phaneric igneous rock, with granular texture, composed of quartz and ægirite in equal proportions and about 23 per cent. of albite: only known to occur at Rockall, in the North Atlantic. *Judd,* 1899.

rock-asphalt (rok′as″falt), *n.* Same as *asphalt stone, asphalt rock.*

rockaway, *n.*—**Coachee rockaway,** a rockaway the rear quarters of which are made up like those of the coachee. See ★*coachee*, 2.—**Coupé rockaway,** a carriage combining in its design features of the coupé and the rockaway.—**Curtain rockaway,** a rockaway like the coupé rockaway, except that curtains are substituted for the glass windows.



Coupé Rockaway.

rock-beauty, *n.* 2. A name of *Holacanthus tricolor*, a fish of the family *Chætodontidæ*, found in the West Indies and southward to Brazil. See ★*Holacanthus*, with cut.

rock-bottom (rok′bot″um), *n.* A stratum of rock which forms a bottom, as for a well or a foundation: also used attributively, and colloquially, in a figurative sense: as, *rock-bottom* figures, or a *rock-bottom* price.

rock-builder (rok′bil″dėr), *n.* One of the invertebrate organisms whose skeletons essentially contribute to the formation of rock masses. Many classes of the invertebrates have at one time or another acted as rock-builders on account of the profusion of their exuviæ. Chief among them are the *Foraminifera*, *Radiolaria*, corals, and corallines; less prominent are sponges, crinoids, brachiopods, and pelecypods.

rock-channeler (rok′chan″el-ėr), *n.* A machine used in mining and quarrying, to cut channels or seams in the rock so that large pieces may be taken out. A *bar-channeler* is one in which the cutters are attached to a bar or carriage.

rock-city (rok′sit″i), *n.* A name applied in southwestern New York to groups of rock bluffs and walls divided along joint-planes into quadrangular forms and separated by intersecting passages of considerable depth and width. These rock-cities lie in conglomerates (Cattaraugus beds) of Cattaraugus and Allegany counties, and those near Panama are especially striking. They appear to be the result of tension upon a very rigid rock produced by upfolding into low anticlinals: the blocks are separated by a continuation of the process of elevation after the separation along the joint-planes has been completed.

rock-cod, *n.* 2. In California, any scorpænoid fish of the genera *Sebastodes* and *Sebastichthys*; also, occasionally applied, there or elsewhere, to fishes of similar form; in New Zealand, a pteropsaroid fish, *Parapercis colias.*—**Black rock-cod.** (*a*) See *cod*2. (*b*) An Australian fish, *Epinephelus dæmeli*, of the family *Serranidæ*: chiefly of New South Wales.—**Red rock-cod.** (*a*) In New South Wales, the fish *Scorpæna cardinalis*, of the family *Scorpænidæ*, marine fishes resembling the sea-perches. *S. cardinalis* is of a beautiful scarlet color. *E. E. Morris*, Austral English. (*b*) In California, *Sebastichthys ruberrimus* and other related species, bright red in color.

rockcraft (rok′kråft), *n.* In mountain-climbing, skill in climbing rocks and cliffs.

> *Rock-craft* consists in the intelligent selection of a line of route and in gymnastic skill to follow the line chosen.
> *Encyc. Brit.*, XXXI. 23.

rock-cut (rok′kut), *a.* Excavated in solid rock, as many cave-tombs in Egypt, Asia Minor, and India. See ★*cave-tomb* and *rock-temple.*

rock-dwelling (rok′dwel″ing), *n.* A dwelling or abode in the hollows of rocks or cliffs: usually applied to those which have been artificially excavated in the solid rock, such as are frequently found in western Asia.

rocker2, *n.* (*n*) In *pianoforte-making*, the piece screwed to a key-tail to which the action-extension is fastened. (*o*) A tanning-vat in which the hides are rocked at intervals to facilitate tanning. *Davis*, Manuf. of Leather, p. 382.—**Brush-rocker,** an attachment to an electric generator or motor by means of which the position of the brushes upon the commutator may be adjusted or shifted.

rocker-arm (rok′ėr-ärm), *n.* An arm or lever attached to a rock-shaft so that it may receive or give a reciprocating angular motion. *Elect. World and Engin.*, Dec. 12, 1903, p. 970.

rocker-bar (rok′ėr-bär), *n.* A bar or lever mounted on a shaft which has an oscillating motion; a rocking-bar; a rocking-beam.

rocker-box (rok′ėr-boks), *n.* The box or bearing for a rock-shaft. *J. G. A. Meyer*, Modern Locomotive Construction, p. 199.

rocket1, *n.* 3. Same as ★*water-rocket*, 3.

> All waterfalls tend to break up into conical masses called water-rockets, and in rare cases a fall may be seen which consists of a slow procession of well-separated "*rockets*" ranged in roughly horizontal lines. A case is described in which this beautiful appearance was due to the formation of roll-waves above the fall.
> *Nature*, April 18, 1907, p. 597.

rocket2, *n.*—**False rocket.** Same as *purple* ★*rocket.*—**Purple rocket,** a handsome cruciferous plant, *Iodanthus pinnatifidus*, of the eastern and southern United States. It is an erect perennial herb with deeply toothed leaves, the lower ones lyrate-pinnatifid, and purple, violet, or white flowers in terminal and axial panicled racemes.—**Scrambling rocket,** the hedge-mustard, *Sisymbrium officinale.*

rocket-boat (rok′et-bōt), *n.* A strongly designed flat-bottomed boat from which Congreve rockets were formerly discharged during a naval bombardment.

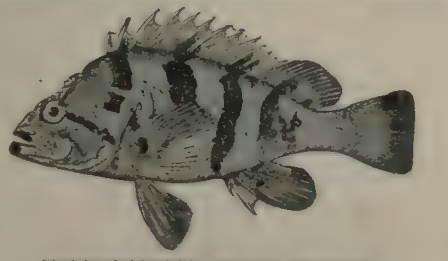
rocket-bomb (rok′et-bom), *n.* In *whaling*, a rocket intended to be projected from the deck of a vessel, and carrying with it a harpoon and bomb-lance combined.

rocket-gun (rok′et-gun), *n.* In *whaling*, the gun from which a whaling-rocket is discharged.

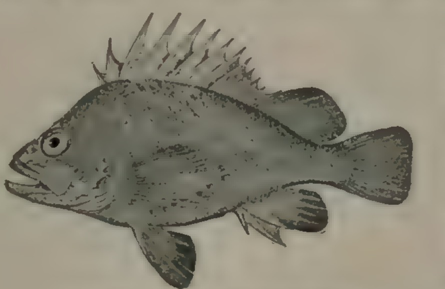
rocket-lightning (rok′et-līt″ning), *n.* See ★*lightning*1.

rock-fever, *n.* 2. Same as *Malta* ★*fever.*

rockfish, *n.*—**Black-and-yellow rockfish,** a scorpænoid fish, *Sebastodes chrysomelas*, found on the Pacific coast of America, from Puget Sound to San Diego Bay.—**Black-banded rockfish,** a scorpænoid fish, *Sebastodes nigrocinctus*, found in rather deep water from Monterey to Vancouver Island.—**Brown rockfish,** *Sebastodes auriculatus*, found off the Pacific coast of America.—**Flesh-colored rockfish,** *Sebastodes carnatus*, from the coast of California.—**Grassy-ground rockfish,** a serranoid fish, *Dules dispilurus*, of the West Indian fauna.—**Marbled rockfish,** a serranoid fish, *Mycteraperca bonaci*, known from Florida to Brazil.—**Red rockfish.** (*b*) Any one of the several red species of *Sebastodes*: usually taken at greater depths and more highly prized for food than the other species of black and dull colors.—**Spotted rockfish,** *Sebastodes constellatus*, from the coast of California.—**Yellow-backed rockfish,** *Sebastodes maliger*, of the Pacific coast of America.—**Yellow-spotted rockfish,** *Sebastodes nebulosus*, found from Vancouver Island to Punta Concepcion.



Black-banded Rockfish (*Sebastodes nigrocinctus*).
(From Bulletin 47, U. S. Nat. Museum.)



Yellow-backed Rockfish (*Sebastodes maliger*).
(From Bulletin 47, U. S. Nat. Museum.)

rock-flour, *n.* 2. The finest powder produced in the rubbing of rocks together. This flour-like matter is a constant product of glacial action and is carried away by the waters of the melting ice to be deposited as a clay-like silicious mud. Compare ★*rock-meal*, 2.

> The water [from a glacier] is usually whitened by fine "*rock flour*," ground beneath the ice.
> *W. M. Davis*, Phys. Geog., p. 329.

rock-froth (rok′frôth), *n.* A vesicular, scoriaceous lava, produced by the inflation of molten material with bubbles of escaping gas.

> Completely fused lava, when cooled rapidly, forms volcanic slag or volcanic glass (obsidian). . . . If it is full of gas-bubbles (*rock-froth*), and hardens in this condition, it forms vesicular or scoriaceous lava.
> *Le Conte*, Elements of Geol., p. 84.

rock-hewn (rok′hūn), *a.* Same as ★*rock-cut.*

rock-house (rok′hous), *n.* 1. A shelter formed, in deep gorges in northern Alabama, by the wearing away of softer strata under one of resistant sandstone. Several delicate ferns and a few other plants are found in them. *C. Mohr*, Plant Life of Alabama, p. 17.—2. In *mining*, a shed or store-house for ore which is to go to the stamp-mill.

rock-ice (rok′is), *n.* Same as *fossil* ★*glacier.*

rocking-bar, *n.* 2. A rocking device to the shedding-motion of a loom dobby.

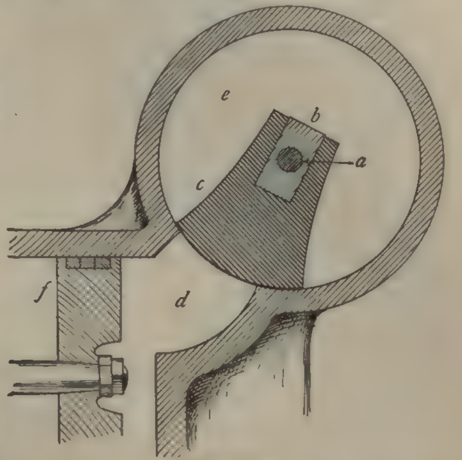
rocking-grate (rok′ing-grāt), *n.* A grate in which the bars roll or rock from side to side to break up the cinder and ashes and allow them to drop out.

Rockingham ware. See ★*ware*2.

rocking-lever (rok′ing-lev-ėr), *n.* 1. A lever or bar used to operate a rocking-grate or similar device.—2. An equalizer or equalizing-bar.—3. A lever or arm moving about a center through an angle of less than 360° and returning to its first position; an oscillating lever.

rocking-link (rok′ing-lingk), *n.* A rocking-lever; a link or lever hung by a point on the link so that the ends oscillate. *D. K. Clark*, Steam Engine, III. 280.

rocking-valve (rok′ing-valv), *n.* A valve of cylindrical or other shape which is a surface of revolution, and which is opened and closed by being rotated through an angle around the axis of its figure with a motion which resembles the swinging of a rocking-chair.



Rocking-valve.

a, cylindrical axis or stem of valve; *b*, rectangular guiding and driving surfaces of spindle; *c*, rocking-valve; *d*, port supplied with steam from chest *e*; *e*, steam-chest around rocking-valve; *f*, piston to be actuated by steam from *e* when *c* opens port *d*.

rock-jasmine (rok′jas″min), *n.* See ★*Androsace.*

rockling, *n.* 2. *Genypterus australis*, of the family *Ophidiidæ.*—**Four-bearded rockling,** a gadoid fish of the genus *Enchelyopus*, of the North Atlantic.—**Three-bearded rockling,** a gadoid fish of the genus *Gaidropsarus*, found in northern seas.

rockman (rok′man), *n.* In excavating for building, one of the men who clear the ground of rocks or ledges by blasting, etc.

> The strike committee appointed by the *Rockmen* and Excavators' Union two weeks ago to order a strike against the 150 members of the Contractors' Protective Association . . . began work yesterday.
> *N. Y. Times*, May 12, 1905.

rock-marking (rok′mär″king), *n.* See the extract.

> M. Georges Courty, whose researches into *rock-markings* in the Department of Seine-et-Oise were mentioned in The Athenæum, No. 4001, has since pursued them in the same Department at Étampes and Milly. In some exposed places, mixed up with modern figures, letters, and other penknife scratchings, he found some marks of the Neolithic type. At the Roche de la Briche he was more fortunate. Removing a natural growth of vegetation from some of the rock surface, he came upon a number of untouched petroglyphs.
> *Athenæum*, April 15, 1905, p. 468.

rock-meal, *n.* 2. A fine mechanical sediment resulting from the grinding together of minerals and rocks. The term is used especially to designate the constituents of the till which resemble ordinary clays in fineness of grain but differ from them in degree of oxidation. *J. Geikie*, The Great Ice Age, p. 72.

rock-medlar (rok′med″lär), *n.* See ★*medlar.*

rock-native (rok′nā″tiv), *n.* See ★*native*, 7.

rock-oak (rok′ōk), *n.* See ★*oak.*

rock-oyster, *n.* 3. *Ostrea glomerata*, of eastern Australia.

rock-perch (rok′pėrch), *n.* An Australian fish, *Glyphisodon victoriæ*, of the family *Pomacentridæ.*

rock-rose, *n.*—**Cretan rock-rose,** *Cistus Creticus.* See *Cistus*, 2 (with cut).

rock-rubble (rok′rub″l), *n.* 1. The crushed rock of a fault-zone.—2. A confused mass of broken rock originating through the disintegrating action of the atmospheric agents. See *rubble-★drift*. *J. Geikie*, The Great Ice Age, p. 392.

rock-scoring (rok'skōr'ing), *n.* In *geol.*, the erosive action of glaciers on rock, or the results of such action. Various kinds of scoring are noted, as: striæ or striations, fine linear scratches, nearly parallel; grooves or furrows, broader depressions, usually straight, sometimes curved, a few inches (rarely a foot or more) deep; gouges, irregular excavations; and crescentic gouges or furrows, broken excavations, transverse to the striæ, with concave side 'up-stream.'

rock-shaft^2 (rok'shȧft), *n.* In *mining*, a shaft constructed for sending down rock for filling stopes which have been worked out. It is usually provided with a valve or trap at the bottom so that rock may be thrown into it at any time and taken out as it is wanted.

rock-shelter (rok'shel"tėr), *n.* A natural cave used as a temporary or permanent dwelling.

The Prehistoric *Rock-shelter* at Schweizersbild, near Schaffhausen. *Geog. Jour.* (R. G. S.), XI. 89.

rocks-man (roks'man̤), *n.* One whose occupation it is to climb and descend cliffs to secure the birds which nest in them or to gather their eggs.

The dexterity of these *rocksmen* is truly astonishing . . . they will creep on hands and knees, though cumbered with a load of birds, along a narrow ledge, seemingly without concern for their personal safety. *Macgillivray*, Hist. British Birds, v. 435.

rock-tomb (rok'töm), *n.* A tomb hollowed out of the solid rock.

rock-trout, *n.*—**Red rock-trout**, a fish, *Hexagrammos superciliosus*, in no way related to or resembling a trout, found from Bering Island to Monterey Bay.

rock-wallaby (rok'wol"a̤-bi), *n.* A marsupial of the genus *Petrogale* (which see). [Australia.]

rock-waste (rok'wāst), *n.* In *phys. geog.*, detritus derived by the superficial disintegration of rock-masses and in process of removal by transporting agencies.

rock-whiting (rok'hwī"ting), *n.* See ★*whiting*^{2}.

rock-wool (rok'wůl), *n.* A white fibrous material made by blowing a stream of air or steam through molten slag as it comes from the blast-furnace or other metallurgical process. Usually known as *mineral wool*.

rock-worm (rok'wėrm), *n.* A local name in the Channel Islands for *Marphysa sanguinea*, a large bronze worm with bright red gills.

rocky^2, *a.* 2. In a shaky, precarious condition. [Slang.]

Old Mosey? He's pretty *rocky*. I'm afraid he won't pull through. *The Century*, June, 1901, p. 227.

The place reeks of fever, and as your present state of health is distinctly *rocky*, you 'll catch it, and be dead and out of the way inside a week easily. *Cutcliffe Hyne*, A Master of Fortune, xi.

Rocky Mountain spotted fever. See ★*tick-fever*.

rod^1, *n.* 8. The central cone or peg in a gustatory cup on an insect's epipharynx.

The structure and armature of the epipharyngeal surface even besides the taste-pits, taste-cups and *rods*, is very varied, the setæ assuming very different shapes. *A. S. Packard*, Text-book of Entom., p. 45.

9. Any gorgonian with long, cylindrical branches.—**Bus-rod**, one of the heavy conductors to which the terminals of the generators in an electric power-house or central station are connected; a bus-bar.—**Maddox rods**, a series of glass rods used in testing for inequality of the visual axes.

Test for exophoria, esophoria and hyperphoria with light about twenty feet, using single prism or *Maddox rod* and red glass; or, preferably, a phorometer of the Stevens or similar pattern, where the testing prisms are held accurately. *Optical Jour.*, April 28, 1904, p. 740.

Marckwald's rods, rods of metallic bismuth upon which polonium has been deposited from a solution of a bismuth salt extracted from pitchblende residues. This deposit is highly radioactive, and was believed by Marckwald to be, or to be closely related to, tellurium: he named it *radioactive tellurium*. It has been suggested that the rod so coated might be used to distinguish a genuine diamond from paste, the former phosphorescing when brought near the rod.—**Wheatstone's rod**, a slender rod fastened at one end and vibrating through a large amplitude when the free end is displaced and then released. The frequencies of vibration in two planes at right angles to each other are adjusted to some simple ratio, as 1:2, 2:3, or 3:4, by suitable shaping of the rod, and the free end consequently describes the corresponding Lissajous's figure, thus affording a simple and elegant demonstration of the composition of simple harmonic motions.

roda (rō'dä̤), *n.* [Pg. *roda*, a wheel, < L. *rota*, a wheel: see *rote*^{1}.] A tin coin of the Portuguese possessions in India, equal to 2¼ bazaruccos or 2 reis.

rodding (rod'ing), *n.* [*rod*^{1} + *-ing*^{1}.] Rods collectively: as, 'a line of *rodding*.' *Encyc. Brit.*, XXXII. 144.

Rodent cancer. Same as *rodent* ★*ulcer*.

rodeo, *n.* 2. The inclosure in which cattle are collected for counting or branding.

rodex (rō'deks), *n.* [Origin obscure.] A state of good repair. [Cornwall.]—**Out of rodex**, out of repair or adjustment. [Cornwall.]

rodinal (rō'di-na̤l), *n.* [A trade-name.] A commercially prepared solution of para-aminophenol hydrochlorid with alkali and a preservative: used as a photographic developer.

roding (rō'ding), *n.* [See *rode*^{5}, *n.*] A rope attached to the anchor of a dory or small fishing-boat. [Bay of Fundy.]

rodite (rō'dīt), *n.* See ★*meteorite*.

rod-mill (rod'mil), *n.* The set of roll-trains in which a billet is rolled to a rod.

The *rod mill*, which has been erected on a site adjoining the steel-making plant, is equipped with machinery for the rolling of rods and drawing of wire, as well as the manufacture of barbed and plain wire fencing, nails, and other staples. *Sci. Amer. Sup.*, July 23, 1904, p. 23870.

rodney (rod'ni), *n.* [Origin obscure.] In Australia, a vagrant. [Slang.]

In a police trial reported in the local [Australian] papers a dock constable declared that the defendant was a "*rodney*"; and when the magistrate asked what is a "*rodney*," the constable answered, "A man who works one day and is idle six months, and yet lives!" The man was sentenced as a vagrant, and this must be accepted as the definition. It is borrowed doubtless from the native dialect. *N. Y. Jour. Commerce*, Nov. 10, 1886.

rod-white (rod'hwīt), *n.* The sensation of dim, misty whiteness produced by the action upon the retina of light so feeble that the rods only and not the cones are stimulated, or of light falling upon portions of the retina devoid of cones.

But at a still higher temperature (up to 700° C. and above) the rods enter into vigorous competition with the cones, and the light red colour seen in gazing at the platinum plate changes in indirect vision into a peculiar colourless white, the "*rod-white*," while at the same time the brightness of the platinum plate increases considerably. *Nature*, Feb. 18, 1904, p. 379.

roeblingite (rėb'ling-īt), *n.* [Named after W. A. *Roebling*.] A mineral regarded as consisting of calcium silicate with calcium-lead sulphite, which occurs in white, massive form at Franklin Furnace, New Jersey.

Rœboides (rē-boi'dēz), *n.* [NL., an error for **Rhæboides*, < Gr. ῥαιβοειδής, crooked-looking, < ῥαιβός, crooked, + εἶδος, form.] A characinoid genus of fishes found in fresh waters of South America.

Roentgenize, Roentgenography, etc. See ★*Röntgenize*, etc.

Rœstelia (res-tē'li-ạ̈), *n.* [NL. (Rebentisch, 1804), < *Roestel*, a German apothecary and amateur botanist.] A form-genus of rust-fungi including the æcidial forms of species of *Gymnosporangium*. This stage occurs on the apple, quince, and other rosaceous plants, while the teleutospores are found on juniper and other closely related conifers.

roger, *n.*—**Jolly roger** (*naut.*), a pirate flag which shows a white skull and cross-bones on a black field.

rogerium (rọ-jē'ri-um), *n.* [NL.] The name of a supposed new chemical element announced in 1879, by J. Lawrence Smith, as present in the mineral samarskite. There has been no confirmation of its existence.

Roger's blast. A sudden, short, and violent motion of air in the nature of a whirlwind. It is mentioned in old nautical works, but its origin is obscure. Its name and character suggest an allusion to pirates.

rogue, *n.* 7. A bait, used in the sardine fishery, consisting of an oily dough made of the roe and entrails of codfish. *Sci. Amer. Sup.*, Feb. 28, 1903, p. 22715.

Roiro lacquer. See ★*lacquer*.

roker, *n.* 2. A rockling.

Rolandic area. Same as *motor* ★*area*.—**Rolandic angle.** See ★*angle*^{3}.

roll, *v. t.* 13. In *bookbinding*, to decorate, as the edges or the sides of the cover of a bound book, with a wheel-shaped tool which constantly repeats the design on its rim.—**To dry-roll**, in *lumbering*, in sacking the rear, to roll stranded logs into the bed of the stream from which the water has been cut off preparatory to flooding.

roll, *n.* 10. (*b*) A miners' term for a fold exhibited in underground workings. (*c*) A dome-like structure in a stratum; especially a mass of barren matter of this form occurring in a coal-seam.—11. The cross-bar of a logging-sled into which the tongue is set.—**Cornish rolls.** See ★*Cornish*.—**Lee roll.** Same as *lee lurch*, which see, under *lurch*^{1}.—**Midshipman's roll** (*naut.*), a manner of rolling up a hammock transversely, or crosswise, and lashing it around with one clue, so as to make a thick, short bundle, instead of a long, narrow one in which both clues are lashed inside.—**On the rolls**, in *Eng. law*, said of those who are regularly admitted to practise law.—**Plate-bending rolls**, in *iron ship-building*, a machine for bending plates into the forms required to fit the curved surfaces of a vessel. The machine consists of two horizontal parallel lower rolls slightly separated from each other but geared together so as to rotate in the same direction, which can be turned by a steam-engine or electric motor. Suspended above and midway between the lower rolls is an upper roll, which rotates freely, each end of which can be moved up or down independently so as to press the plate passing through the machine down in the space between the two lower rolls to a greater or less extent, thus giving it a greater or less curvature at either end as desired.—**Plate straightening rolls**, in *iron ship-building*, a machine to flatten out plates which, as received from the rolling-mills, are usually more or less twisted, bent, and buckled. It consists of a series of three parallel lower rolls, geared together so that all rotate in the same direction, and driven by steam or electric power. A series of parallel upper rolls, one more in number than the lower rolls, rotating freely, is so placed that the upper rolls are above the intervals between the lower rolls. The plate is passed between the two series of rolls and by depressing sufficiently the upper rolls, the plate is grasped between them and the lower rolls, and as it passes through, is stretched and flattened so that, when it leaves the rolls, it is quite flat. Also called *mangle*.—**Roll culture.** See ★*culture*.—**Star roll**, a roll with short, radiating projections, used in textile and other machinery.—**Three-high rolls**, a rolling-mill having three rolls one over the other. This arrangement allows the material to be rolled to be passed one way between the lower pair and the reverse way between the upper pair; hence, the rolls need not be reversed.—**To strike off the roll**, in *law*, to disbar (an attorney) and remove (his name) from the list of members of a court.

roll-boil (rōl'boil), *v. t.* To subject (woolen cloth wound on long rollers) to the action of boiling water to give it a luster.

roll-cloud (rōl'kloud), *n.* A roll-shaped cloud among the cirro-cumulus clouds, resembling a wave or breaker. Larger roll-clouds occur amid the stratus and cumulo-stratus and are often tapering or cigar-shaped. See ★*cloud*^{1}, 1.

roller, *n.* 11. Same as ★*sand-roller*.—**Casting hall roller**, in *glass-manuf.*, same as *running-roll* (which see).—**Nipping-rollers**, a pair of cylindrical rollers used in bleaching-works and dye-works to squeeze cloth which is to be uniformly impregnated with a liquid. Also known as *squeezing-rollers*.—**Roller process.** See ★*process*.—**Squeezing-rollers.** Same as *nipping-*★*rollers*.—**Stepped roller**, a conical roller with steps: part of a warp-shedding mechanism in a loom for keeping the heddle-strap at tension. *T. W. Fox*, Mechanism of Weaving, p. 45.

roller-beam (rō'lėr-bēm), *n.* The beam that supports the drafting-rolls of a sliver-drawing machine in a cotton-mill. *Nasmith*, Cotton Spinning, p. 222.

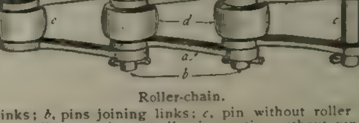
roller-bearing, *n.*—**Straight roller-bearing**, a roller-bearing in which simple, straight rollers are used in the line of pressure parallel to the axis of the shaft without provision in the design for variations in alinement or parallelism of the shaft and the rollers. *Sci. Amer. Sup.*, Feb. 21, 1903, p. 22688.—**Taper roller-bearing**, roller-bearing in which races or tracks are formed in which the rollers revolve and travel, the axes of the latter converging so as to intersect the axis of the shaft. This makes the races conical surfaces, and tapering instead of being straight or cylindrical, and the rollers are also tapering. *Sci. Amer. Sup.*, Feb. 21, 1903, p. 22689.

roller-bitt (rō'lėr-bit), *n.* *Naut.*, a bitt in which one of the upright cylinders or shanks is free to turn on an axis or shaft, thus distributing the strain on the rope or hawser made fast to the bitt.

roller-boat (rō'lėr-bōt), *n.* A cigar-shaped, steam-propelled vessel, the screw of which consists of a cylinder about half the length of the hull which is situated at the center of the hull, and passes around it. The cylinder has fins which run diagonally around it, and their rotation contributes motion to the hull, while the keel is connected at both ends to the hull and hangs below the revolving cylinder.

roller-box, *n.* 2. A series of drawing-rolls in a cotton-combing machine for attenuating the sliver. *Thornley*, Cotton-Combing Machines, p. 85.

roller-chain (rō'lėr-chān), *n.* A pin-chain of the link-belt type having a loose roller on each pin that joins the links. The roller serves to give a rolling contact with the sprocket-wheel



Roller-chain.

a, links; *b*, pins joining links; *c*, pin without roller or next links; *d*, rollers on pin; *e*, roller in position without pin; *f*, slot and key holding links.

of a conveyer and as a bearing to support the chain when it is drawn over an uneven surface, as in a car-haul.

roller-chock (rō′lėr-chok), *n.* See ⋆*chock*4.

roller-cleat (rō′lėr-klēt), *n.* *Naut.*, a roller-chock; a cleat having a roller at the end to distribute the strain on a rope fastened to it.

roller-clutch (rō′lėr-kluch), *n.* A clutch for fastening together two parts of a machine, as a shaft and wheel, so that one will drive the other. It consists of a cage carrying a set of rollers and surrounding the shaft, the hub of the wheel surrounding the cage. When it is desired to connect the two the rollers are wedged between them; at other times they rest in grooves in the stationary part. *Nasmith*, Cotton Spinning, p. 396.

roller-core (rō′lėr-kōr), *n.* In *printing*, the central round bar of iron (sometimes thinly covered with wood) that gives stiffness and security to the inking-roller.

roller-lap (rō′lėr-lap), *n.* In *cotton-manuf.*, the collection of short fibers (or fly) about a clearer-roll that rests on the drafting-rollers of a sliver-drawing machine. *Nasmith*, Cotton Spinning, p. 245.

roller-mill, *n.* **2.** The standard type of roller-mill consists of a strong iron case inclosing four steel corrugated rolls arranged in pairs in a horizontal position. The wheat is led to a feed-box at the top of the machine, and then falls upon a shaking table which distributes it evenly to the two pairs of rolls. The wheat is not ground, but is cracked, the grains falling between the rolls with the least possible injury and being then conveyed away to the bolting-machine and purifier. Roller-mills are made in many styles and sizes, a small machine affixed to a post being called a *post-roll*. They are sometimes arranged in groups or batteries, and in corn-mills have three pairs of rolls placed one over the other. Roller-mills have almost completely superseded grinding-mills.

4. A horizontal tumbling-barrel resting on four rollers. Two are drivers and two idlers, supporting the barrel and enabling it to roll with very little friction.

roller-polo (rō′lėr-pō″lō), *n.* A game somewhat similar to ice-hockey, played in roller-skating rinks. The players are mounted on roller-skates and endeavor, with sticks shaped somewhat like shinny-sticks, to drive the ball into the goals at either end of the rink. These goals are open at the front, but are caged with netting at the back.

roller-race (rō′lėr-rās), *n.* A channel or track on which the rollers of a roller-bearing run.

> The rollers are made to fit the inner and outer treads of the *roller race*, so that each roller is in continuous line of contact with the inner and outer treads of its race, and it has therefore a free rolling tread over its entire length. *Sci. Amer. Sup.*, Feb. 21, 1903, p. 22689.

roller-table (rō′lėr-tā″bl), *n.* A table behind and in front of the train of rolls in which metal pieces are reduced in size. These tables contain a series of rollers which may run loose in bearings (dead rollers) or which may be revolved by mechanical means (live rollers). On these rollers the piece is received and handled during the various passes of the rolling operation. *Elect. World and Engin.*, April 9, 1904, p. 702.

roller-wheel (rō′lėr-hwēl), *n.* A small wheel or hollow roller which turns on a pin or stud: used on the end of a lever which is moved by a cam; a cam-roller.

roller-worm (rō′lėr-wėrm), *n.* See *long-tailed* ⋆*skipper*.

roll-housing (rōl′hou″zing), *n.* The standard or upright which carries the bearings for the journals of the rolls in a rolling-mill.

> Visiting the famous Homestead steel works, some years ago, the gentleman who was taking me through the mills pointed out a strong, good-looking and evidently masterful man standing on the top of a set of heavy *roll-housings* in the armor-plate mills and remarked, 'That man is paid more than your college president.'
> *Pop. Sci. Mo.*, Feb., 1902, p. 352.

rolling, *n.* **6.** In tea manufacture, in China and elsewhere, the operation of pressing the withered leaf, by an arduous manipulation (in modernized practice by machinery). The object is to burst the cells to promote oxidation (in black tea: see under ⋆*tea*1) and to render the extractive matter subject to infusion. The curling or twisting of the leaf results incidentally.—**Direct rolling**, in *kinematics*, the rolling of one body upon another where the instantaneous axis of rotation of the rolling body is in the plane tangent to the point of contact between the two surfaces and at right angles to the path which the rolling body traces upon the surface on which it rolls.

rolling, *p. a.*—**Rolling circle.** (*b*) A describing circle; a circle used to roll along the pitch-circle of a gear to generate the epicycloidal or hypocycloidal curve for the gear tooth; also, the circle used to roll along the pitch-line of a rack to generate the cycloidal curves for the rack teeth. When an epicycloid is to work with a hypocycloid or a cycloid they must be described by the same rolling circle.

rolling-board (rō′ling-bōrd), *n.* Same as ⋆*bread-board*, 1.

rolling-chair (rō′ling-chãr), *n.* A wheeled chair; especially, in the United States, one intended for outdoor use. Such chairs are of various designs and for one or two persons, and are either propelled by the occupant or pushed by an attendant. They are much lighter and more comfortable than their original, the Bath chair.

> When these other portions of the walk are completed, it is probable that a section will be set aside on the lower end of the plank walk which will be devoted to the use of the electric and bicycle *rolling chairs*.
> *N. Y. Evening Mail*, Feb. 10, 1906.

rolling-chamber (rō′ling-chām″bėr), *n.* In *ship-building*, a long, athwartship, water-tight compartment fitted in the interior of a few war-ships and special vessels. When the compartment is partly filled with water the drag of the water in the chamber following the ship as it rolls tends to diminish the amount of the rolling.

> The ship has a *rolling chamber* to keep her steady, and a lifting crow's nest, which affords facilities for directing her through the ice. *Geog. Jour.* (R. G. S.), XV. 34.

rolling-furnace (rō′ling-fėr″nạs), *n.* Same as ⋆*tilting-furnace*.

rolling-grass (rō′ling-gràs), *n.* A grass of the genus *Spinifex*, so named from the fact that the seeds are borne in globular heads which fall at maturity and are driven by the wind over the sands, shedding their seeds, or are carried by the waves and deposited upon newly formed sand-bars. *S. hirsutus*, the spiny rolling-grass, is regarded in New South Wales as extremely valuable for fixing shifting sands, but is of no value for forage.

rolling-mill, *n.* **5.** That part of a powder-manufacturing plant in which the ingredients of the powder are crushed and commingled.

rolling-pin, *n.* **2.** A wooden implement used by potters for rolling out thin sheets of clay for making pie-plates. It is often made in two parts, the handles being attached to the ends of a wooden rod which passes through the hollow body of the roller. *E. A. Barber*, Tulip Ware, p. 51.

rolling-plant, *n.* **2.** A rolling-mill; a manufacturing establishment the principal machinery of which is for rolling.

rolling-press, *n.* **4.** In *letterpress printing*, a printing mechanism in which a cylinder rolls to and fro over the type to be printed, as in the ordinary galley-proof press.

roll-scale (rōl′skāl), *n.* Flakes of oxid of iron which fall from the bloom, ingot, or bar while it is being rolled. *Phillips and Bauerman*, Elements of Metallurgy, p. 148.

roll-up, *n.* **3.** In Australia, a meeting; a gathering of people. [Slang.]

> Making as much noise as if you'd hired the bell-man for a *roll-up*.
> *Rolf Boldrewood*, Miner's Right, xxxv, quoted in E.
> [E. Morris, Austral English.

roll-wave (rōl′wāv), *n.* See the extract.

> In certain rivers, however, of small depth (therefore propagating a wave slowly) and subject to sudden accessions from swollen tributaries the "first rise" of water on the lower reaches frequently takes the form of a steep-fronted wave, or bore, travelling down-stream. On the Tees the phenomenon is called a *roll-wave*.
> *V. Cornish*, in Geog. Jour. (R. G. S.), Jan., 1907, p. 28.

rollway, *n.* **3.** Same as *landing*, 9.—**Fly rollway**, a skidway or landing on a steep slope from which the logs are released at once by removing the brace which holds them.

Roman, *a.*—**Roman-lamp shell.** See ⋆*shell*.—**Roman willow.** See ⋆*willow*1.

Romanic, *a.* **3.** Printed in roman type. *Encyc. Dict.*

romanically (rō-man′i-kal-i), *adv.* In ordinary roman print (and with ordinary spelling).

Romano-British (rō′man-ō-brit′ish), *a.* Of or pertaining to the Romano-Britains. *Smithsonian Rep.*, 1890, p. 531.—**Romano-British pottery.** See ⋆*pottery*.

Romano-Briton (rō′man-ō-brit′on), *n.* An inhabitant of Britain under the Roman occupation. *Keane*, Ethnology, p. 398.

romanticize (rọ-man′ti-sīz), *v. i.* To behave in a romantic or sentimental way. *Encyc. Dict.*

> Enlivened by champagne and some grotesque *romanticising* on the part of the amorous Duchess.
> *The Speaker*, April 15, 1899, p. 424.

Rom. Cath. An abbreviation of *Roman Catholic.*

romeite (rō′mẹ-īt), *n.* Same as *romeine.*

römer (rė′mer), *n.* [G.] See *rummer.*

romerillo2 (rō-mā-rēl′yō), *n.* [Sp. *romerillo*, diminutive of *romero*, rosemary.] **1.** In Mexico, a name applied to several composites with an agreeable aromatic odor, especially to *Chrysactinia Mexicana*, *Porophyllum scoparium*, and *Pectis stenophylla*, all of which are used medicinally. The last species has a strong odor of lemon, and together with several of its congeners is sometimes called *limoncillo*. See ⋆*limoncillo*, 2.—**2.** One of the Mexican milkweeds, *Asclepias Linaria;* also called *romerillo loco.*—**3.** A plant belonging to the family *Chenopodiaceæ*, *Dondia multiflora*, the fleshy leaves of which are used in Mexico during the Lenten season as a pot-herb.—**4.** In Chile, *Tricondylus ferrugineus*, a shrub belonging to the family *Proteaceæ.*—**Romerillo cimarron**, in northern Mexico, *Cowania Mexicana*, a narrow-leaved shrub or small tree of the rose family. It has a fibrous bark, which was formerly used by the Indians for making mats and sandals.

Romneya (rom′nẹ-ä), *n.* [NL. (Harvey, 1845), named in honor of John Thomas *Romney* Robinson (1792–1882), an Irish astronomer.] A genus of plants of the family *Papaveraceæ*, occurring in southern California and Mexico. From other papaveraceous genera it is distinguished by the stigmas being united at the base into a ring but free at the top. *R. Coulteri*, the only species, is the California tree-poppy, or matilija poppy, a tall, somewhat shrubby plant bearing very large white hollyhock-like flowers.

romp, *v. i.* **2.** In *racing*, to run easily, as if in a frolic; run without effort; hence, to accomplish something with apparently little effort. [Slang.]

> Water Color had no trouble in *romping* home an easy winner in the first race of the day, with King Pepper, a long shot, a bad second. *N. Y. Tribune*, May 5, 1901.

romp, *n.* **3.** In *racing*, an easy, unforced pace. [Slang.]

> One said to me, as he pointed at Maghersfontain Kopje, "Set a brewery up on top of that and my regiment will take the place in a *romp*." *War's Brighter Side*, p. 283.

roncadina (rōn-kä-dē′nä), *n.* Same as *croaker*, 4 (*b*).

roncador, *n.*—**Roncador raiado**, a fish, *Hæmulon steindachneri*, of the family *Hæmulidæ*, found on both coasts of tropical America.

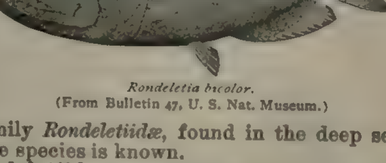
ronco (rōn′kō), *n.* [Amer. Sp. *ronco* (NL. *ronchus*), another use of Sp. *ronco*, a grunt, a snore, < *roncar*, grunt, snore.] Any one of several species of the genus *Hæmulon*, fishes found in warm seas.—**Ronco amarillo**, the yellow grunt, *Hæmulon sciurus.*—**Ronco arará**, the common grunt, *Hæmulon plumieri.*—**Ronco blanco**, *Hæmulon parra.*—**Ronco carbonero**, a fish, *Hæmulon carbonarium*, of the family *Hæmulidæ*, known from the West Indies to Brazil.—**Ronco condenado**, the French grunt, *Hæmulon flavolineatum.*—**Ronco ronco**, the black or common grunt, *Hæmulon plumieri.*

rondanin (ron′da-nin), *n.* [Origin unknown.] The pomfret, *Brama raii.*

rondeau, *n.* **3.** A game in which nine small balls are placed in front of a stick and propelled diagonally across a billiard-table. At least one ball must fall into the corner pocket and at least one must remain on the table. The players bet on whether the number will be odd or even, the bank taking ten per cent. of all the wagers.

ronde-bosse (rond-bos′), *n.* [F.] In *sculp.*, the character of being worked all round: as, sculpture in *ronde-bosse*, sculpture in the round.

Rondeletia, *n.* **2.** A genus of fishes of the family *Rondeletiidæ*, found in the deep seas. One species is known.



Rondeletia bicolor.
(From Bulletin 47, U. S. Nat. Museum.)

Rondeletiidæ (ron″de-le-tī′i-dē), *n.* [NL., < *Rondeletia* + *-idæ.*] A family of fishes which contains only the genus *Rondeletia*.

rondelle, *n.* **4.** A disk of colored glass, used as a decoration in stained-glass windows. Compare *bull's-eye*, 8.

rondellus (ron-del′us), *n.*; pl. *rondelli* (-ī). [ML. : see *rondel.*] In *medieval music*, a very early species of composition in strict imitation, apparently a kind of double counterpoint.

rondino (ron-dē′nō), *n.* [It., dim. of *rondo.*] In *music*, a short rondo.

Ronquilus (ron-kwī′lus), *n.* [NL., < Sp. **ronquil*, given as a Spanish name, appar. < *ronco*, name of a fish. See ★*ronco.*] A genus of fishes of the family *Bathymasteridæ*, found on the north Pacific coast of North America.

Röntgen rays. See *X-rays*, under ★*ray*^{1}.

Röntgenization (rėnt″gen-i-zā′shon), *n.* The act or process of Röntgenizing, or subjecting to the action of the Röntgen rays. *Med. Record*, Nov. 9, 1907, p. 760.

Röntgenize (rėnt′gen-īz), *v. t.*; pret. and pp. *Röntgenized*, ppr. *Röntgenizing.* [Wilhelm Konrad *Röntgen* + *-ize.*] To produce chemical or structural changes in (a substance) by the action of the Röntgen or X-rays; subject to the action of the Röntgen rays. *J. J. Thomson*, Discharge of Elect. through Gases, p. 55.—**Röntgenized air,** air which has been ionized by the passage through it of the so-called Röntgen or X-rays.

Röntgenogram (rėnt′gen-ō-gram), *n.* [Wilhelm Konrad *Röntgen* + Gr. *γράμμα*, a writing.] A picture taken by means of the X-rays; a radiograph. *Med. Record*, Aug. 10, 1907, p. 246

Röntgenograph (rėnt′gen-ō-gråf), *n.* [Wilhelm Konrad *Röntgen* + Gr. *γράφειν*, write.] A radiograph; a Röntgenogram.

Röntgenography (rėnt-gen-og′ra-fi), *n.* [Irreg. < Wilhelm Konrad *Röntgen* + Gr. *-γραφια*, < *γράφειν*, write, record. This formation and others of the group are irregular, undescriptive, and intractable.] The art or process of producing photographic impressions by means of the Röntgen or X-rays. *Nature*, July 27, 1905, p. 301.

Röntgenology (rėnt-gen-ol′ō-ji), *n.* [Wilhelm Konrad *Röntgen* + *-ology.*] The scientific study of the Röntgen or X-rays. *Nature*, July 27, 1905, p. 301.

Röntgenoscopy (rėnt-gen-os′kō-pi), *n.* [Wilhelm Konrad *Röntgen* + Gr. *σκοπεῖν*, view.] The art or process of examining opaque bodies by means of the Röntgen or X-rays. *Nature*, July 27, 1905, p. 301.

Röntgenotherapy (rėnt″gen-ō-ther′a-pi), *n.* [Wilhelm Konrad *Röntgen* + Gr. *θεραπεία*, medical treatment. See *therapeutic.*] Treatment of disease by means of exposure to the Röntgen rays. *Med. Record*, Jan. 31, 1903, p. 168.

Röntgram (rėnt′gram), *n.* Same as ★*Röntgenogram. Houston*, Dict. Elect. [Rare.]

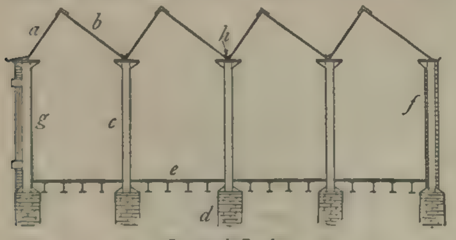
Röntgraph (rėnt′gråf), *n.* Same as ★*Röntgenograph. Houston*, Dict. Elect. [Rare.]

Röntgraphy (rėnt′gra-fi), *n.* [*Röntgraph* + *-y*^{3}.] Same as ★*Röntgenography. Houston*, Dict. Elect. [Rare.]

Röntography (rėn-tog′ra-fi), *n.* Same as ★*Röntgenography. Encyc. Dict.* [Rare.]

rood-stair (röd′stãr), *n.* In *ch. arch.*, a stair leading to the top of the rood-screen or choir-screen, that is, to the jube or rood-loft.

roof^1, *n.*—**Dutch roof.** Same as *gambrel-roof.*—**Fan roof,** a roof built according to fan-vaulting, whether actually in stone or in plaster or wood in imitation of fan-vaulting.—**Gravel roof,** a roof covered with clean gravel, held in place by an adhesive substance.—**High roof,** a steep roof: in *Goth. arch.*, any roof which has a slope greater than an angle of perhaps 50° with the horizon.—**Roof of the world,** the Pamir in Asia: so called because it is the highest inhabited area of the globe. It is from 9,000 to 25,000 feet above sea-level.—**Saw-tooth roof,** a roof consisting, in effect, of a series of roofs in each of which the rafters of one side are longer and of lower pitch than those of the other: the series thus resembling, when seen from the end, the series of teeth in a saw. The roofs are supported by interior columns. By this system very large one-story buildings can be erected. The advantages are a solid floor for heavy machinery and a good light in all parts of the building.—**Split roof,** a roof, as of a logging-camp, made by laying strips split from straight-grained timber, which run from the ridge-pole to the eaves, and breaking the joints with other strips, as in a shingle roof.—**Tilt-roof.** See ★*tilt-roof.*—**Trough roof,** a roof on a logging-camp or barn, made of small logs split lengthwise, hollowed into troughs, and laid from ridge-pole to eaves. The joints of the lower tier are covered by inverted troughs.—**Valley roof,** a roof with valleys down which the water may run. See *valley*, 3.



Saw-tooth Roof.

a, glass roof; *b*, iron and slate roof; *c*, columns; *d*, foundations; *e*, floor; *f*, wall; *g*, wall with window; *h*, gutter.

roofage (rö′fāj), *n.* [*roof*^{1} + *-age.*] The material prepared for building roofs or covering them; generally the covering material only, as sheathing, shingles, slates, and the like.

roof-apron (röf′ā″prun), *n.* In *car-building*, a screen or weather-board hanging from the platform hood of a passenger-car and designed to keep dust and rain out of the car door.

roof-garden (röf′gär″dn), *n.* A place open to the sky on the roof of a building, ornamented with trees, shrubbery, and flowers. In the cities of southern France such pleasure-resorts are arranged on the roofs of private houses, and in the larger cities of the United States they have been introduced to some extent in theaters and hotels.

roofing-canvas (rö′fing-kan″vas), *n.* See ★*canvas.*

roofing-duck (rö′fing-duk), *n.* A light grade of roofing-canvas used in lining the ceilings of passenger-cars.

roofing-seamer (rö′fing-sē-mėr), *n.* A tool for forming seams in a sheet-metal roof.—**Double roofing-seamer,** a hand-tool for making the seams between the sheets of a tin roof. The tool resembles in appearance a tin-roofer's tongs. It is placed over the edges of adjoining plates laid on the roof. One movement of the handles bends the edges, and a second makes a second bend, forming a lock or double seam.

roofing-tile (rö′fing-tīl), *n.* A tile for use in roofing. The name is generally confined to those made of earthenware, which are of two principal kinds, 'flat' and 'ridge-and-furrow.' See *tile*^{1}.

roof-plate, *n.* **2.** In steam-boilers, a crown-sheet; the plate forming the top of the fire-box in a locomotive boiler or other internally fired boiler.

rooinek (rō-i-nek′), *n.* [Cape D. *rooinek*, 'a red-neck' (in allusion to the florid or 'tanned' appearance of new-comers), < D. *rood*, red, + *nek*, neck. In like manner the English language is called the *rooitaal.*] **1.** In Cape Dutch use: (*a*) A contemptuous name for an Englishman. (*b*) An Englishman just out from home, a new-comer to the colony.

> Those of us [war correspondents] therefore, . . . come as mere *rooineks*, or "new chums" to use the Australian equivalent. . . . There is this to be said, however, in extenuation of our greenness to the business, that our early training . . . ought to make for efficiency.
>
> *F. Wilkinson*, in War's Brighter Side, v.

rook^2, *n.*—**To double rooks.** See ★*double.*

rookie, rooky^3 (rủk′i), *n.* A recruit. [British army slang.]

> So 'ark an' 'eed you rookies, which is always grumblin' sore,
> There's worser things than marchin' from Umballa to Cawnpore.
>
> *R. Kipling*, Route Marchin', st. 6.

room^1, *n.* **11.** (*b*) In *coal-mining*, a breast; a chamber.

> Off from the main or side headings of a hard-coal mine "breasts" or "chambers" are opened. In bituminous fields these are known as "*rooms.*" A tunnel or neck forty to sixty feet long may connect the *room* proper with the main passageway. Beyond the neck the chamber may broaden out to a width of thirty or more feet, continuing indefinitely. The coal between the *rooms* forms what is known as a "rib" or "pillar."
>
> *Sci. Amer.*, May 23, 1903, p. 392.

12. In *salt-making*, one of the large stationary pans in which the brine from a salt-well is placed to allow the water to evaporate. The brine goes first to a deep-room, about 12 to 14 inches deep; from that to a lime-room, about 6 inches deep; and from that to a salt-room, about 6 inches deep, from which it is harvested. These rooms are covered over by movable covers during rainy weather. *Sci. Amer. Sup.*, Oct. 3, 1903, p. 23198.

13. In *wood ship-building*, the empty space between two adjacent frames of a wooden ship.—**Room trader.** See *trader.*—**The room,** specifically, in New York, the stock-exchange: as, curb brokers are not allowed to trade in *the room.*—**Timber and room,** in *wood ship-building*, same as *room and space* (which see, under *room*^{1}).

room-work (röm′wėrk), *n.* In *coal-mining*, work in a room or breast. See ★*room*^{1}, *n.*, 11 (*b*).

roost-cock, *n.* **2.** A member of a legislative body who proposes a bill for the benefit of the legislators alone; also, the bill so proposed. [Colloq., U. S.]

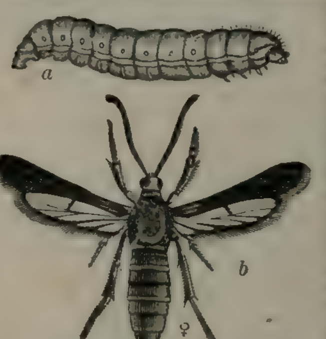
rooster, *n.* **3.** In *lumbering*, same as ★*gooseneck*, 4 (*a*).

rooster-fight (rös′tėr-fīt), *n.* A boys' sport in which the players slip a short bar just under the knees, and then, putting the arms under the bar, clasp the hands in front of the shins and hop about in this position, endeavoring to shoulder one another over.

root^1, *n.* **2.** (*l*) In *mech.*, the part of a gear-tooth where it joins the rim of the wheel; the base of a tooth.—**Absorbing root,** an aërial root which descends from the stem of some tropical root-climbers to the ground. Compare *anchoring* ★*root.*—**Aërating roots.** See ★*aërate.*—**Anchoring root,** an adventitious root on the stem of a root-climber, the office of which is merely to hold to the support. Compare *absorbing* ★*root.*—**Brace root,** one of the roots emitted in verticils from the lower nodes of the stalk of maize above the surface. Such roots often enter the soil and render some aid in holding the plant upright as well as in nutrition.—**Brinton root,** the black-root or Culver's-physic, *Leptandra Virginica.*—**Canada root.** Same as *pleurisy-root.*—**Coronal root,** one of the permanent subterranean roots of wheat, maize, and other monocotyledonous plants, thrown out in verticils from the basal nodes of the stem.—**Derris root,** the cortex of the root of *Deguelia elliptica*, used in the East Indies for killing fish in streams. See *Malayan* ★*fish-poison.*—**Double root.** (*b*) In *alg.*, either of two equal roots.—**Extraneous root,** in *alg.*, one which does not properly belong to the given equation.—**Multiple root,** in *alg.*, either of several equal roots.—**Permanent root,** specifically, one of the ordinary coronal roots of monocotyledons as opposed to their temporary roots.—**Pronic root,** in *math.*, a value for x in a pronic number.—**Residual root,** in *alg.*, the root of a residual quantity, as $(a-b)^{\frac{1}{2}}$.—**Root circle.** See ★*circle.*—**Root fallow.** See ★*fallow*^{2}.—**Root of a function,** in *math.*, the root of an equation obtained by equating that function to zero.—**Roots of unity,** roots of the equation $x^n = 1$.—**Root tone.** See ★*tone*^{1}.—**Root web-worm.** See ★*web-worm.*—**Seminal root.** Same as *temporary* ★*root.*—**Sweet root.** (*a*) See *sweetroot.* (*b*) The sweet-flag.—**Temporary root,** one of a small number of roots (in the wheat plant) put forth by monocotyledons in germination which disappear when the plant is established.—**Triple root,** in *alg.*, either of three equal roots.—**Vandal root,** the officinal valerian, *Valeriana officinalis.*

root^5 (röt or rủt), *v. i.* [Supposed to be a slang use of *root*^{2}, *v. i.*] To work hard for the success of some person or thing: as, to *root* for one's party (at an election); specifically, in *base-ball*, etc., to exert oneself for the success of one's side, usually by uproarious applause intended partly to disconcert the other side. [Slang.]

root-borer, *n.*—**Blackberry root-borer,** one of the giant root-borers, *Prionus laticollis*, a large, prionine, cerambycid beetle whose larva occasionally bores into the roots of blackberry. It also infests the roots of grape, cherry, oak, apple, and chestnut.—**Grape-vine root-borer,** the larva of an American sessiid moth, *Memthyrus polistiformis*. It lives exclusively underground and eats the bark and sap-wood of grape-roots.—**Oak root-borer,** the larva of an American cerambycid beetle, *Mallodon melanopus*, which bores the roots of live oaks in Florida and the Gulf States.—**Sweet-potato root-borer,** a brenthid beetle, *Cylas formicarius*, whose larvæ bore into the tubers of the sweet-potato plant. It has a tropical distribution, but occurs also in Louisiana and Texas.

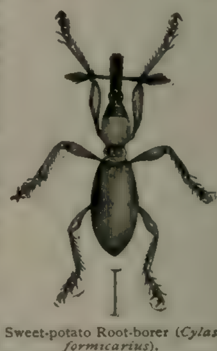


Grape-vine Root-borer (*Memthyrus polistiformis*). *a*, larva; *b*, female moth.

root-canal (röt′ka-nal″), *n.* A passage through the root of a tooth through which nerves and vessels pass to the pulp of the tooth.

root-circle (röt′sėr″kl), *n.* See ★*circle.*

root-climber (röt′klī″mėr), *n.* A liana which ascends by means of aërial roots or rootlets fixed to a support. See *absorbing* ★*root* and *anchoring* ★*root.*



Sweet-potato Root-borer (*Cylas formicarius*).

root-collar (röt′kol″är), *n.* That place at the base of a tree where the swelling, which is the direct result of the ramifications of the roots begins.

root-cutter (röt'kut″ėr), *n.* A modification of the feed-cutter, used to slice potatoes, carrots, and other roots intended as food for animals.

root-disease (röt'di-zēz″), *n.* A disease of the roots.—**Mulberry root-disease.** See ★*disease.*

root-disk (röt'disk), *n.* The radicle plate at the end of a crinoid column.

rooter^{3} (rö'tėr or rụ̈t'ėr), *n.* [*root*^{5}, *v.*, + *-er*^{1}.] One who roots for the success of his patron or his side; specifically, in *base-ball* and other outdoor contests, one who gives aid and encouragement to his side by applause and by shouting advice. [Slang.]

For the answer to this question, 20,000 *rooters* were on hand to bear the shocks of joy and pain promised by the importance of the occasion. *N. Y. Globe*, Oct. 14, 1905.

root-excretion (röt'eks-krē-shọn), *n.* Any substance given off by the root-hairs of growing plants, as carbon dioxid.

That these *root-excretions*, and particularly the acids, may be of service in dissolving and rendering more available various constituents of the soil is an obvious suggestion, and is borne out by Sachs' discovery of the corrosion of marble, and by Molisch's observations that living roots slowly corrode ivory if continuously kept in contact with it. *M. Ward*, Disease in Plants, p. 46.

rootey (rö'ti), *n.* Bread. [Slang.]

Fill mine! Mine too! (Smells like a bloomin' drain) . . .
Bully beef and *rooty*, and something 's give me a pain.
"*Mark Thyme*," in War's Brighter Side, p. 362.

And the 'umble loaf of "*rooty*" costs a tanner, or a bob.
R. Kipling, Prices in Bloomfontein.

root-facer (röt'fā″sėr), *n.* An instrument for smoothing off the surface of the root after the removal of the crown of a tooth.

root-filler (röt'fil″ėr), *n.* An instrument used for the insertion of a filling into a cavity in the root of a tooth.

root-fungus (röt'fung″gus), *n.* Any form of mycorrhiza growing in symbiotic association with the roots of plants.

In general, it may be said that all species devoid of root hairs, such as the orchids, the adder's tongue family, and saprophytes, possess such *root-fungi* (*mycorrhiza*). But the pines, and heaths, and very many others are more or less dependent on these fungi. *Plant World*, July, 1903, p. 154.

root-gall (röt'gâl), *n.* Same as *root-knot.*

root-louse, *n.* **Corn root-louse.** See ★*corn*^{1}.—**Root-louse syrphus-fly.** See ★*syrphus-fly.*—**Strawberry root-louse,** an American aphidid, *Aphis forbesi*, which frequently causes severe injury to the roots of strawberry-plants.

root-maggot (röt'mag″ọt), *n.* Any one of several species of dipterous larvæ which affect the roots of vegetables and other plants. Nearly all belong to the family *Anthomyiidæ.*

root-neck (röt'nek), *n.* The line of union of the root and stem of a plant.

root-nodule (röt'nod″ụ̄l), *n.* See ★*nodule.*

root-pole (röt'pōl), *n.* See ★*polarity*, 5 (*c*).

root-pruned (röt'prönd), *a.* Having been subjected to the operation of ★root-pruning (which see).

root-pruning (röt'prö″ning), *n.* In *hort.*, the pruning of the roots of a tree or shrub; in *agri.*, the cutting of the lateral roots of corn, cotton, etc., by the use of a knife or by close and deep cultivation when the crop is well established, on the theory that the growth is thereby thrown into the useful part. Such treatment has proved in general injurious to corn, but, in the far South, apparently benefits cotton by checking the growth of weeds.

root-rot (röt'rot), *n.* A disease which affects the roots of plants, causing decay and death. Fungi or bacteria are either the primary or the secondary cause of the disease. Unfavorable conditions of soil make plants more susceptible to it.

Root-rot is a common disease in damp, sour clay soils after a continuance of wet weather. *M. Ward*, Disease in Plants, p. 230.

Conifer root-rot, a disease which affects the pine, the fir, and other conifers in Europe: attributed to *Fomes annosus.* The root-rot of conifers in the United States is attributed to *Polyporus Schweinitzii.*—**Ozonium root-rot,** a disease which affects alfalfa, cotton, and a large number of cultivated and wild plants in the southwestern United States: attributed to the sterile fungus *Ozonium.*—**Root-rot of the beet,** a disease due to either *Rhizoctonia Betæ* or *Phoma Betæ.*—**Root-rot of the grape,** a disease due to either *Armillaria mellea* or *Dematophora necatrix.*—**Root-rot of tobacco, root-rot of the violet,** a disease due to *Thielaria basicola.*—**Southern root-rot.** Same as *Ozonium* ★*root-rot.*

root-sheath, *n.* **2.** In *bot.*, a spongy transformation of the many-layered epidermis of the aërial roots of many orchids and various aroids; the velamen radicum. *Strasburger*, Text-book of Bot., p. 113.

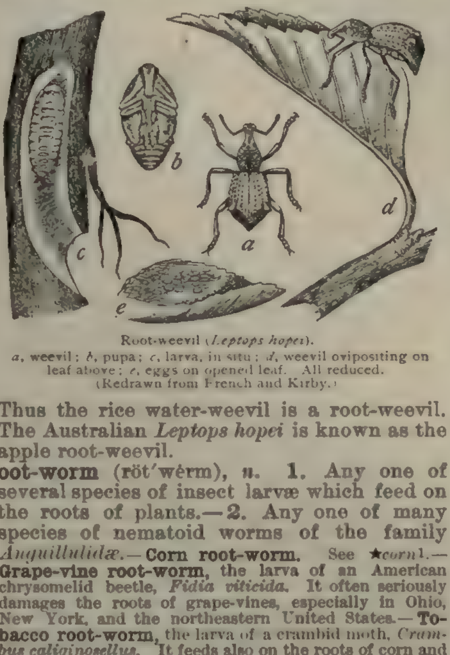
root-sucker (röt'suk″ėr), *n.* Same as *sprout*, 1 (*b*).

root-symbiosis (röt'sim-bi-ō″sis), *n.* The intimate and mutually beneficial relation existing between certain bacteria and fungi and the roots of the higher plants.

root-tubercle (röt'tū″bėr-kl), *n.* A small tuber-like growth produced upon the roots of certain plants, especially legumes, by bacteria which live in a symbiotic relation with the plants and enable them to assimilate free nitrogen.

Hiltner, after a series of experiments, states that first-year alders without tubercles do not thrive in soil free from nitrogen, nor do they take up nitrogen from the atmosphere; when, however, provided with *root-tubercles* they assimilate nitrogen. *Tubeuf*, Diseases of Plants, p. 101.

root-weevil (röt'wē″vl), *n.* Any curculionid beetle whose larvæ live at the roots of plants.



Root-weevil (*Leptops hopei*).
a, weevil; *b*, pupa; *c*, larva, in situ; *d*, weevil ovipositing on leaf above; *e*, eggs on opened leaf. All reduced.
(Redrawn from French and Kirby.)

Thus the rice water-weevil is a root-weevil. The Australian *Leptops hopei* is known as the apple root-weevil.

root-worm (röt'wėrm), *n.* **1.** Any one of several species of insect larvæ which feed on the roots of plants.—**2.** Any one of many species of nematoid worms of the family *Anguillulidæ.*—**Corn root-worm.** See ★*corn*^{1}.—**Grape-vine root-worm,** the larva of an American chrysomelid beetle, *Fidia viticida.* It often seriously damages the roots of grape-vines, especially in Ohio, New York, and the northeastern United States.—**Tobacco root-worm,** the larva of a crambid moth, *Crambus caliginosellus.* It feeds also on the roots of corn and other grain. Same as ★*stalk-worm.*

ropable, ropeable (rō'pa-bl), *a.* **1.** In Australia, uncontrollable; wild; untamable unless roped or lassoed: said of cattle and sometimes of horses. Also used figuratively.

The service has shown itself so '*ropeable*' heretofore that one experiences now a kind of chastened satisfaction in seeing it roped and dragged captive at Sir Frederick's saddle-bow. *The Argus*, Oct. 10, 1891, p. 13, quoted in E. E. Morris, [Austral English.

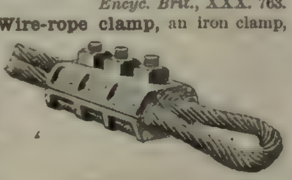
2. Intractable; obstinate; out of temper. [Australian slang.]

rope^{1}, *n.* **5.** The basal anchoring tuft of glassy fibers which occurs in the hexactinellid sponges.—**Driving-rope,** a rope used as a belt to transmit power from one pulley to another; specifically, the tight side of the rope or that part in which the tension is the greater.—**Endless-rope system,** any hauling or driving device in which a continuous or endless rope is the transmitting element; specifically: (*a*) A rope-drive, in which a continuous rope runs in grooves in the faces of the driver and the driven wheel, making a number of traverses across the space between the two wheels, and being kept at uniform tension by a straining pulley at the end of the slack bights, held to its work by weights. (*b*) In mine- or plane-haulage, a continuous rope, usually of wire (driven from a conveniently placed drum) to which, by special grip appliances, the cars to be moved can be attached without stopping the motion of the rope.—**Grapnel-rope,** a rope fastened to a grapnel- or grappling-iron; a grappling-line.—**Locked-coil rope.** Same as *locked-wire rope.*—**Outside the ropes,** said of one who is in the position of an outsider, or is ignorant of the matter in hand. [Slang.]—**Over-rope haulage,** in *mining*, endless-rope haulage in which the rope travels above the mine-cars.

rope-boring (rōp'bōr″ing), *n.* A method of well-drilling in which the drill, suspended on a rope, is drawn up a short distance and then allowed to drop back, thus striking a blow.

In Europe rods, either of iron or wood, seem to be preferred, though *rope boring* is by no means unknown. *Encyc. Brit.*, XXX. 763.

rope-clamp, *n.*—**Wire-rope clamp,** an iron clamp, held together by bolts and nuts, used to hold the end of a wire rope to form a loop or ring. It is used to secure ends of derrick guy-ropes and wire standing rigging.



Wire-rope Clamp.

rope-knife (rōp'nīf), *n.* A tool used by the drillers of oil-wells to cut the rope when the tool at the lower end becomes fast in the well.

rope-machine, *n.* **4.** A machine for twisting hay-rope used in a foundry.

roper, *n.* **5.** One who decoys, inveigles, or 'ropes' people in; a barker. [U. S.]

The *ropers* for gambling-houses—one of the curses of New Orleans—haunt each conspicuous corner. *Edward King*, Great South, p. 61.

rope-race (rōp'rās), *n.* **1.** The groove or track in which a rope runs in passing through a pulley-block or similar device.—**2.** The passageway through which the ropes of a rope-drive pass. *Nasmith*, Cotton Spinning, p. 400.

rope-reel (rōp'rēl), *n.* A frame on which a rope can be wound: usually mounted on a shaft.

rope-rider (rōp'rī″dėr), *n.* In *mining*, a man who has charge of a cable-train for bringing coal from a mine: so called because he frequently rides on the ring connecting the cable to the train.

In soft-coal mines the man in charge of the cable train is called a "*rope rider.*" In bringing his cars out of the mine he sits upon the ring which connects the cable with the train. *Sci. Amer.*, May 23, 1903, p. 392.

rope-spear (rōp'spēr), *n.* A tool used by the drillers of oil-wells to catch the loose end of the rope when it has parted in the well.

rope-stratus (rōp'strā″tus), *n.*; pl. *rope-strati* (-tī). A narrow belt of alto-stratus having striæ which suggest a twisted rope. Such a rope-stratus sometimes surrounds the greater portion of the cumulus cloud, being formed by the twisted currents of air flowing from the cloud below and toward the cloud above.

rope-wheel (rōp'hwēl), *n.* **1.** A pulley-sheave; a sheave or grooved wheel placed to guide a rope.—**2.** A grooved wheel used as a pulley when a rope is used in place of a leather belt.

rope-wire (rōp'wīr), *n.* Wire, usually of iron or soft steel, galvanized for twisting or braiding into rope.

rope-work, *n.* **2.** A netting or fringe made of strands of manila rope or cotton cords.

roping-pole (rō'ping-pōl), *n.* A long pole used by cattlemen in Australia for casting a rope over an animal's head. *E. E. Morris*, Austral English.

roque (rōk), *n.* [An arbitrary reduction of (*c*)*roque*(*t*).] An American game, a modification of croquet. It differs in many details from the parent game; principally, however, in the more perfect surface upon which it is played, the addition of a boundary used somewhat as a cushion in billiards, more perfect balls and clubs, and a more correct setting as well as a narrowing of the wickets.

At a meeting of the National Croquet Association, at Norwich, Conn., in August, 1899, this entire question, through a wisely selected and efficient committee, was brought to a focus and the name of this game as modernly played, with its beautiful courts, its responsive timber borders, its narrow steel arches and solid rubber balls, was changed simply by dropping off the initial and the final letter of the old word, leaving *Roque*, a word of one syllable, to be the name for the improved game. *Spalding*, Roque Guide, p. 6.

rorarii (rō-rā'ri-ī), *n. pl.* [L., appar. pl. of **rorarius*, adj., 'of the dew,' < *ros* (*ror-*), dew. The name was explained as meaning those who engaged in battle before the main fighters came on, as dew precedes the rain.] In *Rom. antiq.*, the lowest property class in the Roman legion, armed only with dart and sling.

Rorate Sunday. See ★*Sunday.*

rosa Americana (rō'zạ̈ ạ-mer-i-kā'nạ̈). [NL., 'American rose.'] A copper coinage of three denominations, 2*d.*, 1*d.*, and $\frac{1}{2}$*d.*, struck by William Wood for the American colonies, 1717–33.

rosace (rọ̄-zäs'), *n.* [F., < NL. *rosaceus*, of the nature of a rose. See *rosaceous.*] Any ornamental circular member of a building, especially of a highly decorative character, as a rondel filled with sculpture.

rosacea (rọ̄-zā'sẹ̄-ạ̈), *n.* Same as *acne rosacea.* See *acne.*

rosacic (rọ̄-zā'sik), *a.* [NL. *rosac*(*eus*), rosaceous, + *-ic.*] Red-colored.—**Rosacic acid,** the name given by Proust to a bright red substance obtained from the latericeous sediment deposited from the urine of fever patients.

rosa-del-monte (rō″sạ̈-del-mon'tā), *n.* [Sp., rose of the mountain.] In the West Indies, a small, leguminous tree, *Brownæa Rosa-del-monte*, often cultivated for its handsome foliage and clusters of showy, crimson flowers. In northern South America the name is applied to other species of the genus, especially to *Brownæa grandiceps*.

> Now turn homewards, past the *Rosa-del-monte* bush, . . . covered with crimson roses, full of long silky crimson stamens. *Kingsley*, At Last, v.

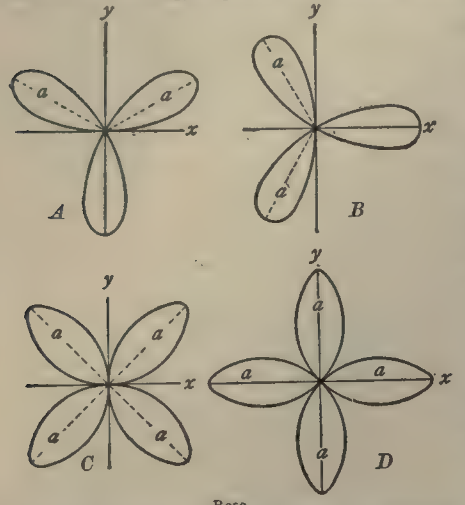
rosalgar (rō-sal′gär), *n.* Realgar; arsenic disulphid.

rosalia, *n.* 4. Scarlet fever.

rosary, *n.*—**Lesser rosary,** five decads of the fifteen composing the entire rosary.—**Rachitic rosary.** See ★*beaded ribs.*

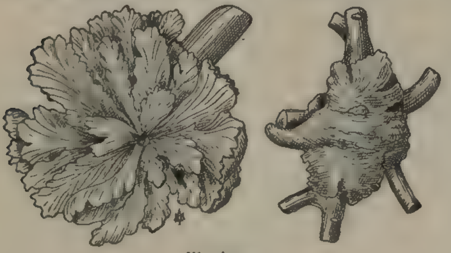
rosary-shell, *n.* 2. The small black shell of a marine mollusk, *Nerita atrata,* used for necklaces, bracelets, and rosaries. [Australia.]

rose¹. **I.** *n.* 18. In *geom.*, certain transcendental curves having, in polar coördinates, equations of the form $\rho = a \cos b\theta$.—**Andes rose,** any one of several species of the genus *Befaria* found in the Andes of Peru and Ecuador.—**Aniline rose,** an old name for safranine.—**Antwerp rose.** Same as *Brabant rose.* See *rose*1, 16.—**Australian rose,** a shrub of the rue family, *Boronia serrulata,* having bright green leaves and very fragrant rose-colored flowers.—**Carolina rose,** the swamp-rose, *Rosa Carolina.*—**Diamine rose.** Same as *diamine* ★*pink.*—**Honey of rose,** clarified honey containing 12 per cent. of fluid extract of rose; mel rosæ.—**Leaf-blotch of rose.** See ★*leaf-blotch.*—**Naphthalene rose.** Same as *magdala red* (which see, under *red*1).—**Native rose.** Same as ★*Bauera,* 2.—**Rose bud-worm.** See ★*bud-worm.*—**Rose carné.** [F.] Same as *rose Pompadour.*—**Rose leaf-beetle.** See ★*leaf-beetle.*—**Rose leaf-hopper.** See ★*leaf-hopper.*—**Rose leaf-spot.** See ★*leaf-spot.*—**Rose of Crete,** the Cretan rock-rose, *Cistus Creticus.* See ★*rock-rose* and also *Cistus,* 1.—**Rose Sunday.** See ★*Sunday.*—**Sensitive rose,** the sensitive brier, *Leptoglottis uncinata.* See *Schrankia.*—**Siberian rose.** See *snow-*★*rose.*—**Snow-rose,** *Rhododendron chrysanthum,* a plant of the arctic regions about a foot high with golden-yellow flowers, and leaves having narcotic and diuretic properties. Also called *Siberian rose.*—**Syrup of rose.** See ★*syrup.*—**Wood-rose,** a remarkable vegetable excrescence, resembling a flower with radiating corrugated petals carved from wood, caused by the union of the saucer-shaped placenta-like base of certain parasitic plants of the mistletoe family with the foster-branch of the host and its persistence after the death of the plant. In Mexico called *rosa de palo,* or *rosa de madera.*



Rose.

A, three-leaved rose of equation $\rho = a \sin 3\theta$; *B*, three-leaved rose of equation $\rho = a \cos 3\theta$; *C*, four-leaved rose of equation $\rho = a \sin 2\theta$; *D*, four-leaved rose of equation $\rho = a \cos 2\theta$. In all, x is horizontal axis, y vertical axis, a radius-vector whose length is the parameter a in the equations.



Wood-rose.

II. *a.*—**Rose vitriol.** Same as *bieberite.*

rose-apple. 2. In Australia, the sweet plum, *Rancooria cerasifera.* See *Owenia,* 1.

rose-bay, *n.*—**East Indian rose-bay,** the crape jasmine, *Tabernæmontana coronaria.* See ★*jasmine.*

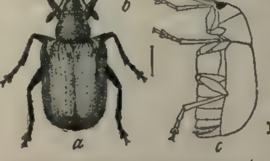
ose-bowl (rōz′bōl), *n.* A globular or bowl-shaped vessel of pottery or glass designed to old cut roses or other flowers.

se-box² (rōz′boks), *n.* A perforated plate or x which is fitted over the end of a suction-pipe in order to prevent solid matter from being drawn into a ship's pump; or an attachment by which a stream of water is converted into spray.

rose-bush. 2. In Australia, a small tree of the anona family, *Eupomatia laurina,* yielding a soft, coarse-grained, yellowish-brown wood.

rose-chestnut (rōz′ches″nut), *n.* A tree of the gamboge family, *Mesua ferrea.* See *Mesua* and *nagkassar.* Also called *Indian rose-chestnut.*

rose-curculio (rōz′kėr-kū″li-ō), *n.* An American curculionid beetle, *Rhynchites bicolor,* which punctures the flower-buds of the rose as well as the bud-stalks and the ripe fruit of the raspberry and blackberry. It is found from New York to California.



Rose-curculio (*Rhynchites bicolor*).

a, beetle; *c*, same in profile: *b*, claw; *a*, *c*, enlarged; *b*, more enlarged. (Chittenden, U. S. D. A.)

rose-end (rōz′end), *n.* A rose (see *rose*1, 10); a strainer; a foot-valve.

rose-gall, *n.*—**Mossy rose-gall,** a polythalamous cynipid gall formed on the stems of sweetbrier. The mass of cells is covered with reddish or green filaments, making it appear mossy.

Rose-geranium oil. See *geranium-*★*oil.*

rose-head (rōz′hed), *n.* 1. A sprinkler nozle; a nozle having many small openings for making a spray; a rose.—2. A head, on a nail or spike, having corrugations or facets; an enlarged end on a mill, or milling-cutter.—3. A nail, etc., having a head with facets or cuts; a rose-nail.

roseine, *n.*—**Acid-roseine.** Same as *acid-magenta.*

roseite (róz′īt), *n.* [Named after its finder, Dr. *Rose.*] An altered mica from Chester county, Pennsylvania. It is soft like talc, and of a pearly luster and brownish-yellow color.

rose-jet (rōz′jet), *n.* 1. A spray; the water-jet from a rose-head.—2. A rose-head; a rose.

rose-laurel (rōz′lâ″rel), *n.* See ★*laurel.*

Rosellinia (rō-ze-lin′i-ä), *n.* [NL. (De Notaris, 1844), < Dr. Ferdinando Pio *Rosellini,* an Italian scientist.] A large genus of pyrenomycetous fungi having mostly carbonaceous superficial perithecia, usually growing upon a subiculum of dark-colored hyphæ. The spores are unicellular and dark brown. About 175 species have been described. They occur chiefly on decaying wood. *R. aquila,* a common cosmopolitan species, is the type of the genus.

rosemary, *n.* 2. In Australia, any one of several species of the genus *Westringia,* belonging to the mint family, especially *W. Dampieri,* whose resemblance to the rosemary of Europe led Dampier to give its name to Rosemary Island in the Dampier archipelago.—**Golden rosemary,** in Tasmania, a plant of the bean family, *Callistachys elliptica.*—**Sand-hill rosemary,** *Ceratiola ericoides,* of the crowberry family, a small, erect, heath-like evergreen shrub of dry pinelands in the southeastern United States from South Carolina to Florida and Alabama. It bears whorls of narrow revolute and almost tubular leaves and reddish diœcious flowers sessile and whorled in the axils.—**Victorian rosemary,** *Westringia rosmariniformis.* See *Westringia.*—**Wild rosemary,** in Queensland, a slender shrub, *Cassinia lævis,* of the aster family.

rose-mildew (rōz′mil″dū), *n.* See ★*mildew.*

rose-moss (rōz′môs), *n.* Same as *Kentucky* ★*moss.*

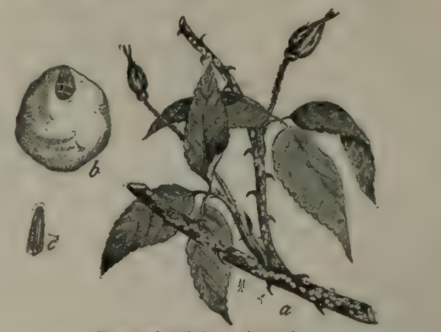
Rosenbergia (rō-zen-bėr′gi-ä), *n.* [NL. (Oersted, 1856), named in honor of Caroline *Rosenberg* (1810–1902), a native of Schleswig-Holstein and a student of the Danish flora.] A genus of plants of the family *Polemoniaceæ.* See *Cobæa.* The best known species is *R. scandens* (*Cobæa scandens* of Cavanilles), a tender perennial climbing by tendrils, usually treated in gardens as an annual. It is one of the popular climbers, being a rapid grower and bearing large bell-shaped violet or greenish-purple flowers.

roseo-. In *chem.*, a prefix used to distinguish a certain class of cobalt-ammine salts, which possess a characteristic rose-red color.

rose-reamer (rōz′rē″mėr), *n.* A mill, or revolving cutter, which has an enlarged, or rose, end, and cuts on its face.

rose-rust (rōz′rust), *n.* See ★*rust*1.

rose-scale (rōz′skāl), *n.* A diaspine scale-insect, *Aulacaspis rosæ,* of cosmopolitan distribution, occurring abundantly on the canes of the rose, raspberry, and blackberry, and also found on the strawberry, myrtle, pear, ailantus, cycas, mango, and other plants.



Rose-scale (*Aulacaspis rosæ*).

a, infested branch, reduced; *b*, female; *c*, male: both enlarged. (Comstock, U. S. D. A.)

rosette, *n.* 2. (*d*) (2) A contagious disease of peach-trees, of unknown cause, characterized by a dwarfing of the foliage and shoots and the formation of them into compact tufts. (*e*) In *phytogeog.*, same as ★*rosette-plant.* 8. In *elect.*: (*a*) A cluster of glow-lamps or of sockets arranged for the mounting of such lamps. *Elect. World and Engin.*, May 7, 1904, p. 887. (*b*) An electrical fixture used when a branch is to be taken from the main wires. It consists, usually, of a porcelain base, which is fastened to a ceiling or other support, and a porcelain cover through a hole in which the branch wires run. Removing the cover disconnects the branch wires from the mains.—**Leaf rosette,** a cluster of usually radical leaves spread out upon or near the ground in the form of a rosette. It generally consists of several contracted whorls of leaves having the same phyllotaxy as those of the stem.

rosette-form (rọ-zet′fôrm), *n.* See ★*rosette-plant.*

rosette-machine (rọ-zet′mạ-shēn″), *n.* 1. A machine for carving rosettes in wooden moldings, etc.—2. In *ceramics,* a press fitted for molding the porcelain for rosettes.

rosette-plant (rọ-zet′plant), *n.* In *phytogeog.*, a plant of a vegetation-form characterized by the clustering of the leaves (of all or of many) at the surface of the ground or at the summit of a caudex. Rosette-plants are most often perennials and are either acaulescent (dandelion, many violets), then having all or most of their leaves in the rosette; or caulescent (many saxifrages, erigerons, thistles, etc.), then sending up a leafy stem, the basal rosette serving the plant early in the season, or often the previous autumn, and perishing as the plant matures. The rosette-form is strongly developed in alpine regions, the tap-root here becoming very strong, but is common also at low altitudes. Rosettes are distinguished by F. E. Clements as *close* (the leaves with short petioles and dense) or *open* (the leaves longer-petioled, the cluster thus loose and less regular).

Rose-water dish. (*c*) In English silver, a shallow platter in which rose-water was poured.

rose-winged (rōz′wingd), *a.* Having a number of white-tipped feathers near the bend of the wing, the markings being arranged in a somewhat circular shape: used in describing pigeons.

rosewood, *n.* 4. In Australia, the timber of any one of four species of trees: (*a*) *Acacia glaucescens,* called also *rosewood acacia, kaareewan,* and *myall;* (*b*) *Stenochilus Mitchelli* (*Eremophila Mitchelli* of Bentham), belonging to the family *Myoporaceæ* and often called sandalwood on account of its very fragrant wood; (*c*) *Dysoxylum Fraseranum* of the family *Meliaceæ;* and (*d*) *Synoum glandulosum,* the fresh wood of which is of a deep red color and emits an odor like that of the common rose.—**Guiana rosewood,** the pinkwood, *Dicypellium caryophyllatum.* See *pinkwood* and *clove cassia* (under *cassia*).—**Polynesian rosewood.** See ★*banago,* ★*bulakan,* and ★*milo.*

Rosh hodesh (rōsh ċhō′desh), *n.* [Heb. *rōsh,* head, beginning, + *ḥōdesh,* new (moon), a month.] The first day of the Jewish month which begins with the new moon. On the first day (some times two days) of the month the ritual is distinguished by additional prayers including *hallel* (which see). See also *Jewish* ★*festivals.*

rosindol (rọ-zin′dol), *n.* [*rose*1 + *indol.*] In *organic chem.*, the general name given to a class of red dyes prepared by the action of benzoyl chlorid on compounds of the indol series.

rosindone (rọ-zin′dōn), *n.* [*rosind*(*ol*) + *-one.*] A red crystalline dyestuff, $C_{22}H_{14}ON_2$, made by heating rosinduline to 178° C. with concentrated hydrochloric acid. By oxidation it yields rosindonic acid. It melts at 261–262° C. Also called *rosindulone.*

rosindonic (rō-zin-don′ik), *a.* [*rosindon*(*e*) + *-ic.*] Derived from rosindone.—**Rosindonic acid,** a crystalline acid, $C_{22}H_{14}O_3N_2$, made by oxidizing rosindone with chromic anhydrid dissolved in glacial acetic acid. It melts at 209° C.

rosinduline (rọ̄-zin′dụ̄-lin), *n.* [*rosind*(*ol*) + *-ule* + *-ine*².] A reddish-brown crystalline base, $C_{22}H_{15}N_3$, made synthetically. When heated to 170° C. with concentrated hydrochloric acid it yields ammonia and rosindone. It absorbs carbon dioxid readily and melts at 198–199° C.

rosindulone (rọ̄-zin′dụ̄-lōn), *n.* [*rosind*(*ol*) + *-ule* + *-one.*] Same as ★*rosindone.*

rosin-grease (roz′in-grēs), *n.* A trade-name of the product obtained by mixing rosin-oil with milk of lime. It is a sticky, pasty material, used as a cheap lubricant and in the manufacture of printers' ink.

rosite¹ (rō′zīt), *n.* [In def. 1, Sw. *rosit* (Svanberg, 1840), < L. *rosa*, rose, + *-ites*, E. *-ite*².] 1. A silicious mineral related to amphibole, perhaps an altered pargasite.—2. A rose-red coloring material extracted from the sediment of new red wines. In the sediment of old wines it is replaced by pourprite.

rosite² (rō′zīt), *n.* [F. *rosite* (Huot, 1841), named after Professor G. *Rose*, who analyzed it.] A sulphid of antimony and copper, now known as *chalcostibite.*

rosocyanin (rō-zọ̄-sī′ạ-nin), *n.* [L. *rosa*, rose (red), + E. *cyanin.*] A red coloring-matter, $C_{10}H_{14}O_4$, formed by the action of boric and sulphuric acids on curcumin. It is a monobasic acid isomeric with curcumin.

rosolite (rō′zọ̄-līt), *n.* [L. *rosa*, rose, + Gr. *λίθος*, stone.] A name given by Kunz to the rose-colored variety of grossular garnet found at Xaloxtoc, Mexico.

rosophenine (rō-zọ̄-fē′nin), *n.* Same as ★*dianthine.*

rosse (ros), *a.* [F., adj. use of *rosse*, a (good-for-nothing) horse, < G. *ross*, a horse.] Characterized by a brutal or cynical disregard of conventionalities or propriety. [French literary slang.]

> The aristocratic salon has dwindled into a tradition. The young men . . . have not the leisure their elders had for the arts and graces of life. The *rosse* literature has spoiled the traditions of the Faubourg for us. . . . The salon is all very well, so are the songs of Montmartre, the Théâtre *Rosse*, but there is just one little point on which the Frenchman is in no mood to blaguer and that is his wife's fidelity.
>
> *Hannah Lynch*, French Life in Town and Country, x.

rosser (ros′ėr), *n.* [*ross*¹ + *-er*¹.] In *lumbering*, one who barks and smooths the side of a log, in order that it may slide more easily. Also called *log-fixer, scalpẹr, slipper.*

rosserie (ros-rē′), *n.* [F. See ★*rosse.*] Cynical disregard of conventionalities and propriety. See the extract and ★*rosse.* [French literary slang.]

> But since no movement ever stops half-way, but continues naturally until it reaches its extreme limit, this tendency [idealism] went farther than M. Renan's idealism, and passed on into mysticism; though this movement, as we look at it now, seems to be split up into singularly various elements, for together with the existence of symbolism and mysticism, incredulity and sensualism have survived, and a brutally cynical element has appeared which has been christened "*rosserie.*"
>
> *Encyc. Brit.*, XXVIII. 496.

rösslerite, *n.* See *roesslerite.*

rostellum, *n.* 2. (*b*) The combined mouth-parts of the true lice, of the family *Pediculidæ.*

rosthornite (ros′tôr-nīt), *n.* [G. **rosthornit*, < *rost* = E. *rust*, + *horn* = E. *horn* + *-it* = E. *-ite*².] A brown mineral resin, $C_{24}H_{40}O$, occurring in lenticular masses in coal in Carinthia.

rostral, *a.*—**Rostral plate.** See ★*plate.*

II. *n.* A scale covering the end of the nose in reptiles; the rostral shield. *Proc. Zool. Soc. London*, 1903, p. 125.

rostrolateralia (ros-trọ̄-lat-ẹ-rā′li-ạ̈), *n. pl.* [NL., < *rostrum* + *laterale*, pl. *lateralia.*] In the structure of the capitulum of the *Balanidæ* or acorn-barnacles, the accessory plates inserted between the lateralia near the rostrum. See ★*lateralia.*

Rosy dryocampa, an American ceratocampid moth, *Anisota rubicunda* (formerly placed in *Dryocampa*), whose wings are yellowish, marked and suffused with a rose-pink. Its larva, known as the green-striped maple-worm, feeds on the foliage of the maple. See *Anisota*, with cut.

rot, *v.* I. *intrans.* 5. To 'make fun'; fool; talk nonsense. [Slang.]

> Oh, all right; go ahead! I thought you were only *rotting.*
>
> *E. Nesbit*, the Wouldbegoods, p. 182.

6. To fail successively at batting: said of a cricket eleven. [Slang.]

II. *trans.* 3. To chaff; make fun of. [Slang.]

> "He behaves like a sulky child and ought to be *rotted* most unmercifully," she apologises.
>
> *Barry Pain*, The One Before, v.

rot, *n.* 4. In *cricket*, the failure of several batsmen on a side. [Slang.]—**Barcoo rot.** Same as *Barcoo* ★*disease.*—**Black rot.** (*a*) See *rot*, 2. (*b*) See ★*black.* (*c*) A name of certain plant-diseases of a bacterial or fungous origin, characterized by decay and blackening of the tissues. The following are the most important: *black rot of the apple*, caused by *Sphæropsis Malorum*; *black rot of the cabbage*, due to *Pseudomonas campestris*; *black rot of the grape*, caused by *Guignardia Bidwellii*; *black rot of the pear* and *quince*, caused by *Sphæropsis Malorum*; *black rot of the sweet-potato*, caused by *Ceratocystis fimbriata* (also called *black-shank*); and *black rot of the tomato*, caused by *Macrosporium Tomato.*—**Brown rot,** a fungous disease of fruits, especially apple, peach, plum, and cherry, caused by *Monilia fructigena* and *M. cinerea.*—**Brown rot of the cabbage.** Same as *black rot of the cabbage.* See *black* ★*rot* (*c*).—**Brown rot of the potato.** Same as ★*bacteriosis of the potato.*—**Brown rot of the spruce,** a decay of the wood of spruce caused by *Polyporus sulphureus.*—**Brown rot of the turnip.** Same as *black rot of the cabbage.* See *black* ★*rot* (*c*).—**Carrot-rot,** a decay of carrots attributed to the fungus *Phoma sanguinolenta.*—**Cocoanut-palm rot,** a disease of the cocoanut-palm, probably due to bacteria, which attacks the terminal bud of the tree.—**Collar-rot,** a disease of undetermined cause attacking fruit-trees near the surface of the soil. *Rural New Yorker*, Feb. 7, 1903, p. 94.—**Cotton-boll rot,** a decay of cotton-bolls which has been attributed to *Bacillus gossypinus.* Also called *boll-rot.*—**Dry rot,** a decay of conifers, especially of hemlock, larch, pine, and spruce, caused by the fungus *Trametes Pini.* Also called *red rot.* The dry rot which affects pear-trees is attributed to the fungus *Thelephora pedicellata*, that of the potato to *Fusarium Solani*, of the sweet-potato to *Phoma Batatæ*, and of the turnip to *Phoma Brassicæ.* See also ★*dry-rot*, 1.—**Egg-plant rot,** a decay of the fruit of the egg-plant attributed to *Penicillium.*—**Foot-rot.** See ★*foot-rot.*—**Fruit-rot,** a decay of fruit, especially of the peach, caused by the fungus *Sclerotinia fructigena.* See *fruit-*★*mold* and *peach-blight.*—**Potters' rot.** Same as ★*potters' asthma.*—**Red rot.** See *dry* ★*rot.*—**Red rot of oak,** a fungous disease, produced by *Polyporus sulphureus*, which causes the rot of oaks as well as of a considerable number of other trees.—**Ripe rot,** a decay of fruits, especially of the apple, grape, and quince, caused by the fungus *Glœosporium fructigenum.* Also, in the case of the apple and quince, called *anthracnose* and *bitter rot.*—**Salsify-rot,** a bacterial decay of salsify.—**Seedling rot,** a disease which attacks the stems of young egg-plants: due to the fungus *Phoma Solani.*—**Stem rot.** See ★*stem-rot.*—**Tomato-rot.** Same as *black* ★*rot of tomato.*—**White rot.** (*b*) A fungous disease affecting the trunks of ash, juniper, oak, and other trees; also a disease of the grape. The white rot of ash is due to *Polyporus Fraxinophilus*, that of juniper to *Polyporus Juniperinus*, and that of oak to *Polyporus igniarius.* See *white* ★*rot of oak.*—**White rot of oak,** a disease, produced by *Polyporus igniarius*, which attacks the oak, hickory, willow, and other trees.

rot (rot), *exclam.* [*rot*, *n.*] Humbug! Nonsense! Stuff! [Slang.]

> "Harold 's asleep," I said; "it seems rather a shame—"
> "Oh, *rot!*" said my brother; "he 's the youngest, and he 's got to do as he 's told!"
>
> *K. Grahame*, Golden Age, p. 94.

rotameter (rọ̄-tam′e-tėr), *n.* [L. *rota*, a wheel, + Gr. *μέτρον*, measure.] A measuring-device consisting of a small measuring-wheel partially inclosed in a case resembling that of a watch and having a dial with hands for indicating in feet and inches the distance traversed by the wheel. It measures up to twenty-five feet. It can also be used, in connection with a watch, to measure the speed of moving surfaces, as in a metal-planer or other machine. A similar measure, for use in measuring plans, drawings, and irregular surfaces, is called a *pocket rotary measure.*

rotary, *a.*—**Rotary converter.** See ★*converter*, 3.—**Rotary field.** See ★*field.*—**Rotary oven.** (*b*) See ★*oven.*—**Rotary planer, shaper, speed, stripper, transformer.** See ★*planer*, etc.

II. *n.* In *elect.*, a rotary converter.

> A three-phase 120-cycle alternator driven by an inverted *rotary* used as a motor and itself capable of giving a three-phase 60-cycle current. *Science*, June 24, 1904, p. 945.

rotation, *n.* 4. In *forestry*, the period represented by the age of a forest, or a part of a forest, at the time when it is cut, or intended to be cut.—**Carrington's law of solar rotation.** See ★*law*¹. **Financial rotation,** in *forestry*, that rotation under which a forest yields the highest net interest on its capital value, calculating at compound interest.—**Income rotation,** in *forestry*, that rotation under which a forest yields the highest net return, calculating without interest.—**Left-handed rotation,** rotation in the opposite direction to that of a right-handed screw or to that of the hands of a clock when viewed from in front; levogyral rotation.—**Moment of rotation.** See ★*moment.*—**Period of rotation,** the time of rotation of a heavenly body around its axis.—**Right-handed rotation,** rotation in the direction of a right-handed screw; clockwise rotation; dextrogyral rotation.—**Simple rotation,** the motion of a body which revolves about a fixed axis; a pure rotation without any translational component.—**Specific rotation,** in *optics*, the angle through which the plane of polarization of light is rotated by a column of liquid 10 centimeters long, when each cubic centimeter of the liquid contains in solution one gram of the optically active substance the specific rotation of which is to be measured.—**Technical rotation,** in *forestry*, that rotation under which a forest yields the material most suitable for a certain purpose.—**Volume rotation,** in *forestry*, that rotation under which a forest yields the greatest quantity of material.

rotational, *a.* 2. In *hydrodynam.*: (*a*) Having vortex motion. (*b*) Having rotation in the sense of curl.—**Rotational coefficient,** the rotatory power, a constant in the expression of the transverse electromotive force in the Hall effect.—**Rotational elasticity.** See ★*elasticity.*—**Rotational resistance.** See ★*resistance.*

rotation-center (rọ̄-tā′shọn-sen″tėr), *n.* The point about which a rotation gives the same result as any given sliding of a polygon in a plane.

rotation-chair (rọ̄-tā′shọn-chãr), *n.* In *exper. psychol.*, a chair so constructed that the subject, seated in it, can be rotated at various rates of speed without appreciable noise or jar. The chair is sometimes made in such a way that it can be extended; back, seat, and front then lie in one plane, and the apparatus forms a ★rotation-table (which see). Further, the seat may be so hung that chair or table can be tilted back and forth, as well as rotated; the apparatus then becomes a combination rotation-chair, tilt-chair, rotation-table, and tilt-table. In all these forms it is employed for the study of the kinesthetic and static senses.

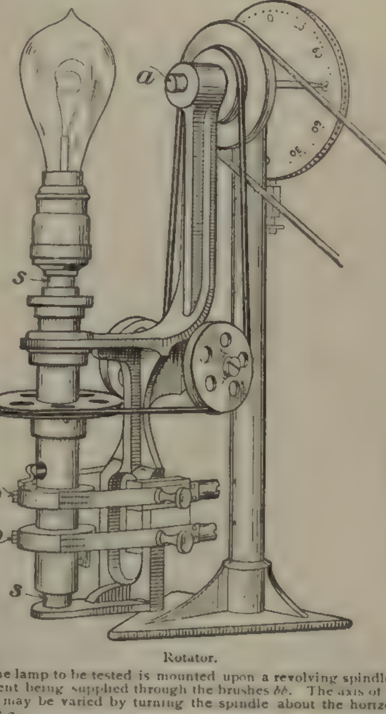
rotation-speed (rọ̄-tā′shọn-spēd), *n.* The speed of a revolving body, as a wheel, expressed in terms of the number of turns in a unit of time.

rotation-table (rọ̄-tā′shọn-tā″bl), *n.* In *exper. psychol.*, a long table so constructed that the subject, extended at full length, can be rotated at varying rates of speed without appreciable noise or jar: used in the study of the kinesthetic and static senses. *E. C. Sanford*, Exper. Psychol., I. 368.

rotativism (rō-tā′tiv-izm), *n.* [*rotative* + *-ism.*] Rotation; the state of being rotative: specifically, in Portuguese politics. See the extract.

> The history of the crisis which ended in the tragedy dates back to last May, when King Carlos dissolved the Chamber and conferred dictatorial powers on Premier Franco. This step was taken by the King as parliamentary government had come to a deadlock and the political parties were mainly interested in securing official spoils. Each party held office by arrangement alternately. The arrangement was known as *rotativism.*
>
> *N. Y. Sun*, Feb. 3, 1908.

rotator, *n.* 4. In *photometry*, a mounting for an incandescent lamp so constructed that the lamp may be given a rapid rotation about its polar axis. By means of such a device the mean horizontal intensity of the lamp may be determined from a single photometric setting.—5. In *math.*, a quantity having magnitude, direction, and position; a rotor.—**Rotatores capitis,** in *Coleoptera*, two flat muscles, one having its origin on the side of the antefurca and the other on the posterior jugular plate. They are inserted on the lateral



Rotator.

The lamp to be tested is mounted upon a revolving spindle, *ss*, current being supplied through the brushes *bb*. The axis of rotation may be varied by turning the spindle about the horizontal shaft *a*.

margin of the occipital foramen.—**Rotatores prothoracis**, in *Coleoptera*, two large muscles having their origin on the posterior part of the pronotum and inserted on the integument between the prothorax and mesothorax and also on the anterior part of the mesothorax.

Rotatory coefficient, tic. See ★*coefficient*, ★*tic*¹.

rotiferon (rō-tif′e̤-ron), *n.*; pl. *rotifera* (-rä̤). [NL. See *Rotifer*.] A rotifer.

Rotomagian (rō-tō̤-mā′ji-a̤n), *n.* [L. *Rotomagi*, a people of ancient Gaul, whose name survives in that of *Rouen*.] In *geol.*, a substage of the Cenomanian Cretaceous rocks in France and Belgium. Also used attributively.

rotometer (rō̤-tom′e-tėr), *n.* [L. *rot*(*atio*), rotation, + Gr. *μέτρον*, measure.] A cyclometer; a device for measuring distances by counting the revolutions of a wheel which rolls through the distance to be measured.

rotor, *n.* 2. In *elect.*, the revolving element of an electric machine.—3. The revolving part of a steam-turbine. It consists of the shaft and the disks carrying the buckets on which the steam pressure acts.

> Each piston is of such diameter as to exactly balance the axial thrust of the steam against its corresponding stage of blades. The *rotor* also carries a series of thrust bearing rings whose sole duty is to maintain an exact relationship between the *rotor* and stator parts.
> *Elect. World and Engin.*, May 14, 1904, p. 925.

Squirrel-cage rotor, in *elect.*, an armature or rotating field the winding of which is of the squirrel-cage type.

rot-steep (rot′stēp), *v. t.* Formerly, to steep, as cotton cloth, in water, to get rid of surface impurities, such as grease, oil, and dirt, prior to bleaching.

rotten¹, *a.* 7. Good for nothing; trashy; mean; detestable. [Slang.]

> "*Rotten* things, misunderstandings," resumed Bobby, after a pause. *A. R. Conder*, Seal of Silence, xxii.

Rotten row (*naval*), a place in a navy-yard where condemned vessels are moored pending their sale or breaking up. [Colloq.]

rotter (rot′ėr), *n.* [*rot*, *n.*, + *-er*².] One who talks or writes 'rot'; a humbug. [Slang.]

> The snake . . . reared up out of the water, exactly like Kaa in the Jungle Book—so we know Kipling is a true author and no *rotter*.
> *E. Nesbit*, The Wouldbegoods, p. 88.

> 'How can you be so uncivil to that man?' . . . 'A *rotter*,' said Merton, 'he has just got that stuff by heart.' *A. Lang*, Disentanglers, p. 338.

rottle (rot′l), *n.* Same as *rotl*.

rottlerin (rot′lėr-in), *n.* [*Rottlera* + *-in*².] A flesh-colored or yellow crystalline dyestuff, $(C_{11}H_{10}O_3)_3$, obtained from *Echinus Philippinensis*. It is the active constituent of the vermifuge kamila. Also called *mallotoxin*.

rotulian (rō̤-tū′li-a̤n), *a.* [*rotula* + *-ian*.] Same as *patellar*.

rouge, *n.* 2. (*b*) A finely powdered red oxid of iron, or hematite (which see), generally mixed with a paste or glue and sold in sticks or in the form of powder.—3. In *roulette*, a bet that the color of the number will be red.—**Rouge de fer** [F., 'iron red'], in *ceram.*, a red color obtained from iron peroxid. Compare ★*rouge d'or*.—**Rouge d'or** [F., 'red of gold'], in *ceram.*, a red color of Oriental glaze obtained from gold precipitate.—**Rouge flambé** [F., 'fired red'], an iridescent glaze of a red color.

> Even the long-sought secret of the Chinese sang de bœuf and *rouge flambé* glazes has been worked out in Europe.
> *Encyc. Brit.*, XXXI. 875.

rougeot (rö-zhō′), *n.* [F. *rouge*, red, + *-ot* (augm.).] A disease of doubtful origin affecting grape-leaves and causing them to turn red and die. Also spelled *rougeau*.

> The term Spanish measles is here used in California for a disease resembling *Rougeot*, so far as the description goes.
> *U. S. Dept. Agr.*, Div. Veg. Physiol. and Pathol., Bulletin 2, 1892, p. 173.

rough¹, *a.*—**Rough dimensions.** See ★*dimension*.

rough¹, *v. t.* 3. In *hat-manuf.*, to compact (the felt) by moisture, heat, and pressure.—4. To expose to winter weather, as cattle; permit to run at large during the winter. [Western U. S.]

> They were great grazing cattle, fattening rapidly on grass, and, when "*roughed*" through our sometimes severe Nebraska winters, their thick coats of hair protected them so thoroughly that they invariably wintered well coming out in the spring in better flesh than did our cattle of any other breed.
> *Rep. Kansas State Board Agr.*, 1901–02, p. 268.

roughage, *n.* 2. In *stock-feeding*, the coarser portion of a ration, as hay, corn silage, etc., containing relatively little nutritive matter, as opposed to the concentrated part or grain feed.

rough-coat (ruf′kōt), *v. t.* In *plastering*, to apply the first coat to (masonry walls or lath).

rough-cut (ruf′kut), *a.* and *n.* **I.** *a.* Having coarse or rough teeth, as a file designed for rough work.

II. *n.* 1. A coarse file.—2. A roughing-cut; the first cut taken on a piece of work by a machine-tool; a coarse or heavy cut to remove superfluous metal.

rougher, *n.* 4. A board filled with long iron teeth for hackling flax by hand.

rough-house (ruf′hous), *n.* In *sports*, rough play; hence, rough play in general; horse-play; rowdy conduct. [Recent slang, U. S., chiefly among boys at school or college.]

rough-housing (ruf′hou-sing), *n.* Same as ★*rough-house*.

roughing (ruf′ing), *a.* Approximate; not finished.

roughing-down (ruf′ing-doun), *n.* The process of cutting to very nearly the required size, including the removing of any skin or hard scale. See *roughing-rolls*.

roughing-filter (ruf′ing-fil″tėr), *n.* A filter which separates coarse impurities from the liquid. *Nature*, Sept. 24, 1903, p. 509.

roughing-mill, *n.* 2. The roll-train in which the ingot receives its first, or roughing, treatment.

> The most easterly division will contain the open-hearth furnaces, which are in line with three sets of heavy *roughing mills* delivering to other mills making finished plates and structural shapes.
> *Elect. World and Engin.*, Jan. 2, 1904, p. 18.

roughing-out (ruf′ing-out), *n.* and *a.* **I.** *n.* 1. Roughing-down; particularly, the approximate shaping of a piece from commercial sizes of material.—2. The rough-forging of a piece, including the welding and swaging of the original stock, but not the finishing with the fullering- and flatting-tools, dies, etc.

II. *n.* Suitable or designed for use in making rough-cuts: as, a *roughing-out* drill. *Jour. Brit. Inst. Elect. Engin.*, 1901–02, p. 312.

roughing-tool (ruf′ing-töl), *n.* The tool used for taking off the outside skin of a piece of metal or wood and cutting the piece to approximately the correct size. It is generally a round-nosed tool, but varies with the material to be cut and the amount of material to be removed.

roughneck (ruf′nek), *n.* See the extract. [Slang.]

> His stated income amounts to union wages from his union of *roughnecks*, as the iron-workers call themselves, as walking delegate.
> *N. Y. Evening Post*, Aug. 17, 1903.

rough-pointed (ruf′poin″ted), *a.* In *stone-cutting*, dressed roughly with the point: said of the first preparation of the surface of a stone. See *point*¹, 2 (*e*).

rough-ride (ruf′rīd), *v. t.*; pret. and pp. *rough-ridden*, ppr. *rough-riding*. To ride as a rough-rider. [Rare.]

> "Hould on, faith an' patience, the other elephints are comin'." . . .
> "Glory!" I sez, "will I *rough-ride* the whole stud?"
> *R. Kipling*, My Lord the Elephant, in Many Inventions, p. 63.

rough-rider (ruf′rī″dėr), *n.* 1. One who breaks young or wild horses to the saddle; in the British army, a non-commissioned cavalry or artillery officer detailed to assist the riding-master, one being allowed to each troop or battery.—2. A horseman accustomed to rough or hard riding, such as cow-boys or frontiersmen: applied specifically, in the late Spanish-American war, to the members of a volunteer regiment of cavalry, recruited partly from Western cow-boys.

> Regiments of cavalry recruited from dwellers on grassy plains are famous as "*rough-riders*," whether they are Russian Cossacks or American cowboys; their skill and endurance as horsemen are a natural result of habits developed in an open country of large distances, where riding is as appropriate a means of going about as walking is in a mountainous district.
> *W. M. Davis*, Elem. Phys. Geog., p. 369.

rough-turn (ruf′tėrn), *v. t.* To turn roughly, in a lathe; turn nearly to size; turn so that the surface is not finely finished. *The Engineer* (London), Aug. 1, 1902, p. 103.

rouille (rö-ēl′), *n.* [F.] A yellowish-brown ferric hydroxid precipitated on calico by the action of sodium hydroxid on ferrous sulphate. Also called *chamois*. *Thorpe*, Dict. of Applied Chem., III. 356.

roulade, *n.* 2. Slices of beef rolled with bacon and then steamed.

roulade (rö-läd′), *v. i.*; pret. and pp. *rouladed*, ppr. *roulading*. [*roulade*, *n.*] In *music*, to sing roulades or divisions.

roulette, *n.* 4. All bets are placed in the various parts of the lay-out, one of which is at each side of the wheel. The five following pay even money: *impair*, that the number will be odd; *pair*, that the number will be even; *manque*, that it will be from 1 to 18; *passe*, that it will be from 19 to 36; *rouge*, or *noir*, that the color will be red or black. In addition to these, *en plein*, flat on any number, pays 35 for 1; *à cheval*, on the line between two numbers, 17 for 1; *un carré*, on a cross-line, taking in four numbers, 8 for 1; *transversale*, any horizontal line of three numbers, 11 for 1; *transversale six*, on the line between two horizontals, taking in six numbers, 5 for 1; *bas*, at the bottom of a vertical column, 2 for 1, and between two columns, ½ for 1. *Premier*, *milieu*, and *dernier* are upon the first, middle, and last 12 numbers respectively, that is, from 1 to 12, 13 to 24, 25 to 36, and pay 2 for 1. These are the payments at Monte Carlo, where the wheels have 36 numbers and only one zero. Wheels in other parts of Europe have two zeros, and in the United States many wheels have two zeros and an eagle besides. The numbers in many American wheels run to 27, 30, and 33 only, the payments being scaled down accordingly.

		0		
Passe	1 4 7 10	2 [illegible] 8 11	3 6 9 12	Manque
Pair	13 16 19 22	14 17 20 23	15 18 21 24	Impair
Noir	25 28 31 34	26 29 32 35	27 30 33 36	Rouge
P M D 12 12 12				P M D 12 12 12

roulette (rö-let′), *v. t.*; pret. and pp. *rouletted*, ppr. *rouletting*. [*roulette*, *n.*] 1. To mark with dotted lines with a roulette.—2. To perforate with a roulette or similar instrument, as in preparing blank checks, for ease and convenience in removal from a stub, or sheets of printed postage-stamps for the separation of the stamps, the one from the other, when needed.

roulette-wheel (rö-let′hwēl), *n.* The paraphernalia of the game of roulette.

> As he was in town on a visit recently he received a letter from a club . . . asking him to . . . purchase a *roulette wheel* for their rooms.
> *N. Y. Com. Advertiser*, May 11, 1905.

Roum. An abbreviation of *Roumanian*.

rounce, *n.*—**Domino rounce**, the card game of ramsch played with dominoes.

round. **I.** *a.* 16. In *phonology*, uttered with contraction of the lips such as to render the opening between them more or less 'round'; uttered with the lip-position characteristic of *o*, *u*, and similar vowels; rounded.—**Round iron**, iron which has been rolled into round rods.—**Round timber.** See ★*timber*¹.—**Round turn.** (*b*) A completed speculative transaction, as in stocks, grain, or the like.—**Round vowels.** See ★*vowel*.

II. *n.* 5. (*b*) *pl.* In *milit.*: (1) The act of visiting the sentries of a guard. The officer of the day is required to make his rounds between midnight and reveille. *Manual of Guard Duty.* (2) A party consisting of the officer of the day and an armed escort making the rounds. Also called *grand rounds*.—7. (*g*) A round game in which there are no partnerships. (*h*) In *poker*, a round of jacks, sometimes called a 'whangdoodle,' in which each player deals off a jack-pot. (*i*) In *archery*, a specified number of arrows shot at specified distances. The York round is 72 arrows at 100 yards, 48 at 80, and 24 at 60; the National round, 48 at 60 and 24 at 50; the American round, 30 arrows each at 60, 50, and 40 yards; the Potomac round, 24 each at 80, 70, and 60; the Ohio round, 96 at 60; the Columbia round, 24 each at 50, 40, and 30. The National and Columbia rounds are ordinarily shot by women. (*j*) In *skat* and other games, each player having dealt once completes a round.

12. In *ship-building*, the arching or camber of a deck-beam considered quantitatively; usually followed by *up*.

> Detailed directions are given for dealing with unusual conditions of sheer of deck, *round* of beam, trim, etc., and with extreme proportions of length to depth, as well as with deck erections and superstructures.
> *White*, Manual of Naval Arch., p. 14.

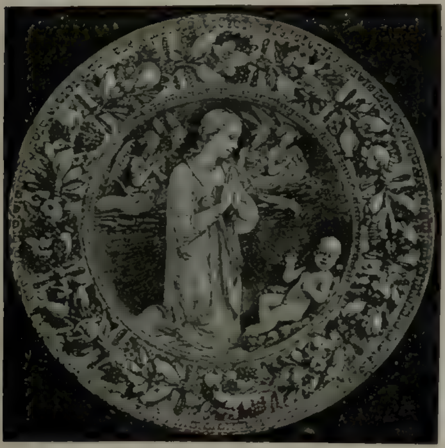
13. In *geodesy* and in *topographical surveying*, a series of horizontal angles between lines to distant stations or points to be observed, mea-

sured with a theodolite, and comprising the entire horizon around the observing station. For the purpose of securing greater accuracy in the observed values of the several angles, they are not individually observed directly, but the angular directions of the lines to the several observed points are observed in a progressive series closing the horizon and forming a round of angles.

> *Rounds* of angles were taken from Pegi hill, the hill on Kaweri island, a rock near Msara, the hill west of Naiko hill, and a rock near Ngo.
> *Geog. Jour.* (R. G. S.), XIII. 411.

Grand rounds. Same as ★*round*1, 5 (*b*) (2).—**To change the rounds.** See ★*change*.

round1, *v. t.* 6. In *tanning*, to trim (a hide) after it has been cleansed and limed, separating the heavier part or butt from the thinner belly and shoulder portions and cutting away ragged scraps from round the more valuable parts.—7. In *phonol.*, to utter with the lips in the contracted (and more or less projecting) position characteristic of *o*, *u*, and similar vowels.



Roundel by Luca della Robbia.

roundel, *n.* 4. In the *fine arts*, a composition or design contained within a circle, a type much favored by the painters and sculptors of the quattrocento in Italy: found also in excavations at Cnosus in Crete; also a wooden platter painted. See *tondo*.

> The enamelled *roundels* of the Throne-Room, which present a close parallelism with those of Tell-el-Yehûdiyeh bring us down on the other hand to the beginning of the thirteenth century.
> *A. J. Evans*, An. Brit. School at Athens, VI. 66.

rounder, *n.* 1. (*b*) Specifically—(1) A tool used by bookbinders for shaping the back of a book. (2) A round-tool. (3) A gage for laying out round work. (4) A machine for making round corners, moldings, etc. (5) A rounding-plane or rounding-jack.

Roundhead, *n.* 3. [*l. c.*] *pl.* Same as *brachycephali*.

> Mr. W. K. Moorehead, one of the best authorities on this subject, recognises two distinct mound-building races, the old long-headed, the later round-headed intruders . . . the chief seat of the long-heads was the Muskingum valley, from Marietta upwards to East Ohio, where the mounds, differing in type from those of the *round-heads*, have yielded pottery, . . . and other ornaments.
> *Keane*, Ethnology, p. 106.

round-headed, *a.* 3. In *arch.*, topped with a semicircular arch, as a window or doorway.

round-heart (round′härt), *n.* The purple meadow-parsnip or alexanders, *Thaspium trifoliatum*.

Rounding-and-channeling machine. See ★*channeling-machine*.

rounding-gage (roun′ding-gāj), *n.* An instrument for cutting hat-brims to a standard measure.

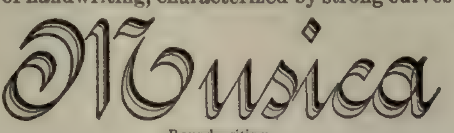
rounding-jack (roun′ding-jak), *n.* A support for holding a hat while it is trimmed into shape.

round-ringing (round′ring″ing), *n.* Same as *change-ringing*.

roundtail (round′tāl), *n.* A cyprinoid fish, *Gila robusta*, of the Colorado river basin.

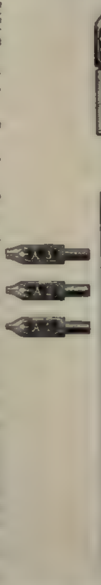
round-tree (round′trē), *n.* [Corruption of *rowan-tree*.] The American mountain-ash, *Sorbus Americana*.

round-wood (round′wůd), *n.* Same as ★*round-tree*.



Round-writing.

round-writing (round′rī″ting), *n.* A method of handwriting, characterized by strong curves with exaggerated shading, used in lettering, ornamental engrossing, and card-writing. Special pens, with one, two, or three points may be used.—**Round-writing instrument,** a penholder carrying three interchangeable pens. With an assortment of nine pens 144 different styles of double lines or 504 styles of triple lines can be written in ink on paper.—**Round-writing pen,** a pen having one, two, or three points of different degrees of fineness.



Round-writing Instrument, with round-writing pens.

roup2, *n.*—**Articles of roup.** See ★*article*.

Ro-urushi lacquer. See ★*lacquer*.

rouse1, *v. t.* 8. To blow air through (the wort of beer) in order to aid in the development of the yeast.

rouseabout (rouz′ạ-bout), *n.* [Eng. dial., also *rousabout*. See *roustabout*.] In Australia, a station-hand put on to any work; a Jack of all work; an 'odd man'; a roustabout. *E. E. Morris*, Austral English.

> The "*rouseabouts*" are another class of men engaged in shearing time, whose work is to draft the sheep, fill the pens for the shearers, and do the branding. . . . The shearers hold themselves as the aristocrats of the shed: and never associate with the *rouseabouts*.
> *The Argus*, Sept. 20, 1890, p. 13.

Rousseau's figure or **diagram.** See ★*figure*.

roustabout, *n.* 2. See ★*rouseabout*.

rout2, *v. t.* 3. To extricate from (other things); hunt up; dig (out); with *out*. [Colloq.]

> It 's just an old suit I *routed* out.
> *Anthony Hope*, Dolly Dialogues, xvi.

rout-chair (rout′chãr), *n.* [*rout*3 + *chair*.] A light chair supplied for private entertainments by caterers. [Eng.]

route1, *n.* 3. An order for a route march.

route1 (röt or rout), *v. t.*; pret. and pp. *routed*, ppr. *routeing* or *routing*. To determine the route or line of transportation or travel of (goods, immigrants, etc.).

> The . . . Company . . . issued to its agents along its line instructions as to manifesting and *routeing* property to eastern points by which it was prescribed that property forwarded by all rail to New York should be forwarded by [certain lines].
> *Newport News and Mississippi Valley versus Baltimore and Ohio R. R.*, Rep. Interstate Commerce Com., Nov. [13, 1889, p. 7.

> The facility which such combination [connecting roads] lends to through *routing* of cars, the convenience of exchanging power and rolling stock and the more liberal system of transfers which becomes feasible; all these things tend to give new life to the united enterprise and to pave the way for even greater improvements.
> *Elect. World and Engineer*, May 23, 1903, p. 856.

route-marching (röt′ mar-ching), *n.* *Mil.*, the act of marching from one station to another to relieve a garrison. It is conducted in open order; keeping step and silence are not required. See *to get the route* and *route-step*.

> We 're marchin' on relief over Injia's sunny plains,
> A little front o' Christmas time an' just be'ind the Rains.
>
> . . . .
>
> Oh, then it 's open order, an' we lights our pipes an' sings,
> An' we talks about our rations an' a lot of other things.
> *R. Kipling*, Route Marchin'.

routing-cutter (rou′ting-kut″ėr), *n.* A routing-tool.

routing-machine, *n.*—**String-routing machine,** a stair-router. See illustration under *routing-machine*.

rove2, *v. t.* 3. In *mech.*, to turn; make round: said particularly of turning stone: as, to *rove* a millstone.

roveling (rōv′ling), *n.* [Appar. an alteration of *roving*2 by conformity with *raveling*, *n.*] Same as *roving*2, 2.

rover, *n.*—**Jolly rover** (*naut.*), a pirate or his vessel.

rovetto (rō-vet′ō), *n.* Same as ★*escolar*.

roving-Jenny (rō′ving-jen″i), *n.* The strawberry-geranium, *Saxifraga sarmentosa*. Also called *wandering Jew*.

row2, *n.*—**Rotten row.** See ★*rotten*1.

row3, *n.*—**What 's the row?** What is the matter? [Slang.]

> Kitty [looking for her sister] . . . walks into the schoolroom as a last chance and looks anxiously around her; . . . and Brandy who is smoking a cigar against all rules . . . asks inelegantly, "*What's the row?*"
> *M. Hungerford*, Beauty's Daughters, ii.

rowing-machine (rō′ing-mạ-shēn″), *n.* A gymnasium apparatus of various forms, designed for exercising the muscles used in rowing. It usually combines a sliding seat, stretchers, and oar-handles, with weights or springs so arranged as to provide sufficient resistance.

Rowland effect. See ★*effect*.

rowlandite (rō′lạnd-īt), *n.* [Named after Professor Henry A. *Rowland* (1848–1901) of Baltimore.] A massive yttrium silicate of a pale drab-green color. It occurs with gadolinite and other related species in Llano county, Texas.

rowlock, *n.*—**Becket rowlock,** a rope becket secured to the gunwale, in which the oar works, instead of in a thole-pin or regular rowlock.

II. *a.* In *arch.*, characterized by having its voussoirs in concentric rings, one closely adjusted to another. The rowlock arch of brick is one in which each ring of brick voussoirs is only the width of the brick, or about four inches, in depth.

row-planting (rō′plan″ting), *n.* In *forestry*, a method of planting in which the young trees are placed in rows, the distance between the rows being greater than the distance between the young trees in the rows. In planting seeds or seedlings in the forest nursery this method is known as *drill-planting*.

roxamine (rok-sam′in), *n.* An artificial red dyestuff, the sodium salt of dioxyazonaphthalene-sulphonic acid: used in wool dyeing. *S. P. Sadtler*, Handbook of Indust. Chem., p. 417.

Roy. An abbreviation of *Royal*.

royal, *n.*—**Camp royal.** See ★*camp*2.—**Royal chapel.** Same as *chapel royal*.—**Royal moth.** See ★*moth*1.—**Royal Saxon porcelain.** Same as *Dresden porcelain* (which see, under *porcelain*1).—**Royal wing.** See ★*wing*.

R. P. An abbreviation (*a*) of *Reformed Presbyterian*; (*b*) of *Regius Professor*; (*c*) of the Latin *Respublica*, republic.

R. P. D. An abbreviation (*a*) of the Latin *Rerum Politicarum Doctor*, Doctor of Political Science; (*b*) of *Royal Purple Degree*.

R. P. E. An abbreviation (*a*) of *Reformed Protestant Episcopal*; (*b*) of *Royal Society of Painter-Etchers*.

r. p. m. In *mech.*, an abbreviation of *revolutions per minute*.

rpt. An abbreviation of *report*.

R. R. An abbreviation of *railroad*.

rs. An abbreviation of *rupees*.

R. S. An abbreviation (*a*) of *Recording Secretary*; (*b*) of *Revised Statutes*; (*c*) [*l. c.*] of *right side*; (*d*) of *Royal Society of London*.

R. S. A. An abbreviation (*a*) of *Royal Scottish Academician*; (*b*) of *Royal Scottish Academy*; (*c*) of *Royal Society of Antiquaries*.

R. S. D. An abbreviation of *Royal Society of Dublin*.

R. S. P. C. A. An abbreviation of *Royal Society for the Prevention of Cruelty to Animals*.

R. S. S. An abbreviation of the Latin *Regiæ Societatis Socius*, Fellow of the Royal Society.

rt. An abbreviation of *right*.

Rt. Wpful. An abbreviation of *Right Worshipful*.

Ru. 2. An abbreviation (*a*) of *Rumanian*; (*b*) of *runic*.

rua (rö′ä̤), *n.* [Maori.] A pit or cave for storing root-crops. *E. E. Morris*, Austral English.

rub, *v. t.* 7. In *needle-making*, to straighten (a wire or needle) by rolling (it) while hot.—

rub, *n.*—**Rub of the green,** in *golf*, something that happens to a ball in motion, such as its being deflected or stopped by any agency outside the match, or by the forecaddie. In the case of such a rub the ball must be played from where it lies.

rubái (rö-bä′i), *n.*; pl. *rubáiyát* (rö-bäi′yät). [Ar. Pers. *rubā'ī*, pl. *rubā'iyāt*.] A quatrain.

> The original *Rubáiyát* (as, missing an Arabic Guttural, these Tetrastichs are more musically called) are inde-

pendent Stanzas, consisting each of four Lines of equal, though varied, Prosody; sometimes all rhyming, but oftener (as here imitated) the third line a blank.
Fitzgerald, Introd. to Rubáiyát of Omar Khayyam [(1st ed.).

rubber^1, *n.* **2.** (*l*) In the amalgamation process for the extraction of gold, a vessel in which the finely pulverized rock is triturated between surfaces of iron in the presence of mercury in order that the latter metal may take up and dissolve the fine particles of gold. (*m*) In *engraving*, an instrument for pressing paper upon a plate or block. Impressions may be taken in this way instead of on a press.

The designs are printed in pale ink by means of a *rubber*. *G. E. Woodberry*, Hist. of Wood-engraving, p. 35.

3. Crude rubber comes into commerce under a great variety of names, which usually designate the geographical region in which the substance is produced. Each one of these kinds of rubber may be the product of one or several plants, is prepared in a certain way, and has one or more distinctive forms which are given special designations. The most important of these are as follows: *Balls*, which come in all sizes, from a half inch to four inches in diameter; *bottles*, pieces formed on a wooden paddle which is afterward removed by splitting the piece of rubber along one side; *buttons*, rubber that has been cut by machinery into small pieces; *biscuits*, thick, oblong pieces; *clusters*, small balls sticking together in blocks or grape-like bunches; *lumps*, pieces of irregular shape; *marbles*, small balls; *negroheads*, large balls made up of residues scraped from the vessels in which the milky juice is collected or from latex which has coagulated before it could be smoked; *niggers*, kneaded balls of masses of stringy rubber; *paste*, soft, irregular masses almost fluid; *sausages*, finger- or sausage-shaped pieces; *scraps*, the drippings of milky juice which adhere to the bark of the tapped tree and which are peeled off when dry; *sheets*, thin pieces of rubber formed by coagulating the latex on a large leaf; *slabs*, pieces of rubber an inch or two thick formed by pressing several sheets together; *strips*, long, narrow sheets or lump-rubber that has been sliced by machinery; *thimbles*, pieces cut into cubes of an inch or less; *tongues*, long, narrow tongue-shaped pieces; *twists*, balls of stringy rubber which are made up like a ball of cord. The principal commercial varieties of rubber are given below.

8. See the extract.

A second kind, and one much used in London for fronts, is a large, light-red brick, so soft as to be readily scratched by the knife. These are called "*rubbers*."
Rep. U. S. Geol. Surv., 1897–98, vi. 407.

Accra, or **Akkra, rubber**, a trade-name of a kind of rubber, in lumps and strips, brought from the Gold Coast of Africa.—**African rubber**, a rubber obtained principally from giant creepers of the genus *Pacouria*, as well as from several trees the most important of which are *Kibatalia elastica* (*Kickxia elastica* of Preuss), *Kibatalia Africana* (*Kickxia Africana* of Bentham), and several species of the genus *Ficus*.—**Antimony rubber.** Same as *red* ★*rubber*.—**Assam rubber**, the product of the india-rubber tree, *Ficus elastica*.—**Banqui rubber**, a kind of crude rubber, in balls, brought from the Kongo State.—**Borneo rubber**, the product of several vines belonging to the dogbane family, the most important of which are *Chavannesia elastica* and *Ancylocladus edulis*. See ★*Chavannesia* and *Willughbeia*.—**Bumba rubber**, a trade-name for a kind of rubber brought from the Kongo State in balls of various sizes, often viscid and of disagreeable smell.—**Bussira rubber**, a kind of crude rubber, brought from the Kongo State in balls.—**Ceara rubber**, a rubber obtained from *Manihot Glaziovii*, a large tree growing on dry, stony soil and native to the state of Ceara in Brazil. The latex drips from wounds in the trunk and coagulates in the form of tears which are gathered into scraps and balls. Ceara rubber is deficient in elasticity and is hard to vulcanize. The rubber obtained from several other species of *Manihot* growing in the adjoining state of Bahia is also marketed under this name. See *manisoba* ★*rubber*.—**Central American rubber**, the product of several species of the genus *Castilla*, especially *C. elastica*. The term in a commercial sense includes all the forms of rubber which are produced in Mexico, Central America, and that part of South America lying north of the Amazon valley. See ★*caucho* and *Colombia* ★*rubber*.—**Ceylon rubber**, rubber produced in Ceylon from *Hevea Brasiliensis*, the principal species from which Para rubber is obtained. The tree is extensively cultivated in Ceylon. Its mode of preparation is very different from that of Para rubber in that the latex is never smoked but is coagulated by means of acetic acid. Formerly *Manihot Glaziovii* yielded most of the rubber which was exported from Ceylon.—**Colombia rubber**, the product of several species of trees belonging to the genus *Sapium*, especially *S. biglandulosum*.—**Colorado rubber**, a substance very much like rubber obtained from the rabbit-weed, *Picradenia floribunda*. See ★*Picradenia*.—**Enameled rubber**, cotton or linen cloth covered on one side with vulcanized rubber, and afterward passed between rollers which give an enameled appearance to the rubber.—**Equateur rubber**, a trade-name of a valuable kind of crude rubber in small balls, brought from the Kongo State in Africa.—**Fenton rubber**, a material used to some extent as a substitute for, or an adulterant of, rubber, obtained by the prolonged action of diluted nitric acid on oxidizable vegetable oils, with addition of tar, creosote, etc., followed by roasting with exposure to air. The mass produced is said to be elastic, like genuine rubber, and capable of being vulcanized.—**Gaboon rubber**, a trade-name for crude rubber, the product of several species of *Pacouria*, brought in balls and strips from Gaboon, the French Kongo region in Africa.—**Gambia rubber**, a trade-name for crude African rubber, brought, in slender strips wound into balls, from Gambia, Sénégal, and Portuguese Guinea.—**Grand Bassam rubber**, a trade-name for a kind of crude rubber in cakes, strips, or irregular lumps, brought from the Gold Coast of Africa.—**Guayaquil rubber**, the product of *Castilla elastica*. See *Central American* ★*rubber*.—**Guayule rubber**, a rubber-like substance extracted from the stems and roots of *Parthenium argentatum*, a shrub of the family *Asteraceæ* native to Texas and Northern Mexico. See ★*hule*, 3.—**Ire rubber.** Same as *silk* ★*rubber*.—**Jamaica rubber**, a woody vine belonging to the dogbane family, *Forsteronia floribunda*.—**Jequie rubber**, the product of several species of trees of the genus *Manihot*, especially *M. dichotoma*. See *manisoba* ★*rubber*.—**Kassai rubber**, a trade-name of a crude rubber brought from the Kongo State. There are two grades: red Kassai, in small mahogany-colored balls, considered the best rubber from the Kongo region, and black Kassai, in small black lumps or tongues, which is less highly valued.—**Kongo rubber**, crude rubber from the Kongo State in Africa obtained principally from giant creepers of the genus *Pacouria*. It comes into commerce under several trade-names which denote the region of production; the following being the most important: *Banqui*, *Bumba*, *Bussia*, *Equateur*, *Kassai*, *Mongala*, *Ruki*, *Sankuru*, *Welle*, and *Yakoma*.—**Lagos rubber**, the product of any one of several species of large trees belonging to the genera *Kibatalia* and *Ficus*, especially *Kibatalia Africana* and *Ficus Vogelii*. See *silk* ★*rubber*.—**Madagascar rubber**, a rubber obtained from a number of species of vines and trees belonging to several genera, especially *Pacouria*, *Mascarenhasia*, and *Euphorbia*.— —**Mangabeira rubber**, the product of *Hancornia speciosa*, a small tree native to southern Brazil. It is prepared in the form of sheets which resemble slices of liver. See *Hancornia*.—**Manisoba rubber**, the product of several species of trees belonging to the genus *Manihot* native to the states of Ceara and Bahia in Brazil, especially *M. Glaziovii* and *M. dichotoma*. The rubber of the first-named species is more commonly known as *Ceara* ★*rubber* (which see).—**Matto Grosso virgin rubber**, a trade-name of a good grade of crude rubber, in flat pieces of light color, from the state of Matto Grosso in Brazil. —**Mineral rubber**, a name sometimes applied to a kind of asphalt or bitumen.

This murkiness may be prevented by dissolving in the paraffin before the rubber is added enough "*mineral rubber*" (asphalt) to give the paraffin a light amber colour. This paraffin-asphalt solution is more transparent than simple paraffin, and so facilitates orientation of the object. *Jour. Roy. Micros. Soc.*, Dec., 1904, p. 719.

Mongala rubber, a trade-name of a kind of crude rubber in balls of varying size brought from the Kongo State.—**Mozambique rubber**, a rubber obtained from several species of vines of the genus *Pacouria*, especially *P. Kirkii* and *P. Petersiana*. See ★*Pacouria* and *Landolphia*.—**New Caledonia rubber**, the product of any one of several species of trees, especially *Ficus prolixa*.—**Padang rubber**, a trade-name of crude rubber, brought in large reddish masses from Java and Padang.—**Panama rubber.** Same as *Central American* ★*rubber*.—**Para rubber.** (*a*) The substance obtained by the coagulation and smoking of the latex of several species of trees native to the humid forests of the Amazon valley, especially *Hevea Brasiliensis*, *H. Guianensis*, and one or more species of the genus *Sapium*. It reaches commerce by way of the Amazon river and the port of Para, whence the name. (*b*) The substance obtained by the coagulation of the latex of *Hevea Brasiliensis*, wherever grown. This is known commercially as cultivated Para. See *Ceylon* ★*rubber*.—**Penang rubber**, a trade-name of crude rubber from the Sunda Islands, the product of *Ancylocladus firmus*, *Leuconoti eugenifolius*, and *Parameria barbata*, in balls, rolls, and slabs, of varying value.—**Pernambuco rubber.** Same as *mangabeira* ★*rubber*.—**Peruvian rubber.** Same as ★*caucho*.—**Potato-ball rubber.** Same as ★*almeidina*.—**Rangoon rubber**, a trade-name of crude rubber from Burma and Annam, marketed in large balls and flat slabs, similar in appearance to Assam rubber, but of rather better quality.—**Reclaimed rubber**, the rubber obtained by mechanical and chemical processes from waste manufactured articles containing rubber, such as old hose, tires, boots, shoes, etc.—**Recovered rubber.** Same as *reclaimed* ★*rubber*.—**Red rubber**, a trade-name of vulcanized rubber colored by the addition of antimony-pentasulphid. It is produced both as soft and hard rubber.—**Root rubber**, the name applied to rubber obtained from the underground stems of several plants of western Africa belonging to the dogbane family, especially *Carpodinus lanceolata*, *Clitandra Henriquesiana*, and *Pacouria Thollonii* (*Landolphia Thollonii* of Dewevre).—**Rubber drug**, a trade-name of any inorganic material added to or compounded with vulcanized rubber, chiefly to increase its bulk and weight, and to cheapen it.—**Rubber shoddy.** See the extract.

Scrap rubber, or *rubber "shoddy"* as it is called, is made up principally of worn-out boots and shoes, but includes every conceivable form of worn-out or disused rubber, ranging from old hose (the poorest grade) to the inner tubes of bicycle and automobile tires, which may be as high as 95 per cent pure rubber. The material is first ground very fine. It is then treated by what is known as the "mechanical" process for removing all foreign substances. This process consists of a series of magnets, sieves, and blowers, through which the material passes until every particle of metal and foreign matter is removed. *Sci. Amer.*, Oct. 5, 1907, p. 240.

Rubber substitute. Very many materials have been proposed for use as substitutes for or diluents of rubber, though all of them are inferior in value to the natural product. The best of these substitutes are made from drying or semi-drying oils (such as those of linseed, colza, or cotton-seed) by treatment with sulphur or sulphur chlorid, in the latter case hydrochloric acid being afterward removed by means of milk of lime. Resins, pitch, asphalt, ozocerite, and residues from the stearic acid and petroleum industries have also been used to substitute or dilute *hard-vulcanized* rubber (vulcanite) for electrical insulators.—**Ruki rubber**, a trade-name of one of the varieties of crude rubber imported from the Kongo State.—**Saukuru rubber**, a trade-name of one of the varieties of crude rubber imported in balls from the Kongo State.—**Scrap rubber.** (*a*) The drippings of milky juice which adhere to the bark of the tapped tree and the coagulated latex remaining in the wound, which are peeled off when dry.

Large yields of *scrap rubber* are sometimes reported from wild trees, but the tapping to which they are subjected is very severe, and the removal of the rubber from the wounds delays healing and exposes the tree to the attacks of insects, so that the cultural production of *scrap rubber* is not likely to be profitable.
Science, Oct. 2, 1903, p. 437.

(*b*) See ★*rubber shoddy*.—**Silk rubber**, the product of either of two species of large trees of West Africa belonging to the dogbane family, *Kibatalia elastica* (*Kickxia elastica* of Preuss) and *Kibatalia Africana* (*Kickxia Africana* of Bentham): so called from the long, silky fibers attached to the seeds.

The Lagos "*silk rubber*" plant, *Funtumia elastica*, continues to be in demand, as the points in its favour are suitability to the climate, easy coagulation, and good rubber-yield at an early age.
Nature, Aug. 27, 1903, p. 395.

Unwashed rubber, crude rubber as imported, before it has been purified by boiling in water and passing repeatedly between fluted rollers under a stream of water, soluble impurities, sand, fragments of woody fiber, and other foreign substances being thereby removed.—**Upper Kongo rubber**, a trade-name of crude rubber, in dark brown balls, the product of *Landolphia Petersiana*, brought from the upper region of the Kongo river in Africa.—**Welle rubber**, the trade-name for a kind of crude rubber, of unknown botanical origin, brought from the Kongo State, Africa, in large slabs of from 10 to 20 pounds each, dark on the outside and white within.—**Yakoma rubber**, the trade-name of a variety of crude rubber in balls brought from the Kongo State, Africa.

rubber^2 (rub′ėr), *n.* [Short for *rubber-neck*.] One who turns around to see something; one who gazes or looks out eagerly: often used as an exclamation in mockery of one who turns to look at something. [Slang, U. S.]

rubber^2 (rub′ėr), *v. i.* [*rubber*^{2}, *n.*] **1.** To turn around to see something; to look out or about in an eager or awkward manner; in general, to look about. [Slang, U. S.]

If they 're [Police Commissioners] any good they prob'ly *rubber* around on their own hook an' they must see these joints . . . everybody *rubbers* in this town [Boston].
Josiah Flynt, in McClure's Mag., June, 1901, p. 117.

2. To listen when others are talking through the telephone (on party lines). [Recent slang, U. S.]

rubber-neck (rub′ėr-nek), *n.* [A humorous term, meaning literally 'one who has, as it were, a long, flexible neck,' which turns easily.] One who turns his head to look or gaze at something or some person he has passed, or at anything that attracts attention; one who gazes eagerly or awkwardly at the sights of the town. [Slang, U. S.]

In the West we have long used the term '*rubberneck*,' just now so popular with you here in the East. Its meaning there differs slightly from the interpretation you put on it. A '*rubberneck*' West is one who snoops around and tries to get into business deals and like things. Now the term is countrywide and attracts but little attention, but formerly, when confined to the West, it always caused inquiry from the Eastern visitor.
N. Y. Tribune, April 14, 1901.

Rubber-neck wagon, a vehicle with cross-seats used for conveying parties of tourists or other persons about the streets of a city, under the direction of a guide, equipped with a megaphone, who calls attention to and describes the various 'sights.' [Recent slang, U. S.]

rubber-neck (rub′ėr-nek), *v. i.* To stare like a rubber-neck; go about staring at or prying into things; rubber. [Slang, U. S.]

Still joy is *rubbernecking* on the street . . .
Still does the masher march around the block.
Wallace Irwin, Love Sonnets of a Hoodlum, xxii.

rubber-stone (rub′ėr-stōn), *n.* A rubbing-stone.

rubbing, *n.* **3.** In *needle-making*, a process for straightening wire, in which the wires are heated and rolled back and forth on a smooth surface under the pressure of a curved tool.

rubbing-bed, *n.* (*b*) A circular revolving table on which slabs, tiles, etc., of marble are placed, to be rubbed down, with sand and water, to a true surface or brought to a square or beveled edge. Such tables are supported on a pivot resting on a steel step and turned by gearing (either below the table or by a central shaft above the table), and are fitted with various appliances for holding the slabs, tiles, etc., in position on the table. Such revolving beds are from four to fourteen feet in diameter.

rubbing-plate (rub′ing-plāt), *n.* See ★*keel*^{1}, 2.

rubbing-strip (rub′ing-strip), *n.* See ★*keel*^{1}, 2.

rubbishry (rub′ish-ri), *n.* Rubbish; worthless trifles. [Rare.]

In port (we used no cargo-steam) I 'd daunder down the streets,

. . . .

Fillin' my bunk wi' *rubbishry* the Chief put overside.
R. Kipling, McAndrews' Hymn, l. 58.

rubble-ballast (rub′l-bal″ast), *n.* Ballast consisting of stones and pebbles.

Instead of having to incur delays and considerable expense in shipping and discharging *rubble-ballast*, the

commander of a ship fitted for water-ballast can readily admit or discharge such ballast.
White, Manual of Naval Arch., p. 35.

rubble-drift (rub'l-drift), *n.* See ★*drift.*

rubbly, *a.* **2.** Of the nature of rubble, or coarse irregular masonry.

rube (röb), *n.* [A generalized use of *Rube*, a rustic abbreviation of *Reuben*, taken, like Joshua, as a type of a homely country name.] **1.** An awkward, unsophisticated countryman; a 'hayseed'; a 'jay.'—**2.** A stage countryman; one who plays on the stage the rôle of an awkward countryman. [Theatrical slang, U. S.]

rubiacic (rö-bi-as'ik), *a.* [*rubiac(in)* + *-ic.*] Derived from rubiacin.—**Rubiacic acid**, an amorphous yellow compound, formed by boiling rubiacin or rubiafin with ferric chlorid.

rubiadin (rö'bi-a̤-din), *n.* [*rubia(cin)* + *-d-* + *-in*².] A yellow crystalline quinone, $C_6H_4(CO)_2C_6H(CH_3)(OH)_2$, or 2,4-dihydroxymethyl-anthraquinone. It is obtained by hydrolysis of rubiadin glucoside. It can be sublimed and melts at about 290° C.—**Rubiadin glucoside.** Same as *rubian.*

rubiadipin (rö-bi-ad'i-pin), *n.* [L. *rubia*, madder, + *adeps* (*adip-*), fat, + *-in*².] A yellowish-brown soft substance formed by the fermentation of rubian.

rubiafin (rö'bi-a̤-fin), *n.* A red or reddish-yellow crystalline product of the fermentation of rubian.

rubial (rö-bẹ-äl'), *n.* [Sp. *espino rubial*, < *espino*; thorn, *rubial, adj.*, < *rubia*, madder.] In Porto Rico, a name applied to several trees of the family *Rutaceæ* from which dyes are prepared, especially *Fagara Martinicensis* and *Fagara monophylla.*

rubicon (rö'bi-kon), *v. t.* [*Rubicon*, the ancient name of a small river in Italy.] To lurch. (See *lurch*³, *v. t.*) In rubicon piquet, when the loser's score does not reach 100 it is added to the winner's. In rubicon bezique, see the extract.

> If the loser fail to score a thousand, he is *rubiconed.* The winner, whether his score reach a thousand or not, adds the score of the loser to his own (excluding fractions of a hundred), and the sum, with thirteen hundred added for the game, is the number of points won.
> *American Hoyle*, p. 200.

To cross the Rubicon, to take the decisive and irrevocable step: in allusion to the crossing of the Rubicon by Cæsar at the beginning of the civil war with Pompey.

rubidia (rọ̈-bid'i-ä̤), *n.* [NL.] In *chem.*, properly rubidium hydroxid: sometimes used to designate rubidium oxid.

rubidin, *n.* **2.** A red crystalline coloring matter found in watermelons and Paradise apples.

rubine², *n.*—**Acid rubine.** See ★*acid-rubine.*—**Azo rubine**, an acid color, one of the fast reds.

rubino (rö-bē'nō), *a.* [It. *rubino*, ruby.] A ruby-colored metallic luster found on some of the old Moorish and majolica wares.

rubio (rö'bi-ō), *n.* [Sp. *rubio*, red.] A local name for an iron ore consisting of concretionary limonite, from Bilbao, Spain.

rubor (rö'bôr), *n.* [L., redness, < *rubere*, be red, connected with *ruber*, red.] Redness of the skin.

rubreserine (rö-bres'ẹ̈-rin), *n.* [L. *ruber*, red, + E. *eserine*, an old name of physostigmine.] A red coloring matter produced by the action of barium hydroxid on physostigmine.

rubrific (rö-brif'ik), *a.* [L. *ruber* (*rubr-*) + *-i-* + *-fic.*] Reddening; tending to make red.

> The homogeneal Light and Rays which appear red, or rather make Objects appear so, I call *Rubrific* or Red-making.
> *Newton*, Opticks (3d ed.), p. 108.

rubrite (rö'brīt), *n.* [L. *ruber*, red, + *-ite*².] A hydrated ferric sulphate occurring in indistinct lamellar crystals of a deep-red color, found in Chile.

rubstone, *n.*—**Kitchen rubstone**, a very soft grade of rubstone for giving quickly a rough edge to a knife.—**Shoemakers' rubstone**, a very hard whetstone.

ruby. **I.** *n.*—**Adelaide ruby**, a rich red variety of garnet found in Australia.—**Ancona ruby.** Same as *rubasse.*—**Artificial ruby.** See the extract.

> In 1887, M. Frémy, with the aid of his *preparateur*, M. Verneuil, undertook new experiments on the crystallization of alumina, and had the satisfaction of obtaining very beautiful *artificial rubies.* Now M. Verneuil, today professor at the Museum, has discovered the method of producing the ruby artificially by melting a mixture of alumina and oxide of chrome at a constant temperature of several thousands of degrees, and in layers superposed from the outside to the inside, in order to prevent the production of cracks in the crystalline mass. This eminent chemist has succeeded in creating a magnificent ruby, weighing about 2,500 grams, and having a commercial value of about 3,000 francs. . . .
>
> The ruby of M. Verneuil has admirable fluorescence, on account of its great purity. It possesses all the physical properties of the natural ruby, and, like the natural ruby, can be cut and receive a very beautiful polish.
> *Jour. Franklin Inst.*, June, 1904, p. 463.

Brazilian ruby. (*a*) See *ruby*, 1. (*b*) The deepest red topaz which owes its color to heating, to the right degree, of the yellow Brazilian topaz. Further heating turns it pink, and still continued heating renders it colorless. See *topaz.*—**Mont Blanc ruby**, a reddish variety of rock-crystal which owes its color to the presence of iron oxid, sometimes artificially introduced.

II. *a.*—**Ruby arsenic**, artificially prepared realgar; ruby sulphur.

rubythroat (rö'bi-thrōt), *n.* An Asiatic warbler of the genus *Calliope* belonging to the thrush family.

ruby-wasp (rö'bi-wosp), *n.* Same as *ruby-tail.*

ruby-zinc (rö'bi-zingk), *n.* Same as *ruby-blende*, 1.

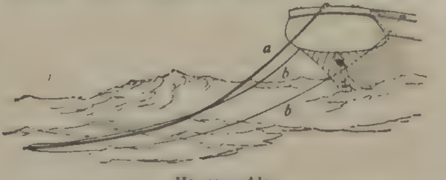
ruche, *n.* **3.** In *zoöl.*, a reticulated folding of the skin found in the hemipenes of some snakes.

ruched (röshd), *p. a.* Provided with a ruche, as a snake.

> In a broad way we may distinguish as leading types the following: The smooth; the plicate or flounced; the calyculate, or *ruched.*
> *Cope*, in Smithsonian Rep. (Nat. Mus.), 1898, p. 703.

rudaceous (rö-dā'shius), *a.* [L. *rudus*, rubble, + *-aceous.*] Rubbly: a descriptive term, suggested by A. W. Grabau, for the coarse texture of those clastic rocks the components of which are larger in size than grains of sand. *Amer. Geol.*, April, 1904, p. 242.

rudder¹, *n.*—**Generous rudder.** A wheelsman is said to use a 'generous rudder' when he is prodigal of the turns given to the steering wheel, or the amount of angle he makes with the tiller, in sailing.—**Hawser-rudder**, a style of emergency rudder, consisting of a long hawser run out over the stern of the vessel, with guys from its extreme end leading to each quarter of the ship. By hauling on one of these guys with a tackle, a bight or bend will be made in the hawser, and this curve will, as the vessel moves ahead, pull the ship's stern one way or the other, and naturally cant her head in the opposite direction. Thus, by hauling in and slacking away on the respective tackles, the ship may be steered.—**Horizontal rudder** (*naval*), a rudder with its axis horizontal, used to control the depth of immersion of submarine boats and automobile torpedoes and to cause them to dive.



Hawser-rudder.
a, hawser; *bb*, hauling-lines, leading through chocks on each quarter.

> It is obvious that a change in depth can be effected in the least time and by the least expenditure of energy, if the vessel be moved in the direction of least resistance; in other words, if she is steered up and down inclines by altering the angle of her longitudinal axis to the horizon. In order to be effective the turning moment used must be of considerable magnitude and under the most sensitive control, conditions best met by *horizontal rudders*, which have also the advantages of simplicity and economy of space, weight and power.
> *Sci. Amer. Sup.*, Feb. 7, 1903, p. 22658.

Small rudder. A wheelsman is said to use a 'small rudder' when he employs but few spokes of the steering wheel, or makes but a small angle with the tiller, in steering.

rudder-fish, *n.* **4.** A fish, belonging to the family *Centrolophidæ*, found in the open sea.

rudder-horn (rud'ėr-hôrn), *n.* *Naut.*, an arm secured to the after edge of a rudder which projects to the rear above water, with eyes on the outer end to which the rudder-chains are fastened.

rudder-indicator (rud'ėr-in"di-kā-to̤r), *n.* See ★*indicator*, 1 (*j*) (2).

rudder-telltale (rud'ėr-tel"tāl), *n.* Same as ★*helm-indicator.*

rudiment, *n.*—**Thoraco-abdominal rudiment**, in *embryol.*, two centers of cell proliferation in the blastoderm of decapod crustaceans which give rise to the thorax and abdomen of the adult animal.

rudistid (rọ̈-dis'tid), *a.* and *n.* **I.** *a.* Having the characters of the *Rudistæ.*

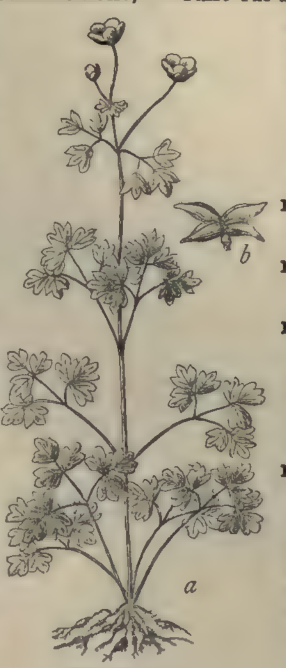
II. *n.* A mollusk of the family *Rudistæ.*

Rudolphi's dilution law. See *Ostwald's* ★*dilution law.*

rudyte (rö'dīt), *n.* [L. *rud*(*us*), rubble, + *-yte*, for *-ite.*] A rudaceous clastic rock. See ★*rudaceous.* *Amer. Geol.*, April, 1904, p. 240.

r. u. e. An abbreviation of *right upper entrance.*

rue-anemone, *n.*—**False rue-anemone**, *Isopyrum biternatum*, a graceful, early blooming ranunculaceous plant of eastern North America with trifoliolate leaves, the leaflets trilobate, and terminal and axillary apetalous flowers, the sepals being white and petal-like.



False Rue-anemone
(*Isopyrum biternatum*).
a, plant, less than one third natural size; *b*, fruit.

ruf¹, *a.*, *n.*, and *v.* An amended spelling of *rough.*

ruf², *a.*, *n.*, and *v. t.* A simplified spelling of *ruff.*

ruff¹, *n.* **2.** (*e*) A large integumental fold surrounding the base of the foot of *Haliotis*, the ear-shell.

ruff³, *n.* **2.** A Victorian fish, *Arripis georgianus*, of the family *Percidæ.* *A. salar* is the Australian fish called *salmon* or *salmon-trout.* See *salmon*, 3 (*c*).—**Bidyan ruff**, a percoid fish, *Therapon richardsoni*, found in fresh waters of southeastern Australia. *E. E. Morris*, Austral English.—**Black ruff.** Same as *blackfish* (*e*).

Ruffini corpuscles. See ★*corpuscle.*

Ruffled lemur. Same as *ruffed lemur.*

rufigallic (rö-fi-gal'ik), *a.* [L. *rufus*, red, + E. *gallic*².] Red, and derived from gallic acid.—**Rufigallic acid**, a red, or yellowish-red, crystalline compound, $(OH)_3C_6H(CO)_2C_6H(OH)_3 + 2H_2O$, or 1,2,3,5,6,7-hexahydroxyanthraquinone, formed by heating gallic acid or its ethyl ester with concentrated sulphuric acid. With alkalis it yields blue or violet salts. Also called *rufigallol.*

rufigallol (rö-fi-gal'ol), *n.* [*rufigall-ic* + *-ol.*] Same as ★*rufigallic acid.*

rufimoric (rö-fi-mor'ik), *a.* [L. *rufus*, red, + NL. *Morus* + *-ic.*] Red, and derived from yellow-wood, *Chlorophora tinctoria* (or *Toxylon pomiferum*).—**Rufimoric acid**, a dark-red amorphous compound, $C_{16}H_{14}O_9$ (?), made by allowing a solution of maclurin in concentrated sulphuric acid to stand, or by boiling maclurin with dilute hydrochloric acid. By boiling with barium hydroxid it is partly changed back into maclurin.

rufin (rö'fin), *n.* [L. *rufus*, red, + *-in*².] A dark-red amorphous substance, $C_{21}H_{20}O_8$, made by heating phlorizin to 200–275° C.

rufiopin (rö-fi-ō'pin), *n.* [L. *rufus*, red, + *op*(*ianic*) + *-in*².] A yellowish-red crystalline substance, $(OH)_2C_6H_2(CO)_2C_6H_2(OH)_2$, or tetrahydroxyanthraquinone, made by heating opianic acid to 180° C. with concentrated sulphuric acid: used as a dyestuff.

rufo-fulvous (rö"fọ̄-ful'vus), *a.* Dull reddish-fulvous.

> The mesopleura closely punctured and thickly covered with *rufo-fulvous* pubescence.
> *Annals and Mag. Nat. Hist.*, April, 1904, p. 298.

rufol (rö'fol), *n.* [L. *rufus*, red, + *-ol.*] A yellow crystalline substance,  $(OH)C_6H_3{-}\left\langle\begin{matrix}CH\\ \\ CH\end{matrix}\right\rangle C_6H_3(OH)$ or β-dihydroxyanthracene, made by fusing the corresponding anthracenedisulphonic acid with caustic potash. The solutions in alkalis have a strong blue fluorescence.

rufo-piceous (rö"fọ̄-pish'ius), *a.* [L. *rufus*, red, + *piceus*, pitchy.] Dull reddish-piceous. *Annals and Mag. Nat. Hist.*, June, 1903, p. 602.

rufo-testaceous (rö"fō-tes-tā'shius), *a.* Dull reddish-testaceous. *Proc. Zool. Soc. London*, 1901, p. 28.

Rugbeian (rug'bẹ-a̤n), *a.* and *n.* **I.** *a.* Of or pertaining to Rugby in England or, especially, to the famous public school at Rugby.

II. *n.* One who has been educated at Rugby; an old Rugby boy.

> Old *Rugbeians* are said to cherish the memory of their school with more than usual pertinacity.
> *N. and Q.*, 10th ser., III. 58.

rugose-punctate (rö″gōs-pungk′tāt), *a.* Having a rugose punctation, as the integument of a beetle.

Thorax at least three times broader than long, . . . the sides strongly *rugose-punctate.*
Proc. Zool. Soc. London, 1903, p. 33.

Ruhmer cell. See ★*cell.*

R. U. I. An abbreviation of *Royal University of Ireland.*

ruke (rök), *n.* [A transposed contraction of *recruit.*] A recruit. Also *rooky.* [Slang.]

Last is the poor "regular Regular" who . . . is not a hero, just a soldier, doing his duty like a man, without a murmur or complaint, going where sent and having life made miserable by having to drill a new bunch of recruits every day; teaching them the first principles of a soldier when they are discharged, and another bunch of *rukes* come. *Army and Navy Jour.*, Aug. 19, 1899, p. 1209.

rukh^2 (rök), *n.* [Hind. *rūkh*, tree.] In India, a forest. Forests are cared for by the Department of Woods and Forests, in whose hands is the reforesting of all India.

Gisbourne['s] . . . bungalow, a thatched white-walled cottage of two rooms, was set at one end of the great *rukh* and overlooking it. . . . He made no pretense at keeping a garden, for the *rukh* swept up to his door, curled over in a thicket of bamboo, and he rode from his veranda into its heart.
R. Kipling, In the Rukh, in Many Inventions, p. 224.

rukus (rö′kus), *n.* [Origin obscure.] A violent altercation or personal encounter; a rumpus; a ruction. *Dialect Notes*, III. iii. 226. [Local, U. S. (Arkansas).]

rule^1, *n.* 2. (*e*) *pl.* In *ship-building*, a book of one of the marine registration societies containing a systematic scheme of scantlings and rules for the construction of all types and sizes of vessels. The most important of these are ★Lloyd's rules (which see). Rules involving somewhat different systems are published by other societies, as the British Corporation rules, Bureau Veritas rules (French), Record of American and Foreign Shipping rules (United States), German Lloyd rules, etc. —**Ampère's rule**, a fanciful but convenient rule for determining the deflecting action of the electric current upon a magnetic needle. It may be stated as follows: imagine yourself swimming with the current and facing the needle: then the north-seeking pole will be deflected to your left hand.—**Archibald's rule**, in *meteor.*, the empirical formula for the rate of diminution of wind-velocity with altitude, deduced by E. D. Archibald from observations with anemometers raised in the air by means of kites. For altitudes up to 2,000 feet Archibald finds $V = v \times 4 \times \sqrt{H \div h}$, where V and v are the velocities at the altitudes H and h.—**Baer's rule.** See *Baer's* ★*law* (*b*).—**Board rule**, a graduated stick for determining the contents of boards. The number of board feet in boards of given widths and lengths is shown upon the stick.—**Bouguer's rule**, a rule established by Bouguer, as the result of his measurements made in the Andes in 1737, for computing the value of gravity at various heights in terms of the value at sea-level. The rule is embodied in the formula: $g_h = g_s\left(1 - \frac{2h}{r} + \frac{3}{2}\frac{h}{r}\frac{\delta}{\Delta}\right)$, in which h is the height above sea-level, r the radius of the earth, δ the density of the strata underlying the upper station, and Δ the mean density of the earth.—**Broun's rule**, in *meteor.*, the rule established by J. Allan Broun, in 1845, from observations of the clouds at Makerston, Scotland, to the effect that the lower cumulus scud moves in a direction differing from that of the lowest surface winds by about 14° to the right, and that the clouds above it differ still more to the right, the deviation amounting to 30° for cirrus clouds. The figures differ in different parts of the globe. Similar laws for England and America were announced independently in 1872 by Ley and Abbe respectively. The analogous deviation to the left for the southern hemisphere is probable, but has not yet been demonstrated.—**Buchan's rule**, in *meteor.*, the rule announced by A. Buchan in 1865: "Stand with your left hand toward the center of low barometer and your right hand toward the high, then, in the northern hemisphere, the wind will be on your back." This is frequently but mistakenly called *Buys Ballot's* ★*law* (which see).—**Buys Ballot's rule.** See *Buys Ballot's* ★*law.*—**Carpenter's rule of three-four-five.** (*a*) The rule that a triangle with sides as 3:4:5 in length must be right-angled. This is the simplest case of three whole numbers such that the sum of the squares of two is the square of the third. For finding such numbers we have the *rule of Pythagoras:* Take n any odd number, then $(n^2-1)/2$ = the second number, and $(n^2+1)/2$ = the third number. (*b*) A carpenter's folding foot-rule, made in sections so arranged that it can be quickly adjusted for use as a yardstick (three feet) or as a four-foot rule or five-foot rule. Sometimes called a *two-four rule*, according to arrangement of sections. Rules of this type are sometimes called *zigzag rules.*—**Consent rule.** See ★*consent.*—**Eötvos rule**, the statement that in the case of many liquids the effect of temperature is such that the quantity $d(Tv^{2/3})/dt$ (where T is the surface-tension, v the molecular volume, and t the temperature) is a constant and independent of the nature of the liquid. The fact that for certain liquids, such as water, this relation does not hold, is supposed to indicate that their molecular volumes vary with the temperature. —**Espy's rule**, in *meteor.*, the rather crude approximation, adopted by Espy about 1834, that the height, in feet, above the observer of the base of cumulus cloud is 300 times the depression of the dew-point in Fahrenheit degrees at the observer's locality.—**Faye's rule**, the rule, in computing the value of gravity in elevated localities, that only the attraction of the excess of matter under the station, above the average level of the near neighborhood, should be taken into account. —**Galton's anticyclonic rule.** See *Galton's anticyclonic* ★*law.*—**Lesbian rule**, a flexible measuring-rule, made of lead and consequently easily bent, formerly used to measure curved and irregular lines.—**Make-up rule**, a thin blade of metal with projections at each end or above the middle, used by compositors in handling or making up composed types in pages or columns.—**Meldrum's rules**, a set of rules for the guidance of navigators when beset by a hurricane in the Indian Ocean, prepared by C. Meldrum, of Mauritius, as an improvement on the older rules of the circular theory. They were still further elaborated by Blanford in 1888, and both are now generalized in the general instructions to navigators on pilot-charts.—**Nernst-Thomson rule**, in *phys. chem.*, the rule that the degrees of dissociation of an electrolyte when dissolved in different solvents are proportional to the dielectric constants of the different solvents.—**Peremptory rule**, in *law*, an absolute rule; a rule without exception or condition.—**Rule absolute**, in *law*, a peremptory rule or order granted upon the hearing of a motion brought on by a rule nisi, and giving the relief sought.—**Rule boxwood.** See ★*boxwood.*—**Rule nisi**, or **rule to show cause**, in *law*, a rule or order, granted upon an ex-parte application, requiring the party against whom it is directed to show cause why the relief demanded should not be granted.—**Rule of Ceres**, the designation by which Euler and his contemporaries knew the process of obtaining the solutions of the equations

$$ax + by + cz + \ldots + lw = m$$
$$a'x + b'y + c'z + \ldots + l'w = m'$$

in the bipartite case in the analytical theory of multipartite denumeration, or the enumeration of the partitions of multipartite numbers in combinatory analysis.—**Rule of consistency.** See ★*consistency.*—**Rule of fifty moves**, in *chess*, the rule that a player may, at any stage of the game, demand that his adversary shall bring about a mate within fifty moves or be satisfied with a draw. A capture nullifies the notice, which must be renewed (if desired) and the count of moves begun again.—**Rule of inversion.** See ★*inversion.*—**Rule of the war of 1756**, in *international law*, a rule, established in 1756, that a belligerent could not give its colonial trade, during war, to a neutral nation without that nation's vessels engaged in the trade being subject to capture. Later an unsuccessful attempt was made in the **Rule of the war of 1793** to enlarge the rule to include all neutral ships trading with colonial ports theretofore monopolized by one of the belligerents, but in war thrown open to general commerce.—**Rule to plead.** See ★*plead.*—**Simplicative rule.** See ★*simplicative.*—**Simpson's rules**, approximate rules for obtaining the area included between a graphic curve and its base-line, largely used in calculations in ship-building. In these rules arcs of parabolas passing through the extremities of equally-spaced ordinates replace the actual curve. In *Simpson's first rule* the number of ordinates is odd; the first and last ordinates are multiplied by the factor 1, other odd numbered ordinates by 2, and even-numbered ordinates by 4; the sum of all the products is multiplied by one third the common interval between ordinates and the product is the approximate area. *Simpson's second rule.* In this rule the area is divided into groups of three intervals. Then the sum of the end ordinates, twice the ordinates dividing groups, and three times the two intermediate ordinates of each group, is multiplied by three eighths the common interval, the product being the approximate area. *Simpson's 5-8 rule* is used for obtaining the area of a curve between the first pair of three equally-spaced ordinates as follows: To five times the first ordinate add eight times the second and subtract the third from the sum; multiply the remainder by one twelfth the common interval. The product is the area between the first and the second ordinate. *Trapezoidal rule.* In this rule, straight lines between the tops of equally-spaced ordinates replace the curve, and the area is the sum of the intermediate ordinates and half each end ordinate multiplied by the common interval between ordinates. *Tchebycheff's rule* is a complicated rule with unequally-spaced ordinates and is not often used.—**Stevenson's rule**, in *meteor.*, a rule, determined by observations at Edinburgh, according to which the velocity of the wind over plain fields increases with altitude above ground in accordance with the formula $V = v\sqrt{(H + 72) \div (h + 72)}$, in which V, v are the velocities at the upper and lower altitudes, and H, h are the altitudes in feet. For heights less than 200 feet Stevenson recommends $V = v\sqrt{H \div h}$.—**Tchebycheff's rule.** See *Simpson's* ★*rules.*—**Thomson's rule.** Same as *Thomson's* ★*law.*—**Trapezoidal rule.** See *Simpson's* ★*rules.*—**Weddle's rule** for finding the content between the first and seventh of equidistant sections: to five times the sum of the even sections add the middle section and all the odd sections; multiply this sum by three tenths of the common distance between the sections. Formula: $\xi = \frac{3}{10} h\,[5\,(y_2 + y_4 + y_6) + y_4 + y_1 + y_3 + y_5 + y_7]$.—**Zigzag rule.** See *carpenter's* ★*rule of three-four-five* (*b*).

rule^1, *v. t.*—**Ruled cubic.** See ★*cubic.*

ruler, *n.*—**Ruler of the synagogue.** See ★*parnes.*

rule-staff (röl′ståf), *n.* In *ship-building*, a lath about four inches in width which is employed for laying off curves.

ruling, *p. a.*—**Ruling case.** Same as *leading* ★*case.*

ruling-machine, *n.* 3. A machine used by lithographers for cutting lines on stone to be printed on paper to take the place of ruled lines in lithographed bill-heads and other blanks.

ruller (rul′ėr), *n.* In *mining*, a laborer who transports rock and ore in a wheelbarrow underground. [Cornwall, Eng.]

rumenotomy (rö-men-ot′ǭ-mi), *n.* [L. *rumen*, rumen, + Gr. -*τομια*, < *ταμεῖν*, cut.] In *vet. surg.*, the operation of cutting through the hide into the rumen or first stomach of a ruminating animal to permit the evacuation of gases, impacted food, and foreign bodies.

rumicin (rö′mi-sin), *n.* [L. *rumex* (*rumic-*), sorrel, + -*in*^{2}.] Same as *chrysophanic acid.*

Rummage sale. (*b*) A sale of garments that have been worn and of cast off furnishings of any description, at very low prices, usually held in connection with church work for the benefit of the poor.

rummy^1, *a.* **II.** *n.* A drunkard; also one who favors the liquor traffic. *Dialect Notes*, III. iii. 198. [Local slang, U. S.]

rumpfite (römpf′īt), *n.* [Named after J. *Rumpf* of Gratz.] A basic silicate of aluminium and magnesium which occurs in greenish-white massive form with granular, scaly structure: found in Upper Styria.

rump-patch (rump′pach), *n.* An area of color, differing from the general color of the body, on the rump of a quadruped or bird. *Nature*, Aug. 14, 1902, p. 375.

rum-sucker (rum′suk″ėr), *n.* One who drinks alcoholic liquors incessantly; a "soaker." *Bartlett.* [Slang.]

One of the best things that can be applied to a rocky pasture infested with bushes, briars, or weeds, is salt. Salt them every week while wet with rain or dew, and let the stock look to that source alone for a supply of that luxury, which they run after with an acquired appetite as strong as that of the *rum-sucker.*
N. Y. Tribune, June 9, 1858.

rumule (rö′mūl), *n.* [NL. **rumula*, dim. of L. *ruma*, a teat.] A mammilla-like tubercle such as is often seen on lepidopterous larvæ.

run^1, *v.* 1. *intrans.* 8. (*b*) To form a paste when rained upon: said of some soils.

If wheat land is plowed during rain, it at once *runs* on the surface, forming a sort of slippery glaze.
W. H. Malden, Tillage and Implements, p. 42.

To run away, to lose its strength or quality; putrefy: said of an indigo dye-vat when an excess of fermentation takes place.

II. *trans.* 1. (*i*) In *varnish-making*, to fuse (a resin, such as copal) in an open pot until frothing ceases, in order to render (it) soluble in linseed-oil and turpentine.—**To run a ball up**, in *golf*, so to play a ball as to cause it to move along the ground rather than to rise into the air, in approaching.—**To run down a meridian** (*naut.*), to sail north or south.—**To run down a parallel**, in *nav.*, to sail east or west.—**To run down a port.** See ★*port*^{1}.—**To run latitude down**, in *nav.*, to sail north or south until the latitude of the place is reached.—**To run longitude down**, in *nav.*, to sail east or west until the longitude of the place is reached.—**To run out.** (*e*) In *cricket*, to get (the batsman) out, by striking his wicket down with the ball after it has touched a fielder, when the batsman is running, or when at any other time he is out of his ground. *Hutchinson*, Cricket, p. 126.—**To run out a cable**, to buoy and let slip the anchor-chain, so that it will all go overboard.—**To run the guard**, to cross the line of sentries without authority.—**To run up.** (*e*) In *golf*, to send (the ball) low and close to the ground in approaching the hole. *Encyc. Brit.*, XXIX. 25.

run^1, *n.* 24. In *golf*, the movement of a ball along the ground after it alights.—25. In *card-playing*, same as *sequence.* In cribbage, *a run of three* is a sequence of three cards.—26. In the manufacture of starch, a long plane or table on which the starch deposits from suspension in water.—27. In *founding*, a run-out; a leak of metal from a mold.—28. In *billiards* or *pool*, continuous scoring by one player when more than one shot in an inning is allowed.—29. In *organ-building*, same as *running*, 6.—**All-round run.** Same as *all-round* ★*break.*—**Club run**, in *bicycling, hare and hounds*, and other sports, a run in which a number of members of a club take part.—**Endurance run**, a trial of the endurance of the various parts of a motor-car, or the like. Speed is not so much considered as the length of time the machine will run without giving out in any part.

Mr. A. . . . drove it [automobile] in the Boston *endurance run* of 1902 and made various touring trips with it. He rode through Cuba and Porto Rico, made several trips between New York and Syracuse and frequently drove to Saratoga and Ogdensburg. On one or two occasions the car was in races on the ice course on the St. Lawrence River. Altogether it has probably been driven from 50,000 to 60,000 miles.
N. Y. Eve. Mail, Feb. 10, 1906.

Forced run, in *base-ball*, a run accorded to a runner when he is forced off third base by the fault of his opponents.—**Pipe-line run.** See the extract.

Usually the terms "production" and "*pipe-line runs*" are considered as synonymous, but production is always slightly in excess of runs. The expression "*pipe-line runs*" means the amount of oil the pipe lines have received from the wells, and as the pipe lines do not run all the oil in the tanks at the wells, it would be remarkable if the same amount remained in the tanks at the wells at the close of each year.
Rep. U. S. Geol. Surv., 1897–98, vi. 29.

Run of one's teeth, one's meals; access to food without charge. [Slang.]

And it suits to a T
To receive as your fee
The run of your teeth
And five guineas a day.
A New Song, quoted in N. and Q., 10th ser., I. 478.

Run of the kiln, bricks of all kinds and qualities just as they happen to come from the kiln.—**Run of the mine,** coal just as it comes from the mine, large and small sizes and all qualities together.—**To get a run for one's money,** to be repaid for making an effort to see or do something. [Sporting slang.]

> Once upon a time Dr. Watson and we, the eager readers, were able to follow him [Sherlock Holmes] step by step to the final unravelling. Now he is inclined to toss the solution at us and Dr. Watson, without letting us have any of the fun. We do not *get the* proper *run for our money,* if we may put it in sporting lingo.
> *Athenæum,* April 1, 1905, p. 397.

runabout, *n.* **3.** A small, light-weight, open motor-car, or one fitted with a buggy-top, designed to carry two persons, and intended to operate in towns or cities or within short distances; also a small motor-boat.

> Of course, you do not need a 30-horse-power motor in a *runabout,* but in any kind of a car you do want a reasonable surplus of power beyond what you ordinarily have to use. *Automobile Topics,* May 27, 1905, p. 495.

4. One of a herd of cattle left to run about and graze at will. [Australia.]

runabout-yard (run′a̤-bout-yärd″), *n.* In Australia, a yard where "runabouts" are fed and protected from the weather. See ★*runabout,* 4. *E. E. Morris,* Austral English.

> "Open that gate, Piambook," said Ernest gravely, pointing to the one which led into the '*run-about*' *yard.*
> *Rolf Boldrewood,* Colonial Reformer, xviii.

runaround (run′a-round), *n.* **1.** A new or artificial channel by which the whole or a portion of the water of a stream is diverted from its usual channel and flows around an obstacle, such as a dam or ice-gorge, and returns again to its normal channel below the obstruction.

> A few hundred feet below the main dam the bed of the *run-around* again joins the river. To prevent the escape of water by way of this *run-around,* save when the river is nearly up to the top of the main dam, a weir dam has been thrown across the lower end of the *run-around.*
> *Elect. World and Engin.,* Feb. 13, 1904, p. 305.

2. In *med.,* paronychia; whitlow.

Runaway star. See ★*star*¹.

rune-tree (rön′trē), *n.* A pine board or piece of birch-bark inscribed with figures, and consulted by the shamans of the Lapps in their incantations. *Keane,* Man, Past and Present, p. 341.

runic, *a.*—**Runic staff.** Same as *clog-almanac.*

II. *n.* A distinctive style of printing-type.

These types are of RUNIC face.

runiform (rö′ni-fôrm), *a.* [*rune*¹ + *-i-form.*] Having the appearance of runes. [Rare.]

> It must not be forgotten that many of these monuments date from the historic epoch and belong, as proved by the *runiform* inscriptions of Mongolia discovered by Yadrintsef and deciphered by Thomson, to the seventh and eighth centuries of the Christian era.
> *Deniker,* Races of Man, p. 363.

run-money (run′mun″i), *n.* *Naut.,* the award for apprehending a deserter.

runnel, *n.* **2.** An open channel for a small stream of water or other liquid.

> This *runnel* is made to follow the steps in a succession of descending curves, and is led by a crooked channel to a settling basin, on its way to a tank below.
> *A. J. Evans,* in Jour. Roy. Inst. of Brit. Architects, [X. 104.

runner, *n.* **1.** (*l*) (2) Same as *leather-jacket* (*c*). (3) The common jurel or hardtail, *Carangus chrysos.* (*m*) A newsboy. [London.]

> How can a busy man whenever he hears a "*runner*" be expected to leave his work, rush down stairs, keep one eye on the "*runner,*" and look for a policeman with the other? . . . What is wanted is for the police to have power forthwith to arrest any newsmonger who shouts.
> *Lancet,* April 4, 1903, p. 983.

(*n*) In *hunting,* see the extract.

> An individual belonging to that race of intelligent and remarkable persons to be found amongst the retinue of most hunts, entitled "*runners*" or "man with the terriers." *Eyre Hussey,* Miss Badsworth, M. F. H., xxvii.

15. A wheel for decorating pottery. See ★*coggle*⁴. Also called *decorating-wheel.*

> Incised ornamentation is sometimes added by the use of a small wheel, bearing an engraved device on the edge, called the "*runner,*" which is held in a frame.
> *E. A. Barber,* Pottery and Porcelain of the U. S., p. 9.

16. *pl.* The fibers that fray off the warp-yarn and collect behind the loom-reed in the process of weaving.

runner-chain (run′ėr-chān), *n.* A chain bound loosely around the forward end of the runners of a logging-sled, as a brake.

runner-dog (run′ėr-dog), *n.* A curved iron attached to a runner of the hind sled of a logging-sled, which holds the loaded sled on steep hills by being forced into the bed of the road by any backward movement.

runner-frame (run′ėr-frām), *n.* In *glass-manuf.,* an iron-shod frame used for grinding the surface of plate-glass on the grinding-table.

runner-up (run′ėr-up″), *n.* In *tennis, golf,* and similar games, the player next to the winner.

> Gwynne is only good on a heavy track, so that Charles Estes and Robert Metcalf ought to be the *runners-up.* Neither of them are sprinters, but the others are not much, and I will take them for second and third as they are named. Sweepstakes is also better on a heavy track.
> *N. Y. Com. Advertiser,* April 11, 1901.

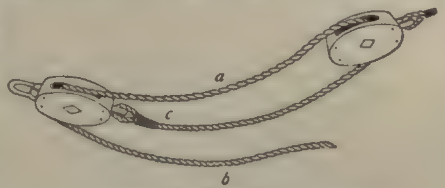
running, *n.*—**First runnings,** in the distillation of coal-tar, the mixture of ammoniacal liquor and light oils which first distils over before the temperature has come to exceed 110° C. *Sadtler.*

running, *p. a.* **8.** In *mach.,* moving; not held tightly; not fixed. A running fit is one where two surfaces in contact fit so loosely that one can move freely past the other.—**Running ground,** in *mining,* earth or rock which slides or caves in.—**Running survey.** See ★*survey.*

running-board (run′ing-bōrd), *n.* In *elect.,* a mounting for reels of wire by means of which, in the construction of overhead lines, several wires can be run off the reels simultaneously and fastened to the cross-arms of the poles. *Houston,* Dict. Elect.

running-frame (run′ing-frām), *n.* In a motor vehicle, the chassis; the frame carrying the running-parts and supporting the motor, in a motor-car.

running-part (run′ing-pärt), *n.* *Naut.,* that part of a rope which is hauled upon is called the hauling-part, the part between the blocks is the running-part, and the part which is made fast is referred to as the standing-part.



Running-part.
a, running-part; *b,* hauling-part; *c,* standing-part.

runo (rö′nō), *n.* [Finn. *runo.*] In Finnish use, a song, ballad, poem, or air.

run-off (run′ôf), *n.* The portion of rainfall which is not evaporated or absorbed by the soil, but flows off in streams or is available for storage. See the extract.

> The total *run off* of a stream depends very largely on the *run off* of the storage period. Usually about 0.75 to 0.85 of the total rainfall of this period runs off in the stream. *Nature,* July 28, 1904, p. 300.

> The true index to the amount of precipitation available for irrigation is not the actual recorded precipitation, but the percentage of this which flows off into the streams and which is known as "*run-off.*" . . . A glance at a *run-off* map of the United States shows in the darker shade of color that portion in which the *run-off* exceeds 20 inches in depth.
> *H. M. Wilson,* in Bulletin Amer. Geog. Soc., XXX. 5.

Coefficient of run-off. See ★*coefficient.*

runt¹, *n.*—**Welsh runt,** a breed of large, long-horned Welsh cattle whose prevailing color is black.

> As graziers' beasts Welsh cattle are well known in the midland counties of England, where, under the name of *Welsh runts,* large herds of bullocks are fattened upon the pastures, or "topped up" in the yards in winter.
> *Encyc. Brit.,* XXV. 191.

Runula (rö′nụ̈-lạ̈), *n.* [NL., dim. of *runa,* a dart, a javelin.] A genus of blennioid fishes found in the eastern tropical Pacific.

runway, *n.* (*g*) The trough by the side of a bowling-alley along which the balls are rolled back from the end. (*h*) The swinging platform leading down to a boat-house float.

rupee, *n.* **2.** A current silver coin of Ceylon, equal to 16 annas or 32.47 United States cents.—**Arcot rupee,** a silver coin struck in Madras from 1788 (?) to 1835, weighing from 176.4 to 180.7 grains.—**Company's rupee** or **government rupee,** a new rupee struck in 1835 by the East India Company, weighing 180 grains eleven twelfths fine: the standard rupee from 1835 of all British India.—**Sicca rupee.** See *sicca.*—**Sonaut rupee,** a name given to the sicca rupee in Bengal. The name (Hind. Ar. *sanwāt,* years) refers to the year of the reign which appears upon these coins.—**Zodiac rupee,** a silver coin of the Mogul emperor Jahangir (1605–27 A.D.) of India, bearing one of the signs of the zodiac. Zodiac mohurs were also coined.

rupestrian (rọ̈-pes′tri-a̤n), *a.* Same as *rupestrine.*—**Rupestrian inscription,** a rock inscription; a petroglyph.

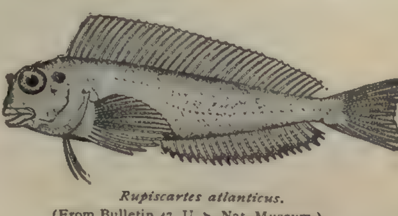
> The carvings on the dolmen des marchands, Brittany, are almost identical with those of the so-called "*rupestrian inscriptions*" of Tunisia and South Algeria.
> *Keane,* Ethnology, p. 137.

rupia² (rö-pē′ä), *n.* [Pg., < Hind. *rūpīya,* rupee.] A current silver coin of Portuguese India, the same as the rupee, and equivalent to 32.47 United States cents.

rupie² (rö′pẹ̄-ẹ), *n.* [G. See *rupee.*] A current silver coin of German East Africa, equal to 64 pesas or 32.47 United States cents.

rupioid (rö′pi-oid), *a.* [*rupia* + *-oid.*] Resembling rupia. *Buck,* Med. Handbook, VII. 611.

Rupiscartes (rö-pi-skär′tēz), *n.* [NL., < L. *rupes,* rock, + Gr. σκάρτης, springing, nimble.] A genus of blennioid fishes found on both coasts of tropical America.



Rupiscartes atlanticus.
(From Bulletin 47, U. S. Nat. Museum.)

rupophobia (rö-pọ̄-fō′bi-ạ̈), *n.* [Prop. **rhypophobia,* < Gr. ῥύπος, dirt, filth, + -φοβια, < φοβεῖν, fear.] A morbid dread of uncleanliness.

rupture, *n.* **4.** In *mech.*: (*a*) The splitting or tearing of a boiler or tank from internal pressure or stress, as distinguished from an explosion in which it flies into pieces. (*b*) A breakage or tearing apart by tensile stress in excess of the resisting capacity of the piece.—**Generative rupture,** a rupture by which a moving object begins to take on one or more additional dimensions, as when a particle during its motion suddenly begins to spread into a pellicule, so that from generating a line, it begins to generate a solid.—**Modulus of rupture.** See ★*modulus.*—**Rupture length.** See ★*length.*—**Tension rupture,** in *geol.,* a break in rocks produced by a tension strain. *Geikie,* Text-book of Geol., p. 684.

rupture, *v. t.* **4.** To tear apart; open along a line or at one point, without destroying the whole structure: said of boilers or tanks, as distinguished from *explode.*

ruptured (rup′tụ̈rd), *p. a.* [Pp. of *rupture, v.*] Having a rupture (specifically, a hernia).

Rural engineering, free delivery, free-delivery route. See ★*engineering* and ★*delivery.*

rurales² (rö-rä′lās), *n. pl.* [Sp. *guardias rurales,* rural guards.] A body of mounted police or gendarmerie in Mexico, established by President Diaz, composed largely of members of the revolutionary and criminal classes, but effective in the maintenance of order.

rush¹, *n.*—**Hard rush,** *Juncus glaucus.* See extract under *soft* ★*rush.*—**Soft rush.** See the extract.

> *Soft Rush* (Juncus effusus, Juncaceæ).—The common *Soft rush* has been used for platting into mats and chair bottoms, and the pith has been utilised for the wicks of candles. The Hard rush, Juncus glaucus, has been utilised in the making of brooms and whisks. The leaves are not nearly so smooth as those of Juncus effusus; they are less pliable, fluted, and crack more readily. The hard rush generally grows in dry situations; its brittle character renders it unfit to be utilised for some purposes. *Hannan,* Textile Fibres of Commerce, p. 64.

rush², *v.* **I.** *intrans.* **5.** In *rowing,* to come forward too fast; to rush the slide.

II. *trans.* **5.** To surround with many attentions and entertain often: as, to *rush* a girl; to *rush* a man for a fraternity. [College slang, U. S.]—**Rush it** (in the imperative), hurry it; get it done quickly. [Slang.]—**To rush the growler,** to go or send many times for beer to be brought in a 'growler' (a pitcher or pail). [Slang.]

rush², *n.* **11.** In *gold-mining,* a place where gold is found in quantities: so called from the rush of miners to mark out claims. [Australia.]

> It is a common practice for them to mark out one or more claims in each new *rush,* so as to make sure if it turn out well.
> *W. Howitt,* Land Labour and Gold, I. 184, quoted in E. [E. Morris, Austral English.

II. *a.* Characterized by haste; requiring haste. [Colloq.]—**Rush order,** in trade, an order which is to be filled in the shortest possible time. [Colloq.]

rush-cart (rush′kärt), *n.* In Lancashire and the West Riding, the cart in which the rushes are carried in procession to decorate the church at its rush-bearing (which see).

rusher², *n.* **4.** A miner who rushes into a newly opened gold region, with a determination to get ahead of others. [Australia.]

Ruskinian (rus-kin′i-an), *a.* Of, pertaining to, resembling, or having, the characteristics of John Ruskin, the noted English writer.

> The appearance of justifying some foregone conclusion as to what a writer or a book "ought" in the *Ruskinian* sense to be.
> *H. James*, Jr., Introd. Kipling, Mine Own People.

ruspo (rös′pō), *n.* [It. *ruspo*, a coin so named, a sequin, < *ruspo*, adj., rough, new, new-coined.] A Tuscan gold coin, the sequin. Same as ★*gigliato*, 2.

ruspone (rös-pō′ne), *n.* [It., aug. of *ruspo*, a coin so named.] A Tuscan gold coin, the triple sequin, of the value of 40 gold lire or 60 paoli.

Russelia (ru-sel′i-ạ̈), *n.* [NL. (Jacquin, 1760), named in honor of Alexander *Russell* (1714–1768), a Scotch physician and naturalist.] A genus of plants of the family *Scrophulariaceæ*, comprising about a dozen shrubs, natives of tropical America, chiefly of Mexico. Two or three species are in cultivation in greenhouses, the commonest one being *R. juncea*, a slender plant with angular spreading or drooping rush-like nearly leafless branches and racemes of small, slender, bright red, tubular flowers.

Russian backgammon, bast, brome-grass, catarrh, tea. See ★*backgammon*, etc.—**Russian cactus.** Same as *Russian* ★*thistle.*—**Russian cat.** Same as *Opelousas* ★*cat.*—**Russian green.** Same as *dark* ★*green.*—**Russian red clover.** See ★*clover.*—**Russian saltwort.** See *Russian* ★*thistle.*—**Russian thistle.** See ★*thistle.*—**Russian tula.** Same as ★*niello-silver.*

Russianization (rush″ạn-i-zā′shọn), *n.* [*Russianize* + *-ation.*] The process of rendering Russian in character or government; incorporation in the Russian Empire.

> Such topics as the *Russianization* of Finland, the coal strike, and the Arbitration Commission are handled without fear or favor. *The Nation*, June 18, 1903.

russium (rus′i-um), *n.* [NL., < *Russia.*] A supposed new chemical element announced by Chroustschoff, in 1889, as probably present along with thorium in monazite. No additional or complete investigation has been published.

rust^1, *n.* **1.** Rust formed on iron by exposure to air and water often approaches pretty closely in composition the mineral limonite, a ferric oxyhydroxid (Fe$_4$O$_3$(HO)$_6$). It also frequently contains some ferrous or ferrosoferric oxid and hydroxid, and is more or less perceptibly magnetic.—**Apple-rust,** a rust of apple-leaves, the æcidial stage of species of *Gymnosporangium* which attack the leaves.—**Asparagus-rust.** See ★*asparagus-rust.*—**Barley-rust,** a rust caused by either *Puccinia graminis* or *P. rubigo-vera*, both of which attack barley.—**Bean-rust,** a rust of the bean due to *Uromyces appendiculatus.*—**Beet-rust** a rust caused by *Uromyces Betæ*, which attacks beet-leaves.—**Blackberry-rust,** a rust-fungus, *Puccinia interstitialis*, which attacks blackberry-leaves.—**Brown rust,** a fungous disease of grains and grasses, especially *Triticum* and *Bromus*, caused by *Puccinia dispersa* and its varieties. The name is also incorrectly applied to various diseased conditions of foliage of uncertain causation, accompanied by brown spots, as the so-called brown rust of the tobacco-plant.—**Carnation-rust,** a rust due to *Uromyces caryophyllinus*, which attacks the leaves and stems of the carnation.—**Celery-rust,** a rust due to *Puccinia bullata*, which attacks celery-leaves.—**Cherry-rust,** a rust caused by *Puccinia Pruni*, which attacks the leaves of the cherry.—**Chrysanthemum-rust,** *Puccinia Chrysanthemi*, which attacks the chrysanthemum.—**Clover-rust.** See ★*clover-rust.*—**Corn-rust,** *Puccinia Sorghi*, which attacks Indian corn; also applied to the wheat-rust, *P. graminis*, in England.—**Cotton-rust,** *Uredo Gossypii*, which attacks cotton-leaves; also applied to a disease of cotton characterized by brown spots and dying of the leaves, supposed to be due to imperfect nutrition.—**Crown-rust,** a rust, *Puccinia coronata*, which attacks oats.—**Flax-rust,** a rust-fungus, *Melampsora Lini*, which attacks the leaves of flax.—**Golden rust,** *Puccinia glumarum*, which attacks wheat, barley, and other grasses. *Tubeuf.*—**Gooseberry-rust,** *Æcidium Grossulariæ*, which attacks the leaves of the gooseberry.—**Hollyhock-rust,** either of two species, *Puccinia malvacearum* or *P. heterogenea*, both of which attack the hollyhock.—**Leaf rust of orange, pine.** See ★*leaf-rust.*—**Oat-rust,** either *Puccinia coronata* or *P. graminis*, both of which attack oats.—**Peach-rust,** *Puccinia Pruni*, which attacks peach-leaves.—**Pear-rust,** the æcidial stage of *Gymnosporangium globosum*, which sometimes attacks pear-leaves.—**Pink rust,** *Puccinia Arenariæ*, which attacks the pink.—**Plum-rust,** *Puccinia Pruni*, which attacks the leaves of the plum, as well as those of peach and cherry.—**Poplar-rust,** *Melampsora populina*, which attacks the leaves of several species of *Populus.*—**Quince-rust,** the æcidial stage of species of *Gymnosporangium*, attacking the leaves and sometimes the fruit of the quince.—**Raspberry-rust,** *Puccinia interstitialis*, which attacks the leaves of raspberries.—**Rose-rust,** *Phragmidium subcorticium*, which attacks rose-leaves. See ★*Phragmidium.*—**Rye-rust,** either *Puccinia graminis* or *P. rubigo-vera*, both of which attack rye.—**White rust,** any one of several species of the genus *Albugo.* They form white blister-like patches on the host which burst and set free the white, powdery conidia. The white rust of the beet is *Albugo Bliti*; that of the cabbage, radish, and turnip, *A. candida*; that of salsify, *A. Tragopogonis*; and that of the sweet potato, *A. Ipomϫ-panduranæ.*

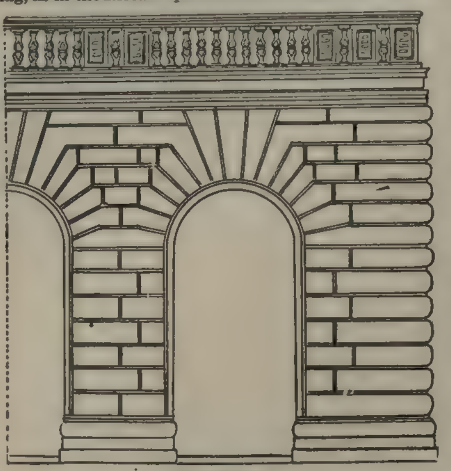
rust-fly (rust′flī), *n.* See the following phrase.—**Carrot rust-fly,** *Psila rosæ*, a cosmopolitan fly of the family *Psilidæ.*

Rustic.

rustic. I. *a.* **5.** Noting a peculiar form or style of lumber with lapping edges, much used in place of clapboards for covering the exteriors of buildings and also used to some extent as a material for the ceilings and interior walls of frame houses. The commonest form consists of a board, usually about six inches in width, which is finished with a beveled edge so constructed as to lap over the lower edge of the board just above. The lower edge is finished with a bevel also, beyond which projects a short tongue, over which the upper bevel of the next lower board is to lap. [Western U. S.]—**Rustic order,** a columnar order in which the shaft has rusticated bands. Compare *banded column* (under *column*) and ★*rustication*, 2.

II. *n.*—**Checkered rustic,** an American noctuid moth, *Paragrotis tessellata.*

rustication, *n.* **2.** Rustication was first treated systematically by the architects of the Renaissance in Tuscany, especially in Florence. The type was probably suggested by the heavy Etruscan masonry still to be seen in Cortona and Fiesole. The fortress palaces of Florence furnished excellent opportunity for its exploitation. As architecture improved rustication was treated with various degrees of refinement, sometimes varying in the same building, as in the Riccardi palace where the rustication is used with less and less boldness in succeeding stories. Rustication has become an accepted motive in the classic scheme.



Rustication.
(From the Palazzo dell' Uguccioni, Florence.)

rusticness (rus′tik-nes), *n.* Rusticity. [Rare.]

> The natural *rusticness* of . . . John Knox.
> *Carlyle*, Lectures on European Literature and Culture, [p. 145.

rustle, *v. i.* **4.** To steal cattle, as a "rustler"; hence to steal, in general. See ★*rustler*, 3. [Western U. S.]

> Then the cowpuncher who had used to go out and "*rustle*" mavericks for his employer became on his own account a "rustler." *F. McElrath*, The Rustler, xii.

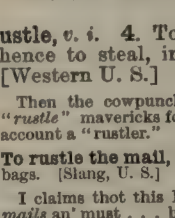
To rustle the mail, to steal from the government mail-bags. [Slang, U. S.]

> I claims thot this Bowlaig b'ar is guilty of *rustlin' the mails* an' must . . . be hanged.
> *A. H. Lewis*, Wolfville Nights, xv.

rustler, *n.* **3.** A cowman who procures his stock by capturing the cattle of other owners and branding them as his own; a cattle-thief. [Western U. S.]

> "What 's a *rustler?*" inquired Hazel. "A fellow who takes other folks' calves to be mavericks and puts his own brand on them," answered Jim.
> *F. McElrath*, The Rustler, iii.

Rust-mite of cotton, an American tetranychid mite, *Tetranychus gloveri*, which sometimes does considerable damage to cotton-leaves.



Rust-mite of Cotton (*Tetranychus gloveri*).
Adult, much enlarged.
(Banks, U. S. D. A.)

rusty^3, *a.* **2**†. Uncivil; surly.

> Cankard Jacke Hare, loke thou be
> not *rusty*,
> For thou shall well knowe I am
> nother durty nor dusty.
> *Skelton*, Magnyfycence, l. 758.

ruthenate (rö′thẹ-nāt), *n.* [*ruthen(ic)* + *-ate.*] A salt which corresponds to the hypothetical ruthenic acid, as potassium ruthenate (K$_2$RuO$_4$); also formerly used for what is now called a perruthenate, as potassium perruthenate (KRuO$_4$). Sometimes written *rutheniate.*

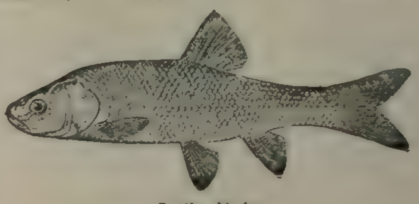
rutheniate (rọ-thē′ni-āt), *n.* [*rutheni(um)* + *-ate*^{1}.] Same as ★*ruthenate.*

ruthenite (rö′thẹ-nīt), *n.* [*ruthen(ic)* + *-ite.*] A name formerly given to a salt which is now called a *ruthenate.* See ★*ruthenate.*

rutherfordine (ruᴛʜ′ėr-fōrd-in), *n.* [Named after Professor Ernest *Rutherford.*] A uranyl carbonate, UO$_2$.CO$_2$, occurring as a yellow alteration crust on pitchblende. It is highly radioactive. Also written *rutherfordite.*

rutidosis (rö-ti-dō′sis), *n.* An irregular form for ★*rhytidosis.*

Rutilus (rö′ti-lus), *n.* [NL., < L. *rutilus*, red.] A genus of cyprinoid fishes found in fresh waters of Europe, Asia, and America.



Rutilus bicolor.
(From Bulletin 47, U. S. Nat. Museum.)

rutinic (rọ-tin′ik), *a.* [L. *ruta*, rue, + *-in*^{2} + *-ic.*] Same as *rutic.*

rutter^4 (rut′ėr), *n.* A form of plow for cutting ruts in a logging-road for the runners of the sleds to run in.

rutylene (rö′ti-lēn), *n.* An oily, unsaturated hydrocarbon, C$_{10}$H$_{18}$, of the acetylene series. It is made synthetically and boils at 150° C.

Ruvettus (rọ-vet′us), *n.* [NL., < It. *ruvetto*, *rovetto*, said to be a name of *Ruvettus pretiosus.*] A genus of fishes belonging to the family *Gempylidæ*, found in deep water in tropical parts of the Atlantic.

rux (ruks), *v. t.* To bother; fret; work (oneself) up. [Slang.]

> Too busy to *rux* 'isself about p'raids.
> *R. Kipling*, The Three Musqueteers in Plain Tales [from the Hills, p. 65.

R. V. An abbreviation (*b*) of *Rifle Volunteers.*

R. W. An abbreviation (*c*) of *railway.* Also Rw.

R. W. D. G. M. An abbreviation of *Right Worshipful Deputy Grand Master.*

R. W. G. M. An abbreviation of *Right Worshipful Grand Master.*

R. W. G. R. An abbreviation of *Right Worthy Grand Representative.*

R. W. G. S. An abbreviation of *Right Worthy Grand Secretary.*

R. W. G. T. An abbreviation (*a*) of *Right Worshipful Grand Templar*; (*b*) of *Right Worthy Grand Treasurer.*

R. W. G. W. An abbreviation of *Right Worthy Grand Warden.*

rye^1, *n.*—**Rock and rye,** rye whisky in which rock-candy has been dissolved.

rye-grass, *n.*—**French rye-grass,** the tall oat-grass, *Arrhenatherum elatius.* See *oat-grass*, 2, and *onion-couch.*—**Giant rye-grass,** the largest of the native rye- and lyme-grasses, *Elymus condensatus*, growing to the height of from 5 to 10 feet. It is common in the Rocky Mountain region and on the Pacific slope, usually growing along streams and protecting their banks by its rootstocks. Cut when young, it makes good hay, and if left standing affords considerable winter fodder. The seeds are used for food by the Indians.—**Macoun's rye-grass,** *Elymus Macounii*, a valuable perennial hay-grass of the northern Rocky Mountains.—**Perennial rye-grass,** *Lolium perenne*, a species indigenous in Europe, northern Africa, and western Asia, distinguished from Italian rye-grass by its smaller size and the absence of awns from the spikelets. It was one of the first of grasses to be agriculturally cultivated, and in Europe is highly prized for hay and preëminently as a grass of permanent pastures, while the Italian rye-grass is sown to be cut for soiling or for hay. Though introduced into America, it is less well adapted to American conditions.—**Western rye-grass.** Same as *giant* ★*rye-grass.*

rye-rust (rī′rust), *n.* See ★*rust*^{1}.

rye-smut (rī′smut), *n.* See ★*smut.*

Rymandra (rī-man′drạ̈), *n.* [NL. (Salisbury, 1809), < Gr. ῥυμός, the pole of a carriage, + ἀνήρ (ἀνδρ-), male (stamen). The name alludes to the long, slender anthers.] A genus of dicotyledonous plants belonging to the family *Proteaceæ.* See *Knightia.*

R. Y. S. An abbreviation of *Royal Yacht Squadron.*

rytidosis, *n.* An irregular form for ★*rhytidosis.*

S 4. An abbreviation (*i*) (2) of *sinister*; (*l*) of *Sabbath*, *Saint* or *Saints*, *series*, *Signor*, *Socialist*, *Spanish*; (*m*) [*l. c.* or *cap.*] of *section*, *see*, *sets* (in almanacs), *sign*, *singular*, *solo*, *son*, *soprano*, *stern*, *succeeded*, *sun*; (*n*) of the Latin *signa*, mark or label; (*o*) in *electrotechnics*, of *south pole*; (*p*) *naut.*, of *summer load-line*. See **free-board*²; (*q*) in *psychophys.*, of *sensation*.

Sa. 1. An abbreviation of *Saturday*.—2. A chemical symbol for *samarium*: but *Sm* is more usual.

S. A. An abbreviation (*b*) of *South Africa*; (*c*) of *South America*; (*d*) of *South Australia*.

saalband (zäl'bänd), *n.* [G. *saalband*, *sahlband*, selvage.] In a dike of igneous rock, the narrow outer border which has a finely crystalline or glassy texture produced by the chilling effect of the walls upon the originally molten mass. *Amer. Geol.*, Feb., 1905, p. 66.

Saarbrücken beds. See **bed*¹.

Sab. An abbreviation of *Sabbath*.

sabadilline (sab-ạ-dil'in), *n.* [*sabadilla* + *-ine*².] A crystalline alkaloid, $C_{20}H_{26}O_5N_2$, found in the seeds of hellebore, *Veratrum viride* and *V. album*, and in sabadilla seeds. It melts at 200° C.

sabadine (sab'a̤-din), *n.* [*sabad(illa)* + *-ine*².] A crystalline alkaloid, $C_{29}H_{51}O_8N$, found in sabadilla seeds. It melts with decomposition at 282–284° C.

sabadinine (sab-ạ-din'in), *n.* [*sabad(illa)* + *-in* + *-ine*².] A crystalline alkaloid, $C_{27}H_{45}O_8N$ (?), found in sabadilla seeds.

Sabalaceæ (sā-bạ-lā'sẹ̄-ē), *n. pl.* [NL. (Schimper, 1871), < *Sabal* + *-aceæ*.] See *Palmæ*².

sabatka (sa-bat'kä̤), *n.* A fish, *Alepisaurus æsculapius*, of the family *Alepisauridæ*, found in deep water from Alaska to California.

Sabayon sauce. See **sauce*.

Sabazia (sa-bā'zi-ä̤), *n. pl.* [L., < Gr. Σαβάζια (sc. *μυστήρια*, mysteries), neut. pl. of Σαβάζιος, adj., < Σαβάζιος, said to be a Phrygian name.] In *Gr. antiq.*, the orgiastic rites of Sabazius, a Phrygian deity identified with Dionysus.

Sabbatical, *a.*—**Sabbatical year.** (*b*) In certain American universities, a year, one in seven or more, granted to a professor for travel and study (commonly with half pay), with entire freedom from teaching. *Science*, Aug. 7, 1903, p. 191.

II. *n.* A contraction of *Sabbatical year*. *Amer. Geol.*, Aug., 1903, p. 131.

sabeca (sa-bē'kä̤), *n.* A musical instrument mentioned in Dan. iii., perhaps the same as *sambuca* or *sambuke*, but certainly not a 'sackbut,' as the English Bible renders it.

sabelliform (sạ-bel'i-fôrm), *a.* [NL. *Sabella* + *-form*.] Having the form of *Sabella*, an annelid; having the prestomium hidden by the forward extension of the peristomium, small tentacles, large, vascular palps, no cirri or setæ on the peristomium, and the parapodia small.

saber-leg (sā'bėr-leg), *n.* See **saber-legged*.

saber-legged (sā'bėr-legd), *a.* Said of horses in which there is a congenital malformation of the hind legs, such that the hind feet stand well under the body, the angle of the hock being more acute than is normal and taking somewhat the appearance of a saber. See **sickle-hammed*. *U. S. Dept. Agr.*, Rep. on Diseases of the Horse, 1903, p. 349.

Sabine², *n.* 2. The language of the Sabines, one of the Old Italic languages, related to Latin, Oscan, etc.

sabina, sabino (sä-bē'nă, -nō), *n.* [Sp. *sabina*, the savin tree (*Juniperus sabina*).] 1. In Mexico, any one of several species of juniper, especially *Juniperus mexicana*, a cypress-like tree yielding a pale yellow resin somewhat like sandarach.—2. The Mexican ahuehuetl, or swamp-cypress, *Taxodium Mexicanum*, magnificent specimens of which grow at Chapultepec, near the city of Mexico.—3. In Texas, the bald cypress, *Taxodium distichum*. See *Taxodium*.—4. In Porto Rico, *Magnolia splendens*, also called *laurel sabino* (probably on account of its aromatic fragrance), a beautiful tree resembling *Talauma Plumieri*, with odorous white flowers and laurel-like leaves used by the natives in flavoring food.

sabino-tree (sạ-bī'nọ-trē), *n.* The bald cypress, *Taxodium distichum*.

sable² (sä'blạ), *n.* [Sp. *sable*, a saber: see *saber*.] A Spanish name of the cutlas-fish.

sabo (sä'bō), *n.* [Native name.] In Jamaica, the antidote cacoon, *Fevillea cordifolia*. See *antidote cacoon*, under *cacoon*.

saboi (sä'boi), *n.* [*saba*, *baboi*, native names in Bengal.] A grass, *Ischæmum angustifolium*, largely used in India for making paper. See *bhabur grass*, under **grass*.

sabuga (sä-bö'gä̤), *n.* [Ar. *ṣabūgha*, smoked fish.] A fish, *Alosa finta*, found in the Nile; the feint shad.

Saburral colic. See **colic*.

sabz (subz), *n.* [Hind., < Pers. *sabz*, green.] A peculiar shade of green used in the decoration of East Indian pottery.

sac², *n.*—**Coxal sacs.** See **coxal*.—**Crystalline-style sac,** in certain mollusks, the sac in which the crystalline style is formed.—**Eversible sacs.** See *defensive* **glands*.—**Olfactory sac,** the organ of smell of the lampreys, consisting of a sort of pocket at the end of the short nostril and in front of the brain. The Schneiderian membrane is spread over ridges at the end of this sac. *Parker and Haswell*, Zoology, II. 124.—**Ovarian sac,** in some annelids, as *Polytoreutus*, one of the lateral sacs containing an ovary and communicating with the oviduct and the spermathecal sac. *Proc. Zool. Soc. London*, 1902.—**Pudendal sac,** a cyst-like structure, containing chiefly fat, in each labium majus.—**Pulmonary sac.** (*b*) See **pulmonary*.—**Serous sac,** the sac formed by the pleura, pericardium, or peritoneum.—**Setigerous sac,** in annelids, as *Nereis*, an invagination of the epidermis lodging a bundle of setæ. *Parker and Haswell*, Zoology, I. 405.—**Spermatophoral sac,** in cephalopods, same as *Needham's sac* or *pouch*. *Parker and Haswell*, Zoology, I. 723.—**Tracheal sac,** one of the many sac-like enlargements of the tracheæ of a flying insect, which afford a greater breathing-capacity. They are largest in the bees, dragon-flies, flies, and moths, which are swift fliers, and are absent in wingless insects and larvæ.—**Vocal sac,** a pouch or sac, lying on the under side of the throat and opening in the mouth cavity, present in the males of many species of frogs and toads. There may be one sac, or a pair, according to the species, which may be distended with air and whose office is to intensify the sound of the voice. *Proc. Zool. Soc. London*, Feb., 1899, p. 167.—**Wing-sac,** a small pouch in the wing of any animal; specifically, a pouch in the antebrachial membrane of a bat of the genus *Saccopteryx*.

> The *wing-sac* is developed only in the male; it is quite rudimentary, or absent in females.
>
> *Dobson*, Cat. of Chiroptera in Brit. Mus., p. 367.

sacaline (sak'a-lin), *n.* [*Sakhalin*, *Saghalin*, the island from which the plant comes.] A coarse species of knotweed or jointweed, *Polygonum Sachalinense*, from the Russo-Japanese island of Saghalin, recently introduced into the United States as a forage-plant, but used chiefly for planting as a screen or cover in rough and waste places. It sends up shoots several feet high, bearing very large ovate-oblong leaves and axillary clusters of small greenish flowers.

sacate, *n.* See **zacate*.

sacaton, *n.* See **zacaton*.

Saccammina (sak-ạ-mī'nä̤), *n.* [NL., < Gr. *σάκκος*, a sack, + *ἅμμα*, a link, + dim. *-ina*.] A genus of *Foraminifera* in which the test is composed of agglutinated sandy particles (*Agglutinantia*) forming spherical or pear-shaped bodies with tubular prolongations at the ends and sometimes united in chains. On the interior the structure is labyrinthiform without septa. These bodies occur in the Silurian and Devonian, and in the Carboniferous at times compose entire strata, as at Elfhills in Northumberland.

saccharascope (sak'a̤-rạ-skōp), *n.* [For **saccharoscope*, < Gr. *σάκχαρον*, sugar, + *σκοπεῖν*, view.] A small glass apparatus intended to indicate the presence and amount of glucose in a sample of abnormal urine by the volume of carbon dioxid given off by fermentation after the addition of a tablet of compressed yeast. See *fermentation saccharimeter*, under *saccharimeter*.

saccharimeter, *n.* 2. A hydrometer for testing saccharine solutions, used by brewers; a saccharometer.

saccharobiose (sak″a̤-rọ-bī'ōz), *n.* [Gr. *σάκχαρον*, sugar, + E. *biose*.] A sugar having the formula $C_{12}H_{22}O_{11}$: so named because such sugars can be hydrolyzed with the formation of two molecules of the same or different monoses, $C_6H_{12}O_6$.

saccharobutyric (sak″ạ-rọ-bū-tir'ik), *a.* [Gr. *σάκχαρον*, sugar, + E. *butyric*.] Relating to a type of intestinal putrefaction in which the bacillus *Aërogenes capsulatus* is the predominating organism. Carbohydrate fermentation and formation of butyric acid stand prominently in the foreground. *Med. Record*, Aug. 3, 1907, p. 173.

saccharolactonic (sak″a-rō-lak-ton'ik), *a.* [Gr. *σάκχαρον*, sugar, + E. *lactonic*.] Noting an acid, a derivative of saccharic acid. *Simon*, Physiol. Chem., p. 55.

saccharolytic (sak″a̤-rọ-lit'ik), *a.* [Gr. *σάκχαρον*, sugar, + *λύσις*, a loosing.] Having the power of chemically splitting sugar.

> It was found that the sugar after forty-eight hours remained the same as after twenty-four hours; in other words, that Bacillus coli showed but a weak sugar-splitting power, the *saccharolytic* action ceasing after twenty-four and sometimes after eighteen hours.
>
> *Jour. Med. Research*, March, 1908, p. 86.

saccharometer, *n.*—**Einhorn's saccharometer,** a form of fermentation saccharometer. The urine to be tested for glucose is mixed with a little compressed yeast and then put in the instrument so as to fill completely the graduated portion. When warmed, fermentation sets in, if sugar is present, and carbon-dioxid gas collects. The arbitrary scale indicates the percentage of sugar corresponding to the volume of gas evolved.—**Fermentation saccharometer,** a bent graduated tube, closed at one end, designed to indicate the amount of sugar in urine by means of the gas collected at the closed end when yeast is added to the urine.

Saccharomycetales (sak″a̤-rọ-mī-sẹ-tā'lēz), *n. pl.* [NL., < *Saccharomyces* (*-cet-*) + *-ales*.] An order of fungi (so named from the genus *Saccharomyces*) including the yeasts, *Saccharomycetaceæ*, and the *Endomycetaceæ*.

saccharomycosis (sak″a̤-rọ-mī-kō'sis), *n.* [Gr. *σάκχαρον*, sugar, + NL. *mycosis*.] A morbid state induced by the presence of saccharomyces.

saccharone (sak'a-rōn), *n.* [Gr. *σάκχαρον*, sugar, + *-one*.] The crystalline lactone, $C_6H_{10}O_5 + H_2O$, of saccharonic acid, from which it is formed when a solution is evaporated by heat or in a desiccator. It melts at 145–146° C.

saccharonic (sak-a̤-ron'ik), *a.* [*saccharone* + *-ic*.] Derived from saccharin. See *saccharin*, 1.—**Saccharonic acid,** a dibasic acid, $C_6H_{10}O_7$, made by heating saccharin ($C_6H_{10}O_5$) with nitric acid. It is known only by its salts and its lactone, saccharone.

saccharorrhea (sak″a̤-rọ-rē'ä̤), *n.* [Gr. *σάκχαρον*, sugar, + *ῥοία*, flowing.] Presence of sugar in some form in the fluid excretions.

saccharose, *n.* 3. A trade-name of the sodium salt of saccharin. See *saccharin*, 2.

saccharumic (sak-a̤-rö'mik), *a.* Noting an acid, $C_{14}H_{18}O_{11}$, which is formed on heating dextrose with an alkali.

sacchulmic, *a.* See **sacculmic*.

Saccocoma (sa-kok'ọ-mä̤), *n.* [NL., < Gr. *σάκκος*, a sack, + *κόμη*, hair.] A genus of articulate crinoids constituting the only known genus of the *Saccocomidæ*. They are stemless, the calyx being composed of radial plates with an extremely small single basal, the arm-plates carrying wing-like expansions on each side of the ambulacral furrows, and the entire skeleton having a reticulated surface. They occur in the Jurassic limestone of Solnhofen, Bavaria.

saccos, *n.* 2. In *Gr. antiq.*, a coarse haircloth sieve; a form of head-dress resembling a bag, used instead of a net.—3. In *Gr. costume*, a coarse cloth, or haircloth; a garment made of such material; in the Byzantine period, a tight-fitting undergarment worn by high dignitaries.

saccospore (sak′ọ̄-spōr), *n.* [Gr. *σάκκος*, sack, + *σπορά*, seed.] In *phytogeog.*, a plant the distribution of which is facilitated by a membranous envelop or air-confining pericarp about the seed, adapting it to transportation by water or wind. *F. E. Clements.*

sacculation, *n.* 2. A small sac or cystic formation.

Six centimetres above the tip of the appendix, on the side opposite the mesentery, is a *sacculation* measuring 12 x 11 mm., with a somewhat constricted base. *Jour. Exper. Med.*, Jan. 15, 1901, p. 341.

sacculmic (sa-kul′mik), *a.* [Also *sacchulmic*; ‹ *sacc*(*harose*) + *ulmic*.] Derived from saccharose and related to ulmin.—**Sacculmic acid**, a black, glistening substance, $(C_{11}H_{10}O_4)_x$, made from saccharose by boiling it with dilute sulphuric acid.

sacculmin (sa-kul′min), *n.* Also *sacchulmin*; ‹ *sacculm*(*ic*) + *-in*^{2}.] A humin-like compound, $C_{44}H_{38}O_{15}$, formed together with sacculmic acid when saccharose is boiled with dilute sulphuric acid.

sachem, *n.* 3. An American hesperiid butterfly, *Hylephila campestris*, which occurs throughout the eastern two thirds of the United States. Its larvæ feed on grasses. It was formerly known under the specific name of *huron*, which probably gave rise to the popular name of *sachem*.

Sach's curvature. See ★*curvature.*

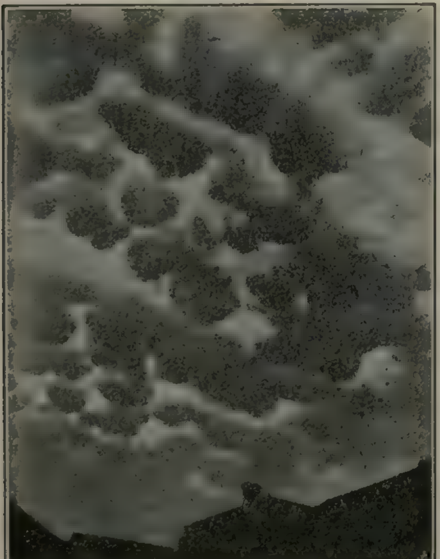
sack^1, *n.*—**Brethren of the sack.** See ★*brother.*

sack^1, *v. t.*—**To sack the rear,** in *lumbering*, to follow a drive and roll in logs which have lodged or grounded. Also *to pick the rear.*—**To sack the slide,** in *lumbering*, to return to a slide logs which have jumped out.

sack-bearer, *n.*—**Melsheimer's sack-bearer,** an American lacosomid moth, *Cicinnus melsheimeri*, reddish gray in color, sprinkled with black dots, and with a narrow blackish line crossing both wings. Its larvæ feed on oak-leaves, protecting themselves in a case made of leaves.

sackcloth, *n.*—**In sackcloth and ashes.** See ★*ash*^{2}.

sack-cloud (sak′kloud), *n.* A form of mammato-cumulus in which the pocket hanging from the cloud becomes so deep as to resemble a sack or bag, sometimes seeming to reach to the ground. The sack-like appearance is due to the descent of the heavier particles of the cloud, which, however, eventually evaporate into the air without reaching the ground as rain or mist.



Sack-cloud (*mammato-cumulus*).

Sacral escutcheon. See ★*escutcheon.*

sacrament-cloth (sak′rạ-mẹnt-klôth), *n.* The veil or cloth which covers the pyx or vessel containing the reserved eucharist.

sacrament-house (sak′rạ-mẹnt-hous), *n.* A medieval term for the tabernacle for the reserved eucharist.

Sacramento cat. See ★*cat*^{1}.—**Sacramento sturgeon,** the white sturgeon. See *sturgeon.*

sacrarial (sạ̄-krā′ri-ạl), *a.* [NL. *sacrari*(*um*) + *-al*^{1}. See *sacrarium*^{2}.] Pertaining to, or forming part of, the sacrarium, or series of vertebræ forming the sacrum, sacral mass, or synsacrum of birds.

Sacred disease. See ★*disease.*

sacred-bark (sā′kred-bärk), *n.* Same as *cascara sagrada bark*, which see, under *bark*^{2}.

sacrifice, *v. i.* 2. In *base-ball*, to make a fair hit, so as to advance a base-runner, while giving the opportunity to put out the batter.

sacring-tablet (sā′kring-tab″let), *n.* An altar-card on which is inscribed the canon of the mass for the use of the celebrant.

sacring-time (sā′kring-tīm), *n.* The time during which the sacring bell is rung at the consecration in the service of the mass.

sacro-anterior (sā″krō-an-tē′ri-ọr), *a.* [L. *sacrum*, sacrum, + *anterior*, before.] Having the sacrum anterior: noting the position of the fetus in utero when its back is directed toward the anterior abdominal wall of the mother.

sacrococcyx (sā-krō-kok′siks), *n.* [NL., ‹ *sacrum* + *coccyx*.] The sacrum and coccyx regarded as one bone. *Buck*, Med. Handbook, II. 638.

sacrocoxalgia (sā″krō-kok-sal′ji-ä), *n.* [NL., ‹ L. *sacrum*, sacrum, + *coxa*, thigh, + Gr. *ἄλγος*, pain.] Pain in the sacro-iliac articulation.

sacrocoxitis (sā″krō-kok-sī′tis), *n.* [NL., ‹ L. *sacrum*, sacrum, + *coxa*, thigh, + *-itis*.] Inflammation of the sacro-iliac articulation.

sacrodorsal (sā-krō-dôr′sạl), *a.* [L. *sacrum*, sacrum, + *dorsum*, back, + *-al*^{1}.] In the synsacrum of certain reptiles, those vertebral elements which have been derived from the dorsal series, as contrasted with those which constitute the distal part of the synsacrum, pertain to the caudal series, and are designated urosacrals.

Sacro-iliac disease. See ★*disease.*

sacroperineal (sā″krō-per-i-nē′ạl), *a.* [L. *sacrum*, sacrum, + NL. *perinæum*, perineum, + *-al*^{1}.] Relating to both sacrum and perineum. *Buck*, Med. Handbook, I. 353.

sacroposterior (sā″krō-pos-tē′ri-ọr), *a.* [L. *sacrum*, sacrum, + *posterior*, behind.] Having the sacrum directed posteriorly: noting the position of the fetus in utero when its back is turned toward the back of the mother.

sacrum, *n.*—**Lateral masses of the sacrum,** the portion of the sacrum on either side of the foramina.

sactosalpinx (sak-tọ̄-sal′pingks), *n.* [NL., ‹ Gr. *σακτός*, crammed, + *σάλπιγξ*, trumpet.] A cystic state of a Fallopian tube due to inflammatory closure of each extremity.

sadd (sad), *n.* [A variant of *sudd*.] A water-tight dam inclosing an area in the bed of a river or other body of water, from the interior of which the water may be removed by pumping in order to permit work to be carried on without interruption from the river, as in making subaqueous excavations or in constructing subaqueous foundations; a coffer-dam.

The modus operandi of the builders was to inclose the area, upon which it was intended to work during the season, by temporary dams or "*sadds*" in November, then to pump the water from the inclosure, and, keeping it down by means of centrifugal pumps, push forward with the work so as to build it above summer level; then, when the river [Nile] was in flood, the force of the water swept away the *sadds*. *Sci. Amer.*, Feb. 28, 1903, p. 152.

sadd (sad), *v. i.* and *t.* [*sadd*, *n.*] **I.** *intrans.* To construct a sadd or coffer-dam.

II. *trans.* To carry on excavation or construction in (a body of water) by excluding the water by means of a sadd or coffer-dam.

The construction of the necessary sadds to inclose the site was commenced on January 28. Even this task in itself was of no small magnitude, for the first inclosure, near the middle of the river, covered no less than 6¾ acres. The centrifugal pumps to remove the water from this *sadded* area were set at work on March 4, and then the troubles began. *Sci. Amer.*, Feb. 28, 1903, p. 152.

saddle, *n.* **3.** (*a*) (2) In *phys. geog.*, a rounded ridge between hills or mountains; a col; a round-crested pass. (*c*) (2) A part of the slide-rest of a lathe below the tool-post or upper carriage, which forms the base for it, and rests upon the inverted V's of the bed. Sometimes this saddle has been held down by a weight in light lathes. (3) The traversing carriage on the arm of the radial drill-press, which carries the spindle, the feed-mechanism, and the driving-gear. (4) The seating for the front end of the locomotive boiler, carrying the steam-passages from the dry pipe to the cylinders and from the exhaust passages to the nozle, and spanning the space between the frames. The cylinders are cast in one piece with half the saddle, right and left. (5) The forging which straddles the leaves of the spring of a locomotive, and transmits the load from and to the frames. (6) A metal plate which slides on the cross-rail of a planer or vertical boring-mill and carries the tool-head. It is usually hooked over the cross-rail, and some device is provided for making it travel back and forth on the rail. (*k*) In *lumbering*, the depression cut in a transverse skid in a skid-road, to guide the logs which pass over it.

saddleback, *n.* 7. A coping with a double slope.—**8.** *Creadion carunculatus*, a passerine bird of New Zealand: so named on account of the chestnut mark on its back.—**9.** A pigeon having a broad mark across the upper part of the back, suggestive of a saddle.

II. *a.* Characterized by having a rather steep double slope. Thus, a *saddleback* roof on a tower is one which has two slopes with a ridge between them and which is bounded at either end by the gable wall. The term is not often applied to the roofs of large masses of buildings.

saddle-bag (sad′l-bag), *v. i.* In *lumbering*, to catch on an obstruction and double around it: applied to a boom.

saddle-check (sad′l-chek), *n.* In old English furniture, a high-topped easy-chair, sometimes called *forty-wink chair*.

saddle-money (sad′l-mun″i), *n.* Chinese copper money, coined from the seventh to the fourth century B.C., of curious shape, and bearing its weight-value and the name of the place of issue.

saddle-nose (sad′l-nōz), *n.* A deformity caused by a sinking in of the bridge of the nose due to fracture or erosion of the septum. *Buck*, Med. Handbook, VI. 124.

saddle-pin (sad′l-pin), *n.* In locomotive-construction, the pin which permits a forging shaped like a capital U, either direct or inverted, to rock or adjust itself to the direction of the stress: particularly the pin of the spring-saddles. See ★*saddle*, 3 (*c*) (5).

saddle-plant (sad′l-plant), *n.* Same as *side-saddle-flower*.

saddler, *n.* 3. A horse used for riding; a saddle-horse.

A horse intended for draft purposes may be marketed somewhat sooner than a harness horse or *saddler*. *Market Classes of Horses*, p. 15.

saddle-reef (sad′l-rēf), *n.* A deposit of ore formed in the saddle-shaped cavities produced parallel with the bedding by the gaping and buckling of strata in a sharp anticline. It contains the saddle proper and the two legs. The type was first recognized in the Bendigo district in Australia, but has since been found in the Nova Scotia gold-mines and elsewhere. *T. A. Rickard*, in Trans. Amer. Inst. Min. Engin., 1891, p. 480.

saddle-seal (sad′l-sēl), *n.* The Greenland seal, *Phoca grœnlandica*, which has an irregular black mark on its back. More commonly called *saddleback* and *saddler*.

saddle-shaped, *a.* 2. In *geol.*, a technical term descriptive of an unbroken symmetrical anticline.

saddle-tank (sad′l-tangk), *n.* A form of water-tank, resembling a saddle in shape, placed on top of the boiler in small switching-engines, to give greater weight on the drivers, with consequent adhesion to the rail and greater tractive power, and to avoid the use of a water-tank on the tender.

saddle-weight (sad′l-wāt), *n.* A weight, usually made of metallic wire, which is placed astride the beam of a balance and can be moved to different points on the length of the beam, so as to be in equilibrium with different weights in the pan hung from the extremity of the other side of the beam; a rider.

Sadduceeist (sad′ụ̄-sē-ist), *n.* [*Sadducee* + *-ist*.] Same as *Sadducee*.

sadh (säd), *n.* [Hind. *sādh*, *sādhu*, pious, holy, ‹ Skt. *sādhú*, straight, right, good, virtuous, ‹ √*sādh*, reach one's goal, make straight, direct to its goal, guide aright, etc. Compare *Puritan*.] A member of a small Hindu monotheistic sect.

sadism (säd′izm), *n.* [From Comte de *Sade* (1740–1814), infamous for the licentiousness of his life and writings.] A form of sexual perversion marked by extreme cruelty.

sadist (säd′ist), *n.* [*sad*(*ism*) + *-ist*.] One who practises sadism.

sadistic (sä-dis′tik), *a.* Relating to sadism or to one who practises it. *G. S. Hall*, Adolescence, II. 112.

Sadymia (sạ̄-dim′i-ạ̈), *n.* [NL. (Grisebach, 1859), an imperfect anagram of *Samyda.*] A genus of plants of the family *Flacourtiaceæ.*

sæter, *n.* See ⋆*seter.*

safari (sä-fä′rẹ̄), *n.* [Swahili *safari*, a journey or voyage.] A caravan.

> Two days later we crossed to Ujiji and, after a few days of the lavish hospitality of Hauptmann Bethe and his colleagues, we collected our *safari* of one hundred and thirty Manyema carriers and started up the lake by land.
>
> *E. S. Grogan*, in Smithsonian Rep., 1900, p. 433.

Safe hit. See ⋆*hit*1.

safe-conduct, *n.* **1.** It may allow personal safety in travel, or it may permit the removal of goods, or it may protect one in residence. If the last, it is usually called a *safeguard* (which see); and it may be a writing given to a hostile resident, or a guard of soldiers to protect him and his property, or it may be a notice affixed to property or buildings (as churches, museums, or libraries).

2. The document issued to the master of a vessel in the merchant service of a neutral or hostile power, insuring immunity.

safe-keeper (sāf′kē″pėr), *n.* One who or that which preserves or guards (something) in safety. [Rare.]

> The written leaf, if it be, as some few are, a *safe-keeper* and conductor of celestial fire, is secure.
>
> *Lowell*, Among My Books, 1st ser., p. 298.

safe-lock (sāf′lok), *n.* A lock used on the door of a safe. It may be a combination-lock or a time-lock, or it may be operated by a key. See *safe*, *n.*

safety, *n.* **8.** Defensive strategy at billiards. In America, since 1879, deliberate resort to misses has been restricted by limiting such misses to three in succession, and contingently to two. *W. Broadfoot*, Billiards, p. 284.—**9.** In *base-ball*, a safe hit.—**Isle** or **island of safety.** See ⋆*isle*1.—**Margin of safety.** Same as ⋆*factor of safety.*—**Safety funnel-tube.** See ⋆*funnel-tube.*

safety-angle (sāf′ti-ang″gl), *n.* The angle, reckoned in degrees, which marks the limit of safety in the rolling of a vessel. If the ship rolls in excess of this limit it is likely to capsize. The safety angle varies according to the vessel. An instrument known as the 'clinometer' records the amount of roll either by a pendulum or a bubble working in a curved tube filled with glycerin. The term 'safety-angle' is sometimes applied to the horizontal and vertical danger angles.

safety-boiler (sāf′ti-boi″lėr), *n.* A boiler the construction or design of which is such that a failure of any part by weakness or overstrain shall not cause a disastrous explosion from too rapid liberation of the stored energy. The sectional boilers are usually safety-boilers.

safety-bridle, *n.*—**Marvin safety-bridle.** See ⋆*bridle*, 10.

safety-cap (sāf′ti-kap), *n.* **1.** A cup-shaped piece placed on the top of the upper bearing-boxes of a roll-train, weaker than the weakest part of the roll itself, and designed to yield by breaking if too severe a stress comes upon the roll from a piece too cool to be compressed in the pass.—**2.** A cap for an engine or working-beam bearing designed to break if excess water in the cylinder endangers the transmission mechanism through inability to escape from the cylinder as the mechanism nears its dead-points.

safety-chain, *n.* **2.** A short chain placed between a car-body and the truck to prevent the latter from swinging at right angles to the body in case it leaves the rails while the car is moving; a check-chain.—**3.** A light chain designed to be attached to a key-ring or watch to prevent it from being stolen from the wearer's pocket.

safety-ladle (sāf′ti-lā″dl), *n.* See ⋆*ladle.*

safety-latch (sāf′ti-lach), *n.* **1.** Any latch having a stop or other device to prevent it from being accidentally opened.—**2.** A latch for an upper berth in a sleeping-car, designed to hold the berth down and prevent it from closing in case of an accident to the car.

safety-nut (sāf′ti-nut), *n.* Same as *jam-nut.*

safety-rope (sāf′ti-rōp), *n.* **1.** A second rope added to the main hoisting-rope on inclined planes or elevators, as a precaution in case of breakage of the main rope.—**2.** A rope attached to a brake, valve, or other stopping-device, by which the motion of the car can be stopped in case of accident on railways or inclines.

safety-stop, *n.* **5.** In a factory or mill, an apparatus by which the power can be shut off at the prime mover in case of accident in any department. In steam-plants the throttle may be closed by the fall of a weight, the weight being normally held up by a detent or catch which can be released by an electromagnet when a push-button or switch is thrown in any department. A brake may also be applied at the engine to shorten the time of the stop.—**6.** A device to shut off power from the engine in case the governing mechanism should fail or break and the engine start to run at excessive speed.—**7.** In *sheet-metal work*, an attachment to a press designed to arrest its motion by throwing the clutch, through which it receives power, out of gear in case the hand of the operator, in feeding the shells or blanks to the press, comes too near the dies for safety, or in case a shell chokes or jams the feed-motion or is wrongly presented to the dies. Safety-stops are also used in presses to prevent the descent of the plungers while the dies are being changed. Compare ⋆*dial-feed.*

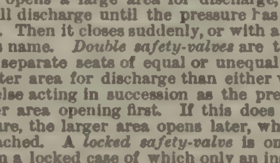
safety-valve, *n.* To be a true safety-valve the area opened by the lift of the valve should be sufficient to carry off all the steam that the boiler can make at that pressure, with the fire at its best and all other outlets closed. It rarely is so ample as this, but the blowing of the safety-valve serves as an alarm, and the pressure rarely rises much above the blowing-off point, because steps are taken at once by the fireman to retard the rapid formation of steam and accumulation of pressure. The force which balances the interior pressure upon the area of the valve may be a weight or a spring. The effort of weight or spring to hold the valve shut may be exerted directly on the back of the valve, or indirectly by means of a lever. The levers should act with knife-edge fulcrums to lessen friction and prevent jamming by side-thrust. With high pressures and large areas of valve the direct-weight system becomes inconvenient. It is still used in England for low pressures, but is little used in the United States. The *spring pop safety-valve* is the most widely used. The pop-valve was first worked out by Richardson of Troy, New York. The pressure comes on a given area when the valve is shut, and tends to lift it. When the pressure overbalances the weight or spring, and the valve rises from its seat, annular grooves in valve and seat are filled with escaping steam, and, by their reaction upon the larger annular area outside the first area of contact, tend to lift the valve higher and to hold it up from its seat until the pressure has fallen below that at which the valve opened—usually five pounds. Hence the valve opens a large area for discharge, and keeps open in full discharge until the pressure has gone down somewhat. Then it closes suddenly, or with a pop, which gives it its name. *Double safety-valves* are those which have two separate seats of equal or unequal area, opening a greater area for discharge than either would open alone, or else acting in succession as the pressure rises, the smaller area opening first. If this does not relieve the pressure, the larger area opens later, when the balance is reached. A *locked safety-valve* is one which is inclosed in a locked case of which only an inspector has the key, or one in which the adjusting device is locked with lock and key, so that when once set to a determined pressure only the possessor of the key can change it.—**Dead-load safety-valve,** a Cowburn valve; a form of safety-valve for steam-boilers, or other pressure-vessels, in which the force necessary to hold the valve on its seat is secured by placing weights directly upon the back of the valve. These are usually annular, and are kept in place by a vertical spindle. The weights may also be hung inside from the spindle on the bottom side of the valve.—**Pop safety-valve.** See above.

saffire, *n.* and *a.* An amended spelling of *sapphire.*

safflower-yellow (saf′lou-ėr-yel″ō), *n.* A yellow dyestuff, $C_{24}H_{30}O_{15}$, extracted from safflower, or false saffron, *Carthamus tinctorius.*

saffranine (saf′ra-nin), *n.* [G. *safran*, E. *saffron*, + *-ine*2.] One of a class of dyes made by oxidizing a mixture of a paraphenylenediamine derivative and a monamine. The saffranines form metallic-green crystals and dye fabrics orange, red, or violet. The simplest, *phenosaffranine*, $C_{18}H_{15}N_4Cl$, is made from paraphenylenediamine and aniline. *Tolusaffranine*, $C_{21}H_{21}N_4Cl$, is made from paratoluylenediamine and toluidine. Also *safranine.*—**Saffranine MN.** Same as *methylene* ⋆*violet.*

saffranol (saf′ra-nol), *n.* [G. *safran*, E. *saffron*, + *-ol.*] A basic compound,



$$\begin{array}{ccccccc}
\mathrm{CH} & \mathrm{:CH-} & \mathrm{C} & \mathrm{:N-} & \mathrm{C} & \mathrm{-CH:} & \mathrm{CH} \\
| & & | & & \| & & | \\
\mathrm{C} & \mathrm{-CH:} & \mathrm{C} & \mathrm{-N-} & \mathrm{C} & \mathrm{-CH:} & \mathrm{COH,} \\
\| & & & | & & & \\
\mathrm{O} & & & \mathrm{C_6H_5} & & &
\end{array}$$

made by boiling phenosaffranine with barium or potassium hydroxid. It forms crystals the color of brass and gives violet solutions with alkalis.

saffron, *n.*—**Antimonial saffron,** in early *chem.*, a yellow material consisting essentially of antimony oxysulphid.—**Indian saffron,** the turmeric plant, *Curcuma longa.*—**Meadow saffron.** (*b*) The hemlock water-dropwort, *Œnanthe crocata.*—**Saffron bronze.** See ⋆*bronze.*—**Saffron substitute.** Same as ⋆*yellow*, 1 (*b*).—**Spanish saffron,** the common saffron, *Crocus sativus.*—**Thistle saffron.** Same as *safflower.*

saffronine (saf′rọ-nin), *n.* See ⋆*saffranine.*

saffronism (saf′rọn-izm), *n.* [*saffron* + *-ism.*] The quality of being like saffron; hence, yellowness: in the extract, an allusion to 'yellow' journalism. [Rare.]

> All the news information concerning the case that could have been printed was fit to be printed—and you gave all the news that we ourselves possessed. Unfortunately, some of your neighbors, deep dyed in journalistic *saffronism*, indulged in cruel fancy, created a tissue of indecent fabrications, and made our already heavy hearts heavier with indignation and renewed sorrow.
>
> *N. Y. Times*, Jan. 22, 1906.

saffron-sugar (saf′rọn-shůg″ạ̈r), *n.* Same as ⋆*crocose.*

saffron-tree (saf′rọn-trē), *n.* In the Bahamas, a small tree of the sapota family, *Chrysophyllum monopyrenum*, the leaves of which are golden-yellow on the under side.

safranol (saf′ra̤-nol), *n.* A compound, $C_{18}H_{12}O_2N_2$, obtained by warming the hydrochlorid of phenosafranine with alcoholic potash. It crystallizes in yellow needles which melt above 330° C.

safrene (saf′rēn), *n.* [G. *safr*(*an*), saffron, + *-ene.*] An oily terpene, $C_{10}H_{16}$, found in the oil of sassafras-root. It boils at 155–157° C.

safrifa (sä-frē′fạ̈), *n.* A plumbaginaceous plant of Morocco, *Limonium mucronatum.* It is a root nervine.

safrosin (saf′rō-sin), *n.* [G. *safr*(*an*), saffron, + *-ose* + *-in*2.] See ⋆*coccin.*

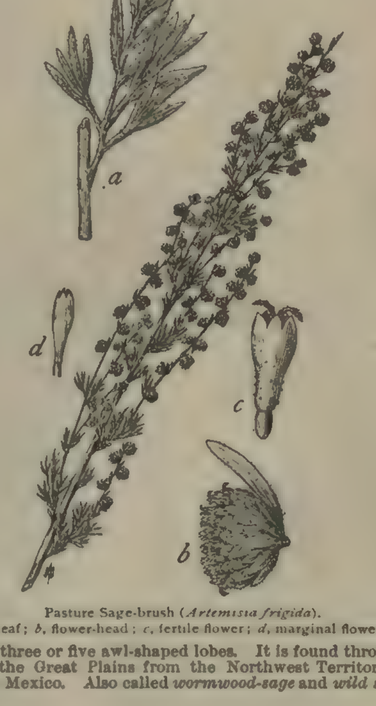
sag, *n.* (*d*) In *railroad construction*, a depression in the grade of a road; the meeting of a down grade with an up grade. An abrupt sag is objectionable, owing to the varying strains upon the cars of a train passing it, the cars on the up grade being pulled apart and those on the down grade being pressed together, the strains being reversed as each car passes the lowest point of the sag. (*e*) A depression in a crest-line or divide.

> In the Fort Benton folio of the Geologic Atlas of the United States, an ancient channel, called the Shonkin *sag*, eroded by the waters thus pouring along the ice border, has been traced by Weed about fifty miles, passing across the low watersheds. *Amer. Geol.*, Sept., 1904, p. 156.

sagakomi (sa̤-gak′ọ̄-mē), *n.* [Also *saccacommis* (Lewis and Clarke); < Canadian F. *saccacomi*, < Ojibwa *sagakomin*, lit. 'smoking berry,' < *sakao* (*sakaw*, Clapin), to smoke (*sakaipwagane*, to smoke a pipe—Clapin), + *min*, berry.] A plant, the bearberry-bush, *Arctostaphylos Uva-ursi*, the leaves and bark of which were formerly smoked (like tobacco) by the Canadian Indians, and are still so used by many of the French Canadians; also, a mixture of this kind for smoking. Compare *kinnikinick. Jour. Amer. Folk-lore*, Oct.-Dec., 1902, p. 256.

sage2, *n.*—**Jerusalem sage,** either of two south European species of *Phlomis*, *P. fruticosa* and *P. tuberosa*, the latter of which is naturalized in the United States.—**Sage camphor.** See ⋆*camphor.*—**Spring sage.** Same as ⋆*bud-brush.*—**Western sage,** *Artemisia gnaphalodes* and *A. Ludoviciana*, two very similar species commonly confused (abundant on the prairies and plains of western North America), more or less white-tomentose and sage-like in appearance. Also called *Western mugwort.*—**Wild sage.** (*d*) See *pasture* ⋆*sage-brush.*—**Wormwood sage,** either of two narrow-leaved species of *Artemisia*, *A. filifolia* and *A. frigida*, of the dry plains of western North America, having a sage-like aspect. The former is also called *silvery wormwood* and the latter, *pasture* ⋆*sage-brush.*

sage-brush, *n.*—**Pasture sage-brush,** *Artemisia frigida*, a low perennial species with short leaves divided into three or five awl-shaped lobes. It is found throughout the Great Plains from the Northwest Territory to New Mexico. Also called *wormwood-sage* and *wild sage.*



Pasture Sage-brush (*Artemisia frigida*).
a, leaf; *b*, flower-head; *c*, fertile flower; *d*, marginal flower.

Sagenichthys (saj-ẹ̄-nik′this), *n.* [NL., translating its Sp. name in Uruguay, *pescadillo del red*, 'fish of the net': < Gr. σαγήνη, net, seine, + ἰχθύς, fish.] A genus of sciænoid fishes found on both shores of tropical America.

sage-of-Bethlehem (sāj″ọv-beth′lẹ̄-ẹm), *n.* 1. The spearmint, *Mentha spicata.*—2. The lungwort, *Pulmonaria officinalis.*

saggar, *n.* 2. The cast-iron box in which white iron castings are packed with an oxid of iron, such as hematite ore, to be exposed to the heat of the reverberatory furnace in the process of rendering them malleable.

saggart (sag′ạ̈rt), *n.* [Also *saggyrt, soggarth, sogarth*, < Ir. Gael. *sagart*, Manx *saggyrt*, OIr. *sacart, sacardd*, = AS. *sacerd*, < L. *sacerdos*, a priest. See *sacerdotal.*] A priest. [Anglo-Irish.] *Eng. Dial. Dict.*

> It is a farmer I should have been, like my brother Denis, had not my uncle Phelim, the thief! tould my father to send me to school, to learn Greek letters, that I might be made a *saggart* of and sent to Paris and Salmanca.
> And you would rather be a farmer than a priest?
> *Borrow*, Lavengro, x.

saggarting (sag′ạ̈r-ting), *n.* [*saggart* + *-ing*¹.] The practice of the priesthood; being a priest. *Borrow*, Lavengro, x.

sagger, *n.* and *v.* Another spelling of *saggar*.

Sagittal gyrus. See ★*gyrus.*—**Sagittal sulcus.** See *coronal* ★*sulcus.*

sago-tree (sā′gō-trē), *n.* In the West Indies, one of several cycads which yield sago, especially *Zamia furfuracea* and *Zamia integrifolia.* See *Zamia.*

saguara (sä-gwä′rä), *n.* Same as *saguaro*, which see.

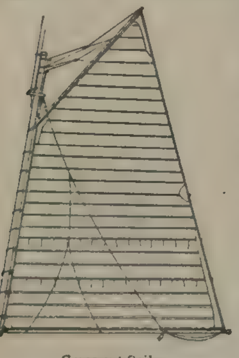
sagvandite (sag′van-dīt), *n.* [*Sagvand* Lake, Norway, + *-ite*².] In *petrog.*, a crystalline rock composed of bronzite and magnesite, with a little chromite, mica, and pyrite. It occurs in the crystalline schists. *Petersen*, 1883.

Sahidic (sä-hid′ik), *a.* and *n.* [*Sahid* or *Saïd* (see def.), Ar. *Ṣa'īd* or *Ṣi'īd*, Upper Egypt, < *ṣa'ad*, rise, ascend.] **I.** *a.* Of or pertaining to Sahid or Said, the Arabic name of Upper Egypt (the Thebaid); Thebaic: used especially with reference to a dialect of Coptic there spoken.

II. *n.* An important dialect of Coptic, spoken in the Thebaid and formerly called Theban. *Encyc. Brit.*, XXVII. 727.

sahuaro (sä-hwä′rō, sä-wä′rō), *n.* Same as *saguaro*, which see.

saibling, *n.*—**American saibling.** Same as *Sunapee* ★*trout.*



Cross-cut Sail.

sail¹, *n.*—**Cross-cut-sail**, a sail in which the canvas seams run fore-and-aft instead of up and down; in other words, a sail having the breadths of canvas running horizontally instead of perpendicularly.—**Crowd of sail.** See ★*crowd*¹. — **Cyclone-boat sail.** See ★*umbrella-boat.* — **Flying sail**, a sail which is not permanently confined to a yard, or mast, or gaff, but is set from the deck like the jib of a cutter yacht, a sprit or club topsail, etc.—**In sail**, the order to reduce the spread of canvas.—**Plain sail**, one of the regular working sails of a vessel, and not one of those which are set flying, such as studding-sails (stun sails), balloon sails, etc.—**Shadow-sail**, a sail designed to take the place of the regular jib-headed spinnaker, the idea being to make a square-headed spinnaker by setting the head of the sail on a gaff secured to the mast under the hounds by a goose-neck, and to spread the foot of the sail on the swinging-boom. When the shadow-gaff was not in use it hung down the mast and was so secured. The head of the shadow traveled on its gaff by hoops, and was hauled out and in respectively by means of an outhaul and brails.—**Sheer sail**, a sail that is used as a drag.—**To mend sail**, to skin the sails afresh after a poor furl; furl the sails in a neater manner.—**Under low sail**, said of a square-rigged vessel when the exposed canvas is limited to a close-reefed topsail, to that and a course, or to a course alone. A fore-and-aft vessel is under low sail when its gaff-sails are close-reefed.—**Under plain sail**, said of a vessel when it is carrying only its working sails, which are permanently confined to yards, booms, gaffs, etc.

sail¹, *v. i.* 8. In *lawn-tennis*, to rise after crossing the net: said of a ball.—**To sail by and large**, to sail alternately close to the wind and off the wind.—**To sail by the wind**, to sail close, so that the sails are kept only well filled, while to allow the vessel's head to fall off generously from the point of *by* is to sail large.—**To sail large.** See *to* ★*sail by the wind.*

sail-hoist (sāl′hoist), *n.* Same as ★*railway*, 3.

sailing, *n.*—**Meridian sailing**, sailing due north or south; sailing on a meridian.

sail-looser (sāl′lö″sėr), *n.* One of the members of a crew who are detailed to lay aloft for the purpose of loosing the sails preparatory to the setting of them, or of breaking out the canvas after a rain so that the sails may dry.

Sailmaker's splice. See ★*splice.*

sail-model (sāl′mod″el), *n.* A miniature representation of a vessel's spars, rigging, and sails, according to scale.

sail-netting (sāl′net″ing), *n.* A rope or canvas netting which acts as a receptacle for certain staysails, such as the main-topmast staysail.

sailor, *n.*—**Climbing sailor, roving sailor**, the Kenilworth ivy, *Cymbalaria Cymbalaria.* Also called *wandering sailor.*

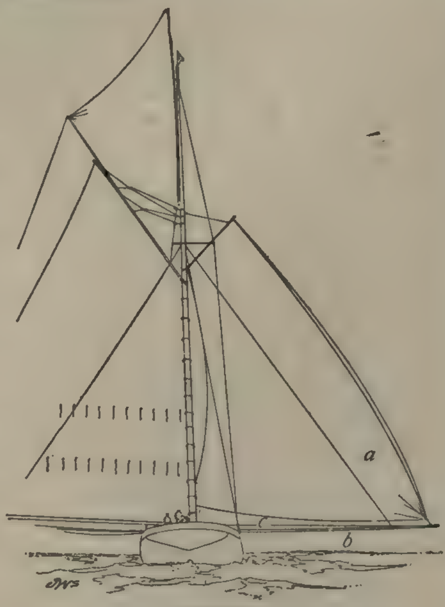
sailoring (sā′lọr-ing), *n.* The act of sailing a ship; doing the work or following the trade of a sailor. [Rare.]

> I'll be wanting a helping-hand myself. It's a rotten, undependable trade, this *sailoring.*
> *Cutcliffe Hyne*, A Master of Fortune, vii.

sailor's-choice, *n.* 3. A West Indian fish, *Hæmulon parra;* also, other fishes related to it. Also called *ronco prieto.*

sailor's-knot (sā′lọrz-not″), *n.* The herb-robert, *Geranium Robertianum.*

sailor's-pocket (sā′lọrz-pok″et), *n.* See *sailor's-purse.*



Shadow-sail.
a, shadow-sail; *b*, boom; *c*, after-boom guy.

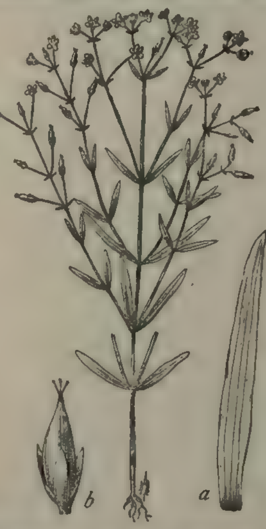
sailors'-skin (sā′lọrz-skin), *n.* A bluish-red discoloration of the skin with thickening of the epidermis and the occurrence of warty elevations, constituting a form of cancerous growth. *Buck*, Med. Handbook, II. 681.

sailor's-tobacco (sā′lọrz-tọ̄-bak″ō), *n.* The common mugwort, *Artemisia vulgaris.*

sail-plan (sāl′plan), *n.* In *naval arch.*, a plan showing the masts, spars, sails, and rigging of a vessel in longitudinal elevation. The cut under *ship* is a sail-plan except that the running rigging is not usually shown on such a plan.

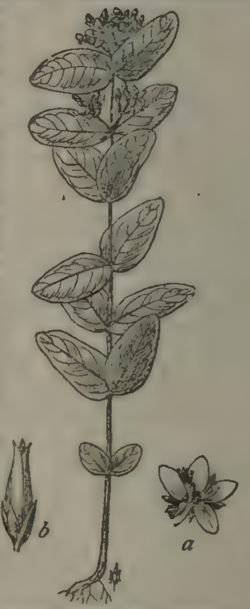
sainete (sä-ẹ̄-nā′tạ̄), *n.* [Sp., relish, flavor, an interlude or farce, dim. of *saín*, grease, fat, ML. **sagimen*, for L. *sagina*, cramming, stuffing, food.] In Spanish dramas, an interlude or intermezzo with music and dancing, usually of a humorous character.

saint¹, *n.*—**St. Andrew**, a gold coin of Scotland.—**St. Bernard**, a breed of large dogs, 28 to 30 inches high at the shoulder, having a large, square, massive head: named from the hospice of St. Bernard in the Alps. The original strain was exterminated by distemper. There are two varieties, the long- and the short-coated; the former is bred by dog fanciers, the latter is that preferred for actual work. The color is tawny, orange and white, or red and white.—**St. Denis red.** See ★*red.*—**St. Erth beds.** See ★*bed*¹.—**St. Guy's dance**, chorea.—**St. James's-weed**, the shepherd's-purse, *Bursa Bursa-pastoris.*—**St. John's dance**, chorea.—**St. John's day.** See ★*day*¹.—**St. John's eve**, midsummer eve. See *midsummer.*—**St. John the Baptist**, a Genoese silver coin.—**St. Mark**, a Venetian silver coin, the crociato or scudo.—**St. Mary's River series.** See ★*series.*—**St. Mary's seed**, the sow-thistle, *Sonchus oleraceus*, also *S. asper.*—**St. Maurice sands.** See ★*sand*¹.—**St. Peter's Chains**, a feast-day in the Roman Catholic Church on August 1, commemorative of the imprisonment of St. Peter.—**St. Stephen**, a Portuguese gold coin of the value of 30*s.*; the milreis.



Canadian St.-John's-wort (*Hypericum Canadense*).
a, leaf; *b*, seed-capsule.

St.-John's-wort (sānt-jonz′wėrt), *n.* See *Hypericum.*—**Bedstraw St.-John's-wort**, *Hypericum galioides*, a plant with whorls of linear leaves resembling those of the bedstraw, found in low ground from Delaware to Florida and west to Tennessee and Louisiana.—**Bushy St.-John's-wort**, *Hypericum densiflorum*, of the eastern and southern United States, with a shrubby and leafy habit, short obtuse leaves, and dense many-flowered cymes.—**Canadian St.-John's-wort**, two similar species, *Hypericum Canadense* and *H. majus*, of eastern North America, ranging well northward. They agree in having lanceolate leaves and mostly terminal few-flowered cymes.—**Creeping St.-John's-wort**, *Hypericum adpressum*, of low grounds from Nantucket to Georgia and west to Missouri and Louisiana. It is somewhat decumbent or creeping at the base, becoming erect, and has rather showy, several-flowered cymes.—**False St.-John's-wort**, the orange-grass or pine-weed, *Sarothra gentianoides.*—**Giant St.-John's-wort**, the great St.-John's-wort. See *Hypericum.*—**Marsh St.-John's-wort**, a plant of the genus *Triadenum*, native of eastern North America, especially *T. Virginicum.* *T. petiolatum* is called *larger marsh St.-John's-wort.* They are marsh herbs of the St.-John's-wort family with opposite, entire leaves mostly sessile or clasping, and pink or purplish flowers in axial and terminal cymes.—**St.-John's-wort family**, the plant family *Hypericaceæ* (which see).—**Shrubby St.-John's-wort**, *Hypericum prolificum*, which is really a shrub with a very leafy stem and a large compound cyme of showy yellow flowers. It grows in sandy and rocky soil from New Jersey to Georgia, and is found at high altitudes in the Blue Ridge and Alleghany Mountains.—**Spotted St.-John's-wort**, *Hypericum maculatum*, of eastern North America, the leaves, sepals, and petals of which are conspicuously black-dotted.



Marsh St.-John's-wort (*Triadenum Virginicum*).
a, flower; *b*, seed-capsule.

Saintpaulia (sānt-pâ′li-ạ̈), *n.* [NL. (Wendland, 1893), named in honor of the German court marshal *St. Paul*-Illaire, and his son, the military governor of Usambara, in German East Africa.] An East African genus of plants of the family *Gesneriaceæ*, comprising 3 species. One of them, *S. ionantha*, a recent acquisition to greenhouses, is a small herbaceous plant bearing a profusion of sky-blue flowers somewhat resembling a violet, whence the name 'African violet.' The leaves are all radical, ovate, or ovate-oblong; the flowers are nodding, one inch across, in few-flowered clusters, with a subrotate two-lipped corolla.

sais (sīs), *n.* An Anglo-Indian variation of *sice*, a groom.

> He became one of the leading players at knuckle-bones which all jhampánis and many *saises* play while they are waiting outside the Government-House . . . of nights. . . He . . . deserved a V. C. if it were only for putting on a *sais's* blanket.
> *R. Kipling*, Miss Youghal's *Sais*, in Plain Tales from the [Hills, p. 31.

sake⁴ (sāk), *n.* [A dial. variant of *seak*, a leak, a place where water oozes forth. See *sike*¹.] 1. A land-spring; a wet spot where the water oozes forth.— 2. The magma or pulpy coagulum deposited from the waste liquors of wool-washing after addition of sulphuric acid. It is pressed cold to remove water; then, with hot pressing, it yields a dark-colored, sticky grease, known as Yorkshire grease, and a residual 'seed-cake' used as a fertilizer.

sakkos, *n.* See ★*saccos.*

sal^1, *n.*—**Sal acetosellæ,** in early *chem.*, same as *salt of sorrel.*—**Sal alkali minerale,** in early *chem.*, sodium carbonate.—**Sal alkali vegetabile,** in early *chem.*, potassium carbonate, obtained from the ashes of plants.—**Sal amarum,** in early *chem.*, magnesium sulphate, of bitter taste.—**Sal ammoniacum fixum,** in early *chem.*, crystallized calcium chlorid.—**Sal ammoniacum secretum Glauberi,** in early *chem.*, ammonium sulphate.—**Sal anglicum,** in early *chem.*, magnesium sulphate, first obtained from the water of the mineral spring at Epsom in England, and hence called *Epsom salts*, and on the continent of Europe *English salt.*—**Sal aperitivum Friederici,** in early *chem.*, sodium sulphate or Glauber's salt.—**Sal auri philosophicum,** in early *chem.*, acid potassium sulphate.—**Sal catharticum,** magnesium sulphate. Also known as *Epsom salts* or *bitter-salt.*—**Sal cornu cervi,** ammonium carbonate.—**Sal culinare,** in early *chem.*, sodium chlorid or common salt, as used in cooking and with food.—**Sal Cyrenaicum,** in early *chem.*, ammonium chlorid.—**Sal digestivum Sylvii,** in early *chem.*, potassium chlorid.—**Sal essentiale tartari,** in early *chem.*, tartaric acid.—**Sal febrifugum Sylvii,** in early *chem.*, potassium chlorid.—**Sal fusibile,** in early *chem.*, sodium-ammonium phosphate.—**Sal Jovis,** in early *chem.*, stannous chlorid.—**Sal marinum,** in early *chem.*, sodium chlorid or common salt, obtained from sea-water.—**Sal Martis,** in early *chem.*, ferrous sulphate or green vitriol.—**Sal microcosmicum,** in early *chem.*, sodium-ammonium phosphate. The term *microcosmic salt* is still in use.—**Sal mirabile perlatum,** in early *chem.*, disodium phosphate or common phosphate of soda.—**Sal narcoticum vitrioli,** in early *chem.*, boracic acid.—**Sal plumbi,** in early *chem.*, lead acetate or sugar of lead.—**Sal polychrestum Glaseri, sal Lamerianum, sal Parisiense,** in early *chem.*, potassium sulphate, made by deflagrating sulphur with saltpeter.—**Sal polychrestum Seignetti,** in early *chem.*, potassium-sodium tartrate or Rochelle salt.—**Sal Saturni,** in early *chem.*, lead acetate or sugar of lead.—**Sal secretum Glauberi,** in early *chem.*, ammonium sulphate.—**Sal sedativum Hombergii,** in early *chem.*, boracic acid.—**Sal soda.** See *sal-soda.*—**Sal succini,** an obsolete name for *succinic acid.* Also called *flos succini.*—**Sal tartari.** See *salt of tartar*, under *salt*^{1}.—**Sal urinæ fusibile,** in early *chem.*, sodium-ammonium phosphate.—**Sal urinæ nativum,** in early *chem.*, sodium-ammonium phosphate.—**Sal vegetabile,** in early *chem.*, normal potassium tartrate, prepared by treating the tartar of wine-casks with water and neutralizing with potassium carbonate.—**Sal vitrioli.** See *salt of vitriol*, under *salt*^{1}.

salacetol (sal-as'e-tol), *n.* [L. *sal*, salt, + E. *acet(ic)* + *-ol.*] A bitter crystalline compound, $C_6H_4(OH).CO_2CH_2.COCH_3$, made by heating monochloracetone with sodium salicylate. It is an antiseptic and antirheumatic, used for diarrhea, gout, rheumatism, etc. It melts at 71° C.

salacot (sä-lä-kōt'), *n.* [Philippine Sp. *salacot*, *salacó*, < Tagalog (whence Bisaya) *salacót* = Bisaya *sadóc.*] In the Philippine Islands, a rather large umbrella-shaped hat or sombrero made of palm-leaves of palm, nito, bejuco, etc.: used in the central (Bisayan) islands chiefly by the women.

salad^1, *n.*—**Salad cucumber.** See ★*cucumber.*

salad-tree (sal'ad-trē), *n.* The red-bud or American Judas-tree, *Cercis Canadensis.*

salai-gugal (sa"lī-gö'gal), *n.* [Hind.] Same as *gugal.*

salai-tree (sa'lī-trē), *n.* [Anglo-Ind.] See *Boswellia* and *gugal.*

salamander, *n.* 9. A wire basket in which waste paper or other combustible refuse can be gathered by street-cleaners, and in which such waste can be burned.—10. A mass of solidified and infusible material in an iron blast- or other smelting-furnace hearth. It usually consists of wrought-iron.—**Salamander's hair.** See ★*hair*^{1}.—**To drink a salamander to one,** in German students' slang, to drink one's health in Bavarian beer, emptying the glass in three draughts, and finally bumping it on the table. *Muret-Sanders.*

salamanderite (sal-a-man'dėr-īt), *n.* [*salamander* + *-ite*^{2}.] A trade-name of a fire-proof plastic material, of which asbestos is the principal ingredient, molded and colored to imitate wood, tiling, etc., in house-construction.

salamandrine, *n.* 2. An alkaloid which has been obtained from the acid cutaneous secretion of the spotted salamander, *Salamandra maculosa.* Also *salamandarine.*

salamangue (sä-lä-män'gā), *n.* [W. African?] A large characinoid fish, *Hydrocyon goliath*, which attains a length of four feet. It is found in the Kongo river and is very destructive to other fish.

salanders, *n.* See *sellanders.*

salantol (sal'an-tol), *n.* [*sal(acetol)* + *-ant-* + *-ol.*] A trade-name of salacetol prepared from acetone and salicylic acid. It forms scales or acicular crystals and resembles salol in physiological action.

Salariichthys (sa-lā-ri-ik'this), *n.* [NL., < L. *Salarias* + Gr. ἰχθύς, fish.] A genus of blennioid fishes found from the West Indies to Brazil.

sälbling (zelb'ling), *n.* [G.] The European char. See *char*^{4}.

salcilla (säl-sēl'yä), *n.* [Sp. *zarcilla*, dim. of *zarza*, bramble.] In Porto Rico, *Schrankia leptocarpa*, a trailing or climbing leguminous shrub armed with recurved prickles. See *Schrankia.*

salcional (sal'si-ō-nal), *n.* Same as *salicional.*

saldid (sal'did), *n.* and *a.* I. *n.* A member of the heteropterous family *Saldidæ.*

II. *a.* Having the characters of or belonging to the family *Saldidæ.*

sale^1, *n.*—**Sale or return.** See ★*return*^{1}.—**Sheriff's sale,** the public sale by a sheriff or deputy of property seized in execution of the mandate of legal process.

salema (sa-lē'mä), *n.* [NL. *salema* (Marcgrave); appar. Braz.] A name applied to *Archosargus unimaculatus*, a sparoid fish, and to *Kyphosus analogus*, a fish of the family *Kyphosidæ.*

salenixon (sal-e-nik'son), *n.* [A corruption of NL. *sal enixum.* Other forms are *salonix* and *sally.*] A manufacturers' name for sodium acid-sulphate, or niter-cake, left as residue from heating sodium nitrate with surplus sulphuric acid in the manufacture of nitric acid.

saleratus, *n.*—**Soda saleratus,** sodium acid-carbonate, or bicarbonate of soda of commerce, as distinguished from the corresponding potassium compound. See *saleratus.*

salfemane (sal-fem'ān), *n.* [*sal*, a syllable mnemonic of *s(ilica)* and *al(umina)*, + *fem*, a syllable mnemonic of *fe(rro)m(agnesian)*, + *-ane*, a termination given to names of classes.] In *petrog.*, in the quantitative system of classification, the name of the third class of igneous rocks, which contain equal or nearly equal amounts of salic minerals (normative quartz, feldspars, feldspathoids, corundum, or zircon) and femic minerals (normative ferromagnesian and other minerals), that is, within the ratio $< \frac{5}{3} > \frac{3}{5}$. See ★*rock*^{1}.

salfemic (sal-fem'ik), *a.* [*sal*, a syllable mnemonic of *s(ilica)* and *al(umina)*, + *fem*, a syllable mnemonic of *f(erro)m(agnesian)*, + *-ic.*] In *petrog.*, in the quantitative system of classification, having salic and femic minerals in equal or nearly equal proportions, that is, within the ratio $< \frac{5}{3} > \frac{3}{5}$. See ★*rock*^{1}.

salfern (sal'fėrn), *n.* [A corruption of *saffron?*] The corn-gromwell, *Lithospermum arvense.*

salic^2 (sal'ik), *a.* [*sal*, a syllable mnemonic of *s(ilica)* and *al(umina)* + *-ic.*] In *petrog.*, in the quantitative system of classification, having the characters of or belonging to the first group of standard minerals, that is, those characterized chiefly by silica (quartz) or alumina (the normative feldspathic minerals). The salic minerals are normative quartz, feldspars, leucite, nephelite, sodalites, corundum, and zircon. See ★*rock*^{1}.

Salicales (sā-li-kā'lēz), *n. pl.* [NL. (Lindley, 1836), < *Salix* (*salic-*) + *-ales.*] An order of dicotyledonous apetalous (mostly achlamydeous) plants containing only the family *Salicaceæ* (which see).

salictum (sa-lik'tum), *n.* [L. *salictum*, a plantation of willows, < *salix*, willow.] A willow holt; a plantation of willows for basket-making. *Encyc. Brit.*, III. 422.

Salicyl hydrid. Same as *salicylic aldehyde.*

salicylage (sal'i-sil-āj), *n.* [*salicyl* + *-age.*] The adding of salicylic acid to food in order to preserve it.

salicylal (sal'i-sil-al), *n.* [*sali(cyl)* + *-al*^{3}.] Same as *salicylic aldehyde.*

salicylaldehyde (sal"i-sil-al'dẹ̄-hīd), *a.* Same as *salicylic aldehyde.*

salicylamide (sal"i-sil-am'id), *n.* The yellowish crystalline amide, $C_6H_4(OH).CONH_2$, of salicylic acid. It is made by treating oil of wintergreen with concentrated ammonia. It has an acid reaction, is easily hydrolyzed to salicylic acid and ammonia, and melts at 139.9° C.

salicylide (sal'i-sil-īd), *n.* [*salicyl* + *-ide*^{1}.] Same as ★*tetrasalicylide.* See also ★*polysalicylide.*

salicylous (sal-i-sil'us), *a.* [*salicyl* + *-ous.*] Containing less oxygen than salicylic acid.—**Salicylous acid.** Same as *salicylic aldehyde.* An undesirable name. *Buck*, Med. Handbook, VII. 9.

salicylsulphonic (sal"i-sil-sul-fon'ik), *a.* Same as ★*sulphosalicylic.*

salicyluric (sal"i-si-lū'rik), *a.* [*salicyl* + *uric.*] Derived from salicylic acid and found in urine.—**Salicyluric acid,** a crystalline acid, $(OH)C_6H_4CO.NHCH_2COOH$, or salicylglycocoll. It is the form in which salicylic acid is excreted in the urine when taken internally. It melts at 160° C.

salifebrin (sal-i-feb'rin), *n.* [*sali(cylic)* + L. *febris*, fever, + *-in*^{2}.] A trade-name of a proprietary compound of acetanilide and salicylic acid. It is sometimes used in medicine as a febrifuge.

saliferous, *a.* 2. Bearing or containing salt: said of plants that grow in saline soil.

saliformin (sal-i-fôr'min), *n.* [*sali(cylic)* + *form(aldehyde)* + *-in*^{2}.] A trade-name of hexamethylenetetramine salicylate. It is used in medicine.

saligallol (sal-i-gal'ol), *n.* A resinous solid consisting of pyrogallol-disalicylate, $C_6H_3(OH)(C_7H_5O_3)_2$, marketed in acetone solution: used as a skin varnish for applying antiseptics.

saligenin (sa-lij'e-nin), *n.* [*sali(cyl)* + *-gen* + *-in*^{2}.] A crystalline phenol-alcohol, $C_6H_4(OH).CH_2(OH)$, or orthohydroxybenzyl alcohol, which is formed when salicin is hydrolyzed by emulsin or by dilute acids; also made by reducing salicylic aldehyde with sodium amalgam. It melts at 86° C.

saligenol (sa-lij'e-nol), *n.* Same as ★*saligenin.*

Salina beds. See ★*bed*^{1}.

salinaphthol (sal-i-naf'thol), *n.* [*sali(cylic)* + *naphthol.*] Same as ★*betol.*

saline, *a.* 3. Same as *halophilous.*

> This curious feature of the Tibetan flora [plants which may be found growing on the sea-coasts of Northern Europe] may be attributed to the immigration of the *saline* types of the Caspian.
>
> *Geog. Jour.* (R. G. S.), XV. 245.

saline, *n.* 2. One of the mineral salts, such as sodium or magnesium sulphate, used medicinally.

salinelle (sal-i-nel'), *n.* A mud-volcano which yields a saline product. *Geikie*, Text-book of Geol., p. 318.

salipyrin (sal-i-pī'rin), *n.* [*sali(cylic)* + *(anti)pyrin.*] A trade-name of salicylate of antipyrin, $C_{18}H_{18}O_4N_2$, a bitter-sweet substance used as a remedy for rheumatism, sciatica, pleurisy, etc. It melts at 92° C.

saliretin (sal-i-ret'in), *n.* [*sali(cylic)* + Gr. ῥητίνη, resin.] A yellowish powder, $(OH).C_6H_4,CH_2.OC_6H_4.CH_2(OH)$, formed by the action of dilute acids on saligenin. Other varieties of saliretin have had ascribed to them the formulas $C_{28}H_{26}O_5$ and $C_{56}H_{50}O_9$.

salitannol (sal-i-tan'ol), *n.* [*sali(cylic)* + *tann(ic)* + *-ol.*] A trade-name of a compound of salicylic and gallic acids, $C_{14}H_{10}O_7$. It is a colorless amorphous powder and is used in surgery as an antiseptic.

saliter (sa-lē'tėr), *n.* [Sp. *salitre*, *salitro* = Cat. *salnitre* = It. *salnitro*, < ML. *sal nitrum*, saltpeter: see *sal*, *nitrum*, and *niter.*] An Anglicized form of the Spanish name (*salitre*) for sodium nitrate which has undergone a single crystallization at the site of its natural occurrence in the district of Tarapacá, Chile.

salithymol (sal-i-thī'mol), *n.* [*sali(cylic)* + *thymol.*] Thymol salicylate, $C_6H_4(OH).CO-OC_6H_3.CH_3.C_3H_7$, a white crystalline powder made by dissolving thymol and salicylic acid in alcohol.

saliva, *n.* 2. In *entom.*, a neutral alkaline fluid secreted by the salivary glands when these are present, and, in their absence, by the epithelial lining of the esophagus. It has the same property as the saliva of vertebrates in transforming starchy foods into glucose.—**Ganglionic saliva,** saliva secreted when the submaxillary ganglion is irritated.—**Sympathetic saliva,** saliva secreted in consequence of stimulation of the sympathetic nerve.

Salivary receptacle. See ★*receptacle.*

sallee (sal'ē), *n.* [Australian.] An aboriginal name applied to many species of *Acacia.* Compare *sallow*^{1} and *sally*^{1}, believed by some to be corruptions of the aboriginal word.

sallet^1, *n.* 2. Lettuce, *Lactuca sativa.*

sally[1], *n.* 2. Also applied to several species of trees belonging to the genus *Eucalyptus.* [Austral Eng.]—**Black sally,** in New South Wales, either of two trees: (*a*) *Eucalyptus stellulata*; (*b*) *Acacia melanoxylon.* See *blackwood*, 2.—**White sally,** in Australia, either of two trees: (*a*) *Acacia longifolia*, and (*b*) *Eucryphia Moorei.* See ★*plum*1, 7.

sally[4] (sal′i), *n.* See ★*salenixon.*

sally-bloom (sal′i-blöm), *n.* The great willow-herb, *Chamænerion angustifolium.*

sally-nixon (sal″i-nik′son), *n.* See ★*salenixon.* *G. Lunge*, Sulphuric Acid, I. 96.

salm[2] (säm), *n.* [It. *salma*: see ★*salma.*] A name sometimes used in Great Britain for one fourth of a ton, five hundredweight, or 560 pounds.

salma (säl′mä), *n.*; pl. *salme* (-mā). [It. *salma*, a load, = Sp. *salma*, a pack-saddle, < ML. *sagma*, < Gr. *σάγμα*, a pack-saddle: see *seam*2.] **1.** A unit of capacity formerly used in Sicily and Malta, varying from 9⅘ to 12 cubic feet. *C. Hering*, Conversion Tables, p. 55.—**2.** A unit of land-measure used in Malta, equal to nearly 4.5 acres.

Salmian (sal′mi-an), *n.* In *geol.*, the Système Salmien, which constitutes the uppermost division of the Cambrian in the Ardennes Mountains of Belgium.

salmine (sal′min), *n.* [L. *salmo*, salmon, + *-ine*2.] A protamine, $C_{16}H_{31}O_3N_9$, found in the testes of the salmon. It is a gummy substance with an alkaline reaction.

salmon, *n.*—**Chinook salmon.** Same as *quinnat.*—**Coho salmon,** the silver salmon. See *salmon*, 2 (*d*).—**Columbia salmon.** Same as *quinnat.*—**Fraser River salmon,** the blue-back salmon. See *salmon*, 2 (*e*).—**Hokkaido salmon,** *Oncorhynchus yessoensis*, a salmon found in Japanese waters.—**Hoopid salmon,** the silver salmon. See *salmon*, 2 (*d*).—**Kennerly's salmon,** the blue-back salmon. See *salmon*, 2 (*e*).—**Lekai salmon,** the dog-salmon. See *salmon*, 2 (*b*).—**Lost salmon,** a name used along the Sacramento river for the hump-backed salmon, *Oncorhynchus gorbuscha.*—**Namaycush salmon.** Same as *great lake-trout* (which see, under *trout*1).—**Red salmon,** the blue-back salmon. See *salmon*, 2 (*e*).—**Sacramento salmon.** Same as *quinnat.*—**Sauqui (sawqui, saukeye, etc.) salmon.** See ★*sauqui.*—**Schoodic salmon.** Same as *land-locked salmon.*—**Sebago salmon.** Same as *land-locked salmon.*—**Sockeye salmon.** Same as *sauqui* ★*salmon.*—**Tyee salmon.** Same as *quinnat.*

salmon-cloud (sam′un-kloud), *n.* A band of cirro-stratus clouds stretching almost entirely across the sky and tapering at each end, by reason of perspective, so that it resembles the outline of a salmon. Sometimes it has tessellations like the scales of a fish.

salmon-club (sam′un-klub), *n.* A club used by the Indians of the North Pacific coast to kill salmon that are caught with the hook or in the net.

salmon-disease, *n.* This disease of the salmon was formerly attributed to *Saprolegnia*, but recent experiments seem to demonstrate that it is primarily due to *Bacillus Salmonis-pestis.*

salmonete (säl-mọ-nā′tạ), *n.* [Sp., < *salmon*, salmon.] Same as *goat-fish*, 2.—**Salmonete amarilla,** the yellow goat-fish, *Upeneus martinicus.*

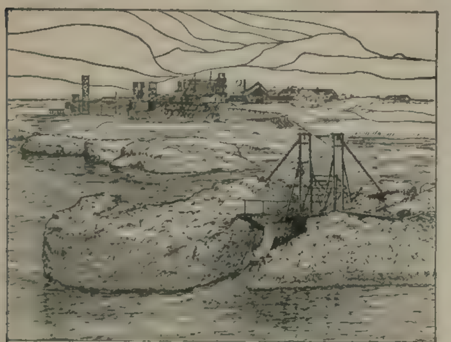
salmon-hook (sam′un-hůk), *n.* A hook attached to a long shaft, used by the Indians of the North Pacific coast for gaffing salmon.

salmonoidean (sal-mọ-noi′dẹ-ạn), *a.* Resembling a salmon.

salmon-patch (sam′un-pach), *n.* A salmon-colored spot on the cornea which occurs in certain cases of syphilitic inflammation of that structure.

salmon-trout, *n.*—**Kamchatka salmon-trout,** *Salmo mykiss* of Kamchatka.

salmon-wheel (sam′un-hwēl), *n.* A large wheel fitted for taking salmon, used in the Dalles of the Columbia river. It is adjusted so that salmon running up narrow swift channels are seized by its flanges and thrown into a receptacle on shore. Commonly called a *fish-wheel.*



Salmon-wheel on the Columbia River.

Salmopercæ (sal-mọ-pėr′sē), *n. pl.* [NL., < L. *salmo*, salmon, + *perca*, perch.] A small suborder of fishes which contains only two genera: a singular archaic group which has fin-spines, ctenoid scales, and the teeth only on the premaxillary, like the *Acanthopteri*, and adipose fin, naked head, and abdominal ventrals, like the *Isospondyli.*

salocoll (sal′ọ-kol), *n.* Phenocoll salicylate.

Salol camphor. See ★*camphor.*

salon, *n.* 2. Specifically, a periodical social gathering of men and women representative of the wit, fashion, literature, art, or politics of the time. The salon flourished principally in France during the eighteenth century.

salonix (sal′ọ-niks), *n.* See ★*salenixon.*

saloon-deck (sạ-lön′dek), *n.* See ★*deck*, 2 (*c*).

Salop. An abbreviation of ML. or NL. *Salopia*, Shropshire.

salophen (sal′ọ-fen), *n.* [*sal*(*icylic*) + *phen*(*yl*).] A trade-name of acetyl-paramido-phenyl salicylate, used medicinally as an antiseptic, antipyretic, and analgesic remedy.

Salopian porcelain. See ★*porcelain*1.

salpingion (sal-pin′ji-on), *n.* [NL., < Gr. *σαλπίγγιον*, dim. of *σάλπιγξ*, a tube: see *salpinx.*] In *craniom.*, the upper lateral terminus of the ostium tympanicum of the pars ossea tubæ Eustachii. *Von Török.*

salpingo-oöphoritis (sal-ping″gọ-ō″ọ-fọ-rī′-tis), *n.* [NL., < Gr. *σάλπιγξ*, tube, + E. *oöphore* + *-itis.*] Inflammation of both the ovary and the Fallopian tube.

salpingostomy (sal-ping-gos′tọ-mi), *n.* [NL., < Gr. *σαλπιγξ*, tube, + *στόμα*, mouth, + *-y*3.] The operative formation of a fistula communicating with the Fallopian or Eustachian tube.

salpinx, *n.* 4. An ancient Greek military trumpet of metal having a straight, flaring tube. It was used for signals. Compare the Roman *tuba* (★*tuba*1, 4).

salseparin (sal-sep′ạ-rin), *n.* Same as ★*parillin.*

salseparisin (sal-sẹ-par′i-sin), *n.* Same as ★*parillin.*

salsify-rot (sal′si-fi-rot), *n.* See ★*rot.*

salt[1], *n.* 14. *pl.* In *glass-manuf.*, same as *glass-gall.* See *anatron*, 1.—15. *pl.* A name given to mixed saline masses obtained by evaporating the water of mineral springs, or by artificially mixing the saline constituents of such springs in the proportions indicated by analysis of the water: as, Karlsbad *salts*, Vichy *salts*, etc.—**Alkaline salt.** (*a*) A salt of one of the alkaline metals, as potassium or sodium. (*b*) A salt which exhibits alkaline reaction or changes the red color of moist litmus-paper to blue, as does disodium orthophosphate.—**Aniline salt.** See ★*aniline.*—**Bile salt.** See ★*bile*2.—**Bitter salts.** Same as *Epsom salts.*—**Black salt.** (*a*) The crude solid product obtained, in the Leblanc process for making carbonate of soda from common salt, by boiling down the liquor furnished by leaching black-ash. It consists chiefly of monohydrated sodium carbonate. (*b*) An impure common salt from India, colored by admixture with tannate of iron. See *bitnoben.*—**Blood-lye salt,** ferrocyanide of potassium, or yellow prussiate of potash: so called because blood from slaughter-houses is one of the forms of animal matter used to furnish carbon and nitrogen in its manufacture.—**Covenant of salt.** See ★*covenant.*—**English salt.** See ★*sal anglicum.*—**Fishery salt,** common salt of moderately coarse grain, obtained by rather slow evaporation of brine, used in curing fish.—**Fishing salt.** Same as *fishery* ★*salt.*—**Glaziers' salt,** in old *chem.*, potassium sulphate.—**Green salt of magnus,** the first-discovered of the numerous ammoniacal platinum compounds. It is a compound of tetrammine-platinous chlorid with platinous chlorid, $(NH_3)_4PtCl_2.PtCl_2$.—**Hexammine salt,** one of a class of salts of cobalt, obtained by exposure to the air of dilute solutions of ordinary cobaltous salts to which ammonium chlorid and ammonia have been freely added. Also called *luteocobaltic salt.*—**Hopper salt,** coarse-grained common salt, in cubical crystals with hopper-like depressions on the faces, produced by slow evaporation of brine with addition of a little alum to the contents of the pan.—**Killed spirits of salt,** a workmen's name for a solution of zinc chlorid made by adding scraps of zinc to 'spirits of salt' (hydrochloric acid) until the smell of the free acid has been destroyed: used by tinsmiths and others to facilitate soldering by cleansing of oxid the metallic surfaces to be united.—**Lime, sulphur, and salt wash.** See ★*wash.*—**Luteocobaltic salt.** Same as *hexammine* ★*salt.*—**Marine salt,** sodium chlorid or common salt obtained from sea-water by evaporation.—**Metallic salt,** a salt of which the basic or electropositive component is a metal, as cupric sulphate or silver nitrate.—**Preparing salts.** See ★*sodium stannate.*—**Primary salt,** a salt in which one only out of a larger number of hydrogen atoms in the corresponding acid is replaced by a metal or electropositive radical, as monosodic orthophosphate (NaH_2PO_4).—**Provision salt,** a trade-name for common salt of the degree of coarseness of grain commonly used for preserving meat.—**Salt acid,** hydrochloric acid as obtained from common salt by heating with sulphuric acid.—**Salt of amber,** an obsolete name for succinic acid.—**Salt of urine,** ammonium carbonate.—**Salt of Venus,** copper sulphate or blue vitriol.—**Seignette salt,** sodium potassium dextrotartrate ($NaKC_4H_4O_6.4H_2O$); also the corresponding sodium-ammonium salt.—**Stassfurt salts,** the mixed salts, chiefly of potassium and magnesium, which occur in large quantity overlying a great bed of rock-salt in the neighborhood of Stassfurt in Prussian Saxony. They are of great value, particularly as the source of potassium compounds for industrial and agricultural use.—**Syracuse salt.** See *Salina* ★*beds.*—**Vacuum-pan salt,** sodium chlorid or common salt obtained by evaporation of brine in a vacuum-pan or under reduced atmospheric pressure.

salt[1], *v. t.* 7. To enrich (a natural deposit) by artificial means, usually for the purpose of deceiving prospective purchasers. Thus a gold-mine is salted when powdered gold is shot into the rock with a gun; a sample is salted when metal, or rich ore, is mixed with it; a mineral spring is salted by the addition of salts; an oil-well by the addition of rich oils, etc.—**Salting of boilers,** in older marine practice, in which natural sea-water was used in the boilers, a name given to the accumulation of scale on the heating surfaces when sea-water was evaporated. Such scale protected the iron from the action of free hydrochloric acid, but the deposit on the plate and the concentration of the solution in the boiler made it necessary to burn more coal. After twice the normal amount of salt had accumulated in the water, or the proportion exceeded 2 in 33 (8 to 10 ounces of salt to the gallon), the boiler was blown down somewhat and new salt water from without was pumped in. Every boiler-room carried salinometers to determine the degree of concentration and indicate the point at which blowing down should be done. In modern practice no salt water is introduced, but, if necessary to supply the waste from leakage and use of whistles and sirens, water from the distillers is pumped in.—**To salt out.** (*b*) In *soap-making*, to separate (the soap) as curd from the original solution by the addition of common salt.

salta (sal′tạ̈), *n.* [Irreg. < L. *saltare*, leap. Compare ★*halma*, which is from the related Gr. verb.] A game which resembles halma, its object being to move one's men, which are set up like checkers, to a similar position on the opposite side of the board before the adversary can get all his men arranged on one's own side. This is usually accomplished by skilfully forcing the opponent to jump over certain men.

saltation, *n.* 1. Specifically, in *biol.*, a wide fluctuation or mutation. See the extract.

> The name '*saltation*,' or in recent years 'mutation, has been applied to extreme fluctuation, the immediate cause of which is unknown. The experiments of Dr. Hugo de Vries on the saltations of the descendants of an American form of evening primrose (Œnothera lamarckiana) have recently drawn general attention again to the possibility that *saltation* has had a large part in the process of formation of species.
>
> [Foot-note.] The name *saltation* has been long used for wide fluctuations without recognizable cause. The more recent name mutation chosen by de Vries has been in use for years for the slow changes appearing in geological time. *Pop. Sci. Monthly*, June, 1906, p. 485.

saltatoric (sal-tạ-tor′ik), *a.* Same as *saltatory.*

Saltatory chorea. See ★*chorea.*—**Saltatory spasm.** Same as *saltatorial spasm* (which see, under *spasm*).

salt-bottom (sâlt′bot″um), *n.* A nearly level plain on which are deposits of salts.

salt-box, *n.* 3. An English naval term for a receptacle in which a temporary supply of gun-cartridges is kept on deck.

saltery (sâl′tėr-i), *n.*; pl. *salteries* (-iz). [*salt*1 + *-ery.*] A factory in which salted fish is prepared and put up for market.

> During 1900 there was but one *saltery* operated solely as such in this district. It is situated on the Nushagak and had an output of 7,186 barrels of redfish and 536 barrels of king salmon for the season.
> *Sci. Amer. Sup.*, March 21, 1903, p. 22751.

salt-grape (sâlt′grāp), *n.* See ★*grape*1.

salt-grass, *n.* The principal American salt-grass is *Distichlis spicata*, less properly called *alkali-grass.* This grass endures the salt of the sea-shore and the alkali of the interior, chiefly in moist ground. It serves as a sand-binder, and is eaten by stock where nothing better can be had. Also called *sand-grass.*—**Bunch salt-grass,** *Spartina junciformis*, a grass of the Gulf coast growing on the landward side of salt-marshes. It forms great tufts from 3 to 6 feet across and from 1 to 4 feet high. The evergreen spiny-pointed leaves are resinous and will burn at any season. Though too bunchy for mowing, it is of great value for grazing, but is said not to produce fat on cattle.—**Fine-top salt-grass.** (*a*) A rush-grass, *Sporobolus airoides*, growing in tussocks in more or less alkaline or saline sandy soils along streams from Montana to Texas and California, and yielding a coarse fodder. Its panicle has slender, widely spreading branches. Also called *alkali zacaton.* (*b*) Same as *rough-leafed* ★*salt-grass.*—**Mexican salt-grass,** *Eragrostis obtusiflora*, a rigid species with sharp-pointed leaves, resembling *Distichlis* in habit, found in sandy alkali soil in Arizona.—**Rough-leafed salt-grass,** *Sporobolus asperifolius*, a low, somewhat creeping species, like *Distichlis* often forming a dense continuous turf. It is found on alkaline plains from Texas to British Columbia, and, as tolerant of alkali, may be worthy of propagation. It has an expanded panicle with capillary branches.

saltiered (sal′tērd), *a.* In *her.*, having a saltier.

salt-money, *n.* 2. Cakes of salt used as a medium of exchange.

salt-mouth (sâlt′mouth), *n.* A wide-mouthed bottle suitable for holding solid chemicals.

saltpeter, *n.* 2. In the tobacco industry, a white saline efflorescence on the midvein and lateral ribs of the curing leaf, consisting usually of a mixture of several salts, sometimes with only a trace of saltpeter. It is thought to be developed by dry weather during the first stages of curing. *U. S. Dept. of Agri.*, Rept. 65, p. 43.—**Soda saltpeter.** Same as *Chile saltpeter.*

salt-tree, *n.* 2. In India, a species of tamarisk, *Tamarix orientalis*, the twigs of which are frequently covered with a slight efflorescence of salt which is used by the poorer natives. See *tamarisk.*

salt-well (sâlt′wel), *n.* A well sunk, usually by boring, in order to procure salt-brine.

salt-yard (sâlt′yärd), *n.* An inclosure in which rock-salt is deposited as it comes from the mine, prior to crushing and screening.

> Since the gathered salt consists of crystals of various sizes, many manufacturers pass it, as it comes from the *salt yard* (the name given to these works) into the storehouse, over a wire screen with 2½ meshes to the square inch, kept in motion by hand or steam power.
> *Sci. Amer. Sup.*, Oct. 3, 1903, p. 23198.

salubrol (sạ̄-lū′brol), *n.* [L. *salubris*, healthy, + *-ol.*] A trade-name of tetrabromomethylene diantipyrin prepared by the action of bromine on methylantipyrin. It has no odor, and is used in surgery instead of iodoform as an antiseptic dusting-powder.

salumin (sal′ū-min), *n.* [*sal*(*icylic*) + (*al*)*umin*(*ium*).] A trade-name for *aluminium salicylate.* It is a reddish-white powder used as an antiseptic.

salung (sa-lung′), *n.* [Siamese *salung.*] A current Siamese silver coin, one fourth of a tical, equivalent to 7 United States cents.

salv, *n.* and *v.* A simplified spelling of *salve.*

salvadoraceous (sal″vạ-dọ̄-rā′shius), *a.* Belonging to the plant family *Salvadoraceæ.*

salvadorite (sal′va-dōr-īt), *n.* [*Salvador* (see def.) + *-ite*^{2}.] A hydrous sulphate of copper and iron ($((\mathrm{Cu,Fe})\,\mathrm{SO_4}+7\mathrm{H_2O})$) analogous to pisanite, but differing in crystallization and optical characters: found at the Salvador mine, Quetena, Chile.

salve^1, *n.*—**Blistering-salve,** an ointment containing cantharides.

salverform (sal′vėr-fôrm), *a.* [*salver*^{3} + *-form.*] Same as *salver-shaped.*

> The two species of Quamoclit have scarlet, *salverform* corollas adapted to humming-birds.
> *Amer. Nat.*, June, 1903, p. 374.

salviniaceous (sal-vin-i-ā′shius), *a.* Belonging to or resembling the *Salviniaceæ*, a family of cryptogamous plants.

Salvio-Cochrane gambit. See ★*gambit.*

salylic (sa-lil′ik), *a.* [*sal*(*ic*)*ylic.*] Obtained from salicylic acid.—**Salylic acid,** a supposed isomer of benzoic acid, $\mathrm{C_6H_5COOH}$, made by successive treatment of salicylic acid with phosphorus pentachlorid and sodium amalgam.

Salzburg black, vitriol. See ★*black*, ★*vitriol.*

sam^1, *v. t.* 3. In *tanning*, to pile up (the hides) after removal from the tan-pits, covering the heap and allowing it to stand for some time in order to soften the leather by equal distribution of moisture and slight fermentative heating.

Sam^3 (sam), *n.* A familiar abbreviation of *Samuel.*—**Shasta Sam,** a variety of California jack in which the remainder of the pack is placed on the table face down.

Sam., Saml. Abbreviations of *Samuel*, a book of the Old Testament.

S. Am. An abbreviation of *South America* or *South American.*

samaderin (sam-a-dē′rin), *n.* [*Samadera* + *-in*^{2}.] A crystalline glucoside found in seeds of *Samadera Indica.* See *karinghota.*

samadh (sa-mäd′), *n.* [Hind. *samādh*, tomb, < Skt. *samādhi*, deep meditation, profound devotion, lit. union, joining, < *sam*, together, + *ā*, to, + √*dhā*, put.] A place of immolation or burial, especially the tomb of a Hindu yogi (originally of one who submitted to be buried alive), supposed to be lying in a state of trance.

samaria (sạ-mar′i-ạ̈), *n.* [NL., < *samarium.*] Samarium oxid.

Samaritan version, a translation of the Samaritan Pentateuch into the Samaritan dialect (a variety of western Aramaic), committed to writing about the fourth century A.D. The manuscript was brought to Europe in 1616 and was first printed in the Paris polyglot in 1632.

samarium, *n.* This metal belongs to the cerium group. The oxid is white, the salts yellow, and characteristic absorption and spark spectra have been obtained. Like so many other members of the cerium and yttrium groups, samarium is of uncertain individual identity. There seems now but little doubt that in its oxid as originally described there is present at least one other element, the europium of Demarçay, Urbain, and Lacombe.

sambhar, *n.* Same as *sambur.*

sambo, *n.* 2. The offspring of a negro and an Indian.

sambucist (sam-bū′sist), *n.* [Gr. *σαμβυκιστής* (fem. *σαμβυκίστρια*), < *σαμβύκη*, sambuka.] One who plays upon a sambuca.

Samek (sä′meċh), *n.* [Heb. *sāmek, sāmekh.*] The fifteenth letter (ס) of the Hebrew alphabet, corresponding to the English *s.* Its numerical value is LX.

samfire, *n.* An amended spelling of *samphire.*

sammy, *v. t.* 2. To season (skins) to a uniform temper. *C. T. Davis*, Manuf. of Leather, p. 386.

samphire, *n.*—**Marsh samphire,** the common glasswort, *Salicornia herbacea.*

sampire (sam′pīr), *n.* In the Bahamas, *Lithophila vermicularis*, a creeping herb of the amaranth family, common on sandy shores. *Memoir Torrey Bot. Club*, XII. 35.

Sample area. See ★*valuation area*, ★*experiment area.*

sampler, *n.* 4. A kind of shovel divided into several parallel rectangular compartments, used in taking uniform and similar samples from a heap of pulverized ore or other material to be assayed.

sample-shovel (sam′pl-shuv″l), *n.* Same as ★*sampler*, 4.

sample-tree (sam′pl-trē), *n.* In *forestry*, a tree which in diameter, height, and volume is representative of a tree class. A *class sample-tree* is one which in diameter, height, and volume represents the average of several tree classes. Also called *arithmetical mean sample-tree.*

samson (sam′sọn), *n.* [Also *sampson;* so named in allusion to *Samson*, the strong man (Judges xiv.–xvi.). See *samson-post.*] 1. An appliance for loosening frozen logs by horse-power, consisting of a strong, heavy timber and a chain terminating in a heavy swamp-hook. The timber is placed upright beside the log to be loosened, the chain fastened around it, and the hook inserted low down on the opposite side of the log. Leverage is then applied by a team hitched to the upper end of the upright timber.—2. A form of brace or stay, used in long and otherwise flexible machines to secure strength and rigidity under the stress of operation at high speed. Particularly used in such textile-machinery as roving-frames.

> The most rigid, and strongest frame [roving-frame] built, having an abundance of *samsons*, which are connected with a rail running the whole length of frame at the back, and, in addition, girths running from this rail, connecting with the spindle rail, and holding bearings for our lifting shaft. *Trade-catalogue.*

samson (sam′sọn), *v. t.* [*samson*, *n.*] In *lumbering*, to direct the fall of (a tree) by means of a lever and pole.

samson-fish (sam′sọn-fish), *n.* 1. In Sydney, a fish, *Seriola hippos*, of the family *Carangidæ.* —2. In Melbourne, the young of a fish, *Arripis salar*, of the family *Percidæ.* See *salmon*, 3 (*c*).

Samyda, *n.* 2. A genus of plants of the family *Meliaceæ.* They are trees or shrubs, with abruptly pinnate leaves, entire leaflets, and hermaphrodite flowers in panicles or raceme-like or spike-like clusters borne either in the axils of the leaves or on defoliated branches. There are about 80 species, chiefly natives of tropical America, but 3 are West African. *Samyda Guidonia* (also known by its later name *Guarea trichilioides*) is the *guara-guao* or *muskwood* of the West Indies. See ★*guaraguao.*

Sana whiting. See ★*whiting*^{2}.

sand^1, *n.*—**Ashdown sand,** in the Wealden formation of Sussex and Kent, England, the lowest stratigraphic division constituting, with the Fairlight clays, the basal member of the Hastings sand. They are 400–500 feet thick, and lie at the bottom of the Cretaceous system in England.—**Barking sands.** See *singing* ★*sands.*—**Black sand,** dark minerals, mainly magnetic iron-sand, found with alluvial sand.—**Blown sand,** sand drifted by the wind; the dune sand of coast regions or the shifting sands of deserts.—**Campinian sands.** See ★*Campinian.*—**Dinotherium sand,** the lower division of the Pliocene Tertiary in the vicinity of Mainz, Germany, characterized by the presence of remains of *Dinotherium giganteum, Mastodon, Rhinoceros,* and various other mammals.—**Foraminiferal sand,** a sand or sandy rock largely constituted of the broken and comminuted remains of *Foraminifera.*—**Glass sand,** quartz sand of a quality suitable for use in making glass. It should consist of silica as free as possible from admixture with foreign substances, especially from oxid of iron if colorless glass is to be made, and as finely and uniformly divided as possible. In 1903, 823,044 short tons of glass sand were produced in the United States.

> The *glass sands* about South Vineland are believed to belong to this formation, being referable to its upper horizons.
> *R. D. Salisbury*, in Geol. Surv. of New Jersey, 1895, p. 5.

Graining-sand, a sharp-edged sand used by lithographers to roughen the surface of a stone and prepare it for the use of a crayon.—**Hastings sands.** The Hastings sand group (according to Geikie) in Sussex and Kent comprises the following subdivisions in descending order: Tunbridge Wells sand (with Grinstead clay); Wadhurst clay; and Ashdown sand (with Fairlight clays). The total thickness is about 1,000 feet. These deposits are regarded as of delta origin, and their abundant organic remains are chiefly fluviatile and terrestrial, comprising plants, fishes, the remains of dinosaurian reptiles, pterodactyls, and turtles. The deltoid formation in which these remains occur extends in an east-and-west direction for at least 200 and from north to south for perhaps 100 miles. Hence the delta may have been nearly 20,000 square miles in area. It has been compared with that of the Quorra. In reality, however, its extent must have been greater than its present visible area, for it has suffered from denudation and is to a large extent concealed under more recent formations. The river probably descended from the northwest, draining a wide area, of which the existing mountain groups of Britain are perhaps mere fragments. *Geikie*, Text-book of Geol., p. 118.—**Headon Hill sands,** the uppermost division of the Eocene Tertiary in the Hampshire basin in England: equivalent to the Barton sands.—**Laekenian sands,** a division of the Middle Eocene Tertiary series in Belgium, lying between the Bruxellian and the Wemmelian sands. —**Midford sands,** passage-beds from the Lias into the Lower Oölite, in the southwestern counties in England, which consist of yellow sands with some limestones in which ammonites and other cephalopods are extremely abundant.—**Monazite sand,** a sand from which monazite may be washed: chiefly applied to certain sands in North Carolina, where this mineral is commercially produced.—**Musical sands.** Same as *singing* ★*sands.*—**Neudorf sands,** a division of the Miocene Tertiary in the Vienna basin, lying below the Leitha limestone, which is near the top of the Mediterranean or marine stage.—**Northampton sands,** a subdivision of the Jurassic system lying at the base of the Lower Oölites in England. They are regarded as of estuarine origin, and carry fresh-water fossils of the genera *Cyrena* and *Unio* and brackish-water forms such as *Ostrea* and *Modiola.*—**Orange sand.** Same as *Lafayette* ★*group.*—**Paluxy sands,** a subdivision of the Lower Cretaceous system in Texas, constituting the uppermost member of the Trinity formation which lies at the base of the series. They rest on the Glen Rose limestone and clays, and the fauna has a marked resemblance to that of the Lower Cretaceous of Portugal. —**Portland sand,** the lowest division of the Portlandian stage of the Jurassic system in England. See *Portland stone*, under *stone.*—**Pötzleinsdorf sands,** a series of fine yellow sands containing marine shells which forms a local facies of the Mediterranean stage of the Miocene Tertiary in the Vienna basin of Austria.—**St. Maurice sands,** in *geol.*, a division of the marine Pleistocene deposits in eastern Canada.—**Saxicava sand,** the uppermost member of the Pleistocene deposits in eastern Canada, laid down during a depression of the land when marine waters entered the present valley of the St. Lawrence, and containing the mollusk *Saxicava rugosa*, bones of whales, etc.—**Sea sand,** a sand which consists, in the main, of fragments of quartz; but on some coasts coral sand is found widely distributed, consisting of small fragments and grains of calcareous corals.—**Singing sands,** a variety of sand, sometimes found upon sea-beaches or in deserts, which gives out a musical note under a footfall. It is a moot point whether the note is due to the expulsion of air confined between the grains, or to their rubbing upon one another, the grains possessing varying hardness, or to some cause not yet discovered. —**Sorel sands,** a division of the Pleistocene marine deposits in Canada between the St. Lawrence river and Lake Champlain.—**Strong sand,** a sand which contains clay or organic matter in admixture.—**Sugar-sand.** See ★*sugar-sand.*—**Thanet sand.** See *Thanet beds.*—**To give her sand,** in *railroading*, to allow a stream of sand to fall on the rails just in advance of the driving-wheels of a locomotive, to secure a better adhesion when the track is smooth or slippery from rain; also, to allow sand to fall on the rails from an electric car for the same purpose, or to prevent the wheels from skidding or sliding on a down grade or wet track when the brakes are applied. Also, in general, to check or delay anything, as a process, while in operation. [Colloq.]—**Trent sand,** a trade-name for silicious sand from the beds of the Trent, Severn, and some other English rivers, used as a polishing material.—**Volcanic sand** or **ash,** the finer detritus erupted from volcanic craters, consisting of angular or rounded fragments of rock or lava up to about the size of a pea.—**Weak sand,** a foundry term, used in England, for molding-sand in which no element is present to furnish gas from its carbonization.

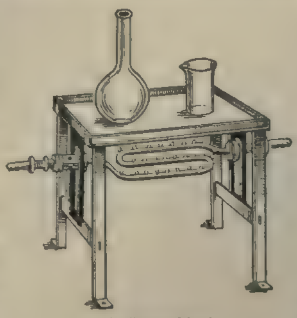
sandalwood, *n.*—**Bastard sandalwood.** (*b*) See ★*dummele.*—**False sandalwood,** the yellow wood of a small tree, *Ximenia Americana*, which when powdered is often substituted for the true sandalwood.—**Fragrant sandalwood,** in Australia, *Mida spicata.* See *Fusanus.* —**Native sandalwood.** (*a*) In Tasmania, a straggling seaside shrub of the dogbane family, *Gynopogon buxifolius,* yielding a fine, close-grained wood smelling strongly of coumarin. (*b*) In Australia, a small tree, *Mida persicaria.*—**Sandalwood camphor.** See ★*camphor.*—**Scrub sandalwood,** a small tree of Australasia, *Exocarpus latifolia,* belonging to the sandalwood family and yielding an excellent cabinet wood.

sandaracolic (san″da̤-ra̤-kol′ik), *a.* Derived from sandarac.—**Sandaracolic acid,** an acid obtained from sandarac. It was probably inactive pimaric acid.

sandat (soṅ-dä′), *n.* [F. *sandat.*] The European pike-perch, *Sandrus lucioperca.*

sand-bar (sand′bär), *n.* A bar of sand formed in the bottom or at the mouth of a river.

sand-bath, *n.*—**Ruedorf's sand-bath,** a simple form of sand-bath in which the temperature can be regulated by raising or lowering an S-shaped burner.



Ruedorf's Sand-bath.

sand-belt (sand′belt), *n.* See ★*sandpapering-machine.*

sand-bin (sand′bin), *n.* A pocket or bin in a shed in or adjacent to a foundry in which molding-sand is received and stored ready for use.

sand-binder (sand′bīn″dėr), *n.* A plant which serves to bind or fix shifting sands: commonly a grass. Sand-binding grasses are either stout and coarse, with deeply burred root-stocks sending up scattered tufts resistant to waves and wind (see ★*cumaphyte*), such as the maram, *Ammophila arenaria;* or low and creeping over the surface, emitting fibrous roots at intervals, and forming close leafy mats, as the St. Augustine grass, *Stenotaphrum secundatum.* The species of sand-binding grasses are very numerous. See *blow-out grass,* under ★*blow-out.*

sand-blast (sand′blȧst), *v. t.* To act upon by the sand-blast, or a current of air or steam carrying dry sand-particles at the high velocity of the jet: used to remove paint or oxid of iron from structures, and for general cleansing of metal surfaces, as well as for decoration of glass and other hard surfaces.

> A simple method is to *sand-blast* the exterior of the bulb, whereby it acquires an appearance similar to that of ground glass. *Encyc. Brit.,* XXVIII. 88.

sand-box, *n.* 4. A box to hold a small quantity of foundry-sand for molders' use, placed near the flask or the molding-machine. In use the sand-box is often above the molding-machine, so that the sand may be delivered by gravity as required.—5. In a street-car, a box or other receptacle for holding sand used in sprinkling the rails to obtain a better adhesion for the wheels. It is usually fitted with a delivery-pipe and valve controlled by the motorman.

sand-breast (sand′brest), *n.* A dam or front in an iron-smelting furnace, made of sand and fire-clay with iron backing, so as to be easily replaced as it is eroded by heat and chemical action. The construction of molded fire-brick with water-cooling in the iron back is the more modern design. The cooling prevents both softening and chemical combination.

sand-bur, *n.* 2. The bur-grass, *Cenchrus tribuloides.* (See *bur-grass,* 1, with cut.) The sand-bur is widely distributed in sandy soils in North America, and is also found in Mexico and South America. It is an annual weed, very noxious on account of its spiny, adhesive fruits. Also one of several other species of *Cenchrus,* as *C. macrocephalus,* the large sand-bur. Compare *hedgehog-grass.*

sand-cherry, *n.*—**Western sand-cherry,** *Prunus Besseyi,* a low shrub of the prairies of western North America, ranging from Minnesota to Manitoba and south to Kansas and Utah. It is similar to the dwarf cherry or sand-cherry, *P. pumila,* but has a larger and sweeter fruit.

sand-cone (sand′kōn), *n.* A conical projection of glacial ice the rapid melting of which is prevented by a covering of sand.

sand-crusher, *n.* 2. A revolving pan fitted with heavy crushing-rolls for crushing sand preparatory to using it in casting metals.

sand-dab, *n.* 2. A common name for a flounder, *Hippoglossoides platessoides,* found on both sides of the North Atlantic.

sand-devil (sand′dev″l), *n.* A small whirlwind carrying sand, leaves, etc.

> On still days even it was rare not to be visited [camp at Modder river] by a number of small whirlwinds, called "*sand-devils,*" which would pass slowly along sucking up quantities of sand and any light articles such as pieces of paper, carrying them to an astonishing height in the air and depositing them broadcast.
> *Lancet,* March 16, 1901, p. 771.

sand-diver, *n.* 2. A fish, *Synodus intermedius,* found from the coast of southern Florida to Brazil, and common in the West Indies.

sand-draw (sand′drâ), *n.* In *geol.,* a band of pure sand, dry on the surface, marking the channel of a subterranean percolating stream which in some cases is sunken to a depth of five meters. Sand-draws abound in western Nebraska, South Dakota, and eastern Wyoming, and have a characteristic flora. *P. A. Rydberg.* [Local, U. S.]—**Sand-draw formation,** a sparse vegetation occupying a sand-draw. In Nebraska it consists typically of *Polanisia trachysperma* and *Cristatella Jamesii,* either together or separate, with scattering grasses. These prepare the way for other species, and later may themselves be crowded out, the sand-draw losing its character. *Pound and Clements.*

sandek (sän′dek), *n.* [Also *sandik,* < Talmudic Heb. *sandek* or *sandik,* usually referred to Gr. *σύνδικος,* an advocate. See *syndic.*] In Jewish usage, one who holds the infant during the ceremony of circumcision and acts the part of a godfather.

sander² (san′dėr), *n.* 1. A sandpapering-machine: as, a disk-*sander* (one employing a revolving disk covered with sandpaper), a belt-*sander,* a blind-*sander,* a *sander* and polisher.—2. A device on a locomotive or an electric car for sanding the track.

> Each section of the locomotive is equipped with one bell, one whistle, two locomotive headlights, approved air-brake mechanism, including two engineer's valves and air gauges, necessary brake cylinders, foundation brake, air reservoirs, couplers and draw heads; also . . . pneumatic track *sanders.*
> *Elect. World and Engin.,* Aug. 22, 1903, p. 312.

Belt-, disk-, drum-sander. See ★*sandpapering-machine.*

sand-feeder (sand′fē″dėr), *n.* A marine organism which passes sand through the alimentary canal so as to extract for food such organic matter as it may contain.

> Boring organisms enter on its central part [of the coral reef] and cause the rock to decay. *Sand-feeders* follow and triturate up the fragments, throwing a constant stream of fine mud into suspension in the water to be removed by the tidal and other currents.
> *Nature,* Feb. 18, 1904, p. 372.

sand-fish, *n.* 2. A silvery scaleless fish of the North Pacific, *Trichodon trichodon.*

sand-fly, *n.* 1. (*b*) Any one of several chironomid flies of the genus *Ceratopogon.*—**Sand-fly bush.** Same as *stinkwood* (*b*). [Australia.]

sand-gate (sand′gāt), *n.* A mechanical device, placed in an irrigating-canal or -ditch, by means of which the accumulated sand or sediment may be flushed out of the canal by suitable gates or valves. *H. M. Wilson,* Irrigation Engineering, p. 245.

Sandgate beds. See ★*bed*¹.

sand-glacier (sand′glā″shiėr), *n.* A dune or sheet of sand which advances slowly under prevalent wind action and thus imitates a true glacier. [Rare.]

> Wind blowing outwards from a deep sand tract forms a horizontal plateau terminated by a talus as steep as the sand can rest. Under these conditions the encroachment of sand recalls the manner of advance of a glacier, and to this formation I restrict the term "*sand glacier.*"
> *V. Cornish,* in Geog. Jour. (R. G. S.), IX. 286.

sand-grass, *n.* 3. Specifically, *Calamovilfa longifolia,* a stout long-leafed grass of sands or sandy soil, found in the Great Lake region and from the upper Missouri to Kansas. Its strong and far-extended rootstocks make it very valuable as a sand-binder. More fully, *big* or *long-leafed sand-grass.*—4. The bluejoint grass, *Calamagrostis Canadensis,* and other species of the genus, as *C. Montanensis, Montana sand-grass,* and *C. hyperborea Americana,* also called *yellow-top.*—5. The salt-grass, *Distichlis spicata.*—6. The Indian millet, *Eriocoma cuspidata.*—**Colorado sand-grass,** one of the beard-grasses, *Andropogon Hallii,* found in the sandy regions of the western United States. It resembles big blue-stem, *A. furcatus,* and is likely to be of considerable value for hay. Called also *turkey-foot.*—**Douglass's sand-grass,** a low and slender tufted spear-grass, *Poa Douglassii* of the sands of the Pacific coast: of some value as a sand-binder.

sand-hog (sand′hog), *n.* A man who works in a caisson or in foundation-work, under air-pressure under water or elsewhere, digging in the sand or silt of river- or harbor-bottoms. Also called *ground-hog.* [Slang, U. S.]

sandia (sän-dē′ä), *n.* [Sp., a watermelon, < Ar. *sindīya,* a kind of melon, < *Sind,* India.] In *phys. geog.,* a mountain or ridge which, when seen in profile, resembles half a watermelon. [Southwestern U. S.]

sandillion (san-dil′yo̤n), *n.* [*sand* + (*m*)*illion.*] The number of the sands on the sea-shore. [Nonce-word.]

> Centillions multiplied beyond the vocabulary of numeration, and ascending to ψαμμακόσια; which word having been coined by a certain Alexis (perhaps no otherwise remembered) and latinized arenaginta by Erasmus, is now Anglicised *sandillions* by me.
> *Southey,* Doctor, Interchap. vi.

sanding-lathe (san′ding-lāᴛʜ), *n.* See ★*sanding-machine.*

sanding-machine (san′ding-ma̤-shēn″), *n.* In *barrel-making,* a sandpapering-machine for surfacing and finishing slack barrels before the hoops are put on: circular clamps hold the assembled package of staves forming the barrel and cause it slowly to revolve in front of a vertical belt-sander, running at a high speed in the opposite direction. The machine performs the shaving up or finishing work formerly done by hand and automatically releases and discharges the barrel when finished. A similar machine for finishing barrels and kegs by the use of hand-tools is called a *barrel-turning* and *-smoothing* (or *-sanding*) *lathe.*

sand-iron (sand′ī″ėrn), *n.* In *golf,* an iron used in playing the ball out of sand.

sand-jack, *n.* 2. A device for lowering heavy weights by having them supported on sand which can be allowed to run out as desired. This device is used to lower bridge-spans into place by having the span mounted on wooden plungers which, in turn, rest on columns of sand in boxes. The bridge is moved over the piers on which it is to rest, and the sand is allowed to run out through a series of openings in the side of each box, thus allowing the bridge to drop as slowly or as rapidly as is desired. In launching ships, the last keel-blocks to be taken out are often supported on bags of sand. A single blow from an ax suffices to let the sand run out so that the keel-block can be removed.

sand-leaf (sand′lēf), *n.* One of the lowest poor leaves of the tobacco-plant: so named as collecting sand on its surface. Also *sand-lug.*

Sandling beds. See ★*bed*¹.

sand-lucerne (sand′lụ-sėrn″), *n.* See ★*lucerne.*

sand-lug (sand′lug), *n.* Same as ★*sand-leaf.*

sand-mixer (sand′mik″sėr), *n.* A machine for blending, disintegrating, and cleaning old and new foundry-sand: essentially a centrifugal screening-machine. A horizontal disk armed with pins projecting upward is inclosed in a casing and rotated at high speed. The sand, old cores, etc., are fed at the top of the casing, and, falling on the disk, are rapidly cleaned and mixed together. Its capacity is five tons of sand an hour. Another type, which has vertical disks, is called a *disintegrator.* Still another type employs paddles on a horizontal shaft revolving in a horizontal box or cylinder. It is sometimes called a *dry-mixer.*

sand-mullet (sand′mul″et), *n.* Same as ★*tallygalone.*

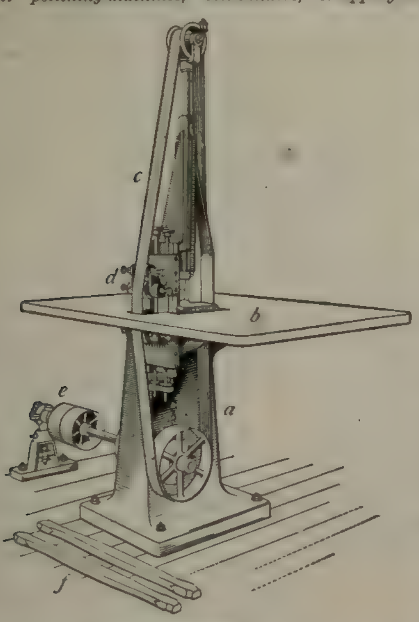
sand-nettle (sand′net″l), *n.* The spurge-nettle, *Cnidoscolus stimulosus.*

sand-oat (sand′ōt), *n.* See ★*oat.*

sand-painting (sand′pān″ting), *n.* A design made by allowing sand of different colors to fall from the hand over a surface, the colored sands forming the desired design. The sand-painting is, therefore, rather a sand-mosaic. Sand-paintings are used in the rituals of Indians of the southwestern territories, but they occur also among the Indians of the plains.

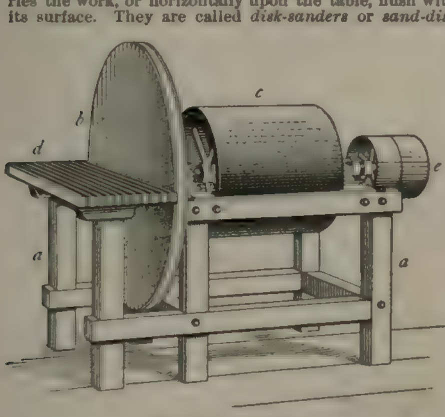
> In passing, attention may be called to the ceremonial *sand painting* of the Hopi and Navajo, where the most beautiful effects are secured by allowing sand in slender streams of different colors to fall from the hand guiding it over the surface to form designs. The blending of the colored sands is soft and harmonious, and the result is a sand mosaic. *Smithsonian Rep.* (*Nat. Mus.*), 1900, p. 467.

sandpapering-machine (sand′pā-pėr-ing-ma̤-shēn″), *n.* See *sandpaper, v. t.* Under this general term is now included a large class of wood-polishing, surfacing, and finishing machines employing paper or woven fabrics coated with sand or other abradant materials. Five types of machines are in use. In one the abradant is spread upon belts or endless bands which vary in width from a few inches to two feet. The bands run horizontally or vertically over pulleys and through openings in a table or under it, a portion of the band being exposed through a slot in the table. In some machines the pulleys are supported by a horizontal adjustable arm to enable the operator to bring the sand-belt to the work in any position. Such belt-machines are called *sand-belts*, *belt polishing-machines*, *belt-sanders*, *strapping-machines*, and *belt-machines*. Another type, for polishing doors and other flat surfaces, employs small horizontal disks covered with sandpaper and supported at the end of jointed adjustable swinging arms. They are called *sash-and-door sandpapering-machines*. A third type employs large disks of wood covered with sandpaper and placed in a vertical position at the side of the table which carries the work, or horizontally upon the table, flush with its surface. They are called *disk-sanders* or *sand-disk machines*. In a fourth, cylinders or drums of sandpaper are suspended under the table, a small section of the surface appearing through a slot in the table. They are called *drum-sanders*. A fifth employs a small vertical spindle covered with sandpaper, and is called a *spindle-sander*. In all sandpapering-machines the work is fed to the rapidly moving sandpaper either by hand or by means of various appliances for holding it in position while it is being polished.—**Sash-and-door sandpapering-machine.** See above.



Belt-sander.

a, standard, supporting machine : *b*, work-table : *c*, fabric coated with sand, in the form of a continuous belt ; *d*, tension-controlling mechanism : *e*, power connection ; *f*, samples of finished work.



Disk- and Drum-sander.

a a, frame of machine ; *b*, vertical disk coated with sand ; *c*, horizontal revolving drum coated with sand ; *d*, work-table for presenting work to disk ; *e*, power connection.

sandpiper, *n.*—**Pectoral sandpiper**, *Tringa maculata*, a species widely distributed through America, Europe, and Asia. The name is given in allusion to the habit of inflating the throat so that it hangs upon the breast. The names actually used are *grass-snipe* and *jack-snipe*.

sand-plain (sand′plān), *n.* In *geol.*, a lobate delta-plain of sand and gravel washed from a glacier into a body of standing water and remaining after the glacier and the water have disappeared.

> Near the ice margin, at its various stands, deposits must have been rather extensively made near the mouths of the sub-glacial rivers. . . . In New England they are found quite commonly, especially near the coast, where they are called *sandplains*.
> *R. S. Tarr*, in Bull. Amer. Geog. Soc., XXX. 207.

sand-plate (sand′plāt), *n.* **1.** A revolving disk of cast-iron, copper, or some other soft metal on which articles of stone or glass are ground or polished with the use of sand or other abrasive material.—**2.** One of a series of plates fitted to the main wheels of the transporting carriage of a life-boat to make an extremely wide tire, thus enabling the carriage to be easily hauled over soft sand.

> The transporting-carriage of to-day is, however, an improvement on that used in 1881, and has been rendered particularly useful at places where the beach is soft, sandy, or shingly, by the introduction in 1888 of Tipping's *sand-plates*. These . . . are composed of an endless plateway or jointed wheel tyre fitted to the main wheels of the carriage, thereby enabling the boat to be transferred with rapidity . . . over beach and soft sand.
> *Encyc. Brit.*, XXX. 232.

sand-plum (sand′plum), *n.* See ★*plum*1.

sand-puncher (sand′pun″chėr), *n.* See ★*sand-rat*, 2.

sandr (sändr), *n.*; pl. *sandar* (sän′där). [Icel.,= E. *sand*, *n.*] In *phys. geog.*, a sandy or gravelly flood-plain or delta formed by glacial streams in Iceland and Greenland: often equivalent to *glacial sand-plain*.

> Here they [glacial streams] cover vast areas with gravelly or sandy deposits, the equivalent of the "*sandr*" of Iceland. *Geog. Jour.* (R. G. S.), XIII. 299.

sand-rammer (sand′ram″ėr), *n.* **1.** (*a*) A wooden tool, used by hand in the making of sand-molds in a foundry, by which the sand is compacted in the flask around the pattern. Large ones are used with two hands and smaller ones with one. (*b*) A mechanical apparatus used for the same purpose, operated by compressed air, particularly in connection with power molding-machines.

> The range of application of pneumatic hammers is almost as wide as that of a hand hammer; they have even been used under water by divers working on wrecks. A recent application of the same principle is to be seen in the [pneumatic] *sand-rammers* employed in making foundry moulds. *Encyc. Brit.*, XXXI. 802.

2. A combination of power-rammers used to produce a uniform pressure all over a flask by pneumatic pressure brought upon all at once, with equalizing levers to prevent concentration of pressure at any point.—**Pneumatic sand-rammer**, a pneumatic hammer which has a rammer attached to the piston-rod, used in ramming sand.

sand-rat, *n.* **2.** A molder in an iron-foundry. Also called *sand-puncher*. [Slang, Eng.]

sand-reef (sand′rēf), *n.* A strip of low, sandy land, or barrier beach, built by wave-action on a shallow sea-floor not far from the coast and inclosing a narrow lagoon.

sand-ripple (sand′rip″l), *n.* Alternate ridge and hollow formed in sand through the influence of waves, wind, or currents.

> The uniformity of the wind-ripple pattern is at all times remarkable. In water-formed *sand-ripples* no such uniformity has been recorded.
> *Geog. Jour.* (R. G. S.), IX. 279.

sand-river (sand′riv″ėr), *n.* A stream carrying a large amount of land-waste in comparison with the volume of water. *Geikie*, Text-book of Geol., p. 494.

sandrock, *n.*—**Calciferous sandrock**, a name introduced by Eaton and adopted by the early geologists of New York State, in the modified form *Calciferous sandstone*, for the lowest division of the Silurian strata, which consists of a somewhat silicious magnesian limestone: now known as *Beekmantown* ★*limestone* (which see).

sand-rocket (sand′rok″et), *n.* See ★*cross-weed*.

sand-roller (sand′rō″lėr), *n.* **1.** Any fish of the family *Percopsidæ*, especially *Percopsis guttatus*, of the eastern and middle United States.—**2.** A wave heavily charged with sediment: specially applied to those of the San Juan river.

> As the San Juan rises, the waves get higher. The river carries more sand and mud than any other stream in the country. It has never been satisfactorily explained how the "*sand rollers*" start in this singular stream, but we know, from personal experience, that sometimes they reach a height of three or four feet.
> *W. K. Moorehead*, in Amer. Inventor, Jan. 15, 1904, p. 33.

Sandrus (san′drus), *n.* [NL., < E. *sander* (?): compare ★*sandat*.] The European genus of pike-perches, closely allied to the American genus, *Stizostedion*: commonly called *Lucioperca*. The common species is the sander, *Sandrus lucioperca*.

sand-shark, *n.* **2.** Same as *blind* ★*shark*.

sand-shell (sand′shel), *n.* A yellow river-mussel, *Lampsilis anodontoides*, or a black mussel, *L. rectus*, found in the Mississippi river and used in the manufacture of pearl buttons.

sand-sifter, *n.* **2.** A machine for screening and cleaning foundry-sand. The simplest form is a horizontal screen or riddle. More complicated forms have a cylindrical rotary tapering screen. Another type consists of a flat screen supported on a tripod and fitted with an automatic device for vibrating or jarring the screen to prevent clogging. Such a device is called a *pneumatic screen-shaker*. Sand-sifters are also called *riddling-machines*.—**Pneumatic sand-sifter**, a screen or riddle mounted on a tripod and fitted with a pneumatic reciprocating motor. The screen is directly connected with a piston-rod which by its motion shakes the screen and causes it to break up the lumps of sand and to sift out bits of slag or other hard materials.

sand-slue, sand-slew (sand′slö), *n.* A small barren area of sand, usually slightly depressed.

> Among other characteristic features of the earthquake was the opening of immense cracks, often several feet across and many feet in depth, and the formation of craterlets, through both of which large amounts of lignite-bearing sands were ejected, probably giving rise to the broad areas known as *sand-slews* where the surface, even today, is in places a barren, sandy, timberless waste, upon which only weeds will grow.
> *Science*, March 3, 1905, p. 349.

sandspit (sand′spit), *n.* A low point of land projecting into a lake or sea and composed of sand and formed by the interaction of waves and currents.

> Professor Branner chose as the subject of his presidential address, 'Geological and Geographical Studies on the Northeast Coast of Brazil,' and illustrated his paper by means of numerous photographs and charts. The most peculiar feature of this coast is the series of hardened *sandspits* occurring at the mouths of most of the rivers.
> *Science*, Feb. 10, 1905, p. 216.

sand-star, *n.* **3.** The sea-sedge, *Carex arenaria*.

sandstone, *n.*—**Aux Vases sandstone**, a subdivision of the Subcarboniferous of Missouri. It was originally termed the *ferruginous sandstone*, and is regarded by Missouri geologists as equivalent to the base of the Kaskaskia group. It is underlain by the Ste. Genevieve limestone and overlain by the Kaskaskia limestone.—**Bukowka sandstone**, a division of the Lower Silurian in Russian Poland.—**Cape Girardeau sandstone**, a division of the upper part of the Lower Silurian in Missouri, regarded by western geologists as equivalent to a part of the Cincinnatian group.—**Carpathian sandstone**, a calcareous sandstone of considerable extent in the eastern Alps. It forms a part of the uppermost Cretaceous system of that region.—**Chilhowee sandstone**, a division of the Lower Cambrian series in Tennessee.—**Comley sandstone**, a division of the Lower Cambrian in western England.—**Connecticut River sandstone**, the sandstone-beds of Jura-Trias age, extending along the Connecticut valley through Massachusetts and Connecticut. They are regarded as equivalent to the Newark sandstone, and attain a thickness of more than 4,000 feet, and rest upon crystalline and Paleozoic rocks. They are characterized by abundant tracks or footprints of amphibians and dinosaurs and occasional bones of the latter (*Anchisaurus*).—**Conoquenessing sandstone**, a local subdivision of the coal-measures in eastern Pennsylvania.—**Deister sandstone**, a division of the Lower Cretaceous or Neocomian series in Germany.—**Desert sandstone.** See ★*desert*1.—**Downton Castle sandstone**, in the Silurian formation of Wales and the adjoining counties of England, a division of the Ludlow group lying above the Ledbury shales and below the tilestones. Some writers regard the latter as essentially transitional to the Devonian or Old Red Sandstone, thus construing the Downton Castle sandstone as the uppermost member of the Silurian system.—**Elgin sandstone**, a name of the sandstones in the district of Elgin, in the north of Scotland, which were formerly referred to the Upper Old Red Sandstone, but are now considered as of Triassic age. They are noted for their empty casts of reptiles representing new forms of anomodonts resembling those found in the South African Karoo beds.—**Ereré sandstone**, a division of the Middle Devonian formation in the lower Amazonas region of Brazil, containing fossils very similar to those of the Hamilton shales of New York.—**Fell sandstone**, one of the lower divisions of the Carboniferous series in the Northumberland district of England.—**Fontainebleau sandstone.** Same as *Fontainebleau limestone* (which see, under *limestone*).—**Gröden sandstone**, a subdivision of the Permian system in the eastern Alps, consisting of red sandstone, underlain by the verrucano conglomerate and overlain by the Bellerophon limestone.—**Harding sandstone**, a division in Colorado regarded by Walcott as of Lower Silurian age and containing the remains of placoderm fishes. Other paleontologists who have studied the fishes think that they have very close affinities with those of Devonian age.—**Hillsboro sandstone**, the uppermost member of the Niagara group of Silurian rocks in Ohio. *E. Orton*, in Geol. Surv. of Ohio, VI. 14.—**Hollybush sandstone**, a division of the Cambrian system in the Malvern Hills in England, lying below the white-leaved-oak shales and above the Malvern quartzite.—**Huamampampa sandstone**, a subdivision of the Devonian system in Bolivia. It is underlain by the Icla shales and correlated with the Hamilton or Middle Devonian of New York.—**Idzumi sandstones**, a division of the Cretaceous system in Japan.—**Lunz sandstones**, a subdivision of the Triassic system in the Alpine basin in Upper and Lower Austria. These sandstones are underlain by the Partnach beds and overlain by the Opponitz limestone, and correlated by Austrian geologists with the Raibl beds. They are characterized by plant remains, especially species of *Pterophyllum* and forms of *Equisetites*, *Calamites*, *Neuropteris*, *Alethopteris*, etc.—**Mahoning sandstone**, a subdivision of the lower barren coal-measures in Ohio and western Pennsylvania, lying at the base of the series and above the lower productive measures.—**May Hill sandstone**, the higher member of the lowest or Llandovery division of the Upper Silurian in England, essentially equivalent in its fossils to the Clinton formation of New York. Its marine fauna is profuse.—**Mentor sandstone**, the uppermost subdivision of the Lower Cretaceous formations in Kansas.—**Montebello sandstone**, a local subdivision of the Middle Devonian in central Pennsylvania.—**Mottled sandstone**, in *geol.*, the English equivalent of the German *Buntersandstein*, the lowest of the three divisions of the Triassic strata.—**Nubian sandstone**, a term applied to a Cretaceous formation widely developed in northeastern Africa and extending into Syria and the Libanos. It probably represents several distinct horizons in the Cretaceous series.—**Oneida sandstone**, a Silurian sandstone or grit occurring in the eastern United States.

—**Oneonta sandstone**, an estuarine deposit of sandstone of early Upper Devonian age, confined to eastern New York, lying below the Catskill sandstone and equivalent in age to the marine beds of the Upper Ithaca group farther west. It contains terrestrial plant remains and a unio-like mollusk, *Amnigenia catskillensis*.—**Parma sandstone**, a white sandstone at the bottom of the coal-measure series of the lower peninsula of Michigan. It has a thickness of 100 feet in the vicinity of East Saginaw, and is an important source of artesian water. Its fossil fauna shows it to be a sandy phase of the Maxville limestone of late Mississippian age.—**Perry sandstone**, a series of plant-bearing sandstones and shales of Devonian age in the State of Maine, United States, and the province of New Brunswick, Canada.—**Saccharoidal sandstone**, a very pure sandstone, much prized as a glass sand, occurring at Crystal City, south of St. Louis, and elsewhere in Missouri. It has a sugary texture and belongs to the Ordovician period. *Amer. Geol.*, Aug., 1904, p. 105.—**Sandstone dike.** See ★*dike*.—**Sherburne sandstone**, a division of the Upper Devonian in central New York, equivalent to the lower part of the Portage group farther west.—**Sillery sandstone**, a term introduced by Sir W. Logan for a division of the rocks near Quebec, regarded as lying at the top of the Quebec group, which taken as a whole was considered as of the age of the Calciferous and Chazy groups. Later investigations have shown that the Sillery formation is probably of Cambrian age.—**Spilsby sandstone**, a deposit in Lincolnshire, England, forming the base of the Neocomian series and resting on the Upper Kimmeridge shales.—**Starucca sandstone**, a division of the Upper Devonian strata in eastern Pennsylvania.—**Torridon sandstone**, the upper member of the pre-Cambrian rocks of northwestern Scotland, so named by Nicol from Loch Torridon.—**Vienna sandstone.** See *flysch*.

sand-strake† (sand′strāk), *n.* A garboard strake.

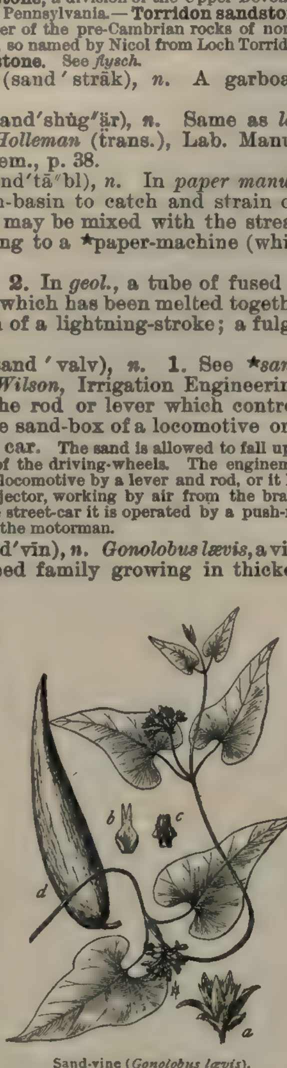
sand-sugar (sand′shůg″ä̤r), *n.* Same as *lactose*. *A. F. Holleman* (trans.), Lab. Manual of Organic Chem., p. 38.

sand-table (sand′tā″bl), *n.* In *paper manuf.*, a box or catch-basin to catch and strain out any sand that may be mixed with the stream of stock flowing to a ★paper-machine (which see).

sand-tube, *n.* **2.** In *geol.*, a tube of fused or sintered sand which has been melted together along the path of a lightning-stroke; a fulgurite in sand.

sand-valve (sand′valv), *n.* **1.** See ★*sand-gate*. *H. M. Wilson*, Irrigation Engineering, p. 248.—**2.** The rod or lever which controls the sand in the sand-box of a locomotive or a street-railway car. The sand is allowed to fall upon the rail in front of the driving-wheels. The engineman controls it in the locomotive by a lever and rod, or it has the form of an ejector, working by air from the brake-reservoir. In the street-car it is operated by a push-rod under the foot of the motorman.

sand-vine (sand′vīn), *n.* *Gonolobus lævis*, a vine of the milkweed family growing in thickets from Pennsylvania to Florida and west to Kansas and Texas. It has deeply cordate, ovate leaves, small whitish flowers in axillary cymes, and large follicles.



Sand-vine (*Gonolobus lævis*).
a, flower; *b*, crown-lobe tipped by a 2-cleft awn; *c*, stamen-tube; *d*, follicle or seed-pod.

sandware (sand′wãr), *n.* A coarse pottery or stoneware, composed largely of sand, used for crucibles in which metal is melted.

> The *sandware* crucibles used in melting the alloy, and the molds in which the bar is cast.
> *Sci. Amer. Sup.*, June 25, 1904, p. 23816.

sand-warped (sand′wârpt), *a.* Said of a vessel when it is left on a sand-bar by the ebbing tide.

sand-wash (sand′wosh), *n.* A sloping surface of sand spread out by an intermittent stream or flood. [Southwestern U. S.]

> From this point the party worked down the *sandwash* of Rio San Ignacio (or Rio Altar) to the coast of the Gulf of California, where the Tepoka Indians lived until recently. *Science*, Jan. 4, 1901, p. 38.

sand-wave (sand′wāv), *n.* In *phys. geog.*, a low ridge of sand formed by waves or currents of water.

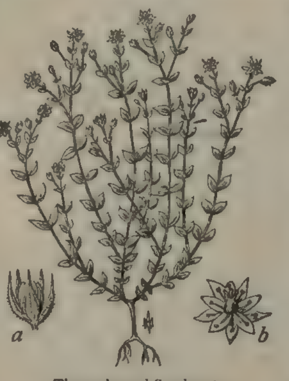
> The water-wave was really controlled by a submerged *sand-wave*, the up-stream flank of which was exposed to a heavy shower of sand from the turbid water.
> *Geog. Jour.* (R. G. S.), XIII. 625.

sand-wheel (sand′hwēl), *n.* A wheel of large diameter fitted with buckets on its periphery by which the water and sand from stamp-mills or ore-dressing works are elevated and then, by launders or flumes on a sufficient incline, conveyed away to points of disposal.

sandwich, *n.*—**Club sandwich**, slices of bread or toast with thin layers of cooked bacon and cold roast chicken with Mayonnaise dressing and sometimes lettuce between them.—**Spanish sandwich**, Graham bread in thin slices spread with mustard, with a layer of cottage cheese and one of chopped olives mixed with Mayonnaise dressing.

sandwich-girder (sand′wich-gėr″dėr), *n.* See ★*girder*¹.

sandwort, *n.*—**Arctic sandwort**, *Arenaria biflora*, which ranges from Greenland and Labrador to Quebec and west to Alaska; also south in the mountains to Arizona.—**Blunt-leaved sandwort**, *Mœhringia lateriflora*, a widely diffused North American plant closely related to *Arenaria* and formerly united with it.—**Large-leaved sandwort**, *Mœhringia macrophylla*, a species with larger leaves, ranging from the Great Lakes to British Columbia and south to California.—**Pine-barren sandwort**, *Arenaria Caroliniana*, a native of the pine-barrens of New Jersey and extending south near the coast to Florida.—**Rock sandwort**, *Arenaria Michauxii*, which grows in rocky places throughout most of eastern North America and has whorls of rigid subulate leaves.—**Sea-beach sandwort**, the sea sandwort, *Honkenya peploides*.—**Seaside sandwort**, the salt-marsh sand-spurry, *Tissa marina*.—**Texas sandwort**, *Arenaria Texana*, of dry rocky soil in Texas and northward to Kansas and Missouri. It closely resembles the rock sandwort.—**Thyme-leaved sandwort**, *Arenaria serpyllifolia*, an old-world species thoroughly naturalized in America as a weed. It has very short opposite leaves.



Thyme-leaved Sandwort (*Arenaria serpyllifolia*).
a, capsule surrounded by the scarious calyx; *b*, expanded flower.

sandy¹, *a.*—**Sandy-ground bug.** See ★*bug*².

sandy³ (san′di), *n.* [Prob. < *sandy*¹, *a.*] A Tasmanian fish, *Uphritis urvillii*. Also called the *fresh-water flathead*.

sandy-blight (san′di-blīt), *n.* A form of conjunctivitis common in some parts of Australia. *E. E. Morris*, Austral English.

sang³, *n.* **2.** Same as *malignant anthrax* (F. *sang de rate*).

sang⁴ (sang), *n.* A reduction of *ginseng*. Also *seng*. [Rural, U. S.]

> The average "*sang*" digger has very little conscience.
> *M. G. Kains*, Ginseng, p. 31.

sang⁴ (sang), *v. i.* [*sang*⁴, *n.*] To gather ginseng for the market. [Rural, U. S.]

sangar (sang′gä̤r), *n.* In South Africa, a low stone wall or screen built to protect a firing party; a trench. See *trench*. Also *sungar*.

> We ran round an' about, an' all we got was shootin' into the camp at night, an' rushin' empty *sungars* wid the long bradawl, an' bein' hit from behind rocks, till we was wore out.
> *R. Kipling*, 'Love-o'-Women,' in Many Inventions, p. [303.
>
> Here and there dotted in all directions were little stone walls or forts, to all appearance lifeless, except when someone showed to change his position, or move from one wall to another. Instantly the opposing *sangars* would blaze with musketry.
> *United Service Mag.*, April, 1901, p. 70.

sängerbund (seng′ėr-bönt), *n.* [G., < *sänger*, singer, + *bund*, union.] A German male singing society or chorus.

sängerfest (seng′ėr-fest), *n.* [G., < *sänger*, singer, + *fest*, festival.] A song-festival; a social gathering of German choral societies for competition.

> It is thought that the event will attract several hundred shooters from all over the United States, as the *Saengerfest* will be in progress here the week of the shoot. Resolutions were adopted that the officers of the *Saengerfest* be tendered an invitation to the shoot.
> *Forest and Stream*, Jan. 24, 1903, p. 78.

Sanghara-nut, *n.* Same as *Singhara nut* (which see, under *nut*).

sangley (säng-lā′), *n.* [Philippine Sp., given as from "Chinese *hiang lay*, a traveling merchant" (Blumentritt, Vocab.), meaning perhaps Chinese *hing*, go, + *lai*, come.] A Chinese trader or merchant. [Philippine Is.]

sanglot (soṅ-glō′), *n.* [F. *sanglot*, OF. *sanglout*, *senglout*, < L. *singultus*, a sobbing. See *singult*.] In *singing*, an embellishment consisting of an aspirated sob-like grace-note added to the penultimate tone in certain skips: used mostly with interjections of sorrow or despair.

sangree-root (sang′grē-röt), *n.* Same as ★*sangrel*.

sangrel (sang′grel), *n.* The Virginia snakeroot, *Aristolochia Serpentaria*. Also *snagrel* and *sangree-root*.

sanguifacient (sang-gwi-fā′shient), *a.* [L. *sanguis*, blood, + *faciens*(-*ent*-), making.] Blood-forming.

sanguimotor (sang-gwi-mō′tọr), *a.* [L. *sanguis*, blood, + *motor*, mover.] Relating to the circulation of the blood.

sanguimotory (sang-gwi-mō′tọ̄-ri), *a.* Same as ★*sanguimotor*.

sanguinarin, *n.* This acrid alkaloid, $C_{20}H_{15}O_4N + H_2O$, is used in medicine as an expectorant, purgative, and emetic.

sanguineoserous (sang-gwin″ẹ̄-ọ̄-sē′rus), *a.* [L. *sanguineus*, bloody, + E. *serous*.] Same as serosanguinolent.

sanguinite (sang′gwi-nīt), *n.* [L. *sanguis* (*sanguin*-), blood, + -*ite*².] A sulpharsenite of silver occurring in hexagonal scales which are of a deep-red color by transmitted light: found at Chañarcillo, Chile.

sanguisuction (sang-gwi-suk′shọn), *n.* [L. *sanguis*, blood, + NL. *suctio*(*n*-), suction.] The sucking of blood.

san-hien (sän-hē-en′), *n.* [Chin.] A Chinese three-stringed lute or banjo similar to the Hindu ravanastron. Compare ★*ur-hien*.

sanicle, *n.*—**Black sanicle.** (*a*) The great black masterwort, *Astrantia major*. (*b*) *Sanicula Marilandica*. Also called *black snakeroot*.—**False sanicle**, the bishop's-cap, *Mitella diphylla*.—**Yorkshire sanicle**, the butterwort or marsh violet, *Pinguicula vulgaris*.

sanidinite (san′i-di-nīt), *n.* [*sanidine* + -*ite*².] In *petrog.*, phaneric masses occurring like segregations in trachytic and phonolitic volcanic lavas and sometimes ejected as bombs: composed chiefly of orthoclase feldspar with subordinate amounts of other minerals. It has been proposed by Weed and Pirsson (1895) to apply the name *sanidinite* to syenitic rocks composed almost wholly of orthoclase.

sanification (san-i-fi-kā′shọn), *n.* The process of sanifying or rendering sanitary; the putting and keeping (something) in a sanitary condition.

> The educational ideal is now to develop capacities in as many directions as possible, to indulge caprice and velleity a little, to delay consistency for a time, and let the diverse prepotencies struggle with each other. Now everything psychic tends in its turn to be intense to the point of illusion or positive obsession, but nature's rhythm, if allowed to have its due course, prevents stagnation and hebetude, and the passion to change keeps all powers fluent and plastic, gives elasticity and develops power of *sanification*. Sometimes there seem almost to be dual or multiplex personalities.
> *G. S. Hall*, Adolescence, II. 89.

saniopurulent (sā″ni-ọ̄-pū′rọ̈-lẹnt), *a.* [L. *sanies*, sanies, + *purulentus*, purulent.] Partly sanious and partly purulent. *Buck*, Med. Handbook, VII. 52.

sanioserous (sā″ni-ọ̄-sē′rus), *a.* [L. *sanies*, sanies, + NL. *serosus*, serous.] Partly sanious and partly serous. *Buck*, Med. Handbook, VII. 52.

sanitary, *a.*—**Sanitary chemistry, survey.** See ★*chemistry*, ★*survey*.

II. *n.* A public water-closet, urinal, and lavatory.

Sannoisian stage. See ★*stage*.

sanoform (san′ọ̄-fôrm), *n.* [L. *sanus*, sound, + E. *form*(*aldehyde*).] A trade-name of methyl diiodosalicylate, $HO\overset{2}{C}_6H_2I_2\overset{1}{C}OOCH_3$, prepared by the action of iodine on oil of wintergreen. It is a colorless, odorless, tasteless crystalline powder, and is used in surgery as a substitute for iodoform.

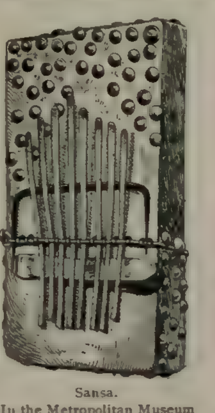
sanose (san′ōs), *n.* [L. *sanus*, sound, + -*ose*.] A commercial product, essentially a mixture of albumoses.

san-pedrito (sän″pe-drē′tō), *n.* [Sp., 'little Saint Peter.'] Same as ★*mariposa*, 2.

Sans nombre, in *law*, without number, unlimited; also, uncertain in number.—**Sans recours**, in *law*, without recourse. These words added to an indorsement render the indorsee not liable. See *indorsement*, 4.

Sans. An abbreviation of *Sanskrit*.

sansa² (san′sạ̈), *n.* [Also *sansi*; African.] An African musical instrument which consists of a sounding-board of some hard wood with strips of iron, or occasionally bamboo, fastened to it so as to leave one end free to vibrate. The instrument is usually played by holding it in both hands and with the thumbs pressing down and releasing the keys, of which there are sometimes forty or more. Also called *zimba*.



Sansa.
(In the Metropolitan Museum of Art, New York.)

san-sam (san-sam′), *n.* [Korean *san sam*, 'mountain ginseng.'] The wild ginseng of Manchuria and Korea, apparently including the 'imperial.' Its roots are sometimes a foot long and an inch in diameter.

> The extreme rarity of *san-sam* augments the superstitious repute in which it is held.
> *G. C. Foulk*, Foreign Relations of the U. S., 1885, [p. 329.

Sansc. An abbreviation of *Sanscrit* (Sanskrit).

sanse, *n.* See *zanze*.

sansi (san′si), *n.* Same as ★*sansa*².

Sansk. An abbreviation of *Sanskrit*.

Sanskritize (san′skrit-īz), *v. t.*; pret. and pp. *Sanskritized*, ppr. *Sanskritizing*. [*Sanskrit* + *-ize*.] To render similar to Sanskrit; modify by Sanskritic influences.

> Dr. Grierson is of opinion that Assamese is fortunate in not having been *Sanskritized* like its sister, Bengali.
> *Athenæum*, Aug. 13, 1904, p. 199.

sant² (sänt), *n.* Same as *sunt*.

Santa Cruz formation. See ★*formation*.

santal, *n.* **II.** *a.* Same as *santalaceous*; also, belonging to the order *Santalales*. See ★*Santalales*.

Santalales (san-tạ-lā′lēz), *n. pl.* [NL. (Lindley, 1836), < *Santalum* + *-ales*.] An order of dicotyledonous archichlamydeous (mostly apetalous) plants, characterized chiefly by diœcious or hermaphrodite flowers with the ovary inferior and one-celled. It embraces seven families, of which the most important are the *Santalaceæ*, *Loranthaceæ*, *Balanophoraceæ*, and *Olacaceæ*.

santalol (san′ta-lol), *n.* [*Santalum* + *-ol*.] An ethereal oil, $C_{15}H_{26}O$, found in sandalwood-oil. It yields water and a sesquiterpene, $C_{15}H_{24}$, when treated with phosphorus pentoxid. It boils at 310° C.

santapee (san-tạ-pē′), *n.* [Fr. Creole pron. of *centipede*.] In British Guiana, a hooligan.

> The "centipede" has been defined as a youth (say) under thirty years of age who "pursues the occupation of idleness with an interminable industry." A gang of "centipedes" for a consideration will waylay and assault and beat anyone. There is a street ditty which says that
>
> Man *santapee* bad,
>
> but
>
> Oman *santapee* wussa bad,
>
> i.e., the female "centipede" is worse than the male.
> *J. Platt, Jr.*, in N. and Q., 10th ser., X. 264.

santol (sän-tōl′), *n.* [Philippine name.] An evergreen tree, *Sandoricum Indicum*, belonging to the *Meliaceæ*, having trifoliolate leaves and axillary panicles of small sweet-scented flowers. Its fruit, which is about the size of an orange, contains 5 one-seeded nuts surrounded by a fleshy acid pulp of a peculiar odor but edible. It is eaten either raw or in the form of preserves, and is sold on the streets of Manila.

Santo Martino (sän′tō mär-tē′nō). [It.] A seventeenth-century silver coin of Lucca, equal to 15 soldi: so named from the saint a likeness of whose head is stamped on the reverse.

santone (san′tōn), *n.* [*sant*(*onica*) + *-one*.] An unsaturated liquid hydrocarbon, $C_{15}H_{26}$, obtained by reducing santonic acid with hydriodic acid. It boils at 235–245° C.

Santonic acid, a yellow crystalline acid, $C_{15}H_{20}O_4$, made by boiling santonin with barium hydroxid. It is isomeric with santoninic acid and melts at 163.6° C.

santonide (san′tō-nid), *n.* [*santon*(*ica*) + *-ide*¹.] A crystalline compound, $C_{15}H_{18}O_3$, made by boiling santonic acid with glacial acetic acid and heating the residue to 180° C. It melts at 127° C.

santoninic (san-tọ-nin′ik), *a.* [*santonin* + *-ic*.] Derived from santonin.—**Santoninic acid**, a colorless crystalline acid, $C_{15}H_{20}O_4$, made by heating santonin with caustic potash or soda solution. When heated to 120° C. it yields santonin and water. The sodium salt is used as an anthelmintic.

Santorin earth. See ★*earth*¹.

Santorini's duct. Same as *Bernard's canal* (which see, under *canal*¹).

santorinite (san′tọ-ri-nīt), *n.* [*Santorini* + *-ite*².] In *petrog.*, a name proposed by Washington (1897) for those andesites which contain labradorite and anorthite with pyroxene, such as the pyroxene-andesites of Santorini.

sanza (san′zạ̈), *n.* The marc or residual cake from ripe olives, crushed and pressed at common temperature to produce olive-oil. Also known as *nocciulo*.

Sao (sā′ō), *n.* [NL., < Gr. Σαώ, a Nereid.] A genus of opisthoparian trilobites with distinctly lobed glabella, seventeen thoracic segments, and extremely small pygidium. *Sao hirsuta* is a well-known form, abundant in the Cambrian rocks of Bohemia, whose ontogeny has been fully described by Barrande.

são-felipe (souṅ-fā-lē′pạ̄), *n.* [Pg., 'Saint Philip.'] A silver coin of Philip III. of Portugal (1621–40).

são-joão (souṅ-zhō-ouṅ′), *n.* [Pg., 'Saint John.'] A silver coin of Johan IV. of Portugal (1640–56).

sap¹, *n.* **4.** In *archery*, the light-colored portion of a bowstaff composed of the sap-wood. This portion forms the back of a self-bow.—**5.** A quarryman's name for rock which is partially decayed and which exhibits this quality by iron stains and other discolorations. It is usually thrown away.

> Some of the Cape Ann granite is iron stained, and on casual inspection might be taken for *sap*. However, it is not such, but a very tough, durable stone, which is well adapted for use in paving blocks or retaining walls. There is, of course, as at all quarries, plenty of *sap*, but it is not identical with the iron-stained rock to which reference has just been made. *Sap* is not only stained from exposure, but shows signs of weakness and disintegration which render it unfit for construction work.
> *Rep. U. S. Geol. Surv.*, 1897–98, VI. 232.

Nuclear sap, the thin liquid contents of the cell-nucleus; the karyolymph or karyenchyma, as distinguished from the cell-sap or cytolymph.

sapanin (sap′ạ-nin), *n.* [*sapan* + *-in*².] A crystalline compound, $C_{12}H_6(OH)_4 + 2H_2O$, formed, together with resorcinol and pyrocatechol, when the extract of sapan-wood is melted with caustic soda. It is probably tetrahydroxydiphenyl.

sap-chafer (sap′chā″fėr), *n.* A beetle that feeds on the sap of trees.—**Melancholy sap-chafer**, an American cetoniid beetle of somber colors, *Euphoria melancholica*, which frequents flowers for nectar and feeds on the exuding sap of trees.

sapek (sä′pek), *n.* [Also *sepek*, *sepeck*; < Annamese *sapek*.] A brass coin of Annam.

saphir d'eau (sa-fēr′ dō). [F., 'water sapphire.'] A clear deep-blue variety of iolite used in jewelry.

sapindal (sap′in-dạl), *a.* Same as *sapindaceous*; also, belonging to the order *Sapindales* (which see).

sapo¹, *n.* **2.** Soap prepared from sodium hydroxid and olive oil; castile soap. *U. S. Pharmacopœia*.

sapocarbol (sā-pọ-kär′bol), *n.* [L. *sapo*, soap, + E. *carbol*(*ic*).] A solution of crude cresols in potash soap. It is antiseptic. *Buck*, Med. Handbook, VII. 30.

sapocrinin (sạ-pok′ri-nin), *n.* [L. *sapo*, soap, + E. *crinin*.] A crinin, said to be different from secretin, obtained by the action of alkali soaps upon the mucous membrane of the duodenum or jejunum.

sapodermin (sā-pọ-dėr′min), *n.* [L. *sapo*, soap, + Gr. δέρμα, skin, + *-in*².] A neutral antiseptic soap containing .2 per cent. of mercury in the form of albuminate or caseinate: a bactericide for external use. *Buck*, Med. Handbook, VII. 30.

Sapodilla family, the plant family *Sapotaceæ* (which see).

sapogenin (sạ-poj′e-nin), *n.* [L. *sapo*, soap, + *-gen* + *-in*².] A crystalline compound, $C_{14}H_{22}O_2$, obtained by saponifying saponin. It melts at 257–260° C.

sapokrinin, *n.* Same as ★*sapocrinin*.

sapolan (sap′ọ-lan), *n.* [L. *sapo*, soap, + E. *lan*(*olin*).] A non-irritating brownish ointment base consisting of crude naphtha, lanolin, and dry soap: used as an external application for eczema and skin diseases generally.

saponaretin (sap-ọ-nar′e-tin), *n.* A crystalline compound formed by the hydrolysis of saponarin.

saponarin (sạ-pon′ạ-rin), *n.* [*Saponaria* + *-in*².] A crystalline glucoside, $C_{19}H_{22}O_{11}$, or $C_{21}H_{24}O_{12}$, found in *Saponaria officinalis*. It melts at 231° C. and gives a blue color with sodium.

saponary, *a.* **II.** *n.* The soapwort, *Saponaria officinalis*.

Saponification equivalent, saponification number or **value.** See ★*equivalent*, ★*value*.

saponifier, *n.*—**Natrona saponifier**, a trade-name of sodium aluminate, which is manufactured from Greenland cryolite at Natrona, Pennsylvania, and is sold for use in soap-making.

saponin, *n.* **2.** A general name applied to glucosides similar to saponin (see def. 1) which yield a foam or lather when the aqueous solution is shaken. Smilacin is a saponin. The poisonous saponins are called *sapotoxins*.

saporetin (sạ-por′e-tin), *n.* An amorphous substance, $C_{17}H_{32}O_{10}$, obtained when sapotin is hydrolyzed by dilute sulphuric acid.

sapota, *n.* **2.** (*b*) Same as ★*zapote*.—**White sapota.** Same as ★*cochilsapote*.

sapote (sä-pō′tạ̄), *n.* Same as ★*zapote*, which see.

sapotin (sạ-pō′tin), *n.* [*Sapota* + *-in*².] A bitter crystalline glucoside, $C_{29}H_{52}O_{20}$, found in the seeds of the sapodilla-plum, or *Sapota Zapotilla*. When hydrolyzed by dilute sulphuric acid it yields glucose and saporetin. It melts at 240° C., has a burning taste, and attacks the eyes and nose strongly.

sapotoxin (sap-ọ-tok′sin), *n.* [L. *sapo*, soap, + E. *toxin*.] A glucoside, $C_{17}H_{26}O_{10}$, found in Levantine soaproot from *Gypsophila Arrostii* or *G. paniculata*. It is a white powder which gives a foam in aqueous solutions. It has a burning taste, and attacks the mucous membranes strongly. Kobert has proposed to use the name *sapotoxin* also for those varieties of the saponin glucosides which are poisonous.

sapper¹, *n.* **2.** Any insect which sucks the sap of plants, as the rice-sapper.

sapphire, *n.*—**Brazilian sapphire**, the blue indicolite variety of tourmalin found in Brazil.

II. *a.*—**Sapphire humming-bird**, one of the hummers of the genus *Hylocharis*, which have brilliant blue reflections on the under side of the throat.

sapphire-quartz (saf′īr-kwârts), *n.* A dark-blue variety of quartz.

sapphist (saf′ist), *n.* [*sapph*(*ism*) + *-ist*.] One who practises sapphism.

sapping, *n.* **2.** The undermining of a river's bank, especially if it is a cliff, by the moving water and its suspended grit. *Chamberlin and Salisbury*, Geol. I. 127.

saprine (sap′rin), *n.* [Gr. σαπρός, rotten, + *-ine*².] A non-poisonous ptomaïne, $C_5H_{14}N_2$, isomeric with and very similar to cadaverin. It occurs in decaying meat.

saprobiosis (sap″rọ-bī-ō′sis), *n.* [NL., < Gr. σαπρός, rotten, + βίωσις, living.] The doctrine or opinion that living beings are generated, or may be generated, from decomposing organic matter: contrasted with the doctrine of spontaneous generation from inorganic matter. [Rare.]

saprodontia (sap-rọ-don′ṭi-ạ̈), *n.* [Gr. σαπρός, rotten, + ὀδούς (ὀδοντ-), tooth.] Dental caries.

saprol (sap′rol), *n.* [Gr. σαπρός, rotten, + *-ol*.] A commercial name of a mixture of crude cresol and high-boiling hydrocarbons. It is used as a disinfectant.

saprolegniaceous (sap-rọ-leg-ni-ā′shius), *a.* Pertaining or belonging to *Saprolegnia* or the *Saprolegniaceæ*.

Saprolegniales (sap-rọ-leg-ni-ā′lēz), *n. pl.* [NL., < *Saprolegnia* + *-ales*.] An order of phycomycetous fungi named from the genus *Saprolegnia* and including the so-called water-molds.

saprolegnious (sap-rọ-leg′ni-us), *a.* [*Saprolegnia* + *-ous*.] Of the class of fungi which includes *Saprolegnia*.

saprolite (sap′rọ-līt), *n.* [Gr. σαπρός, rotten, + λίθος, stone.] In *petrog.*, a term applied by Becker (1894) to disintegrated and more or less decomposed rock which remains in place, that is, has not been transported.

> Becker suggested the use of the term "*saprolite*" for material such as this, which is the product of rock decay in place. Unfortunately "*saprolite*" has, in the Dahlonega district, been adopted by the miners and used in a sense entirely different from that intended by Becker. For this reason the term will not be used in the present discussion.
> *Contrib. to Econ. Geol.*, U. S. Geol. Surv., Bulletin 213, [1902, p. 60, note.

saprolitic (sap-rǫ-lit′ik), *a.* Of the nature of saprolite. *M. Bauer* (trans.), Precious Stones, p. 361.

sapromyzid (sap-rǫ-mī′zid), *n.* and *a.* **I.** *n.* A member of the dipterous family *Sapromyzidæ*.

II. *a.* Having the characters of or belonging to the family *Sapromyzidæ*.

saprophile (sap′rǭ-fil), *n.* [Gr. *σαπρός*, rotten, + *φιλεῖν*, love.] A bacterium which is incapable of producing the profound changes caused by zymogenic and saprogenic organisms, but which requires that the substances upon which it grows be previously decomposed.

sap-spile (sap′spīl), *n.* Same as *spile*^{1}, 2.

sap-stain (sap′stān), *n.* Discoloration of the sap-wood of a tree.

sapwort (sap′wėrt), *n.* The dog's-mercury, *Mercurialis perennis*.

sapygid (sap′i-jid), *n.* and *a.* **I.** *n.* A member of the hymenopterous family *Sapygidæ*.

II. *a.* Having the characters of or belonging to the *Sapygidæ*.

saquebute†, *n.* See *sackbut*.

sar^3 (sär), *n.* [*s*(*ulphur*) + *a*(*lkali*) + *r*(*esin*).] A trade-name of a fungicide preparation which consists chiefly of sodium sulphid. It is made from sulphur, alkali, and resin. *Nature*, April 3, 1902, p. 518.

Sar. An abbreviation (*a*) of *Sardinia*; (*b*) of *Sardinian*.

S. A. R. An abbreviation (*a*) of the French *Son Altesse Royale*, His Royal Highness; (*b*) of *Sons of the American Revolution*.

Saracenic pottery. See ★*pottery*.

sarai, *n.* See *serai*.

sarape, *n.* Same as *serape*.

Saratoga (sar-ạ-tō′gä̤), *a.* and *n.* **I.** *a.* Pertaining to Saratoga Springs, a watering-place in the State of New York: as, *Saratoga* waters; a *Saratoga* trunk.

II. *n.* A contraction of *Saratoga trunk*; a large trunk originally intended to carry a woman's dresses, etc.

Saratogan (sar-ạ-tō′gan), *a.* Of or pertaining to Saratoga in New York; specifically, in the geology of New York, noting the uppermost division of the Cambrian system, embracing the Schaghticoke shale, Potsdam sandstone, and Greenfield limestone.

sarbican (sär-bi-kän′), *n.* [G. *sarbacane*.] The blow-gun of the Guiana Indians. It is made of the lower part of the stem of a tall grass, *Arthrostylidium Schomburgkii*. See *blow-pipe* ★*bamboo*, *sarbacane*.

sarcidium (sär-sid′i-um), *n.*; pl. *sarcidia* (-ä̤). [NL., < Gr. *σαρκίδιον*, a bit of flesh, dim. of *σάρξ* (*σαρκ-*), flesh.] A caruncle.

sarcin (sär′sin), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *-in*^{2}.] Same as *hypoxanthine*.

sarcle (sär′kl), *n.* [L. *sarculum*, a hoe, < *sarrire*, hoe.] A weeding-hoe or similar tool.

sarcocarcinoma (sär″kǫ-kär-si-nō′mä̤), *n.*; pl. *sarcocarcinomata* (-mạ-tä̤). [NL., < Gr. *σάρξ* (*σαρκ-*), flesh, + *καρκίνωμα*, cancer.] A tumor which has both sarcomatous and carcinomatous elements. *Buck*, Med. Handbook, VII. 724.

sarcocoptes (sär-kǫ-kop′tēz), *n.* [NL., < Gr. *σάρξ* (*σαρκ-*), flesh, + *κόπτειν*, cut, cut up.] The itch.

sarcocyte (sär′kǫ-sīt), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *κύτος*, a hollow (cell).] In gregarines, a clear layer of cytoplasm immediately underneath the cuticle. Compare ★*myocyte*, 2.

sarcodictyum (sär-kǭ-dik′ti-um), *n.*; pl. *sarcodictya* (-ä̤). [NL., < Gr. *σάρξ* (*σαρκ-*), flesh, + *δίκτυον*, a net.] The network of protoplasm on the surface of the calymna of a radiolarian.

sarcoepiplocele (sär″kǭ-e-pip′lǭ-sēl), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + NL. *epiplocele*.] Epiplocele and sarcocele combined.

sarcogenic (sär-kǭ-jen′ik), *a.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *-γενης*, -producing, + *-ic*.] Flesh-forming.

sarcolin, sarcoline (sär′kǫ-lin), *n.* Same as *sarcolite*.

sarcolyte (sär′kǭ-līt), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *λυτικός*, that looses.] A giant cell containing many nuclei, occurring in degenerating muscular tissue. *Buck*, Med. Handbook, VI. 27.

sarcoma, *n.*—**Mammary sarcoma**, a malignant growth which has the texture and appearance of a mammary gland.

sarcomatrix (sär-kǭ-mā′triks), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + L. *matrix*, matrix.] The layer of protoplasm on the capsule of a radiolarian.

sarcomelanin (sär-kǫ-mel′ạ-nin), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *μέλας* (*μελαν-*), black, + *-in*^{2}.] The dark pigment found in melanosarcomata.

sarcomere (sär′kǫ-mēr), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *μέρος*, part.] **1.** A segment of a muscular fibril inclosed between two Krause's membranes. *Buck*, Med. Handbook, III. 270.—**2.** One of the segments or pieces of a sarcostyle.

sarcomphalocele (sär-kom′fạ-lǫ-sēl), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *ὀμφαλός*, navel, + *κήλη*, tumor.] A fleshy tumor of the umbilicus.

Sarcomphalus, *n.* **2.** [*l. c.*] Same as ★*sarcomphalocele*.

sarcomyces (sär-kǫ-mī′sēz), *n.* [NL., < Gr. *σάρξ* (*σαρκ-*), flesh, + *μύκης*, a fungus.] A fleshy fungous growth.

sarcoplasm (sär′kǫ-plazm), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *πλάσμα*, anything formed.] In *histol.*, the clear protoplasmic substance which separates the fibrillæ, or sarcostyles, in a striated muscle-fiber.

The chemical condition of the *sarcoplasm* of the cardiac muscle itself. *Encyc. Brit.*, XXXI. 732.

sarcoplasmic (sär-kǫ-plaz′mik), *a.* [*sarcoplasm* + *-ic*.] Relating to or of the nature of sarcoplasm.

The muscle-cells of the ventricles are thicker, less *sarcoplasmic*, and more clearly striated than the auricular muscle. *Encyc. Brit.*, XXXI. 733.

sarcoplast (sär′kǭ-plast), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *πλαστός*, formed.] In *embryol.*, a substance found in developing muscles and supposed to produce the striated portion of the fibers.

sarcoplastic (sär-kǫ-plas′tik), *a.* [*sarcoplast* + *-ic*.] Of or pertaining to a sarcoplast.

sarcopoietic (sär″kǫ-poi-et′ik), *a.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *ποιητικός*, < *ποιεῖν*, make.] Flesh-forming.

Sarcoptic acariasis. See ★*acariasis*.

sarcosine (sär′kǫ-sin), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *-ose* + *-ine*^{2}.] Methylaminoacetic acid, a sweetish crystalline substance, $NH(CH_3).CH_2COOH$, made by boiling caffein or creatine with barium hydroxid; also by the action of monochloracetic acid on methylamine. It melts at 210–215° C. Also called *methylglycine*.

sarcosoma (sär-kō-sō′mä̤), *n.* See ★*sarcosome*.

sarcosome (sär′kǫ-sōm), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *σῶμα*, body.] **1.** The fleshy part of a coral.—**2.** The darker and actively contractile portion of a muscle fibril. *Buck*, Med. Handbook, III. 270.

sarcospongus (sär-kǫ-spong′gus), *n.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *σπόγγος*, sponge.] Same as ★*sarcomyces*.

Sarcosporidia (sär″kō-spǭ-rid′i-ä̤), *n. pl.* [NL., < Gr. *σάρξ* (*σαρκ-*), flesh, + *σπορά*, seed (spore), + dim. *-ίδιον*.] An order of *Sporozoa*. The trophozoite is an elongated motionless body found almost exclusively in the striped muscle-fibers of birds and mammals, where it is known as a *Miescher's tube*. Spores are produced in great numbers, usually in the form of minute sickle-shaped or spindle-shaped bodies with a very delicate envelop. Infection with these organisms may cause the death of the host, but the natural method of dissemination of the parasites and the reinfection of new hosts has not been determined.

Since the discovery of sporozoan parasites belonging to the order now known as *Sarcosporidia* in the muscle fibers of the house mouse by Miescher in 1843, many other mammals and not a few birds have been found to harbor them. *Jour. Exper. Med.*, Nov. 29, 1901, p. 1.

sarcosporidiosis (sär″kǫ-spǭ-rid″i-ō′sis), *n.* [NL., < *Sarcosporidia* + *-osis*.] Infection with sarcosporidia.

The record of *sarcosporidiosis* in man is meagre and in part uncertain in value. Only two cases—one described by Kartulis and one by Baraban and Saint-Remy—seem to be genuine. In those of Lindemann and Rosenberg the diagnosis must remain doubtful. The case of Kartulis was that of a Sudanese. An abscess had formed in the liver and had extended to the abdominal wall. The sarcosporidia cysts were found in considerable numbers both in the liver and the muscular tissue forming the periphery of the abscess. *Jour. Exper. Med.*, Nov. 29, 1901, p. 1.

sarcostosis (sär-kos-tō′sis), *n.* [NL., < Gr. *σάρξ* (*σαρκ-*), flesh, + *ὀστέον*, bone, + *-osis*.] An osseous tumor developing in muscular tissue; osteosarcoma.

sarcostyle, *n.* **2.** One of the delicate fibrillæ which make up the fiber of a striated muscle.

sarcothlasia (sär-koth-lā′ziä̤), *n.* [NL., < Gr. *σάρξ* (*σαρκ-*), flesh, + *θλάσις*, bruising.] A bruise of the muscles.

sarcothlasis (sär-koth′lạ-sis), *n.* [NL.] Same as ★*sarcothlasia*.

Sarcura (sär-kū′rä̤), *n. pl.* [NL., < Gr. *σάρξ* (*σαρκ-*), flesh, + *οὐρά*, tail.] A suborder of rays, the thick-tailed rays, which have two dorsal fins and a caudal fin.

sarcylic (sär-sil′ik), *a.* [Gr. *σάρξ* (*σαρκ-*), flesh, + *-yl* + *-ic*.] Noting a hypothetical nucleinic acid in which hypoxanthine (sarcine) is the only xanthine base that is represented.

sardina (sär-dē′nä̤), *n.* [Sp., anchovy, sardine. See *sardine*.] A sardine; an anchovy.——**Sardina blanca** ('white sardine'), *Curimata magdalenæ*, a characinoid fish found in the Rio Mamoni, Panama.—**Sardina bocona** ('big-mouth sardine'), *Anchovia macrolepidota*, a fish found from the Gulf of California to Panama.—**Sardina de España** ('Spanish sardine'), *Clupanodon pseudohispanicus*, one of the sardines found in the Gulf of Mexico.—**Sardina escamuda** ('scaled sardine'), *Sardinella humeralis*, found in the West Indies and the Gulf of Mexico.

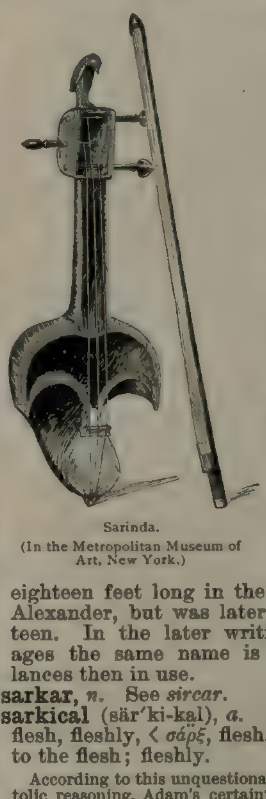
sardine^1, *n.* **7.** A fresh-water fish, *Conosirus erebi*, of the herring tribe, which occurs in rivers of western and northwestern Australia and Queensland: so called in the Brisbane river region. It is the *bony-bream* of the New South Wales rivers and the *Perth herring* of Western Australia. *E. E. Morris*, Austral English.—**Japanese sardine-oil.** See ★*oil*.—**Scaled sardines**, species of fishes belonging to the genus *Sardinella*.—**True sardines**, members of the genus *Clupanodon*, found in temperate seas of America and Europe.

Sargasso crab. See ★*crab*^{1}.

sargasso-fish (sär-gas′ō-fish), *n.* See ★*sargassum-fish*.

sargassum-fish (sär-gas′um-fish), *n.* Any fish of the family *Antennariidæ*, especially *Pterophryne histrio*, found in tropical parts of the Atlantic, often among floating masses of sargassum.

sarinda (sä-rin′dä̤), *n.* [E. Indian.] A Hindu viol, which has a body made of a single wooden block, elliptical in general contour, flat in front and arched at the back, which is hollowed out to a shell, but with the lower part of the cavity thus formed covered with a stretched skin and with deep lunes in the sides to facilitate bowing. It usually has three strings, and the head is often carved in imitation of a bird or other object. Also *serinda*.



Sarinda.

(In the Metropolitan Museum of Art, New York.)

sarissa (sạ-ris′ä̤), *n.* [ML. *sarissa*, **sarisa*, < Gr. *σάρισα*, less prop. *σάρισσα*, in MGr. *σάριττα*, a long lance.] The long lance used by the Macedonian phalanx. It was eighteen feet long in the time of Philip and Alexander, but was later shortened to fourteen. In the later writings of the middle ages the same name is given to the long lances then in use.

sarkar, *n.* See *sircar*.

sarkical (sär′ki-kạl), *a.* [Gr. *σαρκικός*, of the flesh, fleshly, < *σάρξ*, flesh.] Of or pertaining to the flesh; fleshly.

According to this unquestionable purport of the apostolic reasoning, Adam's certainty of *ἁμαρτία* and subjection to Death were provided for ab initio in his *sarkical* constitution, and were only evinced, not caused by his trespass.
J. Martineau, Seat of Authority in Religion, p. 387.

Sarmatian, *n.* **2.** In *geol.*, the uppermost stage of the Miocene Tertiary in the Vienna basin.

sarmentiferous (sär-men-tif′ẹ-rus), *a.* Same as *sarmentose*.

sarraceniaceous (sar-ạ-sē-ni-ā′shius), *a.* Belonging to or resembling the *Sarraceniaceæ* or pitcher-plant family.

sarracenial (sar-ạ-sē′ni-ạl), *a.* [*Sarracenial*(*es*).] Belonging or relating to the order *Sarraceniales*. See ★*Sarraceniales*.

Sarraceniales (sar-ạ-sẹ-ni-ā′lēz), *n. pl.* [NL. (Engler, 1892), < *Sarracenia* + *-ales*.] An order of dicotyledonous choripetalous plants, characterized by scapose flowers and basal leaves which secrete a viscid liquor and are often greatly modified for the entrapping of insects. It embraces the three families *Sarraceniaceæ*, *Nepenthaceæ*, and *Droseraceæ*, to which most insectivorous plants belong.

sarrie (sar'i), *n.* [Appar. an English factory use of *sari.*] A fanciful and intricate colored weft-heading, 15 or 20 inches long, at the end of a piece of cotton cloth: a style used chiefly in goods for the East Indian trade.

Sarritor (sa-rī'tor), *n.* [NL., < L. *sarritor*, a hoer, a weeder, < *sarrire*, hoe.] A genus of agonoid fishes, found in rather deep water in the northern Pacific.

sarsaparilla, *n.*—**American sarsaparilla**, the wild sarsaparilla, *Aralia nudicaulis.*—**Australian sarsaparilla.** Same as *native* ★*sarsaparilla.*—**Big sarsaparilla**, the Dutchman's-pipe, *Aristolochia macrophylla.*—**False sarsaparilla**, the wild sarsaparilla.—**Native sarsaparilla**, in Australia, either of two climbing plants: (*a*) *Smilax glycyphylla.* See *Smilax.* (*b*) *Hardenbergia monophylla.* See *Hardenbergia.*—**Rough sarsaparilla**, the bristly sarsaparilla.—**Yellow sarsaparilla**, the Canada moonseed, *Menispermum Canadense.*

sarsaparillin (sär"sa-pa-ril'in), *n.* [*sarsaparilla* + *-in*².] Same as ★*parillin.*

sarsar (sär'sär), *n.* [Ar. *sarsar*, a cold wind; Hind. *sursurā*, a piercing or biting wind; Hindi *sarsar*, *sursur*, rustling: prob. imitative like *susurrus*, whisper.] A cold wind of Persia, otherwise called *shamsir* ('a sword'); an icy-cold, death-dealing blast.

> The flight and the pursuit seemed to go on for ever and ever. Frost gathering frost, some *Sarsar* wind of death, seemed to repel me; some mighty relation between God and death dimly struggled to evolve itself from the dreadful antagonism between them.
>
> *De Quincy.* Works (ed. Masson), I. 42.

sarsasapogenin (sär-sa-sa-poj'e-nin), *n.* [*sarsasapo(nin)* + *-gen* + *-in*².] A cleavage-product, $C_{28}H_{46}O_4$, of sarsasaponin.

sarsasaponin (sär-sa-sap'ō-nin), *n.* [*sarsa(parilla)* + L. *sapo(n-)*, soap, + *-in*².] A crystalline glucoside, $(C_{22}H_{36}O_{10})_{12}$, found in the roots of various species of *Smilax.*

Sart² (särt), *n.* [Turki *Sárt.*] A name applied by the nomads of Turkestan (Kirghiz, Kazaks, etc.) to dwellers in settled habitations.

sartoriad (sär-tō'ri-ad), *n.* [L. *sartor*, a tailor. Cf. *Iliad.*] An epic on the model of the Dunciad, with a tailor as the theme.

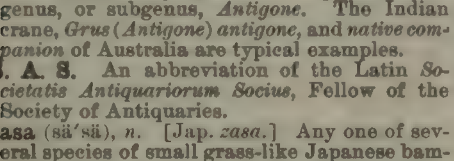
> "Material enough for a *sartoriad*," said Drummond to Lady Jocelyn.
>
> "Excellent. Pray write it forthwith, Drummond," replied her ladyship.
>
> *G. Meredith*, Evan Harrington, p. 258.

Sarus crane. [Hind. *sāras.*] A name given to two or three species of cranes placed in the genus, or subgenus, *Antigone.* The Indian crane, *Grus* (*Antigone*) *antigone*, and *native companion* of Australia are typical examples.

S. A. S. An abbreviation of the Latin *Societatis Antiquariorum Socius*, Fellow of the Society of Antiquaries.

sasa (sä'sä), *n.* [Jap. *zasa.*] Any one of several species of small grass-like Japanese bamboos belonging to the genus *Bambusa* and having very slender stems from one to six feet in height.

sash-chain (sash'chān), *n.* A chain of peculiar make used to replace a sash-cord when the sash is very heavy. It passes over a pulley in the circumference of which is a flat groove, and is so made that it will keep its place in such a groove. Its construction consists of two plates pierced at each end and alternating with a single plate of the same character, the plates being free to move around pins by which they are fastened, as in a chain of eye-bars.



Sash-chain.

sash-cord (sash'kôrd), *n.* The small rope which connects a sliding sash with the weight which serves as a counterpoise. The cord passes over a pulley which has a deep groove in its circumference.

sash-fastener, *n.* **2.** A device for holding in place a sliding sash, either shut or open. The term is generally applied to a kind of rotary bolt so placed as to hold the meeting rails together and prevent the opening of either the outer or the inner sash.

sash-lift (sash'lift), *n.* An ornamental casting designed to be screwed to and sometimes mortised into a window or shutter to furnish a hand-hold for raising it; a shutter-lift.

sash-line, *n.* **2.** A rope employed in raising telegraph-poles to the vertical position.

sash-lock (sash'lok), *n.* A lock or catch for fastening a window-sash.

sash-pocket (sash'pok"et), *n.* The hollow upright or box of a window-frame prepared for the weights of a counterpoised window-sash.

sash-pull (sash'pụl), *n.* A hook fastened to the end of a pole, used to open and close a high window from the top.

sash-tool, *n.* **2.** A cutter used in forming the moldings in window-sashes.—**3.** Any tool or plane-iron used in the making of sashes.

sash-weight (sash'wāt), *n.* A long and slender casting of some cheap metal hung by a sash-cord in the casing of a window-frame and used to counterbalance the weight of the sash.

saskatoon (sas-ka-tön'), *n.* [Blackfoot Indian.] The service-berry or June-berry, *Amelanchier Canadensis*, probably also the shad-bush, *A. Botryapium*, and perhaps the western service-tree, *A. alnifolia*, all of which are likely to be more or less confused by the Indians.

> *Saskatóon.* The name in the Canadian Northwest, for a species of berry and the bush upon which it grows. The word is of Blackfoot origin.
>
> *Jour. Amer. Folk-lore*, Oct.-Dec., 1902, p. 257.

sassafras, *n.*—**Black sassafras**, in Australia, a large tree of the laurel family, *Cryptocarya glaucescens*, yielding a soft wood, not durable, but used for staves and interior finishing of houses. Called also *white laurel.*—**California sassafras**, the California laurel, *Umbellularia Californica.*—**Gray sassafras**, the Moreton Bay laurel, *Cryptocarya australis*, yielding a light, easily worked wood, offensive to insects on account of its odor.—**New Zealand sassafras.** Same as *New Zealand* ★*laurel.*—**Queensland sassafras.** (*a*) A large, handsome tree of the laurel family, *Beilschmiedia obtusifolia.* (*b*) A smaller related tree, *Daphnandra micrantha*, of the family *Monimiaceæ.*

sassafras-laurel (sas'a-fras-lâ"rel), *n.* See ★*laurel.*

sassafrid (sas'a-frid), *n.* [*sassafr(as)* + *-id*¹.] A yellowish-brown granular compound formed spontaneously from the tannin peculiar to fresh sassafras-bark.

sastrugi (sas-trö'gi), *n. pl.* A term current in Siberia for flutings or little ridges of wind-blown snow, running parallel with the direction of the air-currents, and now sometimes quoted in English. See *zastruga.* *Rep. Brit. Ass'n Advancement of Sci.*, 1900, p. 817.

satan-monkey (sā'tan-mung"ki), *n.* See ★*monkey.*

Satanoperca (sā"tan-ō-pėr'ka), *n.* A genus of pomacentroid fishes found in the fresh waters of Brazil and Peru.

satellite, *n.* **2.** The following is a list of the satellites of the solar system thus far discovered:

PRIMARY	SATELLITE.	DISTANCE FROM ITS PRIMARY, in miles.	PERIOD, days.	hr.	min.	DIAMETER, in miles.	DISCOVERY.
Earth	Moon	238,840	27	7	43.2	2,162	
Mars	Phobos	5,850		7	[illegible]	35 ?	A. Hall, 1877
	Deimos	14,650		30	17.9	10 ?	A. Hall, 1877
Jupiter	(1) Io	1,167,000	16	16	32.2	2,960	Galileo, 1610
	(2) Europa	261,000	1	18	27.6	2,500	Galileo, 1610
	(3) Ganymede	415,000	3	13	13.7	2,100	Galileo, 1610
	(4) Callisto	664,000	7	3	42.6	3,550	Galileo, 1610
	(5) Nameless	112,500		11	57.38	100 ?	Barnard, 1892
	(6) "	7,185,000	253.4			100 ?	Perrine, 1905
	(7) "	7,403,000	260			40 ?	Perrine, 1905
	(8) " [1]	17,300,000 (?)	931 (?)			[illegible]	Melotte, 1908
Saturn	Mimas	117,000		22	37.1	600 ?	W. Herschel, 1789
	Enceladus	157,000	1	8	53.1	800 ?	W. Herschel, 1789
	Tethys	186,000	1	21	18.4	1,200 ?	J. D. Cassini, 1684
	Dione	238,000	2	17	41.2	1,100 ?	J. D. Cassini, 1684
	Rhea	332,000	4	12	25.2	1,500 ?	J. D. Cassini, 1672
	Titan	771,000	15	22	41.4	3,500 ?	Huygens, 1655
	Hyperion	934,000	21	6	39.5	500 ?	G. P. Bond, 1848
	Iapetus	2,225,000	79	7	54.3	2,000 ?	J. D. Cassini, 1671
	Phœbe[1]	8,000,000	546	12		200 ?	W. H. Pickering, 1898
	Themis	906,000 (?)	20	20	(?)	30 ?	W. H. Pickering, 1905
Uranus	Ariel[2]	120,000	2	12	29.4	500 ?	Lassell, 1851
	Umbriel[2]	167,000	4	8	27.6	400 ?	Lassell, 1851
	Titania[2]	273,000	8	16	56.5	1,000 ?	W. Herschel, 1787
	Oberon[2]	365,000	13	11	7.1	800 ?	W. Herschel, 1787
Neptune	Nameless[2]	221,500	5	21	2.7	2,000 ?	Lassell, 1846

[1] The motion appears to be retrograde.

[2] The motion is retrograde.

There are thus 26 satellites of 6 planets, of which 25 have been discovered in modern times (since 1610) by 9 observers (Galileo 4, Cassini 4, W. Herschel 4, Lassell 3, Hall 2, Perrine 2, Pickering 2, others 1 each).

3. (*b*) The point of intersection with a cubic curve of a tangent at a given point of the curve is this given point's *satellite.*—**5.** A vein accompanying an artery.—**6.** One of the smaller pathological formations which are associated with the primary larger one.—**7.** In gregarines, any member except the first in a chain-like association. Compare ★*primite.*

satellitium, *n.* **2.** In *astrol.*, an assemblage of four or more planets in the same sign of the zodiac or house of heaven. Strictly speaking, they should be in attendance upon the sun or moon, but the term is now used more generally.

sathrophilous (sa-throf'i-lus), *a.* [Gr. σαθρός, rotten, + φιλεῖν, love.] In *phytogeog.*, growing upon decaying organic matter, offal, etc.: applied to certain fungi. *Pound and Clements.*

satin. **I.** *n.* **2.** A yellow mixture applied to the flesh side of a hide or skin to get a yellow back. *Modern Amer. Tanning*, p. 116.

II. *a.*—**Satin leather, white.** See ★*leather*, ★*white*¹.

satinette (sat-i-net'), *n.* [See *satinet.*] A breed of small, short-billed, domesticated pigeons related to the 'owls.' The body is white, 7 to 10 flight-feathers white; the shoulders tricolored, the ground color being pinkish-white, shading into white, the coverts marked with black. The tail is purplish blue with a white spot at the end of each feather, this being the most important marking. The bird may or may not be crested.

satin-flower, *n.* **2.** The chickweed, *Alsine media.*

satin-grass (sat'in-gràs), *n.* Any grass of the genus *Muhlenbergia*; sometimes specifically *M. racemosa*, the wild timothy. The name refers to the slightly glistening leaves. For other species, see *nimble-Will*, ★*blow-out grass*, *knot-root* ★*grass*, *bearded* ★*zacaton*, and *black* ★*grama* (*c*).

satin-moth, *n.* **2.** A British collectors' name for a European and Asiatic liparid moth, *Stilpnotia salicis*, whose larvæ feed on the willow and poplar.

satin-pod (sat'in-pod), *n.* Either of the two species of *Lunaria* called satin-flower, especially *L. rediviva.* See *Lunaria*, 1.

satin-walnut (sat'in-wâl"nut), *n.* The sweet-gum, *Liquidambar Styraciflua.*

Satisfaction of record, the record of a satisfaction piece. In England this is called the entry of satisfaction on the roll.

sativic (sa-tiv'ik), *a.* [L. *sativa* (see def.) + *-ic.*] Derived from hemp-seed, *Cannabis sativa.*—**Sativic acid**, a crystalline acid, $C_{17}H_{31}(OH)_4COOH$, or tetrahydroxystearic acid, made by oxidizing linoleic acid with potassium permanganate. It melts at 173° C.

sato-imo (sä-tō-ē'mō), *n.* [Jap. *sato*, village, + *imo*, potato.] In Japan, the taro, *Caladium Colocasia*, the starchy rhizomes of which are one of the food-staples of the natives. See ★*imo.*

saturater, *n.* (*d*) A shallow receptacle which contains liquid pentane through which air is drawn and saturated with vapor: an essential part of a pentane-lamp. See *pentane-lamp*. *W. M. Stine*, Photometrical Measurements, p. 139. (*e*) In *beet-sugar manuf.*, an apparatus for treating the juice extracted from the beet with carbonic-acid gas to free it from lime. It is essentially a closed vessel in which the juice is subjected to the gas under pressure.

saturation, *n.* (*a*) In the saturation of a liquid with a solid by solution, the quantity of the solid dissolved varies largely, in most cases, with varying temperature, the general rule being that rise of temperature is attended with increase in the quantity of the solid needed to produce saturation. In the saturation of a liquid with a dissolved gas the opposite relation prevails, as more of the gas is required to produce saturation at a low than at a high temperature, and in this case the influence of pressure is also very marked, increase of pressure being attended with increase in the quantity of gas needed to produce saturation.

2. In *biol.*, the hypothetical influence of an unborn offspring upon the body or the reproductive organs of the mother in such a way that children afterward borne by the mother to other sires resemble the first sire: a hypothesis to account for telegony. See ★*telegony*. —**Belt of saturation,** a zone or belt in the rocks of the earth's crust where the spaces are filled with water. This belt varies in depth and extent and in relationship to the other less completely saturated belts with local or seasonal changes. *Van Hise*, in U. S. Geol. Surv., Monograph XLVII. vi. 420.—**Curve of saturation.** See ★*curve*.—**Degree of saturation.** (*a*) In *phys.*, the weight of the vapor of a given liquid contained at a given temperature in a given volume, stated as a fraction of the weight of the saturated vapor contained in the same volume at the same temperature. Meteorologists have to do with water, and speak of the degree of saturation of the air with aqueous vapor. (*b*) In *phys. chem.*, the amount of a dissolved substance contained in a given volume of a solution, stated as a fraction of the amount of the dissolved substance contained in a solution saturated at the same temperature.—**Lit-par-lit saturation.** See ★*injection*. —**Magnetic saturation,** in *elect.*, the property of magnetic materials that for high magnetizing forces the magnetic induction increases less than proportionally to the magnetizing force. Also, the limiting value of magnetic induction, approached at very high magnetizing forces.

saturation-value (sat-ū-rā′shọn-val″ū), *n.* In *exper. psychol.*, the relation of color to brightness, or of chromatic to achromatic component, in a colored impression.

Saturday, *n.*—**Baff Saturday.** See ★*baff*^{3}.

Saturn's ring. The idea that the ring might consist of separate small particles moving like independent moons had been suggested by Cassini and Wright, in the eighteenth century, as well as by Roberval, but had attracted little attention until the work of Peirce. A little later (1857) Clerk-Maxwell showed that no ring could be permanent unless so constituted, and that such a ring might be. Since then there has been a general acceptance of this theory. It has received observational confirmation from Seeliger's photometric work upon the reflecting power of the ring, and more recently from Keeler's spectroscopic demonstration that the inner edge of the ring moves more swiftly than the outer, an observation since confirmed by several other spectroscopists.

saturniid (sā-tėr′ni-id), *n.* and *a.* **I.** *n.* A member of the lepidopterous family *Saturniidæ*.

II. *a.* Having the characters of or belonging to the family *Saturniidæ*.

Saturnine cachexia. See ★*cachexia*.

saturnismus (sat-ėr-nis′mus), *n.* [NL., < ML. *saturnus*, lead: see *Saturn*.] Chronic lead-poisoning.

satyr^1, *n.*—**Carolinian satyr,** an American agapetid butterfly, *Cissia sosybius*, occurring commonly in the Mississippi valley and the southern United States, and feeding, in the larval stage, on grasses.—**Georgian satyr,** an American agapetid butterfly, *Neonympha phocion*, small in size and dull mouse-brown in color, common in Georgia. Its larvæ feed on coarse grasses.

satyrid (sat′i-rid), *n.* and *a.* **I.** *n.* A member of the lepidopterous subfamily *Satyrinæ*.

II. *a.* Having the characters of or belonging to the subfamily *Satyrinæ*.

sauce, *n.*—**Agra dolce sauce,** an Italian sauce used with venison, sweetbreads, etc.—**Bearnaise sauce,** a rich egg-sauce flavored with tarragon.—**Bischoff sauce,** a rich wine-sauce containing fruits and sometimes almonds: served with cabinet puddings.—**Chaudfroid sauce,** a rich stiff sauce, made of stock and gelatin, used to cover cold meats.—**Chilli sauce.** See ★*chilli*.—**Dutch sauce,** a rich sauce served with fish.—**Espagnole sauce,** a highly seasoned sauce made of brown stock and flavored with wine: used as a foundation for many brown sauces.—**Financière sauce,** a rich brown sauce containing wine and mushroom catchup.—**Genoese sauce,** sauce made of white stock highly seasoned and flavored with wine: served with fish.—**Green sauce,** a sauce made with finely cut green herbs, vinegar, pepper, salt, etc. It was formerly considered very desirable with fish.

> *Grene sauce* is good with grene fysshe & halybut, cottell, & fresshe turbot.
> *Boke of Keruynge* (Wynkyn de Worde), p. 282.

Hard sauce, a creamy sauce of butter and sugar, usually flavored with vanilla or the like.—**Hollandaise sauce,** a thick rich sauce served especially with fish, but also with meats and sometimes with vegetables.—**Hot sauce,** in the West Indies, same as *pepper-sauce*.—**Long sauce,** beets, carrots, parsnips, etc.: opposed to *short sauce*, the vegetables that are shorter in shape and size and grow above ground, as peas, beans, tomatoes, etc. See *sauce*, 2. —**Piquante sauce,** an acid sauce, highly seasoned.—**Poivrade sauce,** a brown sauce flavored with claret.—**Ravigote sauce,** a sauce highly flavored with green herbs.—**Richelieu sauce,** a rich sauce containing candied fruits and almonds, served with puddings.—**Sabayon sauce,** a creamy sugar-sauce, usually flavored with wine, and served with fruit or plum-puddings.—**Soubise sauce,** purée of onions, mixed with brown sauce, and served with chops.—**Tabasco sauce,** a sauce seasoned highly with red peppers. See ★*tabasco*.—**Velouté sauce,** a smooth white sauce made with chicken or veal stock instead of milk: used with fish and vegetables. —**Villeroi sauce,** a rich, thick sauce used to coat eggs and cold meats when they are re-heated.

sauce-plate (sâs′plāt), *n.* A small saucer-like plate used to hold 'sauce.' It is usually placed by the side of the dinner-plate. [New England.]

saucer^2 (sâ′sėr), *n.* [*sauce*, *v.*, + *-er*.] A tobacco adapted by large absorptive capacity to take the 'sauces' in vogue in Continental Europe, which are said to consist chiefly of salt, sal-ammoniac, and sugar. See *sauce*, 6. A German and a Dutch saucer are known to the trade, consisting of varieties of the heavy export type chiefly from Virginia.

sauqui (sâ′kwē), *n.* [Also *sau-qui*, *sawqui*, *saw-qui*, *sawkeye*, *saukeye*, *saw-kwey*, *sockeye*; from an Amerindian name?] The blue-back salmon. See *salmon*, 2 (*e*). Also *sauqui salmon*. *Jordan and Evermann*, Amer. Food and Game Fishes, p. 156.

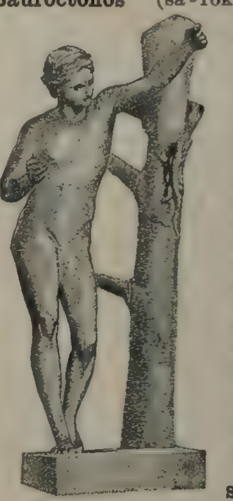
sauriderma (sâ-ri-dėr′mä), *n.* [NL., also *sauroderma*, prop. **saurodermia*, < Gr. σαῦρος, lizard, + δέρμα, skin.] A form of ichthyosis accompanied with an altered state of the sebaceous secretion. Also called *ichthyosis hystrix*.

sauriosis (sâ-ri-ō′sis), *n.* [NL., irreg. < Gr. σαῦρος, lizard, + *-i-* + *-osis*.] Same as ★*sauriderma*.

saurocrotaphous (sâ-rō-krot′a-fus), *a.* Having temporal fossæ similar in character to those of reptiles.

> I cannot accept the contention of McGregor that the Ichthyosauria had a primitively *saurocrotaphous* type of skull. *Williston*, in Proc. U. S. Nat. Mus., XXXII. p. 489.

Sauroctonos (sâ-rok′tọ-nos), *n.* [Gr. σαυροκτόνος.] The lizard-killer; the name of a bronze statue of Apollo described by Pliny (Nat. Hist. 34–70) which represented the divinity as a boy leaning with one hand upon the trunk of a tree and killing a lizard with an arrow held by the other. This statue is probably represented by many replicas, notably a bronze statuette in the Villa Albani in Rome, and marble statues in the Vatican and the Louvre. The original was probably suggested by some well-known cultus statue.



Apollo Sauroctonos.
(In the Louvre.)

saury, *n.* 2. Any mackerel-like pelagic species of fish belonging to the family *Scombresocidæ*, swimming close to the surface in large schools in temperate regions.

sausage, *n.* 2. In *milit. mining*, a canvas tube filled with powder.—3. *pl.* A commercial name for crude rubber in finger- or sausage-shaped pieces. See ★*rubber*^{1}, 3.—**Prankfort sausage.** See ★*frankfurter*.

sausage-stuffer (sâ′sāj-stuf″ėr), *n.* An appliance for filling sausage-skins with the minced and prepared meat. It is a hand-power screw-press with a spout over which the empty skin is held while being filled.

sauté (sō-tā′), *p. a.* [F., pp. of *sauter*, fry in a greased pan, lit. 'bounce.'] Fried. See *sauter*.

savanna, *n.* (*c*) In *phytogeog.* See ★*grass-land*.

savart (sa-vär′), *n.* [Named from Félix *Savart* (1791–1841), a French physician and physicist.] In *acoustics*, a unit proposed by Guillemin for interval of pitch; an interval of ten to one or of three octaves and a major third.

> In acoustics it is common to measure large intervals of pitch in octaves and smaller ones in "commas." M. A. Guillemin proposes to adopt instead of these units the *savart* and the millisavart. By the *savart* is meant an interval of ten to one, which equals three octaves plus a major third. The millisavart, which is the thousandth part of the *savart*, represents the interval between two French standard diapasons giving one beat per second.
> *Nature*, Aug. 21, 1902, p. 398.

Savastana (sav-as-tā′nä), *n.* [NL. (Schrank, 1789), named in honor of Francesco Eulalio *Savastano* (1657–1717), an Italian poet-botanist.] A genus of grasses. See *Hierochloë*.

savate (sa-vät′), *n.* [F., also an old shoe, < Prov. *sabata* = Sp. *zapata* = It. *ciabatta*, an old shoe.] The use of the feet for attack and defense: a method of fighting practised by the French and Cornishmen.

savice (sav′is), *n.* [Corruption of *service*^{2}.] The service-berry, *Amelanchier Canadensis*.

Savill's disease. See ★*disease*.

savin, *n.*—**Horse savin,** the common juniper, *Juniperus communis*.—**Red savin,** the red cedar, *Juniperus Virginiana*.

saving-tree (sā′ving-trē), *n.* The savin, *Juniperus Sabina*.

Savona pottery. See ★*pottery*.

savory^1, *a.* **II.** *n.* In *cookery*, a small, highly seasoned entrée, such as a cheese fondant, a tiny salt herring with red pepper, on toast, or deviled eggs: served at the end of a dinner.

> [The] justification of the existence of a *savoury* at the end of a dinner is surely convincing. It has nothing to do with hors d'œuvres. It takes the place of the now discarded cheese service.
> *A. Kenney-Herbert*, Common-sense Cookery for Eng.
> [Households, p. 419.

Savoy cabbage. Same as *savoy*.—**Savoy cakes,** lady's-fingers.

saw^1, *n.*—**Chairmaker's saw,** a form of fret-saw with wood frame and straining-link for the scroll forms used in chair-making by hand; hence, any scroll- or jig-saw with straining-frame.—**Chisel-tooth saw,** a circular saw used for logs or rafted lumber, in which the teeth are inserted into the periphery of the plate, and each tooth cuts on its front edge, which is sharpened like a chisel. The teeth are not set laterally, but the cutting-edge is wider than the gage of the plate of the saw. The teeth of saws for rough and rafted logs often encounter embedded pebbles and sand, and are liable to injury. To have them removable and easily inserted enables the saw to be always sharp at all points of its periphery.—**Cold-iron saw,** a circular saw, thick in proportion to its diameter, having short teeth, sharpened square across the edge of the disk. It runs at a slow speed, and is usually driven by power, though saws worked by hand by intervention of bevel-gearing are employed where a portable form is desired. A small circular saw is used for cutting slits in the heads of screws, and other articles where shallow and narrow grooves are required. Cold-iron saws having no teeth and running at a very high speed are also used. They cut through large pieces of iron or steel by a method which is practically melting a path through the material by the heat of friction.—**Corner saw.** (*a*) A saw for beveling the corners of blocks. (*b*) A keyhole saw; a saw which has a very narrow, thin blade, so that it can turn corners.—**Double-cut saw,** a saw, for hand use or in a reciprocating frame, in which the teeth are so sharpened as to cut both on the pulling and the pushing strokes. The cutting edges are formed on both faces of the symmetrical tooth of the cross-cut saw, or on the alternate teeth of the ripping- or slitting-saw.—**Foxtail saw,** a saw with an especially thin or especially thick blade, according to the desired use, for making in the end of tenons the slit to receive the foxtail wedge which is to expand the tenon when the wedge reaches the bottom of the mortise: also used in the thin-blade form for dovetails.—**Gigli saw,** in *surg.*, a wire toothed all around like a saw, so that it will cut in any direction. Also called *Gigli wire saw*.—**Insertable-tooth saw,** a circular saw the teeth of which can be removed separately. This allows of the insertion of a new tooth at any time to replace one which is damaged or dulled.—**Left-hand circular saw,** a saw situated at the left end of the carriage or saw-table, as seen by one toward whom the top of the saw turns.—**Long saw,** a log saw for hand use, intended to be used by two sawyers, one of whom stands above the log, and the other in a pit below the log.—**Metal-slitting saw.** See *milling-*★*saw*.—**Milling-saw,** a milling-machine employing a cutter resembling in form a circular saw. The disk is armed with teeth slightly wider than the disk to give it clearance. The cutter, and sometimes the machine itself, is called a *metal-slitting saw*. See ★*milling-machine*, 1, and ★*milling-cutter*, 2.—**Miter-box saw,** a saw for making joints in a miter-box. It is usually a fine-toothed, thin-gage, cross-cut saw, with a stiffened back.—**Screw-head saw,** a metal-cutting saw or milling-disk for cutting into screw-blanks the slot or nick which receives the screw-driver.—**Vertical saw.** (*a*) A reciprocating gang or muley-saw in which the frame or sash moves in vertical guides. (*b*) A circular saw turning in a vertical plane or with its shaft horizontal.

saw^1, *v. i.*—**To saw by,** in *railroading*, to drill cars on a single-track road by a method whereby two trains, meeting at a siding that is too short to contain either one of the trains, are enabled to pass. This method is troublesome and complicated, and is now seldom used.

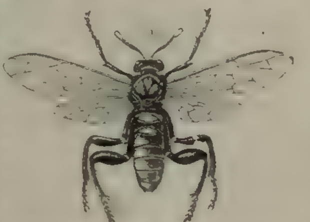
saw-back, *n.* 2. A regularly serrate ridge or mountain.

saw-brier (sâ′brī″ėr), *n.* 1. In the Bahamas, a climbing plant, *Smilax Havanensis*, having prickles on the midrib and margin of many of its leaves.—2. Same as *china* ★*brier*.

sawdust-chain (sâ′dust-chān″), *n.* A special type of conveyer-chain having cross-bars and wings that serve as flights: used in sawmills to convey the sawdust, through the conveyer, from the mill to the boiler-house, where it is used as fuel. See ★*conveyer*, 4, and ★*flight*¹, 10 (*c*).

Saw-fish shark. See ★*shark*¹.

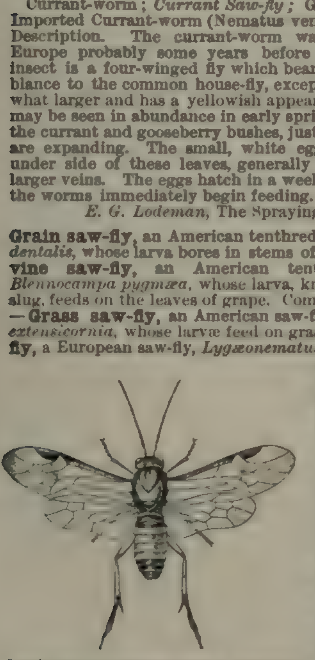
saw-fly, *n.* —**American saw-fly,** *Cimbex Americana*, a large and handsome species occurring commonly in the eastern United States, where its larvæ feed on the foliage of elms, willows, and birches. —**Apple saw-fly,** a hymenopterous insect, *Hoplocampa testudinea*, of the family *Tenthredinidæ*, found in England, France, Germany, and Sweden. In the larval stage it injures young apples and pears. —**Cranberry saw-fly,** an American tenthredinid, *Pristophora idiota*, whose larvæ feed on the foliage of the cranberry. —**Currant saw-fly,** the adult of the imported currant-worm. See *currant-worm* (*a*).



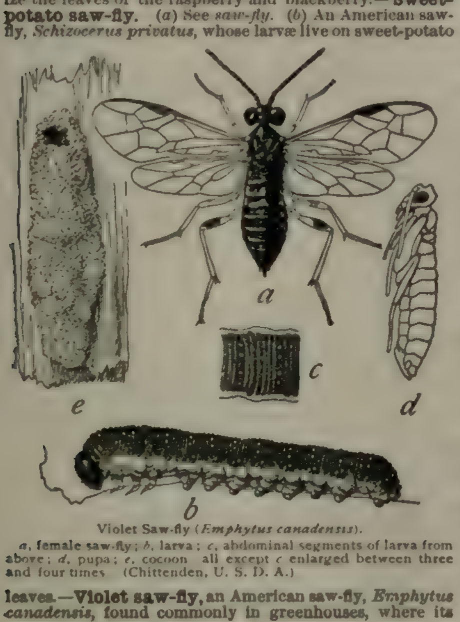
American Saw-fly (*Cimbex Americana*): natural size. (U. S. D. A.)

> Currant-worm; *Currant Saw-fly*; Gooseberry Saw-fly; Imported Currant-worm (Nematus ventricosus Klug.).—Description. The currant-worm was imported from Europe probably some years before 1860. The adult insect is a four-winged fly which bears a certain resemblance to the common house-fly, except that it is somewhat larger and has a yellowish appearance. These flies may be seen in abundance in early spring hovering about the currant and gooseberry bushes, just as the first leaves are expanding. The small, white eggs are laid on the under side of these leaves, generally in rows along the larger veins. The eggs hatch in a week or ten days, and the worms immediately begin feeding.
>
> *E. G. Lodeman*, The Spraying of Plants, p. 286.

Grain saw-fly, an American tenthredinid, *Cephus occidentalis*, whose larva bores in stems of wheat.—**Grapevine saw-fly,** an American tenthredinid insect, *Blennocampa pygmæa*, whose larva, known as the grape-slug, feeds on the leaves of grape. Compare ★*grape-slug.* —**Grass saw-fly,** an American saw-fly, *Pachynematus extensicornia*, whose larvæ feed on grass.—**Larch saw-fly,** a European saw-fly, *Lygæonematus erichsonii*, which also occurs in Labrador, Canada, and New England. It is red and black in color, and its whitish larvæ often defoliate larch forests over large areas.—**Locust saw-fly,** an American saw-fly, *Pteronus trilineatus*, whose larvæ eat the leaves of the black locust. —**Ohio currant saw-fly,** an American saw-fly, *Pristiphora rufipes*, whose larva feeds on the foliage of the currant in Ohio and neighboring States.—**Pine saw-fly,** any one of a number of tenthredinid insects whose larvæ injure the leaves of pine. *Abbot's white-pine saw-fly* is *Lophyrus abbotii*. The *pitch-pine saw-fly* is *Lophyrus pini-rigidæ*. Other species having this as a food-plant are *Lophyrus abietis* and *L. pinetum.*—**Raspberry saw-fly,** an American saw-fly, *Monophadnoides rubi*, whose larvæ skeletonize the leaves of the raspberry and blackberry.—**Sweet-potato saw-fly.** (*a*) See *saw-fly*. (*b*) An American saw-fly, *Schizocerus privatus*, whose larvæ live on sweet-potato leaves.—**Violet saw-fly,** an American saw-fly, *Emphytus canadensis*, found commonly in greenhouses, where its larvæ damage violets by eating the leaves and occasionally cutting the flower-stalks.—**Willow saw-fly.** See *willow-sawfly*.



Larch Saw-fly (*Lygæonematus erichsonii*): enlarged nearly twice. (U. S. D. A.)



Violet Saw-fly (*Emphytus canadensis*).

a, female saw-fly; *b*, larva; *c*, abdominal segments of larva from above; *d*, pupa; *e*, cocoon all except *c* enlarged between three and four times (Chittenden, U. S. D. A.)

sawkeye, saw-kwey. *n.* See ★*sauqui*.

saw-knife (sâ'nīf), *n.* A small hand-saw having a web which resembles the blade of a table-knife.

saw-log, *n.* **2.** A log for use in building. *Dialect Notes*, III. iii. [Local, U. S. (Arkansas).]

sawney² (sâ'ni), *a.* and *n.* [Origin obscure.] **I.** *a.* **1.** Soft; suave; somewhat deceitful or intended to persuade through excessive blandness.

> Lady Hampshire . . . spoke in her *sawney* voice of factitious enthusiasm as if she pitied the lot of all those who were not about to sleep in wet sheets.
>
> *Disraeli*, Tancred, i. 5.

2. Dawdling; idling.

> Curzon Street, after a long, straggling, *sawney* course, ceasing to be a thoroughfare, . . . is quite in keeping with all the accessories. *Disraeli*, Tancred, i. 1.

II. *n.* **1.** A stupid, easy-going man. [Local, Eng.]

> In my young days a *sawney* was not uncommonly used for a 'softy.' *H. P. L.* in N. and Q., 9th ser., VIII. 68.

2. A suave, soft-spoken, artful person. *T. Ratcliffe*, N. and Q., 9th ser., VIII. 68.—**To have a sawney.** See the extract.

> If a minder in a cotton mill have four or five hundred "ends" or threads broken through the chance intervention of an obstacle when the carriage is on the outward run, or through the sudden breaking of a band, he is said *to "have a sawney."* Incompetence is suggested in the use of the expression; but this feature is also noticeable, that when a "*sawney*" occurs the lineality of the carriage has been suddenly lost. *N. and Q.*, 9th ser., VIII. 170.

sawneying (sâ'ni-ing), *n.* Idling; lounging; dawdling.

> It looks like a sneaking, *sawneying* Methodist parson.
>
> *Southey*, Letters, ii. 63, quoted in Davies, Sup. [Eng. Glossary.

Saw-tooth roof. See ★*roof*¹.

sawwort, *n.* **2.** The button-snakeroot, *Laciniaria spicata*.

sawyer, *n.* **6.** In New Zealand, a large wingless locustid, *Deinacrida heteracantha* or *D. megacephala*. Called by the natives *weta-punga* or *weta*.

saxe² (saks), *n.* An apparatus consisting of a series of rectangular boxes containing some mercury on the bottom and provided with agitating blades. These boxes are used for removing the slime from the gold amalgam. *Phillips and Bauerman*, Elements of Metallurgy, p. 852.

saxifrage, *n.*—**Aconite saxifrage,** *Therofon aconitifolium*, closely related to *Saxifraga* and of similar habit, native to the southern United States. The leaves somewhat resemble those of the aconite, but the stem is hairy.—**Early saxifrage,** *Saxifraga Virginiensis*. See *saxifrage* (with cut).—**Mountain saxifrage,** the purple saxifrage, *Saxifraga oppositifolia*.

saxoline (sak'sō-lin), *n.* [NL. *Saxolinum*, < L. *saxum*, rock, + *-ol* + *-inum*.] A trade-name of a semisolid mixture of petroleum hydrocarbons, resembling vaseline. Also called *saxolinum*.

Saxon topaz. See ★*topaz*.

Saxonian (sak-sō'ni-an), *a.* [ML. *Saxonia*, Saxony.] In *geol.*, noting a division of the Permian system in Europe, embracing the red beds of the middle part of the formation, which extend from Germany to the northwest of England.—**Saxonian epoch.** See ★*epoch*.

say¹, *n.* **5.** In *poker*, the turn of a player to declare whether or not he will ante.

> When it is the turn of any player to declare what he will do, whether he will bet, or pass his hand, it is said to be his *say*. *Amer. Hoyle*, p. 163.

saya (sä'yä), *n.* [Tagalog and Bisaya *saya*.] In the Philippine Islands, a woman's skirt or petticoat worn in the manner of a sarong.

S. B. An abbreviation (*a*) of the Latin *Scientiæ Baccalaureus*, Bachelor of Science; (*b*) of *South Britain*; (*c*) of *Spartan Brotherhood*; (*d*) of *Steamboat*.

S. B. D. In *astron.*, an abbreviation of (Schönfeld's) *Southern Bonn Durchmusterung* (see ★*Durchmusterung*). Usage is divided between this abbreviation and ★*S. D. M.* (which see).

sc. An abbreviation (*d*) of *scene*.

S. C. An abbreviation (*c*) of *South Carolina*; (*d*) of *Staff Corps*; (*e*) of *Supreme Court*.

scab, *n.*—**Beet-scab,** a fungous disease of beet-roots caused by *Oöspora scabies*.—**Cherry-scab,** a disease which attacks the fruit of the cherry, due to the fungus *Cladosporium carpophilum*.—**Cucumber-scab,** a disease of the cucumber due to *Cladosporium Cucumerinum*.—**Fig-scab,** a disease of the fig due to the fungus *Fusarium roseum*.—**Follicular scab.** See ★*sheep-scab*. —**Grape-scab,** a disease of grapes caused by *Cladosporium viticolum*.—**Lemon-scab,** a fungous disease due to *Cladosporium Citri*, which attacks the young fruit of the lemon. The same fungus also attacks the fruit of the lime.—**Olive-scab,** a disease of the olive due to *Cycloconium oleaginum*. See ★*Cycloconium*.—**Onion-scab,** a disease of onion-bulbs due to the fungus *Vermicularia circinans*, which produces black blotches on the surface. See ★*Vermicularia*.—**Orange-scab,** a disease of the orange due to *Cladosporium Citri*.—**Peach-scab,** a disease of the peach due to *Cladosporium carpophilum*, which produces small brown or black spots on the side of the fruit.—**Plum-scab.** Same as *peach-★scab*.—**Potato-scab.** See ★*potato-scab*.—**Tomato-scab,** a disease of the tomato due to *Cladosporium fulvum*.—**Wheat-scab,** a disease of wheat due to any one of the following fungi: *Cladosporium herbarum*, *Fusarium culmorum*, or *F. roseum*.

scabby, *a.* **5.** In *founding*, blistered or marred with scabs: said of a casting. *Stand. Dict.*

scabby-head (skab'i-hed), *n.* The hedge-parsley, *Torilis Anthriscus*.

Scabies ferina, acariasis, scab, or itch of animals, caused by parasitic mites. See *acariasis*.

scabish (skab'ish), *n.* Sundrops, *Kneiffia fruticosa*; also the more southern species, *K. glauca*. The name is sometimes less properly applied to the common evening-primrose, *Œnothera biennis*.

scabrities (skā-brish'i-ēz), *n.* [L., < *scaber*, rough, scaly.] A condition of roughness and scaliness of the skin.

scad¹, *n.*—**Goggle-eye scad.** Same as *goggle-eyed jack*.

scaffold, *n.*—**Hanging scaffold,** in *mining*, a hanging platform in a mine-shaft attached to a crane or hoisting-engine.

scaffolding, *n.* **5.** In *tobacco-growing*, the hanging of the freshly cut plant upon a structure of poles or rails variously supported to wilt before housing: much practised in the heavy export and white Burley districts.

scalage¹ (skā'lāj), *n.* [*scale* + *-age*.] In *leather-manuf.*, an allowance in weight of hides, usually about 15 per cent., made for scalings that may drop off. *Stand. Dict.*

scalar. **I.** *n.* **2.** In *physics*, a quantity, such as mass or volume, which has magnitude but not direction.

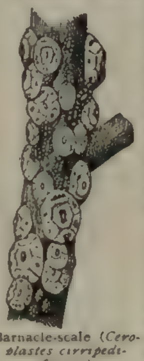
II. *a.*—**Scalar multiplication.** See ★*multiplication*.

scald¹, *n.* **2.** Same as ★*sun-scald*, 2.—**Scald of cranberry,** a fungous disease of the cranberry, due to a species of *Guignardia* which causes a softening and discoloration of the fruit.—**Scald of grape,** a disease of the grape due to the fungus *Aureobasidium vitis*, which attacks the fruit, producing livid depressed spots and at last completely destroying it. Also called *grape-fleck*.

Scaldesian (skal-dē'zhian), *n.* In *geol.*, a division of the Pliocene Tertiary in Belgium and Holland, lying above the Diestian sands.

scalduggery, *n.* Same as *skulduddery*.

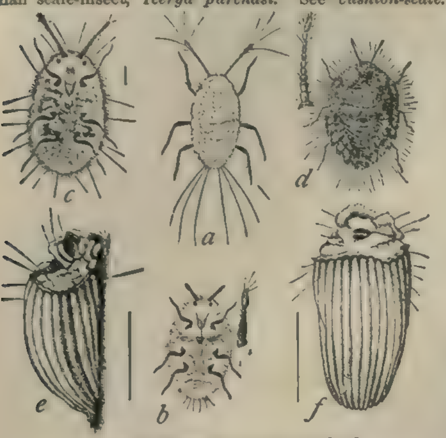
scale¹, *n.* **5.** An incrustation on the inside of a boiler or other vessel in which water is evaporated which contains in solution salts which are precipitated by heat. These salts are usually present in solution as compounds rich in carbonic acid, such as the acid carbonates of lime and magnesia, or as sulphates or silicates. The carbonates lose one atom of CO_2 on boiling and become insoluble protocarbonates, and the sulphates are less soluble in hot water than in cold. Such scale causes local overheating and injury to the metal of the vessel, retards the transfer of heat to the water to be evaporated, and clogs up waterways. —**Armored scale,** a name given to any or all of the scale-insects of the subfamily *Diaspinæ*, all of which are covered with a protecting scale.—**Auxiliary scale.** Same as ★*adipose lobe*.—**Barnacle-scale,** a coccine scale-insect, *Ceroplastes cirripediformis*, which occurs upon citrus-trees in Florida and somewhat resembles a very small barnacle, whence the popular and the specific names.—**Blackberry soft scale,** an American scale-insect, *Eulecanium fitchii*, occurring on the blackberry and raspberry in Canada and the northeastern United States. —**Broad scale.** Same as *brown* ★*scale*.—**Brown scale,** a cosmopolitan scale-insect, *Coccus* (*Lecanium*) *hesperidum*, occurring on various plants of economic importance. Also called *soft scale*, *flat scale*, and *turtle-back scale*.—**California red scale,** a diaspine scale-insect, *Chrysomphalus aurantii*, destructive to citrus-trees in California.—**Camellia scale,** another popular name for the so-called 'greedy scale,' *Aspidiotus rapax-camelliæ*, a cosmopolitan scale-insect which feeds on a great variety of plants.—**Canthal scale.** See ★*canthal*.—**Cherry scale.** See ★*cherry*¹. —**Circular scale,** a popular name sometimes applied specifically to the so-called red scale of Florida, *Chry-*



Barnacle-scale (*Ceroplastes cirripediformis*).

Group of scales on twig, showing different stages of growth: enlarged about 2 diameters. (After Marlatt, U. S. D. A.)

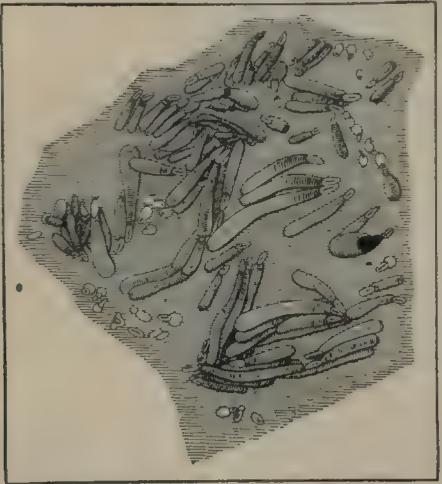
somphalus ficus.—**Cottony cushion-scale,** an Australian scale-insect, *Icerya purchasi.* See *cushion-scale.*



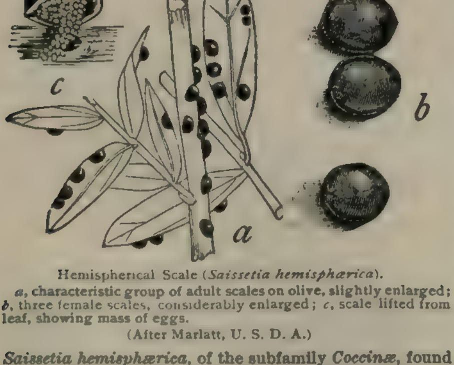
Cottony Cushion-scale (*Icerya purchasi*).

Female series, showing the development of the female insect from young larva to adult gravid stage: *a*, newly hatched larva; *b*, second stage; *c*, third stage; *d*, full-grown female; *e* and *f*, same after secretion of egg-sac. Lines show natural size. (After Marlatt, U. S. D. A.)

—**Cottony scale,** a scale-insect of the genus *Pulvinaria:* as, the *cottony maple-scale, P. vitis.*—**Cranberry scale.** See ★*cranberry-scale.*—**Crude scale,** in the manufacture of solid paraffin wax from petroleum or shale-oil, the impure product obtained by the first crystallization by cooling of the heavier fractions of the distilled oil.—**Currant scale,** an American coccine scale-insect, *Eulecanium ribis* Fitch.—**European fruit-scale.** See ★*Aspidiotus.*—**Forbes's scale,** an American diaspine scale-insect, *Aspidiotus forbesi,* found on many orchard and forest trees. Also called *cherry-scale,* since it was first found on cherry. It occurs throughout North America and in Germany.—**Genital scale,** in ophiuroids, the smaller of the two bar-like plates bounding the genital slit. See *genital* ★*plate.*—**Giant scale,** any homopterous insect of the family *Coccidæ* and subfamily *Monophlebinæ,* especially the species of the Australasian genus *Monophlebus,* some of which are an inch in length.—**Glover's scale,** a cosmopolitan scale-insect, *Lepidosaphes gloverii,* occurring abundantly on citrus-trees in various parts of the world. It is especially abundant in Florida, where it is known as the long scale.—**Grape scale.** See ★*grape-scale.*—**Greedy scale,** a cosmopolitan diaspine scale-insect, *Aspidiotus camelliæ* (often called *A. rapax*), which occurs in destructive numbers on many different trees and plants in many parts of the world.—**Hemispherical scale,** a common cosmopolitan naked scale, *Saissetia hemisphærica,* of the subfamily *Coccinæ,* found on a great variety of plants and especially abundant in greenhouses in the northern United States.—**Mealy scale.** Same as *mealy bug* (which see, under *bug*^{2}).—**Peach and plum scale,** an American coccine scale-insect, *Eulecanium nigrofasciatum,* wide-spread in the United States and occurring principally on peach and plum, but also on apple, olive, sycamore, maple, and other trees. Also called *terrapin scale.*—**Pernicious scale.** Same as *San José scale.* See ★*Aspidiotus.*—**Putnam's scale,** *Aspidiotus ancylus,* a comparatively innocuous North American diaspine scale.—**Quince scale,** a diaspine scale-insect, *Aspidiotus camelliæ,* possibly of American origin, but also found in Ceylon and Samoa, which attacks quince, fig, orange, cactus, the tea-plant, and other plants.—**Red scale.** (*b*) A diaspine scale-insect, *Chrysomphalus aurantii,* cosmopolitan in its distribution and occurring on orange, lemon, cocoa, fig, and many other trees. Also called the *California red scale,* to distinguish it from *Chrysomphalus aonidum* (*ficus*), sometimes called the *Florida red scale.*—**Ribbed scale,** in *entom.,* same as *cushion-scale.*—**Scale caterpillar.** See ★*caterpillar.*—**Soft scale.** Same as *brown* ★*scale.*—**Spindle-tree scale,** a diaspine scale-insect, *Chionaspis euonymi,* which occurs on the spindle-tree or euonymus-bush in Europe and North America.—**Terrapin scale.** Same as *peach and plum* ★*scale.*—**Tulip-tree scale,** a large American naked scale-insect, *Toumeyella liriodendri,* which often crowds the twigs and smaller branches of the tulip-tree, magnolias, and linden.—**Turtleback scale.** Same as *brown* ★*scale.*—**Walnut scale.** See *walnut-scale* and ★*Aspidiotus.*—**Willow scale.** This name is also given to *Chionaspis salicis-nigræ, Eulecanium capreæ, Chionaspis ortholobis, Aspidiotus camelliæ,* and others.—**Yellow scale,** a variety of the red scale of California, *Chrysomphalus aurantii,* var. *citrinus.*



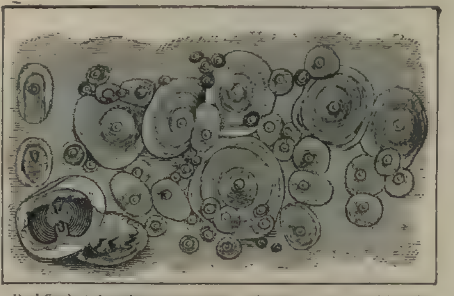
Glover's Scale (*Lepidosaphes gloverii*); showing cluster of male and female scales on fruit of orange: greatly enlarged. (Marlatt, U. S. D. A.)



Hemispherical Scale (*Saissetia hemisphærica*).

a, characteristic group of adult scales on olive, slightly enlarged; *b*, three female scales, considerably enlarged; *c*, scale lifted from leaf, showing mass of eggs.

(After Marlatt, U. S. D. A.)



Red Scale (*Aspidiotus aurantii*); showing a group of female and male scales on orange-leaf: greatly enlarged. (Marlatt, U. S. D. A.)

scale^{1}, *v.* **I.** *trans.* **9.** To cover with a crust or deposit: as, this water *scales* the boiler or the kettle.

II. *intrans.* **3.** To become crusted with a deposit from the feed-water: said of a boiler or other evaporating-vessel.

scale^{2}, *n.* **4.** Weight: an abbreviation of *scale weight.*

> Some of the best Hereford herds in England contain a large number of highly prized cows of a light-red color, very deep-fleshed cattle, and of very great *scale.*
> *Rep. Kansas State Board Agr.,* 1901–02, p. 148.

Abattoir scales. See ★*abattoir.*—**Army scales,** a *weigh-beam* (which see).—**Canal-boat scales.** See ★*canal-boat.*—**Cloth-sampling scale,** a weighing-scale for ascertaining the weight of a square or running yard of cloth by weighing a sample of standard size. The weight on the scale-beam gives the weight, in ounces and small fractions, of a yard of the same kind of cloth as the sample.—**Combination scales,** scales having several beams or several counterweights or sets of graduations upon one beam.—**Counter-scales,** weighing-scales of any form designed to be used on the counter of a store. Spice-scales, butter-scales, express-package scales, tea-scales, druggists' scales, and many other scales having various names may all be counter-scales.—**Creamery scales,** platform-scales for weighing milk. They have five or more scale-beams. In weighing milk delivered at the creamery the empty can is weighed on one beam; the first delivery of milk is then weighed in the can on another beam; the second delivery placed with the first in the same can is weighed on another beam; and so on.—**Dairy scales,** platform-scales with two beams, one for true weight and one for net weight.—**Dormant scale,** a weighing-scale which has a weighing-platform flush with the floor and fitted with appliances for rendering it firm and unmovable (dormant) when not in use.—**Milk-scales.** See ★*milk-scales.*—**Postage-indicator scales,** postal scales having a special form of beam for giving, in addition to the weight, the required postage, in cents, for the article weighed.—**Postal and coin scales,** postal scales having a series of slots on the platform which can be used to test the diameter and thickness of coins. They have also a supplementary beam and counter-weight to test the weight of the coins.—**Postal scales,** small scales for weighing letters and packages for mailing; a letter-scale. Another form of postal scale is the tangent balance (which see, under *tangent*).—**Railway scales,** large platform-scales having rails laid on the platform and used for weighing cars. See ★*computing-scale.*—**Torsion scale.** (*a*) A pair of scales in which the applied weight or force causes a calibrated wire to twist through an observed angle. The angle of torsion measures the applied force. (*b*) A form of scales in which the usual knife-edge fulcrums are replaced by flat bands, the loads twisting these bands through a small angle, quite within their elastic limit of stress. Such fulcrums are frictionless, or the molecular distortion is not variable with applied load.—**Tramway scale,** a scale adapted to the weighing of coal- or oil-cars and buckets on a wire cableway; the buckets or tram-cars travel over a section of track which is suspended from the levers of the scales.—**Weigh-lock scales,** scales used for weighing canal-boats when in a lock. This was done to ascertain the amount of toll to be paid for the boat. The scale used was a beam-scale of large capacity.

scale^{3}, *n.* **9.** In *graphics,* the ratio of the lines of the drawing to those of the object. Thus, if six inches on the drawing represent one foot on the object the scale is one half, variously indicated: as, *Scale* $\frac{1}{2}$; *Scale* 1 : 2; *Scale* 6 in. = 1 ft.; *Scale* $6'' = 1'$.—**Absolute** or **photometric scale,** the scale of stellar magnitudes proposed by Pogson in 1850 and now generally adopted as far as possible. It is based on the photometric determination of Sir John Herschel that the average first-magnitude star is just about 100 times brighter than the average sixth-magnitude star, the faintest steadily visible to the naked eye. The absolute scale therefore adopts for the uniform ratio between the brightness of two stars differing by one magnitude the fifth root of 100, or 2.512+, the logarithm of which is 0.4. For the lucid stars this scale agrees in the main with Argelander's, but diverges from it for telescopic stars. Its sixteenth magnitude is about the limit of visibility with our present telescopes. Stars brighter than Aldebaran (the standard first-magnitude star) have magnitudes less than unity. Thus Vega and Arcturus are 0.3 magnitude, and Sirius is −1.4 magnitude.—**Argelander's scale,** the scale of stellar magnitudes adopted by Argelander in his Durchmusterung. It is an arbitrary scale, but for the visible stars does not vary greatly from the absolute scale now generally accepted: for the telescopic stars it diverges seriously. See *absolute* or *photometric* ★*scale.*—**Base of the scale of notation,** the ratio of increase for each transfer one place to the left. In the Hindu notation it is 10.—**Beaufort scale,** the scale of wind-force introduced into the British navy in 1805, by Admiral, afterward Sir, Francis Beaufort. It proceeds from 'calm' to 'hurricane' by grades numbered as in the list given below. The values of the numbers were originally defined by the speed of a standard full-rigged naval vessel sailing under the influence of the respective winds; but as these vessels are now no longer used and as many studies have been made to determine the values as expressed by the velocity of the wind, the latter only are here given as published by Hann. See *wind-scale,* under *scale*^{3}.

NUMBER.	NAME.	VELOCITY.
Zero.	Calm.	
1	Light air	1.7 meters per second
2	Light breeze	3.1 " " "
3	Gentle breeze	4.8 " " "
[illegible]	Moderate breeze	6.7 " " "
5	Fresh breeze	8.8 " " "
6	Strong breeze	10.7 " " "
7	Moderate gale	12.9 " " "
[illegible]	Fresh gale	15.4 " " "
9	Strong gale	18.0 " " "
10	Whole gale	21.0 " " "
11	Storm	30 " " "
[illegible]	Hurricane	50 " " "

Baumé scale. See *hydrometer.* The two Baumé hydrometers have been constructed according to specifications modified arbitrarily by the instrument-maker, so that much confusion exists. A contract specifying a given degree Baumé may occasion great annoyance unless the particular Baumé scale intended is itself identified by stating what specific gravity corresponds to some given degree. The following table gives, for liquids heavier than water, that Baumé scale which was adopted and published by the Manufacturing Chemists' Association about 1877; for liquids lighter than water, the scale adopted by the United States Petroleum Association about 1864.

VALUES OF BAUMÉ DEGREES

LIQUIDS HEAVIER THAN WATER.			LIQUIDS LIGHTER THAN WATER.	
TEMPERATURE 60° F.			TEMPERATURE 54.5° F.	
Baumé degree	Specific gravity		Baumé degree	Specific gravity
0	1.000		10	1.0000
5	1.036		15	0.9[illegible]
10	1.071	[1.074]	20	0.9359
15	1.114	[1.115]	25	0.9068
[illegible]	1.158	[1.160[	30	0.8795
25	1.208		35	0.[illegible]
30	1.262	[1.261]	40	0.8295
[illegible]	1.317	[1.318]	45	0.[illegible]
40	1.386	[1.381]	50	0.7849
45	1.451	[1.450]	55	0.7644
50	1.531	[1.526]	60	0.7449
55	1.616	[1.611]	65	0.7264
60	1.705	[1.706]	70	0.7087
[illegible]	1.814	[1.813]	75	0.6919
[illegible]	1.835		80	0.6759
			85	0.6606

All the numbers but three in the table for heavy liquids contain errors of 1, 2, 3, or 5 units in the third decimal place, but since the table has been adopted by the chief users of this hydrometer it is given as so used; but the correct figures are added within brackets. Instruments, however, are likely to be graduated according to the correct figures.—**Board scale.** See ★*board-measure.*—**Circumference scale,** a measuring-scale marked on one edge in inches and fractions of an inch, and on the opposite edge with the corresponding diameters, so that, by measuring the circumference of a cylindrical body with the scale its diameter also is given.—**Distance scale,** a scale, attached to a range-finder, telemeter, or other device, for the optical determination of distances, so graduated as to indicate the number of meters or yards between an observed object and the instrument.—**Flying scale,** in *persp.,* a scale representing long measure directed toward the center of the picture.—**Front scale,** in *persp.,* a scale representing long measure parallel to the horizontal line.—**Fuller's scale,** the method devised by Fuller (1897) for expressing the reaction of nutrient media by titration with $\frac{n}{20}$ sodium hydroxid or $\frac{n}{20}$ hydrochloric acid.—**Full scale,** in *lumbering*, measurement of logs in which no reduction is made for defects.—**Index of the natural scale.** See ★*index.*—**Logarithmical scales,** logarithms placed on lines for multiplying and dividing by means of compasses or slide-rules.—**Logarithmic scale,** a scale upon which divisions marked with successive numbers are set down at distances from the origin proportional to the logarithms of those numbers, or to logarithms of a given function of the numbers. In the former case the scale is called a logarithmic scale of numbers; in the latter, a logarithmic scale of sines, tangents, or other functions.—**Log-book scale** (*naut.*), a scale which indicates the character of the sea-swell by capital letters, as follows: S., smooth; M., moderate; L., long; R., rough; C., cross; H., heavy; V. H., very heavy.—**Mohs's scale,** the accepted series of minerals, numbered from one to ten, by reference to which the hardness of a given species is defined. See *hardness*, 5. Also called *scale of hardness.*—**Natural scale** (*math.*), the scale of natural numbers, whose essence consists in the arrangement of its elements; the unending sequence of signs:

1, 2, 3, 4, 5, . . ., or
"one," "two," "three," "four," "five," . . .

—**Normal thermometric scale,** the scale of the hydrogen thermometer of constant volume type.—**Personal scale,** a scale numerically representing any personal peculiarities in an observer's habit of observation. Same as *personal equation.* *Smithsonian Rep.*, 1890, p. 178.—**Photometric scale.** See *absolute* or *photometric* ★*scale.*—**Radix of the scale.** Same as *base of the* ★*scale.*—**Scale of absolute temperatures.** See *thermometric* ★*scale.*—**Scale of multiples** of A, A, 2A, 3A, 4A, etc.—**Scale of notation,** in *arith.*, the particular progression of the local values for the numerals in a system of arithmetical notation like the Hindu (our so-called 'Arabic'). In the Hindu or denary scale the value of the unit as one proceeds from right to left increases tenfold.—**Scale of sines, tangents,** etc., a scale upon which numbers representing angles in arithmetical progression from zero are set down at distances from the origin proportional to their sines, tangents, or other functions.—**Scale of the gas-thermometer.** See *thermometric* ★*scale.*—**Scale of the hydrogen thermometer.** See *thermometric* ★*scale.*—**Scale of the platinum thermometer.** See *thermometric* ★*scale.*—**Sexagesimal scale,** a scale using 60 as base.—**Smithsonian wind-scale.** See *wind-*★*scale.*—**The complete scale,** in *math.*, the natural scale extended backward by zero and the negative integers, namely: . . ., −5, −4, −3, −2, −1, 0, 1, 2, 3, 4, 5, . . .—**Thermodynamic scale of temperatures.** See *thermometric* ★*scale.*—**Thermometric scale,** a scale used in the designation or measurement of temperatures; the scale of a thermometer. In addition to the ordinary scales, for the mercury thermometer, devised by Fahrenheit, Réaumur, and Celsius (see *thermometer*), there are numerous special thermometric scales. *The scale of absolute temperatures.* On this scale the degree is of the same size as in the centigrade scale, one degree corresponding to 1/100 of the interval between the temperature of melting ice and that of steam at normal pressure. The zero of the absolute scale, however, is at −273° C., the ice-point being designated +273° and the steam-point +373°. *The scale of the gas-thermometer.* In gas-thermometers, in which the expansion of air or of some other permanent gas is used for the measurement of temperatures, one degree of the thermometric scale corresponds to that change of temperature which causes a variation in the volume of the gas, at constant pressure, equal to 1/273 of its volume at the ice-point. Since a permanent gas expands by this amount when heated from 0° to 1° C., the scale of the gas-thermometer coincides at this point with the corresponding scale of the mercury thermometer. In the construction of the latter instrument it is assumed that the apparent expansion of mercury in a glass thermometer-tube is uniform, but this is not strictly true since there are slight variations in the coefficient of expansion of mercury and of glass. The gas-thermometers and the mercury thermometers do not agree, therefore, at every point. Thermometric scales based upon the assumption of the uniformity of the apparent expansion of that liquid in glass are designated as *mercury-in-glass scales.* *The scale of the hydrogen thermometer.* This is a thermometric scale based upon the assumption that hydrogen is a perfect gas. The definition of a degree, as in the case of other gas-thermometers, is that it is the interval corresponding to a change of volume of 1/273 of the volume of the hydrogen at the ice-point. *The scale of the platinum thermometer.* This is a thermometric scale based upon the change of electric resistance of a platinum wire with change of temperature. The relative change in the resistance of such a wire when heated from 0° to 1° C. is taken as 1° of the platinum scale. Since the temperature coefficient of platinum is not strictly the same at very high and very low temperatures the scale of the thermometer does not correspond throughout its entire range with the scale of the gas-thermometer. Numerous variations of substances due to heat, aside from the expansion of mercury or of a gas or the change of electrical resistance of a metal, are employed in the determination of temperatures. Thus, Wedgwood, in the eighteenth century, measured the heat of furnaces by means of the change in length of a porcelain bar. The linear expansion of platinum and of other metals, the electromotive force of thermojunctions, the specific heats of substances such as mercury, platinum, and carbon, and numerous other thermal properties of matter have been used by physicists in the determination of temperature. Owing to the complexity of the laws covering the change of such properties, however, it is not customary to base thermometric scales upon them and the indications of instruments in which such means are used are reduced by calibration to the scale of the gas-thermometer. *The thermodynamic scale of temperatures.* The thermometric scales mentioned above are based upon the thermal properties of particular substances, and such scales differ according to the thermometric substances employed. Recognizing the importance of a scale which shall be independent of these properties, Kelvin, in 1848, devised a so-called 'thermodynamic scale of temperatures' which he defined as follows: "The absolute values of two temperatures are to one another in the proportion of the heat taken in to the heat rejected by a perfect thermodynamic engine working with a source and a refrigerator at the higher and the lower of the temperatures respectively." This scale satisfies the equation $\frac{T_1}{T_2}=\frac{Q_1}{Q_2}$ where T_1 and T_2 are the absolute temperatures and Q_1 and Q_2 the corresponding quantities of heat. The thermodynamic scale thus defined agrees completely with that of a thermometer in which an ideal gas is employed, and it coincides so closely with the scale of the hydrogen thermometer that for most purposes the two may be regarded as the same. —**Thousandfold scale.** Hydrometers are said to be graduated on the thousandfold scale when, to avoid the use of decimals, the density of the standard substance, water, is represented by 1000 instead of 1.—**Universal scale,** a measuring-scale, for the use of draftsmen, on which all proportional divisions in common use for drawings are engraved in parallel rows. If used on a flat surface all scales not on the edges must be transferred by dividers, since they cannot be used directly. For this reason a scale of triangular form is preferable, since by it six edges are made available and six scales—or twelve scales, if the two on any edge are to each other as one is to two. —**Wind-scale.** The *Smithsonian wind-scale* is a scale of ten numbers and terms introduced by the Smithsonian Institution for the use of observers in the United States, whence it has spread through other countries and with some changes has been called an 'international wind-scale.' The scale is as follows: 0, calm; 1, light air, deflecting forms of smoke; 2, light wind, merely moving the leaves; 3, fresh wind, moving the smallest branches; 4, stronger wind, raising the dust and moving the larger branches; 5, stronger wind, moving the bodies of the trees; 6, stronger wind, swaying the largest trees; 7, strong, breaking off the branches; 8, strong, breaking the small trees, injuring roofs; 9, hurricane, breaking the larger trees, carrying away roofs; 10, whirlwind or tornado, that nothing can resist.

scalebark, scalybark (skāl', skā'li-bärk), *n.* Same as *shagbark*, 1. See *shellbark.*

scale-book (skāl'bu̇k), *n.* In *lumbering*, a book especially designed for recording the contents of scaled logs.

scale-caterpillar (skāl'kat"ėr-pil-ä̤r), *n.* See ★*caterpillar.*

scale-detector (skāl'dẹ̄-tek"to̤r), *n.* A small device which can be run into a boiler-tube and which indicates, through the motion of a pointer, any obstruction in the tube by scale.

scale-house (skāl'hous), *n.* A building in which are scales used in weighing or measuring the product of a manufactory or the food, material, etc., served out.

> This tract is made up of pastures, tilled fields, and feeding pens, all radiating around Hymer station, where are located the stock-yards, mill and elevator, blacksmith shop, *scale-house* and headquarters office of the company.
> *Rep. Kansas State Board Agr.*, 1901–02, p. 276.

scalelet (skāl'let), *n.* A diminutive accessory scale, sometimes found on the larger scales in fishes. *Rep. Brit. Ass'n Advancement of Sci.*, 1902, p. 660.

scalenohedral, *a.*—**Scalenohedral class of crystals.** See ★*symmetry*, 6.

scalenohedron, *n.*—**Tetragonal scalenohedron.** A form belonging to the tetragonal system having eight faces, each a scalene triangle, arranged in four pairs. Also called a *disphenoid*, 6.

scale-pad (skāl'pad), *n.* A thickening of the skin from which arise the scales found on the under side of the tail in squirrels of the genus *Anomalurus.*

> Before the spot above the end of the lower *scale-pad* is reached the tail is covered with long black hair.
> *Proc. Zool. Soc. London*, 1898, p. 451.

scale-pan (skāl'pan), *n.* A shallow dish, commonly of sheet-brass, sometimes of glass, suspended from an end of the beam of a balance, and serving to contain the material to be weighed or the weights.

scale-rule (skāl'röl), *n.* See *log-scale.*

scale-tooth (skāl'töth), *n.* A tooth-like arrangement of scales on the wings of certain lepidopterous insects.

scaling[1], *n.* **4.** Scales collectively or the arrangement of scales, as on an insect's wing or on a fish.

> Primaries with a short line of grey scales across the cell close to its end, beyond which is a double V-shaped mark, beyond which is another V-mark placed horizontally, below which is a larger patch of grey *scaling.*
> *Annals and Mag. Nat. Hist.*, Sept., 1903, p. 330.

5. Specifically, the structure and distribution of the scales of fishes considered as a basis for classification.

> If it is true that the application of cut and dried definitions of the *scaling* will no longer enable us satisfactorily to subdivide the Pisces . . . nevertheless these facts do not by any means prove that the *scaling* is of little systematic importance.
> *E. S. Goodrich*, in Quart. Jour. Micros. Sci., March, 1904, [p. 466.

6. In *dentistry*, removing the tartar from the teeth.

scaling[3] (skā'ling), *n.* **1.** The measurement or estimation of the amount of lumber in logs or standing timber.—**2.** The taking of dimensions from a drawing by means of a measuring-scale, in the absence of figured dimensions. *Lockwood*, Dict. Mech. Engin. Terms.

scall, *n.*—**Honeycomb scall.** Same as *favus*, 2.—**Milky scall,** an eruption of minute whitish blisters which break, discharge, and form small scabs. The eruption occurs in infancy and chiefly on the cheeks and forehead.

scallop, *n.*—**Great northern scallop,** *Pecten tenuicostatus*, a kind of scallop, of large size, now nearly extinct; a sea-scallop.

scallum (skal'um), *v. t.* In *basket-making*, to force or plait (osiers) between the rods forming the bottom of a basket. [Prov. Eng.]

> [In basket making] osiers are forced or plaited, "*scallumed*," between the rods of the bottom.
> *Encyc. Brit.*, III. 423.

scalp[1], *n.* **7.** An early type of cultivator blade, nearly horizontal in position, so called as cutting a thin layer from the soil. Cf. ★*sweep*, 12 (*b*).

> But it may be made to work along three, five, or seven furrows according as the *scalps*, or broad feet (by many called duck-feet), may be placed.
> *T. Williamson*, Agricultural Mechanism, p. 265.

Scalp Act. See ★*act.*

scalp-dance (skalp'dȧns), *n.* A ceremonial of the American Indians in which scalps were used in celebrating a victory.

> Küfüra, the *Scalp Dance.* In this old war dance, which is no longer celebrated, both men and women formed a ring around one of their number—a woman who held aloft a scalp tied to a stick.
> *J. W. Fewkes*, in Amer. Anthropologist, Jan.–March, [1902, p. 67.

scalper[1], *n.* **4.** A heavy, compressed leather boot shaped to cover the forward portion of the cornet.—**5.** In *lumbering.* See ★*rosser.*

scalprum (skal'prum), *n.*; pl. *scalpra* (-prä̤). [L., a knife, chisel.] The cutting edge of an incisor tooth, such as is found in rodents. See *scalpriform.*

scaly, *a.* **6.** Covered with a scale or incrustation, as a boiler or kettle in which water containing mineral salts which become insoluble on heating has been evaporated.

scaly-fin (skā'li-fin), *n.* A fish of the suborder *Squamipinnes*, comprising a large number of species showing analogies with the *Carangidæ* on the one hand and with percoid fishes on the other.

scammonic (ska-mon'ik), *a.* [*scammon(y)* + *-ic.*] Derived from scammony.—**Scammonic acid,** an acid obtained from scammonin and said by some authorities to be identical with jalapic acid, while others deny this.

scammonin (skam'ọ-nin), *n.* [*scammon(y)* + *-in*[2].] Same as *jalapin.*

scammonose (skam'ọ-nōs), *n.* [*scammon(ia)* (see def.) + *-ose.*] A mixture of rhodeose, glucose, and a methyl pentose, obtained from the roots of *Convolvulus Scammonia*: formerly regarded as a chemical unity.

scammony, *n.*—**German scammony,** the hedge-bindweed, *Convolvulus sepium.*—**Scammony-root.** (*b*) Same as *wild* ★*scammony.*—**Wild scammony,** the wild potato-vine or man-of-the-earth, *Ipomœa pandurata.*

Scan. An abbreviation of *Scandinavian.*

Scanderoon (skan-dẹ-rön'), *n.* [For *Iskanderun*, Alexandretta, on the Gulf of Iskanderun?] A breed of domesticated pigeons, supposed to have originated in Persia, having long heads, bodies, and legs, wide shoulders, and a long curved bill with a moderate wattle at the base of the upper mandible. The birds may be plain-colored, or varied; in the latter case the wings are white, the saddle, upper neck, and upper breast, colored.

scandia (skan'di-ä̤), *n.* [NL., < *scandium.*] In *chem.*, scandium oxid.

Scanian epoch. See ★*epoch.*

scansionist (skan'sho̤n-ist), *n.* [*scansion* + *-ist.*] One who is expert in scansion; one who makes a study of scansion or meter.

> In a brief paper, entitled 'The Battle of the *Scansionists*,' Kent discusses the relative merits of stress-prosody and scansion by classical feet, and contrives to display a wide knowledge and an exquisite ear for metrical and rhythmical effect, without, however, arriving at any definite conclusion on the question.
> *Athenæum*, Jan. 28, 1905, p. 108.

Scaphaspis (ska-fas'pis), *n.* [NL., < Gr. *σκάφη*, a skiff, + *ἀσπίς*, a shield.] A generic name applied to the ventral shields of certain pteraspidian fishes of Devonian age, in the belief that they represented dorsal shields. See *Pteraspis.*

scaphium, *n.* **4.** In Greek pottery, a vase of boat-like form.

> Among the many forms of Greek cups one of boat shape was known as *scaphia*.
> *S. Gardner*, Old Silver-work from the XV–XVIII Centuries, p. 4.

scaphocephalus (skaf-ọ̄-sef′ạ-lus), *n.*; pl. *scaphocephali* (-lī). [NL., < Gr. *σκάφη*, a skiff, + *κεφαλή*, head.] A scaphocephalic individual or skull.

scapose (skā′pōs), *a.* [*scape* + *-ose.*] In *bot.*, bearing scapes, as plants; borne on scapes, as flowers.

s. caps. An abbreviation of *small capitals.*

scaptin (skap′tin), *n.* An obsolete name for an active extract of digitalis.

Scapula superior. Same as *post-temporal. Starks,* Synonymy of the Fish Skeleton, p. 520.

Scapular index. See ★*index.*

scapulare, *n.* **2.** In *ichth.*, same as *post-temporal. Starks,* Synonymy of the Fish Skeleton, p. 520.

scapularium, *n.* **2.** (*b*) Same as *episternum,* 3.

scapulospinal (skap″ụ̄-lọ̄-spī′nạl), *a.* Relating to the scapula and the spinal column. *Philos. Trans. Roy. Soc.* (London), 1897, ser. B, p. 188.

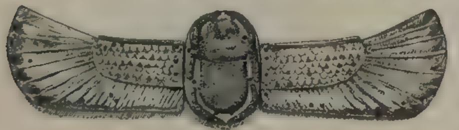
scapulothoracic (skap″ụ̄-lọ̄-thọ̄-ras′ik), *a.* Relating to the scapula and the thorax. *Buck,* Med. Handbook, II. 811.

scapus, *n.* **6.** (*a*) In sea-pens, the main stem, the lower part of which is sunk in the mud while the upper bears the zoöids. (*b*) In actinians, the main part of the body as differentiated from the upper, tentacle-bearing region or capitulum.

scar[1], *n.* **8.** A manufacturers' name for lumps or cakes of imperfectly fused ferrous sulphid which form in the burning of iron pyrites in making sulphuric acid, due to an insufficient supply of air to the burners. The formation of scars involves waste of sulphur which fails to be fully burned off. *G. Lunge,* Sulphuric Acid, I. 215.

scarab, *n.* **4.** A conventionalized beetle, which is a common motive in Egyptian art.

> The more oval form here seen still bears a closer affinity to some Egyptian *scarab*-borders of the Eighteenth Dynasty. *A. J. Evans,* in Jour. Hellenic Studies, XVII. 345.



Scarab.

Scarabeus, *n.* **2.** [*l. c.*] The curve $4(x^2+y^2+2ax)^2(x^2+y^2) = b^2(x^2-y^2)^2$.

Scarborough series. See ★*series.*

scarb-tree (skärb′trē), *n.* A wild or seedling apple-tree.

scare[4] (skãr), *v. t.* [Icel. *skara,* join the planks of a boat so that they overlap, clinch.] To fasten (two pieces of wood) by splicing; join by fitting; splice. *Eng. Dial. Dict.* [North Eng. and Scotch.]

scare[4] (skãr), *n.* [*scare*[4], *v.*] **1.** A joint in carpentry; a splice; one of the parts of a fishing-rod; etc. *Eng. Dial. Dict.* [North Eng. and Scotch.]—**2.** In *golf,* the narrow part of the neck of the club where it is fastened to the shaft, then glued and bound with whipping. [Scotch.]

scare-head (skãr′hed), *n.* A sensational headline in a newspaper. [Colloq.]

scare-line (skãr′līn), *n.* In *trap-shooting,* a line used to scare the bird and make it fly.

> Then, too, they were a freaky lot of birds. Four out of five of them needed the *scare lines* to make them move.
> *Forest and Stream,* Feb. 21, 1903, p. 159.

scare-sleep (skãr′slēp), *n.* In Dutch Guiana, the great fulgorid lantern-fly, which stridulates at night. *Kirby and Spence,* Entomology, p. 499.

scarf[1], *n.*—**Tabled scarf,** one in which the face of the joint of each part at the thin end has a rectangular projection which fits into a corresponding recess in the face of the joint on the other part so as to interlock the two parts together.

scarfing-machine, *n.* **2.** A machine for shaping the ends of a wire or rod so that they may be joined by a scarf-joint, using either welding, soldering, brazing, or any other process which may be convenient for making the two pieces one. The two ends are formed into half wedges, so that when placed together the joint line makes an acute angle with their common axis. *Jour. Brit. Inst. Elect. Engin.,* 1903–04, p. 852.

scarid (skar′id), *n.* A scaroid or parrot-fish.

scarlet. **I.** *n.* **4.** In *archery,* the second or next to the innermost circle of the target, which is colored red. See ★*red*[1], 7.—**5.** The rank, dignity, or office of a cardinal: so called from the official color of his robes.—**Acid scarlet.** Same as ★*acid-ponceau.*—**Acridine scarlet,** a mixture of acridine red and acridine yellow.—**Anisidine scarlet,** an acid coal-tar color related to anisidine: seldom used at the present time.—**Azin scarlet,** a basic dyestuff of the azin type. It is similar to safranine in composition and properties, but gives a yellower red.—**Biebrich scarlet,** an acid coal-tar color. Same as ★*ponceau 3RB.*—**Brilliant scarlet** an acid coal-tar color. Same as *cochineal* ★*red A.*—**Cochineal scarlet G, PS, 2R,** and **4R,** acid coal-tar colors of the monoazo type, derived from aniline or one of its homologies. They all dye wool red in an acid bath.—**Crocein scarlet B, 2B, 3B, 7B, 8B, 10B, BX, OX,** and **R,** acid coal-tar colors of the diazo type, derived from either amidoazobenzene or amidoazotoluene. They all dye wool red in an acid bath.—**Crocein scarlet 4BX.** Same as *cochineal* ★*red.*—**Crystal scarlet 6R.** Same as *crystal* ★*ponceau.*—**Diamine scarlet,** a direct cotton coal-tar color of the diazo type, derived from benzidine. It dyes unmordanted cotton red in a salt bath. It possesses good fastness.—**Direct scarlet,** a direct cotton coal-tar color of unpublished composition. It dyes unmordanted cotton red in a salt bath.—**Double brilliant scarlet,** an acid coal-tar color. Same as *brilliant* ★*ponceau 4R* (*a*).—**Eosin scarlet.** Same as ★*eosin B, BN,* or *BW.* Also see ★*coccin.*—**Fast scarlet.** (*a*) An acid coal-tar color of the diazo type, derived from amidoazobenzene. (*b*) A name by which *benzopurpurin 4B* is sometimes known.—**Imperial scarlet.** Same as ★*ponceau 3RB.*—**Induline scarlet,** a basic coal-tar color of the azonium-chlorid type. It dyes tannin-mordanted cotton scarlet, but is chiefly used in calico-printing.—**Milling scarlet.** Same as ★*acid-scarlet.*—**Naphthalene scarlet.** Same as *magdala red* (which see, under *red*1).—**Oxamine scarlet,** a direct cotton coal-tar color. It dyes unmordanted cotton red in a salt bath.—**Palatine scarlet,** an acid coal-tar color of the monoazo type, prepared by combining diazotized meta-xylidine with α-naphthol disulphonic acid. It dyes wool a yellowish red from an acid bath.—**Scarlet GR.** Same as *brilliant* ★*orange R.*—**Scarlet OOO.** Same as ★*crocein 2B* or *3BX.*—**Scarlet R.** Same as *brilliant* ★*orange R.*—**Scarlet 6R,** an acid coal-tar color of the monoazo type, prepared by combining diazotized naphthonic acid with β-naphthol-monosulphonic acid. It dyes wool scarlet from an acid bath.—**Scarlet 2R.** Same as *α-naphthylamine* ★*red.*

II. *a.*—**Scarlet acid,** a name sometimes given to a solution prepared by dissolving tin in a mixture of nitric and hydrochloric acid: used in the dyeing of cochineal scarlet.

scarlet-berry (skär′lẹt-ber″i), *n.* The bittersweet, *Solanum Dulcamara,* or its berry.

scarlet-cross (skär′let-krôs), *n.* The scarlet lychnis, *Lychnis Chalcedonica;* also called *knight-cross, Jerusalem-cross, Maltese-cross,* and *scarlet-lightning.*

scarlet-lightning (skär′let-līt″ning), *n.* Same as ★*scarlet-cross.*

scarp[1], *n.*—**Detached scarp,** a scarp-wall detached from the rampart in its rear.

Scarred snout-beetle. See ★*snout-beetle.*

scar-tattooing (skär′ta-tö-ing), *n.* Raised or depressed scars produced by incision and arranged in definite order on the skin, so as to serve as tribal marks, or for purposes of ornament. Scar-tattooing is used in place of tattooing by dark-skinned races, the light scars contrasting distinctly with the dark pigment of the skin. *Ratzel* (trans.), Hist. of Mankind, II. 427.

Scartella (skär-tel′ạ̈), *n.* [NL., < Gr. *σκάρτης,* springing, nimble, + L. dim. *-ella.*] A genus of blennioid fishes found in Cuba.

Scartichthys (skär-tik′this), *n.* [NL., < Gr. *σκάρτης,* springing, nimble, + *ἰχθύς,* fish.] A genus of blennioid fishes known from the coast of Chile and Peru and northward to Panama.

scat[5], *n.* See ★*skat*[2].

scatol, *n.* See *skatol.*

scatologia (skat-ọ̄-lō′ji-ạ̈), *n.* [NL.] See *scatology.*

scatologic (skat-ọ̄-loj′ik), *a.* [*scatolog*(*y*) + *-ic.*] Of or pertaining to scatology; also, relating to the study of excrements in relation to religious ceremonies and the like. See the extract.

> *Scatalogic* [scatologic] rites of all nations. A dissertation upon the employment of excrementitious remedial agents in religion, therapeutics, divination, witchcraft, love philters, etc., in all parts of the globe.
> *J. G. Bourke,* in Smithsonian Rep., 1891, p. 466.

scatological (skat-ō-loj′i-kạl), *a.* Same as ★*scatologic. G. S. Hall,* Adolescence, I. 116.

scatology, *n.* **2.** Study of the feces in relation to normal and pathological composition and the diagnostic importance of the latter.—**3.** The study of the use (or examination) of excrements in religious rites, witchcraft, etc.

scatophagic (skat-ọ̄-faj′ik), *a.* [*scatophag*(*y*) + *-ic.*] Relating to or practising scatophagy or the eating of excrements, particularly of human ordure. *An. Rep. Bur. Amer. Ethnol.,* 1896–97, p. 213.

scatophagy (skạ̄-tof′ạ-ji), *n.* [Gr. *σκατοφάγος,* eating dirt or dung, < *σκῶρ* (*σκατ-*), dirt, dung, + *φαγεῖν,* eat.] The eating of excrement, as a morbid habit or ceremonially, as in various savage rites.

> In general socialry no other known tribe better, or indeed so well, exemplifies zoocracy, while in such special features as those of ethnogamic mating, ceremonial *scatophagy,* and mortuary magnification of the blood-carriers, the folk mark the most primitive known phase of cultural advancement.
> *An. Rep. Bur. Amer. Ethnol.,* 1896–97, p. 295.

scatoxyl (skạ̄-tok′sil), *n.* [Gr. *σκῶρ* (*σκατ-*), dirt, dung, + E. *ox*(*ygen*) + *-yl.*] The radical, C_9H_8ON, of hydroxyscatol.—**Scatoxyl sulphuric acid,** a compound, $C_9H_8N.O.SO_3H$, found in human urine in the form of its potassium salt.

scatter, *v. t.* **6.** In *optics,* to reflect diffusely or irregularly, as from a rough surface.—**Scattered seed method.** See ★*seed.*

Scaur limestone. See ★*limestone.*

scavenge, *v. t.* **2.** In certain forms of the internal-combustion motor, to sweep out of (the cylinder) by an inrush of atmospheric air the burnt products of the previous combustion-stroke. By thus cleansing or scavenging the cylinder the fresh intake of combustible mixture is not diluted with incombustible gases, nor is it heated by them so as to contain less weight of fuel per cubic foot of volume.

> In all engines employing the two-stroke cycle, *scavenging* must be accomplished either by special piston movement or by a blast of air from an auxiliary pump, directed in such a manner as to force out the remaining burned gases, thus clearing the way, so to speak, for the incoming pure mixture. . . . The engine under description *scavenges* thoroughly and completely upon the return stroke of the pistons, which then draw in their charge of explosive mixture, undiluted either by products of combustion or by *scavenging* air.
> *Amer. Inventor,* Aug. 15, 1903, p. 78.

scavenger, *n.*—**Lamellicorn scavenger,** any laparostict scarabæid beetle. Consult *Laparosticta.*—**Scavenger cells.** See ★*cell.*—**Water scavenger.** See *water* ★*scavenger-beetle.*

scavenger-beetle, *n.*—**Water scavenger-beetle,** any member of the coleopterous family *Hydrophilidæ* (which see).

scavenging, *n.* **2.** The process of cleansing, especially in internal-combustion motors. See ★*scavenge,* 2.

> A still further improvement is the removal or *scavenging* of all products of combustion from the compression space in the cylinder. Apart from ensuring a more prompt and more regular ignition of the charge, *scavenging* reduces the risk of the explosive mixture being fired prematurely. *Encyc. Brit.,* XXVIII. 607.

Sc. B. An abbreviation of the Latin *Scientiæ Baccalaureus,* Bachelor of Science.

Sc. D. An abbreviation of the Latin *Scientiæ Doctor,* Doctor of Science.

Sceaux pottery. See ★*pottery.*

scelalgia (skel-al′ji-ạ̈), *n.* [NL., < Gr. *σκέλος,* leg, + *ἄλγος,* pain.] Pain in the leg.

scenograph (sē′nō-gráf), *n.* [Gr. *σκηνογραφία,* scene-painting. See *scenographic.*] A perspective drawing of some object, as a building.

scent, *n.*—**Mixed scent,** in *exper. psychol.,* the simple resultant of a mixture of olfactory qualities; a scent, simple to introspection, produced by the mixture of other and known smell-qualities.

> As certain visual qualities mix, to give a new quality, a quality which lies between the two primaries on the colour-cone, but is still itself simple, and different from either of them, so may smell qualities mix, to give a new '*mixed scent.*'
> *E. B. Titchener,* Exper. Psychol., I. i. 83.

scent-scales (sent′skālz), *n. pl.* Same as ★*androconia. A. S. Packard,* Text-book of Entom., p. 198.

scent-tuft (sent′tuft), *n.* An odoriferous tuft of scales or hairs which occurs on various parts of the body of certain insects.

scepter, *n.* **3.** A common name for the gold sovereign of James I. of England.

scepter-quartz (sep′tėr-kwârts), *n.* A crystallized variety of quartz in which a slender prism is terminated by larger crystal in parallel position.

sceptrella (sep-trel′ạ̈), *n.*; pl. *sceptrellæ* (-lē). [NL., < *sceptrum,* scepter, + dim. *-ella.*] In the nomenclature of the sponge-spicules, a cylindrical rhabd furnished with spines and disks in successive whorls.

sceptrelliform (sep-trel′i-fôrm), *a.* [NL. *sceptrella* + *forma*, form.] Having the form of a sceptrella.

schablone (shä-blō′ne̤), *n.* [G., a pattern, model, routine, routinism, late MLG. *scamplioen*, D. *schampelioen*, pattern, MD. *schampioen*, a model, another use of MLG. *schampelūn*, champion, < OF. *champion*, champion, = It. *campione*, champion, pattern: see *champion*. Compare *pattern* as related to *patron*.] In figurative use, the following of a model; routine; routinism: applied to music of a correct but mechanical sort (compare ⋆*kapellmeister music*), or to dry, dispiriting educational methods, etc.

schaefer (shā′fėr), *n.* [G. *schäfer*, shepherd?] A peddler of cheap oysters. [Local, U. S.]

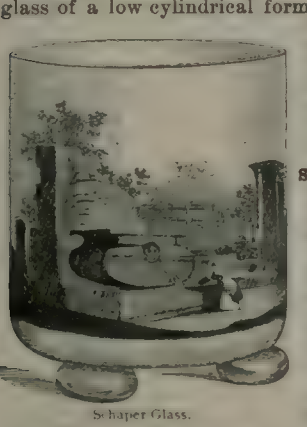
> *Schaeffers.*—Cart-boys, or Arabs, who peddle a mean quality of oysters (Maryland stock) about the streets of Baltimore. *E. Ingersoll*, The Oyster-Industry, glossary.

Schaeffer's acid. See ⋆*acid.*

schal (shäl), *n.* A common name of the catfish, *Synodontis schal*, which inhabits the Nile.

schalmei (shäl-mī′), *n.* [G., also *schalmey*. See *shawm*.] **1.** Same as *shawm*.—**2.** In clarinet music, same as *chalumeau*, 2.—**3.** In the bagpipe, same as *chanter*^{1}, 5.—**4.** In *organbuilding*, a soft reed-stop. Also called a *musette*.

Schaper glass (shä′pe̤r glås), *n.* A drinking-glass of a low cylindrical form: named from its originator, Johann Schaper, a German glass-painter of the seventeenth century.



Schaper Glass.
(In Victoria and Albert Museum, London.)

schappe, *n.* **2.** Yarn spun from waste silk, from which the gum has been removed by a process of maceration or fermentation.

> *Schappe* silk—This is known also as spun silk. In the operation of reeling the silk from the cocoon there is often some that has become disarranged or entangled in such a manner as to prevent its being reeled in the ordinary way. In some cocoons, where the cultivation of silk is carried on extensively, the moth is allowed to emerge, for the purpose of promoting a good breed or reproduction of silkworms at a later stage of the industry. The cocoons from which the moth emerges have their threads displaced. This silk is collected with the waste obtained from the various processes, such as winding, twisting, etc. *Hannan*, Textile Fibres of Commerce, p. 177.

scharf (shärf), *n.* [G., = E. *sharp*.] In *organbuilding*, a high mixture-stop.

scheam-arch (skēm′ärch), *n.* Same as *scheme-arch*.

Schedophilus (skē̤-dof′i-lus), *n.* [NL., irreg. < Gr. σχεδια, a raft, + φιλεῖν, love.] A genus of fishes of the family *Icosteidæ*, found in the open seas.

Scheele's acid. See ⋆*acid.*

scheelization (shā-li-zā′sho̤n), *n.* [*scheelize* + *-ation*.] In the manufacture of wine, the addition of glycerol, commonly called 'glycerin,' to the already fermented wine, in order to give sweetness of taste without revival of fermentation. *Sadtler*, Handbook of Indust. Chem., p. 206.

scheelize (shā′līz), *v. t.*; pret. and pp. *scheelized*, ppr. *scheelizing*. To treat (wine) with glycerin. See ⋆*scheelization*.

scheererite (shā′rėr-īt), *n.* [G. *scheererit*. Named (1827) after Captain Von *Scheerer*, its discoverer.] A native hydrocarbon, perhaps a polymere of marsh-gas. It occurs in whitish crystalline folia with brown coal, at Uznach, Switzerland.

Schefflera (shef′le̤-rä̤), *n.* [NL. (Forster, 1776), named in honor of *Scheffler*, a physician and botanist of Danzig, Prussia, who lived in the eighteenth century.] A genus of plants of the family *Araliaceæ*. See *Sciadophyllum*.

scheme, *n.* **8.** In *printing*, the written or printed summary of the proper quantity of types for each character: in Great Britain a 'scheme' of type is called a 'bill' of type. *DeVinne*, Plain Printing Types, p. 165.

schepel (scħep′e̤l), *n.* [D., a bushel, etc.] In Holland, a decaliter, equal to 2.64 United States gallons.

Scheuchzeriaceæ (shök″zē-ri-ā′sē̤-ē), *n. pl.* [NL. (Agardh, 1858), < *Scheuchzeria* + *-aceæ*.] A family of monocotyledonous plants of the order *Naiadales*, the arrow-grass family, chiefly characterized by racemed or spiked flowers and united carpels. There are four genera, of which *Scheuchzeria* is taken as the type and *Triglochin* is the best known. See *Juncaginaceæ*.

Schiaparellian canals. See ⋆*canals of Mars.*

Schilbeodes (shil-bē̤-ō′dēz), *n.* [NL., < *Schilbe*, a genus of siluroids, + Gr. -ωδης, < εἶδος, form.] A genus of catfishes which live in the fresh waters of the eastern United States.

schillerfels (shil′ėr-fels), *n.* [G., < *schiller*, glitter (see *schiller*), + *fels*, rock.] In *petrog.*, a variety of peridotite containing bronzite or enstatite, which has a glistening, silky to submetallic luster. Some rocks called schillerfels are bronzite-bearing gabbro. See *schillerite*.

schist, *n.*—**Blocky schist**, a schist which is cut up into blocks by intersecting series of joints.

> Claim No. 1 of Gold Run joins with Claim No. 3, Rhode Island. The bed rock consists of schists similar to those on Glenn Creek. It is described by the prospectors as a "*blocky schist*."
> *Contrib. to Econ. Geol.*, U. S. Geol. Surv., Bulletin 213, 1902, p. 53.

Callaway schist, a series of metamorphic rocks in the northwestern Highlands of Scotland, associated with the Precambrian Lewisian gneiss. *Rep. Brit. Ass'n Advancement of Sci.*, 1901, p. 623.—**Gembloux schist**, in *geol.*, a subdivision of the Silurian in the Ardennes in Belgium and France. It is correlated with the Caradoc of Britain or the upper division of the Lower Silurian.—**Goffered schist**, finely crumpled or puckered schist, best shown in micaceous varieties.—**Matagne schists**, in *geol.*, the upper subdivision of the Frasnian stage which constitutes the lower division of the Upper Devonian in Belgium and northern France.—**Moine schist**, a series of flaggy schists in the Scotch highlands, which belong to the later Archæan. *Geikie*, Textbook of Geol., p. 793.—**Przibram schists**, a series of Precambrian slates in Bohemia, constituting Barrande's 'Étage A,' lying unconformably beneath the great series of Cambrian basal quartzites, conglomerates, slates, and igneous rocks that form 'Étage B.'

Schistochoanites (skiz-tō̤-kō-a̤-nī′tēz), *n. pl.* [NL., < Gr. σχιστός, cloven, + χόανος, funnel, + *-ites*, E. *-ite*^{2}.] In Hyatt's classification of the cephalopods, a suborder of the *Nautiloidea*, with incomplete siphonal funnels, developed on one side but imperfect on the side near the shell-wall.

schistocystis (skis-tō̤-sis′tis), *n.* [NL., < Gr. σχιστός, cloven, + κύστις, bladder.] Congenital fissure of the bladder.

schistocyte (skis′tō̤-sīt), *n.* [Gr. σχιστός, cloven, + κύτος, a hollow (a cell).] A segmenting blood-cell.

schistocytosis (skis″tō̤-sī-tō′sis), *n.* [NL., < Gr. σχιστός, cloven, + κύτος, a hollow (cell), + *-osis*.] Cell-division; specifically, division of a blood-cell.

schistoglossia (skis-tō̤-glos′i-ä̤), *n.* [NL., < Gr. σχιστός, cloven, + γλῶσσα, tongue.] Congenital fissure of the tongue.

schistoid (shis′toid), *a.* [*schist* + *-oid*.] In *petrog.*, somewhat like schist.

> These fragments consisted of granites, quartziferous diorites, *schistoid* diorites, amphibolites, mica schists, grained quartzites, sandstone, a few fragments of compact limestone, and partially decomposed earthy shales. *J. Murray*, in Smithsonian Rep., 1893, p. 360.

schistorrhachis (skis-tor′a̤-kis), *n.* [NL., < Gr. σχιστός, cloven, + ῥάχις, spine.] Same as *spina bifida*.

schistoscope (skis′tō̤-skōp), *n.* [Gr. σχιστός, split, + σκοπεῖν, view.] A simple polariscope for the production of complementary colors.

> By the aid of polarized light it is possible to produce with ease and certainty . . . colours which are truly complementary. There are quite a number of instruments for accomplishing this, but perhaps the simplest and best is that which was contrived by Brücke, . . . and called by him a *schistoscope*. *O. N. Rood*, Modern Chromatics, p. 161.

schizæaceous (skiz-ē̤-ā′shius), *a.* Of or pertaining to the *Schizæaceæ*.

schizaxon (skī-zak′son), *n.* [Gr. σχίζειν, divide, + ἄξων, axis.] In *neurol.*, the Y-shaped division of the axon of a sensory nerve-cell in the spinal cord. *Von Lenhossek.*

schizochroal (skī-zok′rō̤-a̤l), *a.* [Gr. σχίζειν, divide, + χρόα, skin, + *-al*^{1}.] In the compound eye of the trilobites, that type in which the corneal lenses are separated by interstitial portions of the sclera or test: contrasted with *holochroal*. See ⋆*holochroal*.

Schizodonta (skiz-ō̤-don′tä̤), *n. pl.* [NL., < Gr. σχίζειν, divide, + ὀδούς (ὀδοντ-), a tooth.] A division of the pelecypod mollusks in which the teeth of the valves are heavy, amorphous, and variable, often obscurely divided into subumbonal and lateral elements.

schizogamy (skī-zog′a̤-mi), *n.* [Gr. σχίζειν, divide, + γάμος, marriage.] A method of reproduction in which a sexual form is produced by fission or by gemmation from a sexless one, as in some worms. Same as *metagenesis*.

> This group is one of the most interesting to naturalists from the frequence of *schizogamy* and epigamy among its members. *Annals and Mag. Nat. Hist.*, April, 1902, p. 296.

Schizogenic cycle. See ⋆*cycle*^{1}.

schizogenous, *a.* **2.** Reproducing by schizogony or fission.

schizogonia (skiz-ō̤-gō′ni-ä̤), *n.* [NL., < Gr. σχίζειν, divide, + γόνος, generation.] Reproduction by successive cell-division; schizogony.

schizogonic (skiz-ō̤-gon′ik), *a.* [*schizogon*(*y*) + *-ic*.] Pertaining to or exhibiting schizogony; schizogonous.

> In *Klossia Eberthi*, for example, both microgametes and spores are formed, but there is no *schizogonic* cycle, only a sporogonic. *Encyc. Brit.*, XXXII. 816.

schizogonous (skī-zog′ō̤-nus), *a.* Same as ⋆*schizogonic*.

schizogony, *n.* **2.** Self-mutilation; autotomy.

> A constriction somewhat similar to that which occurs in Linckia before *schizogony* of the arm takes place. *Proc. Zool. Soc. London*, 1900, p. 289.

Schizogregarinæ (skiz-ō̤-greg-a-rī′nē), *n. pl.* [Gr. σχίζειν, divide, + NL. *Gregarinæ*.] A group of *Gregarinida* in which schizogonic reproduction takes place during the extracellular phase of the trophozoite, in addition to the ordinary sporogony. Compare ⋆*Amœbosporidia*.

schizolite (skiz′ō̤-līt), *n.* [Gr. σχίζειν, cleave, split, + λίθος, stone.] A silicate of manganese, calcium, and sodium, occurring in prismatic, triclinic crystals of a pink to brown color. It is related to pectolite in form and composition. Found in south Greenland.

schizolytic (skiz-ō̤-lit′ik), *a.* [Gr. σχίζειν, cleave, split, + λυτικός, < λύσις, dissolution.] In *biol.*, forming any organ or reproductive body by simple division or fission.

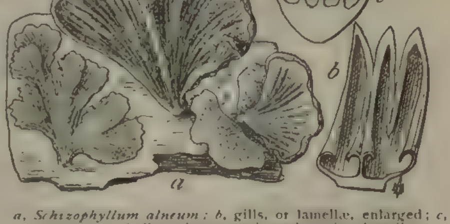
> The separation of the gemmae is by a *schizolytic* process. *Bulletin Torrey Bot. Club*, XXXI. 206.

schizomycetic (skiz″ō̤-mī-sē′tik), *a.* [*Schizomycetes* + *-ic*.] Of or pertaining to the *Schizomycetes* or bacteria. *Lancet*, July 11, 1903, p. 104.

schizont (skiz′ont), *n.* [Gr. σχίζων (σχιζοντ-), ppr. of σχίζειν, cleave, split: see *schism*.] In some sporozoans, an asexual reproductive body in which spores are formed by the internal division of the contained protoplasm into few or many gymnospores. *Proc. Roy. Soc.* (London), 1902, I. 74.

Schizopetalon (skiz-ō̤-pet′a̤-lon), *n.* [NL. (Sims, 1823), < Gr. σχίζειν, cleave, + πέταλον, leaf, petal.] A small genus of Chilian cruciferous herbs with laciniate purple or white petals. One of them, *S. Walkeri*, is grown as a flower-garden annual. It reaches a height of one or two feet and bears sessile sinuate or entire leaves and many fragrant white flowers.

Schizophyllum (skiz-ō̤-fil′um), *n.* [NL. (Fries, 1821), < Gr. σχίζειν, split, + φύλλον, leaf, in allusion to the split lamellæ.] A small genus of agaricaceous fungi, having the pileus coriaceous and the lamellæ split and revolute. A dozen or more species have been



a, *Schizophyllum alneum*; *b*, gills, or lamellæ, enlarged; *c*, cross-section of pileus showing split and revolute lamellæ.

described, most of which are probably mere forms of one or two polymorphic species. The plants are very common and cosmopolitan, occurring on dead wood. *S. alneum* is the type of the genus and the most common form.

Schizophyta (skiz-ọ̄-fī'tạ̈), *n. pl.* [NL., < Gr. *σχίζειν*, cleave, split, + *φυτόν*, plant.] A subdivision of the *Thallophyta*, including the *Schizophyceæ*, or blue-green algæ, and the *Schizomycetes*, or bacteria.

schizorhiny (skiz-ọ̄-rī'ni), *n.* [*schizorhin*(*al*) + *-y*³.] The fact or condition, found in certain groups of birds, of having a schizorhinal palate. *Proc. Zool. Soc. London*, 1901, p. 592.

schizospore (skiz'ọ̄-spōr), *n.* [Gr. *σχίζειν*, cleave, split, + *σπορά*, seed (spore).] A nonsexual spore formed by division in the *Chamæsiphonaceæ*, a family of blue-green algæ: same as the *conidiospore* of some authors.

schizotarsian (skiz-ọ̄-tär'si-ạn), *a.* Of or pertaining to the *Schizotarsia*.

schizotrichia (skiz-ọ̄-trik'i-ạ̈), *n.* [NL., < Gr. *σχίζειν*, cleave, split, + *θρίξ* (*τριχ-*), hair.] Splitting of hairs at their ends.

schizozoite (skiz-ọ̄-zō'īt), *n.* [Gr. *σχίζειν*, divide, + E. *zoite*.] A phase or form of an animal resulting from an asexual method of reproduction, as by fission or gemmation, as in some worms.

> Development of Metameres in Salmacina dysteri.— A. Malaquin has studied the development of the sexually produced larva ("oozoite") of this Serpulid, and compares it with what he has previously observed in the asexually produced form ("*schizozoite*").
> *Jour. Roy. Micros. Soc.*, Oct., 1903, p. 613.

Schleich's anesthetic mixture. See ★*anesthetic*.

schlempe (shlem'pẹ), *n.* [G.] Still-wash, the liquid residue left from distilling off alcohol from a fermented liquid. The name is especially applied to this residue from the distillation of fermented beet-root molasses, which is a valuable source of potash salts, principally potassium carbonate. The corresponding French term is *vinasse:* both words have been to a certain extent adopted into English. *Sadtler*, Handbook of Indust. Chem., p. 230.

schlempekohle (shlem'pe-kō-lẹ), *n.* [G., < *schlempe*, still-wash, + *kohle*, coal.] A black, porous mass obtained by evaporating schlempe to dryness and heating the residue until the organic matter present is charred. By leaching this mass with water the potash salts are dissolved out. See ★*schlempe*.

schlicker (shlik'ėr), *n.* [G.] The skimmings from molten unrefined lead, containing chiefly copper, iron, and zinc, with a little antimony and arsenic.

schlieren (shlē'ren), *n. pl.* [G. *schlieren*, prop. pl. of G. dial. *schlier* (OHG. *sclierro*, MHG. *schliere*), a boil.] In *petrog.*, streaks or irregularly shaped portions of an igneous rock which differ in texture or composition from the main mass.

> The figure shows a curious banded concretionary structure in deeper shades resembling the landscape marble from Cotham in England. It is a distinct *schlieren* structure in a sedimentary rock, as if a heavier layer had settled upon a lighter, and the latter had at stated points risen up into the former. The lines of flow marked by a delicate banding, and expanded outwardly into a fan structure. *Amer. Geol.*, Feb., 1905, p. 98.

schlieric (shlē'rik), *a.* [G. *schlier*(*en*) + *-ic*.] In *petrog.*, having the properties of schlieren. Schlieric texture is a streaked heterogeneous texture in which different parts of the rock exhibit differences in mineral composition accompanied or not by textural differences.

schlitte (shlit'ẹ), *n.* [G. dial. *schlitte*, G. *schlitten*, a sled, sledge, OHG. *slito*, m., *slita*, f., < *slītan*, G. *schleiten* = E. *slide*.] A Swiss form of small coasting sled, steered by hand with short, iron-pointed sticks. *Sci. Amer. Supp.*, April 15, 1905, p. 24488.

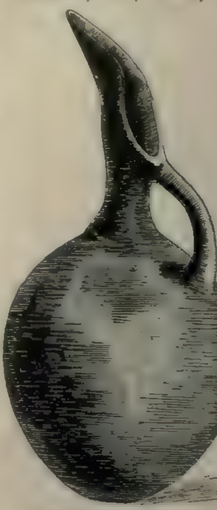
schloss (shlos), *n.* [G., a lock, castle, in OHG. *sloz* (= D. *slot*, etc.), a bolt, lock, castle, < *sliozan*, G. *schliessen*, shut, lock: see *slot*¹.] In German, a castle or manor-house: a term equivalent to the French *château*.

schmalzöl (shmälts'ėl), *n.* [G., < *schmalz*, lard, + *öl*, oil.] Literally, lard-oil: a term used as a trade-name for refined rape-seed oil, prepared for table use as salad-oil by treatment for the removal of a somewhat acrid taste. *Groves and Thorp*, Chem. Technol., II. 28.

schmeltz, *n.* See *schmelze*.

schnabelkanne (shnä'bel-kän-e), *n.* [G., < *schnabel*, bill, beak, + *kanne*, jug, can.] A jug or pitcher with the spout in the form of a tube: used in Greco-Roman archæology for vessels of a peculiar form found in great abundance among Mycenæan and later Greco-Roman work.

> A certain form of beaked jug, called by German archæologists *schnabelkanne*, is characteristic of the whole area from before the first introduction of the potter's wheel to the end of the period.
> *Encyc. Brit.*, XXXI. 56.



Schnabelkanne (Trojan).

schnapper (shnap'ėr), *n.* [Prop. *snapper*, the spelling *schnapper* having appar. arisen out of a notion that the word is Dutch or German. But the D. word would be ★*snapper* (compare D. *snaper*, the hornback, a fish), and the G. *schnapper* is not applied to a fish.] A fish, *Pagrus unicolor*, abundant in all Australasian waters and similar to the red porgy of the Mediterranean, and the red tai of Japan. *E. E. Morris*, Austral English.—**Cock schnapper,** the young of the Australian schnapper.—**School schnapper,** a name given to the schnapper when it begins to school.

schneider (shnī'dėr), *n.* [G., cutter, tailor, one who gets the worst, as in a game; < *schneiden*, cut.] A German equivalent for *lurch*, applied to the adversaries of the single player (*a*) in *skat*, when they fail to reach 30, and (*b*) in *sixty-six*, when they fail to make 33. *Double schneider* is the same as ★*schwarz*, 2.

schneller (shnel'ėr), *n.* [G., a jerker, lever, picker, < *schnellen*, jerk, let go, < *schnell*, quick, = E. *snell*.] In *music*, a term sometimes used for ★*pralltriller*, when the embellishment occurs with notes that are detached, not in a descending series.

schnorrer (shnōr'ėr), *n.* [Yiddish, < G. *schnurren*, to hum. It is said that wandering beggars used to play a trifling musical instrument called *schnurrpfeife*, 'humming pipe,' which produced a buzzing sound: hence the name.] Among German Jews, a beggar; a tramp.

schola cantorum (skō'lạ̈ kan-tō'rum). [L., 'school of singers.'] In *medieval music*, either the choir or chapel of a cathedral or monastery, or a choir-school attached to such an establishment; specifically, the Papal Choir at Rome.

scholasticate (skọ̄-las'ti-kāt), *n.* A house in which advanced courses in philosophy, theology, and science are given to candidates for the priesthood in the Jesuit Order.

schönite, *n.* See *schœnite*.

school¹, *n.*—**Ambulatory school.** See ★*ambulatory*.—**Austrian school,** in *polit. econ.*, a group of economists of whom the Austrian writers, Menger, Wieser, Sax, and Böhm von Bawerk, are the most prominent. The essential characteristic of the school is the explanation of the phenomena of valuation by the theory of "final utility."—**Barbazon** or (properly) **Barbison school,** the group of French landscape-painters, classed as realists, who from about the middle of the nineteenth century made their home in Barbison and other villages near Fontainebleau. The group includes Théodore Rousseau, Millet, Corot, Daubigny, Jules Dupré, Diaz, Troyon, and others.—**Classical school,** in *polit. econ.*, a group of writers of the early part of the nineteenth century including Ricardo, Malthus, J. B. Say, M'Culloch, James Mill, and minor writers. The underlying philosophy of the school was utilitarianism and the method employed was deductive. Also called the *orthodox school* or the *Ricardian school*.—**Dynamic school.** (*a*) In *sociol.*, a group of writers who teach the possibility of improving society by human effort directed by scientific knowledge, in opposition to those who doubt man's ability to hasten the processes of natural evolution. (*b*) A medical sect, followers of Stahl, so called because of the doctrine that all vital phenomena proceed from the action of an internal force. See *animism*, 2.—**Free school,** a school in which tuition fees are not charged. Specifically:—(*a*) A charity-school. (*b*) A school maintained in a community by taxes levied for the purpose.—**Historical school.** (*b*) In *polit. econ.*, a group of economists who emphasize the interdependence of economic, social, political, and legal phenomena, and who maintain that the economic condition of a nation can be understood only through a historical study of the institutional development of that nation. The earliest prominent representatives of the historical school were the German writers Wilhelm Roscher, Bruno Hildebrand, and Karl Knies. The historical school became predominant in German economics in the last half of the nineteenth century and profoundly influenced economic thought throughout the world.—**Latin school,** a school in which the pupils are instructed especially in Latin and Greek, in preparation for a college or university.—**Médan school,** a group of realistic writers who advocated a laborious reproduction of life in its most material features. Zola was the most noted of this school. *M. V. M. Crawford*, Studies in Foreign Literature, p. 64.—**National school.** (*b*) A school of political economy which represents a reaction against the laisser-faire doctrines and the cosmopolitanism of the classical economists. Writers of the national school regard state encouragement of industry, in the form of protective tariffs, bounties, etc., as essential to the development of the latent resources of a country. Friedrich List and Henry C. Carey were the most prominent writers of this school.—**Neapolitan school of painting.** See ★*naturalisti*.—**Norwich school of painting.** See ★*painting*.—**Pisan school of sculpture,** the small but influential coterie of sculptors which was formed in Pisa, Italy, in the thirteenth century. Its chief masters were Niccolò da Pisa, and his son Giovanni. It was much influenced by certain antique remains now in the Campo Santo at Pisa.—**Secondary school,** a school between the primary school and the college, university, or technological school.

> The *secondary school* course is normally four years in length. . . . The conditions prescribed by the colleges for admission to their courses affect powerfully both the *secondary school* programme and the methods of teaching.
> *Encyc. Brit.*, XXVII. 681.

> The school which seeks to retain its pupil to the age of sixteen or seventeen, and to prepare him to enter a skilled trade or one of the minor professions, is a *secondary* or intermediate *school*. *Encyc. Brit.*, XXVII. 663.

Staticokinetic school, in *sociol.*, those writers who merely try to explain society, without attempting to direct human progress by means of scientific knowledge.—**Tapestry school.** See the extract.

> Miss . works in all the stock effects of the *tapestry school*, reveling particularly in great splotches of red color. Helvin's hair is blood red. Brynhild's and Randvar's locks are gold red, the villain — a polished person who has learned his manners in France — wears slashed garments of red Spanish leather; when there is a fight blood flows redly from the rents in the garments of the combatants, the wine is red in the cups, and the campfire blazes red against the dark trees of the forest primeval. *N. Y. Times*, Sat. Rev., Feb. 24, 1906, p. 112.

Vested school, in Ireland, a school the control of which is vested in commissioners.

school-fish, *n.* **3.** A collective name for codfish which inhabit the open sea. *Stand. Dict.*

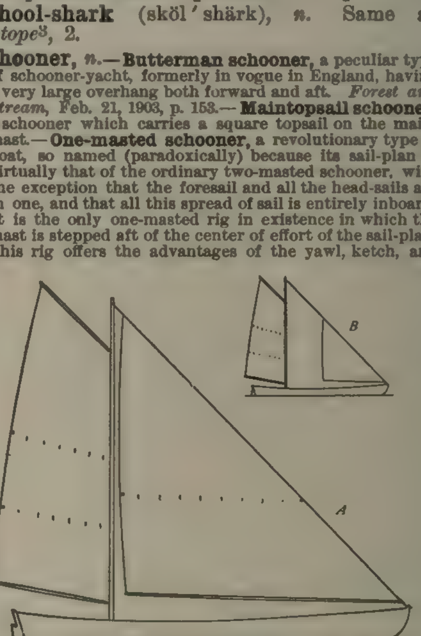
school-land (sköl'land), *n.* A portion of government land which is appropriated for the use or support of schools, as for an agricultural school.

schoolmaster, *n.* **2.** A common name of *Lutianus apodus*, a fish of the family *Lutianidæ*, found in the West Indies.

school-section (sköl'sek″shọn), *n.* A section of the public land devoted to the support of the public schools. [Western U. S.]

school-shark (sköl'shärk), *n.* Same as ★*tope*³, 2.

schooner, *n.*—**Butterman schooner,** a peculiar type of schooner-yacht, formerly in vogue in England, having a very large overhang both forward and aft. *Forest and Stream*, Feb. 21, 1903, p. 153.—**Maintopsail schooner,** a schooner which carries a square topsail on the mainmast.—**One-masted schooner,** a revolutionary type of boat, so named (paradoxically) because its sail-plan is virtually that of the ordinary two-masted schooner, with the exception that the foresail and all the head-sails are in one, and that all this spread of sail is entirely inboard. It is the only one-masted rig in existence in which the mast is stepped aft of the center of effort of the sail-plan. This rig offers the advantages of the yawl, ketch, and regular schooner, inasmuch as by simply lowering the jib the boat will lay head to wind; also that by having one mast instead of two there is saving of weight aloft and a natural increase of stability, while the large jib exerts a tremendous lifting power. The absence of a mast in the forward part of the boat increases her buoyancy and life in a seaway, and permits her to rise readily to a head sea. By reefing the jib, the balance of the sail-plan is not impaired, but leaves it like that of an ordinary two-



One-masted Schooner.
A, full sail; *B*, jib reefed.

masted schooner under jib and mainsail. The high, narrow-headed mainsail is of special service in a heavy sea as it catches the wind which blows over the crests, and thus keeps steerageway on the boat. This type of vessel is generally known as the *Andrade one-masted schooner.*

schott (shot), *n.* [G. *schott*, prob. < D. *schot*, a payment: = E. *shot*^{2}.] **1.** One twenty-fourth of a mark, gold and silver weight, at Danzig. —2. An early Prussian silver coin.

schraufite (shrouf'īt), *n.* [Named after Prof. A. *Schrauf*, an Austrian mineralogist (died 1897).] A native mineral resin of a deep-red color which occurs in the sandstone of Wamma, Bukowina.

Schroeder's figure, Schroeder's stair figure. See ★*figure.*

Schroeter's valley. See ★*valley.*

schungite (shöng'gīt), *n.* [*Schunga* (see def.) + *-ite*^{2}.] Amorphous carbon, intermediate between graphite and anthracite. It occurs in phyllite near Schunga, Russia.

Schuylkill cat. See ★*cat*^{1}.

Schwann cell. See ★*cell.*

schware (shvä're), *n.*; pl. *schwaren* (-ren). [LG. *schware*, < *schwar*, G. *schwer*, heavy.] **1.** Copper currency of Bremen in the eighteenth and nineteenth centuries, equal to one fifth of a groat.—**2.** A subsidiary coin of Oldenburg, one twelfth of a silver groschen; equivalent to one fifth of a United States cent.

schwarz (shvärts), *n.* [G. *schwarz*, black.] **1.** A coin of the Hanse Towns, equal to one fifth of a groat.—**2.** A double lurch or double schneider. In *skat*, if the adversaries of the single player fail to make a point, they are *schwarz.* In *sixty-six*, if a player fails to win a trick, he is *schwarz.* See ★*schneider.*

> If, however, he fails to make 61 points, he loses the game; if his opponent make 90 points, he is Schneider; or if he makes no points at all, he is *Schwarz*, and he pays each of his opponents (silent players included, if any) the value of his game, increased, as the case may be, by the additional payment for Schneider or *Schwarz.*
> *Amer. Hoyle*, p. 266.

schwegel (shvā'gel), *n.* [G., in OHG. *swegala*, a flute.] 1. An old form of pipe or flageolet. —**2.** In *organ-building*, a flue-pipe.

sci. An abbreviation (*a*) of *science*; (*b*) of *scientific.*

Sciadeichthys (sī-ad-ẹ̄-ik'this), *n.* [NL., < *Sciades*, a related genus, + Gr. ἰχθύς, fish.] A genus of marine catfishes found in tropical American waters.

sciænid (sī-ē'nid), *n.* A fish of the family *Sciænidæ.*

Sciænops (sī-ē'nops), *n.* [NL., < Gr. σκίαινα, a sea-fish (see *Sciæna*), + ὤψ, eye, face, appearance.] A genus of sciænoid fishes found on the South Atlantic and Gulf coast of the United States.

sciagram (sī'a̤-gram), *n.* [Gr. σκιά, shadow, + γράμμα, writing.] Same as ★*radiogram* or *radiograph*, 2. Also *skiagram.*

> The *skiagram* showed that there was a very great deficiency in the lime salts. *Lancet*, July 4, 1903, p. 32.

sciagrammatic (sī"a̤-gra-mat'ik), *a.* Pertaining to, of the nature of, or recorded by means of, a sciagram. Also *skiagrammatic.*

sciagrammatically (sī"a̤-gra-mat'i-kạl-i), *adv.* By means of a sciagram or of sciagraphy. Also *skiagrammatically.*

sciagraph, *n.* **2.** A photograph taken with the X-rays. See ★*ray*^{1}. Also *skiagraph.*

> When taking a *skiagraph* of the lungs the plate will not be marred as the result of movement of the ribs and lung and diaphragm, which is always the case when long exposures are made.
> *Amer. X-Ray Jour.*, Feb., 1903, p. 43.

sciagraph (sī'a̤-gråf), *v. t.* [*sciagraph, n.*] To take a sciagraph or radiograph of. Also *skiagraph.*

> The time of exposure depends largely upon the size and character of the apparatus employed, the degree of vacuum of the tube, and the thickness of the part to be *skiagraphed.* *Amer. X-Ray Jour.*, Feb., 1903, p. 41.

sciagraphic (sī-a̤-graf'ik), *a.* [*sciagraph*(*y*) + *-ic.*] Pertaining to or of the nature of sciagraphy; obtained by means of sciagraphy. Also *skiagraphic.*

sciagraphy, *n.* **4.** Photography by means of the Röntgen rays or other forms of radioactivity. Also *skiagraphy.*

> Many of the "old timers" refuse at first to believe that such a thing as instantaneous *skiagraphy* is possible, and become converted only after seeing for themselves.
> *Amer. X-Ray Jour.*, Feb., 1903, p. 41.

sciametry (sī-am'e-tri), *n.* [Gr. σκιά, shadow, + -μετρια, < μέτρον, measure.] Same as *skiascopy.* *Optical Jour.*, June 16, 1904, p. 42.

Sciara army-worm. See ★*army-worm.*

sciascope (sī'a̤-skōp), *n.* The ophthalmoscopic mirror employed in the shadow-test. See *skiascopy.*

sciascopic (sī-a̤-skop'ik), *a.* Of or pertaining to sciascopy. Also *skiascopic.*

> To make a *skiascopic* chimney for an argand burner, take a piece of tin about four inches square; with a small carpenter's chisel cut a circular hole out of it about two inches in diameter. *Optical Jour.*, Dec., 1903, p. 782.

science, *n.*—**Concrete science,** a science, not of laws of nature and their possible results, but descriptive and explanatory either of the kinds of objects (as in chemistry) or of the individual objects (as in astronomy) whose existence or potential existence (as in the case of a salt not hitherto made but which certainly might be made) has hitherto been revealed to us by experience. The term was introduced by Comte, along with *abstract science.* Spencer added an intermediate division, *abstract-concrete science.*—**Domestic science,** the applications of science (physics, chemistry, biology, hygiene, etc.) to household or domestic economy.—**Mental science.** (*a*) The science of mind; psychology. (*b*) A so-called system of healing, which aims at a cure of all physical ailments by educating the mind of the patient in certain directions. The mind is supposed to be trained to exclude every idea of the existence of any real discomfort, on the ground that all such discomfort is the result of abnormal mental conditions; the mind being properly trained to ignore the body, no discomfort exists, since the mind does not admit it. The system has many variations, but in general is, evidently, a form of mind-cure or faith-cure.—**Nautical science,** the arts of seamanship and navigation, to which may be added ship-designing, marine engineering, and naval gunnery.

scienter (sī-en'tėr), *n.* [L., *adv.*, knowingly, with knowledge.] In *law*, the clause in a complaint or indictment charging that the defendant has knowledge which renders him responsible or guilty; also, the fact that the defendant has such knowledge.

scientist, *n.*—**Christian Scientist.** See ★*Christian.*

scieropia (sī-ẹ-rō'pi-a̤), *n.* [NL., < Gr. σκιερός, shady (< σκιά, shadow), + ὤψ, eye.] A pathological condition in which objects seen appear to be in a shadow.

sciffarine (sif'a̤-rin), *n.* A trade-name of a plastic material, made of sawdust, hemp-fiber, starch, glue, and a mineral filler, intended for use in finishing interior walls of houses, filling spaces between joists, etc.

scillain (sil'a̤-in), *n.* [L. *scilla*, squill, + *-in*^{2}.] A bitter, poisonous, amorphous glucoside found in squills, *Urginea maritima.* It is hydrolyzed by acids into sugar and a resin. Its physiological action is similar to that of digitalin.

scillin (sil'in), *n.* [L. *scilla*, squill, + *-in*^{2}.] A light-yellow crystalline glucoside found in squills, *Urginea maritima.*

scillipicrin (sil-i-pik'rin), *n.* [L. *scilla*, squill, + Gr. πικρός, bitter, + *-in*^{2}.] A yellowish-white hygroscopic, pulverulent glucoside contained in squills.

Scillitan (sil'i-ta̤n), *a.* Of or pertaining to Scillium, a town in Numidia. See the extract.

> The recovery in their original form of the Acts of the *Scillitan* Martyrs has given us the earliest documents of the Church of Africa and, it would seem, the earliest specimen of Christian Latin. The martyrs take their name from Scilla (or Scillium), a town in Numidia.
> *Encyc. Brit.*, XXXII. 462.

scillitin (sil'i-tin), *n.* [L. *scilla*, squill, + *-it-* + *-in*^{2}.] A bitter compound found in squills, *Urginea maritima.* It is a diuretic used in certain forms of dropsy.

scillitoxin (sil-i-tok'sin), *n.* [L. *scilla*, squill, + E. *toxin.*] A light-brown amorphous glucoside found in squills. It is a cardiac poison, its action being similar to that of digitalin.

scind (sind), *v. t.* [L. *scindere*, cut.] To cut; cleave; separate. [Rare.]

> That which is false cannot be good, nor can it be beautiful. That which is beautiful must be true and good. It is impossible to *scind* these distinct aspects of perfection. The philosopher seeking truth errs if he attempts to oppose what is certain to what is goodly.
> *Baring-Gould*, Origin and Development of Religious [Belief, II. 37.

scintillescent (sin-ti-les'ẹnt), *a.* [See *scintillate.*] Scintillating; twinkling; having a tremulous motion to the eye.

> The moon,
> Bright, breathless, and buoyant, and brimful of June,
> . . . .
> Poised herself loose in mid-heaven, with one pale,
> Minute, *scintillescent*, and tremulous star
> Swinging under her globe like a wizard-lit car.
> *Owen Meredith*, Lucile, II. iii. 12.

scintilloscope (sin-til'ọ-skōp), *n.* [L. *scintilla*, spark, + Gr. σκοπεῖν, view.] An apparatus devised by F. H. Glew for detecting the effect of radioactive substances on polonium screens or other screens. A modification of the ★spinthariscope (which see).

> The little instrument, which is called the "*Scintilloscope*," consists of a simple magnifier of adjustable focus, as in the spinthariscope, but instead of the fixed screen and particle of radio-active substance a small double plate of glass is used. One of these pieces of glass is coated with a radio-active salt, and the other is a radio-sensitive screen. Upon looking at a combination of this kind with the lens the sparkling appearance is very clearly seen.
> *Nature*, Sept. 29, 1904, p. 535.

sciophilous (sī-of'i-lus), *a.* [Gr. σκιά, shade, shadow, + φιλειν, love, + *-ous.*] In *phytogeog.*, shade-loving; adapted to live in shade. *Pound and Clements.*

sciophyte (sī'ọ-fīt), *n.* [Gr. σκιά, shade, + φυτόν, plant.] In *phytogeog.*, a shade-loving plant.

Scipionism (sip'i-ō-nizm), *n.* [L. *Scipio* (*Scipion-*) + *-ism.*] The distinctive character of Scipio. [Rare.]

> Every great man is a unique. The *Scipionism* of Scipio is precisely that part he could not borrow.
> *Emerson*, Self-reliance, Essays, 1st ser., p. 82.

scirrhoma (si-rō'mä), *n.*; pl. *scirrhomata* (-ma̤-tä̤). [NL., < Gr. σκίρρος, a tumor, + *-oma.*] Same as *scirrhus.*

scirtopodous (sėr-top'ọ-dus), *a.* Pertaining to or characteristic of the *Scirtopoda.*

scissor-leg (siz'o̤r-leg), *n.* A deformity consisting in adduction of both hips, the legs crossing each other.

scissors, *n. pl.*—**De Wecker's scissors,** small surgical scissors the blades of which are opened and closed by pressure on two steel springs united at one extremity like the blades of a pair of tweezers: used in operations on the eyeball.

scissors-telescope (siz'o̤rz-tel"e-skōp), *n.* A stereotelescope the interobjective distance of which can be varied by rotation of the arms about a joint so situated with reference to the eyepieces that the interocular distance remains constant.

sciuromorphine (sī-ū-rọ-môr'fin), *a.* [*sciuromorph* + *-ine.*] Same as *sciuromorphic.* *Proc. Zool. Soc. London*, 1896, p. 187.

sclaff (sklåf), *v.* [Also *sklaff*; imitative. Compare *baff* and *slap.*] To strike with the open hand or with anything flat; specifically, in *golf*, nearly the same as *baff.* See the extract. [Scotch.]

> The distinction between the two words is somewhat subtle. In baffing a ball the stroke is played with the intention of lofting it high in the air, whereas a *sclaffed* ball is not necessarily lofted high.
> *W. Park, Jr.*, Game of Golf, p. 269.

sclaffy (sklåf'i), *a.* [*sclaff* + *-y*^{1}.] In *golf*, applied to a stroke when the ball is not taken clean but is struck only after the club has plowed through the ground behind it. *W. Park, Jr.*, Game of Golf, p. 91.

sclera, *n.* **2.** The test of the crustaceans, especially those parts of the test which separate the corneal lenses in aggregated schizochroal eyes.

sclereid (sklē'rẹ̄-id), *n.* [Gr. σκληρός, hard, + *-e-* + *-id*^{2}.] In *bot.*, a hardened and thickened cell; a lignified cell or stone-cell. See *sclerotic parenchyma*, under *sclerotic.*

sclerite, *n.* (*d*) One of the elements which by union or coalescence form the skeleton of a coral.

> At the base of the polyp between each pair of mesenteries, the infolded ectoderm secretes small, round, oval or irregular calcareous bodies (*sclerites*); these are opposed against one another in radial directions, and as others are successively laid down on the top of them, upright partitions or septa (Sternleisten, cloisons) are built up. *Zittel* (trans.), Text-book of Paleon., I. 69.

sclero-adipose (sklē-rọ-ad'i-pōs), *a.* [Gr. σκληρός, hard, + E. *adipose.*] Both fibrous and fatty; composed of a mixture of these two structures.

> There is deposited around the cæcum a thick and resistant *sclero-adipose* mass which gives the impression of a neoplasm. *Jour. Exper. Med.*, Nov. 29, 1901, p. 38.

sclero-anthin (sklē-rọ-an'thin), *n.* [Gr. σκληρός, hard, + ἄνθος, flower, + *-in*^{2}.] A little-known compound said to be present in ergot.

sclerocauly (sklē'rọ-kâ-li), *n.* [Gr. σκληρός, hard, + καυλός, stem, + *-y*^{3}.] In *phytogeog.*, the character exhibited by plant stems which, in response to conditions of physiological dryness, have become slender, hard, and dry as in *Ephedra* and *Spartium.* *A. F. W. Schimper.*

sclerochoroiditis (sklē-rọ-kō-roi-dī'tis), *n.* [NL., < Gr. σκληρός, hard, + NL. *choroides* + *-itis.*] Inflammation of both the sclerotica and the choroid.

sclerocornea (sklē-rọ-kôr'nẹ̄-ä), *n.* [NL., < Gr. σκληρός, hard, + NL. *cornea.*] The sclerotica and cornea considered together.

sclerocrystalline (sklē-rọ-kris'ta-lin), *n.* [Gr. σκληρός, hard, + κρυστάλλινος, of crystal.] A colorless crystalline compound found in ergot of rye, from which it is extracted by ether.

sclerodactylia (sklē"rọ-dak-til'i-a̤), *n.* [NL.,

‹ Gr. σκληρός, hard, + δάκτυλος, finger.] A condition of atrophy and deformity of the fingers, with thickening and hardening of the skin which covers them.

Scleroderma^3 (sklē-rọ-dėr′mä̤), *n.* [NL. (Persoon, 1801), ‹ Gr. σκληρός, hard, + δέρμα, skin.] A genus of gasteromycetous fungi having the peridium simple and coriaceous, rupturing irregularly and the gleba divided by irregular partitions. *S. verrucosum* is a common and widely distributed species occurring in grassy places.

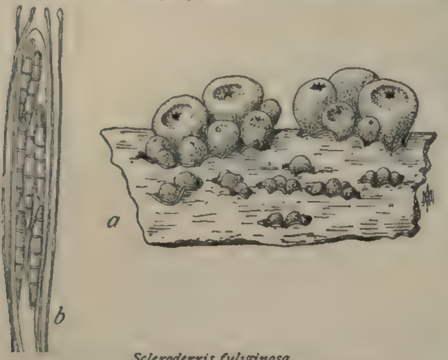
Sclerodermataceæ (sklē-rọ-dėr-mạ-tā′sẹ-ē), *n. pl.* [NL., ‹ *Scleroderma*^{3} (*Sclerodermat-*) + *-aceæ.*] A small family of gasteromycetous fungi, so named from the genus *Scleroderma* and including the common thick-skinned puffballs.

sclerodermatitis (sklē-rọ-dėr-mạ-tī′tis), *n.* [NL., ‹ Gr. σκληρός, hard, + δέρμα(τ-), skin, + *-itis.*] Inflammation of the skin with hardening of the cutaneous and subcutaneous tissues.

> Hence the results of the treatment in this case are very suggestive that in some cases at least *sclerodermatitis* is rheumatic in origin. *Med. Record*, Feb. 7, 1903, p. 228.

sclerodermite, *n.* **2.** In the corals, one of the calcareous elements occurring detached in the ectoderm and mesoderm or forming compact tubes which are periodically partitioned off into stories with the upward growth of the animal.

Scleroderris (sklē-rọ-der′is), *n.* [NL. (Persoon, 1822), ‹ Gr. σκληρός, hard, + δέρρις, a leather covering.] A genus of discomycetous fungi having coriaceous ascocarps arising from a stroma seated beneath the surface of the substratum. At first they are subglobose and closed, but finally the covering ruptures and exposes the disk. The spores are hyaline, elongate, and 4 to 8-celled. Over 25 species are known, mostly saprophytic on trunks and branches. *S. fuliginosa* is said to be parasitic on twigs and branches of willows in Europe and North America.



Scleroderris fuliginosa.
a, immature ascocarps: *b*, ascus containing spores and accompanied by paraphyses.

sclero-erythrin (sklē″rọ-e-rith′rin), *n.* [Gr. σκληρός, hard, + ἐρυθρός, red, + *-in*^{2}.] A red coloring-matter found in ergot of rye.

sclerogenic (sklē-rọ-jen′ik), *a.* [Gr. σκληρός, hard, + -γενης, -producing, + *-ic.*] Same as *sclerogenous*^{1}.

sclerogummatous (sklē-rọ-gum′ạ-tus), *a.* [Gr. σκληρός, hard, + E. *gummatous.*] Both fibrous and gummatous.

> Next in importance in syphilitic cardiac affections comes *sclerogummatous* arteritis. This is sooner or later complicated by insufficiency of the aortic valves and aortic aneurysm. *Med. Record*, Feb. 7, 1903, p. 229.

sclero-iodin (sklē-rọ-ī′ọ-din), *n.* [Gr. σκληρός, hard, + ἰώδης, like a violet, + *-in*^{2}.] A coloring-matter found in ergot of rye.

sclerokeratitis (sklē-rọ-ker-ạ-tī′tis), *n.* [NL., ‹ Gr. σκληρός, hard, + κέρας (κερατ-), horn, + *-itis.*] Inflammation of both the sclerotica and the cornea.

> Sandford says in the British Medical Journal of November 1, 1902, that by the term *sclerokeratitis* he means an inflammatory cellular infiltration of the fibrous tissue of the sclerotic coat, extending more or less into the substantia propria of the cornea.
> *Therapeutic Gazette*, Feb. 15, 1903, p. 115.

scleromere (sklē′rọ-mēr), *n.* [Gr. σκληρός, hard, + μέρος, part.] A primitive segment from which an osseous structure is developed: distinguished from a *myomere* or primitive muscular element. *H. Gadow*, in Philos. Trans. Roy. Soc. (London), 1896, ser. B, p. 12.

sclero-optic (sklē-rọ-op′tik), *a.* Relating to both the sclerotica and the optic nerve. *Buck*, Med. Handbook, I. 557.

sclerophyllous (sklẹ-rof′i-lus), *a.* [Gr. σκληρός, hard, + φύλλον, leaf, + *-ous.*] In *phytogeog.*, having coriaceous leaves: said of vegetation; favorable to vegetation with such leaves: said of conditions. Sclerophyllous plants are found in all xerophytic formations, but are commonest in mild temperate regions with wet winters and dry summers. See ★*garrigue* and ★*maqui*^{2}.

sclerophylly (sklẹ-rof′i-li), *n.* [Gr. σκληρός, hard, + φύλλον, leaf, + *-y*^{3}.] In *phytogeog.*, the character presented by a type of foliage reduced in size, thickened, and hardened in response to conditions of physiological dryness. *A. F. W. Schimper.*

scleroprotein (sklē-rọ-prō′tẹ-in), *n.* [Gr. σκληρός, hard, + E. *protein.*] A term suggested to designate the albuminoids which occur widely distributed in the skeletal tissues of the animal organism. *Nature*, March 7, 1907, p. 439.

sclerosarcoma (sklē″rọ-sär-kō′mä̤), *n.*; pl. *sclerosarcomata* (-mạ-tä̤). [NL., ‹ Gr. σκληρός, hard, + σάρκωμα, sarcoma.] A hard fleshy growth, especially one on the gums.

sclerose (sklẹ-rōs′), *v.*; pret. and pp. *sclerosed*, ppr. *sclerosing.* [*sclerosis, n.*] **I.** *trans.* To cause sclerosis or hardening.

> *Sclerosing* disorders, such as chronic alcoholism.
> *Buck*, Med. Handbook, II. 496.

II. *intrans.* To become affected with sclerosis.

scleroseptum (sklē-rọ-sep′tum), *n.*; pl. *sclerosepta* (-tä̤). [NL., ‹ Gr. σκληρός, hard, + L. *septum*, partition.] One of the calcareous septa of a coral, contrasted with the fleshy mesenteries or sarcosepta.

sclerosis, *n.*—**Unicellular sclerosis,** invasion of a gland by fibrous bands passing between the individual cells.

> Lemoine and Lannois, as already noted, have studied pancreatitis in four cases of diabetes and have thought that the new growth of interstitial tissue has its seat of origin in the perivascular tissue whence fibrous processes extend between the parenchymatous structures. An important feature of the inflammatory change described by them is the penetration of fibrous strands into the acini, separating the cells and producing what they designate *unicellular sclerosis.*
> *Jour. Exper. Med.*, Jan. 15, 1901, p. 424.

Vascular sclerosis. Same as *arteriosclerosis.*

> Dehio examined fingers that had been amputated on account of Raynaud's disease and found in these endarteritis, endophlebitis and degenerated nerves, but he only had about 1 cm. of normal tissue above the gangrenous area for his investigation. He, too, was uncertain whether the *vascular sclerosis* preceded the gangrene or vice versa. *Jour. Exper. Med.*, Oct. 1, 1900, p. 106.

sclerostenosis (sklē″rọ-stẹ-nō′sis), *n.* In *pathol.*, the contraction and hardening of a structure.

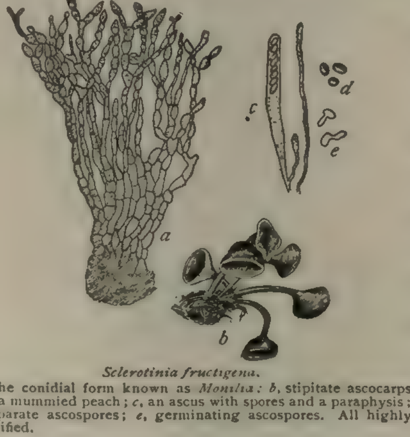
Sclerostoma, *n.* *Sclerostoma armatum* is a large palisade-worm (nematode) of horses: same as ★*Strongylus equinus.* *Sclerostoma tetracanthum*, or *Cylichnostomum tetracanthum* (Mehlis, 1831), is one of the smaller (9 to 12 millimeters long) nematode worms found in the cæcum and colon of horses.

Sclerotic plate, one of the series of thin plates of bone which surround the opening of the pupil of the eye and form the outer part of the eyeball in many birds, or, as in the owls, a deep bony box. See cut under *sclerotal.*

scleroticectomy (sklē-rot-i-sek′tọ-mi), *n.* [NL. *sclerotica* + Gr. ἐκτομή, excision.] Excision of a portion of the sclerotica.

scleroticotomy (sklē-rot-i-kot′ọ-mi), *n.* [NL. *sclerotica* + Gr. τομή, a cutting.] Incision through the sclerotica.

Sclerotinia (sklē-rọ-tin′i-ä̤), *n.* [NL. (Fückel).] **1.** A genus of discomycetous fungi having smooth-stalked, funnel or saucer-shaped ascocarps arising from sclerotia. The ascospores are unicellular and hyaline. Many of the species are parasitic on fruit of ericaceous plants. The conidial forms have been described as *Botrytis* and *Monilia.* *S. Fuckeliana*, the vine-sclerotinia, attacks various plants but especially the grape, destroying leaves, stems, and fruit. *S. Trifoliorum* attacks leaves and stems of clover and *S. fructigena* is the ascigerous form of the fruit-mold or Monilia of peaches and other fruits.



Sclerotinia fructigena.
a, the conidial form known as *Monilia*: *b*, stipitate ascocarps from a mummied peach; *c*, an ascus with spores and a paraphysis; *d*, separate ascospores; *e*, germinating ascospores. All highly magnified.

> Bees carry the spores of *Sclerotinia* as they do the pollen of the bilberries. *Encyc. Brit.*, XXXI. 575.

2. A fungus of the genus *Sclerotinia.*

Onion sclerotinia, *Sclerotinia bulborum*, a species which attacks the bulbs of onions and hyacinths. Its conidial stage belongs to the form-genus *Botrytis.*

sclerotinial (sklē-rọ-tin′i-ạl), *a.* [NL. *Sclerotinia* + *-al*^{1}.] Pertaining to or caused by fungi belonging to the genus *Sclerotinia.*

> De Bary's pioneer paper on Sclerotinia and *sclerotinial* diseases. *Science*, April 18, 1902, p. 607.

sclerotioid (sklẹ-rō′ti-oid), *a.* [NL. *sclerotî(um)* + *-oid.*] Resembling or pertaining to a sclerotium. Also *sclerotoid.*

sclerotium-disease (sklẹ-rō′shi-um-di-zēz″), *n.* Any parasitic disease of plants due to fungi of the genus *Sclerotinia.*

sclerotized, *a.* (*b*) In *pathol.*, same as *sclerosed.*

sclerotoid (sklē′rọ-toid), *a.* Same as ★*sclerotioid.*

sclerotome, *n.* **3.** That portion of the metamerically segmented mesoderm of the vertebrate embryo which gives rise to the sustentacular or supporting structures, such as the bony, cartilaginous, and connective-tissue skeleton.

scleroxanthin (sklē-rọ-zan′thin), *n.* [Gr. σκληρός, hard, + ξανθός, yellow, + *-in*^{2}.] A yellow crystalline compound extracted by ether from ergot of rye.

sclerozone (sklē′rọ-zōn), *n.* [Gr. σκληρός, hard, + ζώνη, a girdle.] One of the bony girdles, or series of bones, to which the limbs are attached; the shoulder girdle and pelvic girdle. [Rare.]

scob (skob), *n.* [Cf. *scobs.*] A fault, in weaving, caused by the entanglement of a broken warp-thread in the shed through which the weft passes. *R. Marsden*, Cotton Weaving, p. 481.

scobicular (skọ-bik′ụ-lär), *a.* Same as *scobiform.* Also *scobiculate.*

scobiculate (skọ-bik′ụ-lāt), *a.* Same as ★*scobicular.*

scodella (skọ-del′ä̤), *n.* [It. *scodella*, ‹ L. *scutella*, a shallow vessel, a waiter. See *scuttle.*] A majolica vessel in the form of a shallow bowl on a footed stem. Also *scudella.* See *tazza*, 1.

scof, *n.* and *v.* A simplified spelling of *scoff.*

scoff, *n.* **3.** Food; "grub." [Slang.]

> Duke's son, cook's son, all of 'em want their *scoff*,
> Fifty thousand horse and foot struggling to get some grub.
> *R. Kipling*, in War's Brighter Side, xv.

scoff, *v. t.* **3.** To steal; carry off. [Slang.]

> Their storeroom is a regular theatre, sir. . . . There's enough [paint] for two first-rates, and I've *scoffed* the best half of it.
> *R. Kipling*, Judson and the Empire, in Many Inventions, p. 396.

scoggan (skog′ạn), *n.* [Also *scoggin;* origin obscure.] **1.** A vane; a weathercock. [Prov. Eng.]—**2.** A device for operating the valve of an engine, consisting of cords attached to the valve-handle and pulled by some reciprocating part of the mechanism. This device was used as a valve-gear in some of the earliest forms of steam-engine.

scoggin (skog′in), *n.* Same as ★*scoggan.*

scoleciasis (skō-lẹ-sī′ạ-sis), *n.* [NL., ‹ Gr. σκωληκίασις, the condition of being worm-eaten, ‹ σκώληξ (σκωληκ-), worm.] Same as *helminthiasis.*

scolecoiditis (skọ-lē-koi-dī′tis), *n.* [NL., ‹ Gr. σκώληξ (σκωληκ-), worm, + εἶδος, form, + *-itis.*] Inflammation of the vermiform appendix; appendicitis.

scolecology (skō-lẹ-kol′ọ-ji), *n.* [Gr. σκώληξ (σκωληκ-), worm, + -λογια, ‹ λέγειν, speak.] Same as *helminthology.*

scolecomorphic (skọ-lē-kọ-môr′fik), *a.* Relating to or resembling the *Scolecomorpha.*

Scolecosporæ (skọ-lē-kọ-spō′rē), *n. pl.* [NL., ‹ Gr. σκώληξ (σκωληκ-), worm, + σπορά, seed (spore).] A name given by Saccardo to artificial divisions of various families and orders of fungi, especially to those of the *Pyrenomycetes* and *Fungi Imperfecti*, and including the genera which have the spores rod-like or filiform.

scoliid (skō′li-id), *n.* and *a.* **I.** *n.* A member of the hymenopterous family *Scoliidæ.*

II. *a.* Having the characters of or belonging to the family *Scoliidæ.*

scoliokyphosis (skol′i-ọ-kī-fō′sis), *n.* [Gr. *σκολιός*, curved, + *κύφωσις*, humpbacked condition.] A pathological condition in which the spinal column is curved laterally as well as posteriorly.

scoliometer (skol-i-om′e-tėr), *n.* [Gr. *σκολιός*, curved, + *μέτρον*, measure.] An instrument used for measuring the amount of deformity in lateral curvature of the spine.

scolion, *n.* See *skolion.*

Scolithus (skō′li-thus), *n.* [NL., for **scolecolithus*, < Gr. *σκώληξ* (*σκωληκ-*), worm, + *λίθος*, rock.] A generic name which has been given to supposed annelid tubes or worm-casts occurring in many sandstone rocks, especially those of Cambrian age.

Scolymus (skol′i-mus), *n.* [NL. (Linnæus, 1753, adopted from Tournefort, 1700), < Gr. *σκόλυμος*, the name of *Scolymus Hispanicus.*] A genus of plants of the family *Asteraceæ.* It contains three species, natives of the Mediterranean region. *S. Hispanicus*, the Spanish oyster-plant or golden thistle, is sometimes cultivated for its edible root, which is used like that of salsify. Other species are rarely grown for ornament.

scolytid (skol′i-tid), *n.* and *a.* **I.** *n.* A member of the coleopterous family *Scolytidæ.*

II. *a.* Having the characters of or belonging to the family *Scolytidæ.*

scombriform (skom′bri-fôrm), *a.* [L. *scomber*, a tunny or mackerel, + *forma*, form.] Scombroid.

scombrin (skom′brin), *n.* [Gr. *σκόμβρος*, a tunny or mackerel, + *-in*^{2}.] A protamine found in the testicles of the mackerel.

scombron (skom′bron), *n.* [Gr. *σκόμβρος*, a tunny or mackerel, + *-on.*] A histon found in the immature testicles of the mackerel.

Scombrops (skom′brops), *n.* [NL., < Gr. *σκόμβρος*, a tunny or mackerel, + *ὤψ*, eye, face (appearance).] A genus of fishes of the family *Cheilodipteridæ*, found in rather deep water in the western Atlantic.

Scone, the stone of. See ★*stone.*

sconse, *n* and *v. t.* A simplified (restored) spelling of *sconce.*

scooner, *n.* A simplified spelling of *schooner.*

scoot^1, *v. t.* **2.** To send or impel (something) with a quick, light motion at high speed. *Automobile Topics*, May 27, 1905, p. 462. [Colloq.]

scoot^1, *n.* **3.** Same as ★*dray*^{1}, 3.

scooter^1, *n.* **3.** An oblong plow, or cultivator shovel, from under 2½ to 5 inches wide, suited to break a furrow, and thus contrasted with a *sweep* or *scrape;* also a plow-stock fitted with such a blade; a scooter plow: used to break out the middle of cotton-beds, to mix fertilizer which has been deposited in furrows, etc. [Southern U. S.]

> A *scooter*, which is merely a flat shovel four to five inches wide and about twelve inches long.
> *T. F. Hunt*, Forage and Fiber Crops in America, p. 352.

> As soon as the tobacco plants are firmly set, a "*scooter*" is run between the rows, which throws up a flat bottom furrow through which the water is directed from the troughs.
> *Dept. Com. and Labor*, Bureau of Census, Bulletin 16, [Irrig. in U. S., 1902, p. 24.

4. Same as *ice-scooter.*—**Wing scooter,** a scooter blade developed above into lateral wings.

scooter (skö′tėr), *v. i.* To sail a scooter or ice-scooter.

Scopaic (skọ-pā′ik), *a.* In the style of Scopas (born about 420 B.C.), a celebrated Greek sculptor and architect, as it is known from ancient texts and probable copies of his works. It represented strong emotions and dramatic action. The so-called Niobide of the Chiaramonte Museum in Rome may be considered a fine example of the style of the Scopaic school, followers and imitators of Scopas.

scoparius (skọ-pā′ri-us), *n.* [See *scoparious.*] The dried tops of the leguminous plant *Cytisus Scoparius;* broom; broom tops; Irish or Scotch broom. It contains the alkaloid sparteine and the glucoside scoparin, and is a heart tonic and diuretic, used in dropsy.

scopelid (skop′e-lid), *n.* Any fish of the *Myctophidæ* (*Scopelidæ*) or lantern-fishes.

scopeloid^2 (skop′e-loid), *a.* [Gr. *σκόπελος*, a high rock, + *εἶδος*, form.] In *anthrop.*, noting a cranium which has a summit on its posterior part and an occiput rapidly descending to the wide base. *G. Sergi* (trans.), Var. of the Human Species, p. 46.

scopola (skō′pọ-lạ̈), *n.* [See the def.] The dried rhizome and larger roots of *Scopolina carniolica*, incorrectly called *Japanese belladonna.* It contains practically the same constituents as *Atropa Belladonna*, and is a mydriatic, sedative, and hypnotic.

scopolamine (skop′ọ-lam-in), *n.* [*scopol(in)* + *amine.*] A difficultly crystallizable alkaloid, $C_{17}H_{21}NO_4+H_2O$, obtained from *Scopolina carniolica, S. Japonica, Duboisia myoporoides, Atropa Belladonna, Datura Stramonium*, and other plants of the *Solanaceæ:* identical with *hyoscine.* The hydrobromide is most used. It is a soporific and anesthetic.

scopoleine (skop′ọ-lẹ-in), *n.* [*scopolin.*] An ether-like compound or alkaloid produced by heating scopolin with an organic acid anhydrid; analogous with the tropeines.

scopoletin (skop′ọ-let-in), *n.* [*Scopola* (see def.) + *-et-* + *-in*^{2}.] A colorless crystalline methyl ether of esculetin, $C_9H_5O_4.CH_3$, found in the root of *Scopolina japonica* and in belladonna root, and prepared by boiling scopolin with dilute sulphuric acid. Its solution in alcohol shows a blue fluorescence. It is slightly acid and melts at 198° C. Also called *chrysatropic acid.*

scopolin (skop′ọ-lin), *n.* [*scopol(amine)* + *-in.*] A colorless crystallizable alkaloid, $C_8H_{13}NO_2$, produced by boiling scopolamine for a long time with baryta water.

scopule (skop′ụl), *n.* [L. *scopulæ*, a little broom, dim. of *scopa*, thin twigs, a broom.] In the sponge-spicules, a long straight rhabd bearing at one end a cluster of rays each ending in a bulb. It is derived from the hexactine.

scopuliferous (skop-ụ-lif′ẹ-rus), *a.* [L. *scopulæ*, a broom, + *ferre*, bear, + *-ous.*] Bearing or furnished with a scopula, as the tarsi of certain hymenopterous insects.

scorch, *v. i.* **2.** To ride very fast on a bicycle or in a motor-car. [Colloq.]

> Why go '*scorching*' along the roads? To say nothing of the danger, the blinding clouds of dust raised are in proportion to the speed attained.
> *The Grand*, Oct., 1907, p. 521.

scorcher, *n.* **3.** One who rides very fast on a bicycle or in a motor-car. [Colloq.]

scorching, *n.* **2.** Fast riding on a bicycle or in a motor-car. [Colloq.]—**3.** The injury caused to tender bark or leaves of plants by excessive heat of the sun. See ★*firing*, 7.

scordinema (skôr-di-nē′mạ̈), *n.* [NL., < Gr. *σκορδίνημα*, retching, used in the earlier sense of the verb, stretching or yawning, < *σκορδινᾶσθαι*, stretch, yawn.] Same as *pandiculation.*

score^1, *n.* **5.** (*b*) In *archery*, a record of all the shots of an archer; a record of all the shots of all the archers in a shooting-match; the sum of all the units won by an archer in a round. See ★*round*, 7 (*i*).—**Open score,** in *music*, a score in which each voice or instrument is noted on a separate staff.

score^1, *v.* **I.** *trans.* **9.** In *lumbering*, to chip off the side of a log to a line, preparatory to facing it by hewing.—**To score a century.** See ★*century*^{1}.

II. *intrans.* **1.** (*b*) Specifically, in *archery*, to keep a record of all the shots of one or several archers; make an entry on such a record. By the present method of scoring, hits in the gold, red, blue, black, and white are scored 9, 7, 5, 3, and 1 respectively. See ★*target*, 2.—**4.** In *horse-racing*, to try for a start.—**5.** To part or tend to part along the elements of the surface: said of castings which split from unequal contraction on cooling of the various parts.—**6.** In *geol.*, to erode in striæ or grooves: said of glaciers. See ★*rock-scoring.*

score-book (skōr′bu̇k), *n.* A book in which the tallies or runs in base-ball, cricket, and other games are kept.

score-card (skōr′kärd), *n.* A card which shows the position of players in base-ball, cricket, and similar sports, with spaces in which to enter the record of each player and of the game.

score-playing (skōr′plā″ing), *n.* The act, process, or result of playing upon a keyboard instrument from music noted in full vocal or orchestral score.

score-reading (skōr′rē″ding), *n.* The act or process of appreciating and interpreting music noted in full vocal or orchestral score.

score-sheet (skōr′shēt), *n.* A sheet of paper upon which a record of the tallies or runs in base-ball, cricket, and similar games is or may be written.

scoria^1, *n.*—**Thread-lace scoria,** a form of basaltic pumice so highly inflated that the rock material between the bubbles is reduced to mere threads. It is found in small quantities at Kilauea. *J. D. Dana*, Manual of Geol. (4th ed.), p. 281.

scoring, *n.*—**Glacial scoring.** See ★*glacial.*

scoring-book (skōr′ing-bu̇k), *n.* In *archery*, a book for keeping the record of the shots; a score-book.

Scorpænichthys (skôr-pẹ-nik′this), *n.* [NL., < *Scorpæna* + Gr. *ἰχθύς*, a fish.] A genus of cottoid fishes of large size, found from Puget Sound to San Diego.

Scorpiid (skôr′pi-id), *n.* [*Scorpio, Scorpius*, + *-id*^{2}.] A meteor belonging to the flock which has its radiant in the constellation Scorpio.

> In April many fine meteors diverge from Virgo and Libra, while in May there are Serpentids, *Scorpiids* and Ophiuchids. *Nature*, April 14, 1904, p. 571.

Scotch. I. *a.*—**Scotch blessing,** a stern reprimand. [Colloq.] *Dialect Notes*, III. iii. p. 198.—**Scotch feed.** See ★*feed.*

II. *n.*—**Broad Scotch.** See ★*broad.*—**Court Scotch,** the court language of Scotland while it was still a separate kingdom. *Scott.*—**Highland Scotch,** the Gaelic language of Scotland.—**Lowland Scotch,** Scotch as spoken in the Lowlands.

Scotchman^1, *n.*—**Flying Scotchman,** a fast express-train that runs between Edinburgh and London. [Colloq.]

Scotic (skō′tik), *a.* [LL. *Scoticus*, < *Scoti*, the Scots.] Of or relating to the Scots.

scotodinia (skot-ọ-din′i-ạ̈), *n.* [NL., < Gr. *σκότος*, darkness, + *δῖνος*, a whirling.] Vertigo with dimness of vision.

scotography (skọ-tog′rạ-fi), *n.* [Gr. *σκότος*, darkness, + *-γραφια*, < *γράφειν*, write.] Same as *sciagraphy.*

Scotoma auris, inability to hear a sound which comes from a certain point, the disability being determined by the direction rather than by the distance from the ear.

scotomatous (skọ-tom′ạ-tus), *a.* [*scotoma(t-)* + *-ous.*] Relating to or affected with a scotoma.

scotoscopy (skọ-tos′kọ-pi), *n.* [Gr. *σκότος*, darkness, + *σκοπεῖν*, view, + *-y*^{3}.] Same as *skiascopy.*

scototherapy (skot-ọ-thėr′ạ-pi), *n.* [Gr. *σκότος*, darkness, + *θεραπεία*, medical treatment.] The treatment of disease by absolute exclusion of light-rays, with or without the admission of the ultra-violet rays.

> He [Dr. A. F. A. King] suggested several experiments in *scoto-therapy*—keeping some patients in the dark or in rooms with purple or indigo window glass, and exposing others, nude, to brilliant sunshine.
> *Science*, Jan. 2, 1903, p. 24.

scour^1, *v.* **II.** *intrans.* **4.** To pass through the soil without the latter adhering, the blade being thus rubbed bright: said of an agricultural implement.

> In the average soil there [Eastern U. S.] the cast-iron plow would *scour* perfectly. *Amer. Encyc. Agr.*, p. 742.

scour^1, *n.* **1.** (*b*) The violent removal of sand by the wind, especially when it blows through a funnel-shaped pass or cañon.

> The sandhill was afterwards attacked by a S.W. wind, which commenced to reshape it, and this alteration at first led to the formation of notches in the crest, in which the wind became concentrated, leading to a violent *scour* and to the excavation of deep pits to leeward.
> *Nature*, Dec. 10, 1903, p. 138.

scour-and-fill (skour″ạnd-fil′), *n.* The violent removal of loose materials, such as sand and gravel, by swift currents of air or water and the deposition of the same on the slowing up of the velocity.

> In the discussion alluded to, by Professor Chamberlin, occupying thirty-four pages of the Journal of Geology, the first ten pages are occupied by an illustrated introduction and an "academic statement" of the operation of *scour-and-fill* in river bottoms.
> *Amer. Geol.*, May, 1903, p. 264.

scour-fish (skour′fish), *n.* The escolar, *Ruvettus pretiosus*, named from its rough skin.

scouring, *n.* (*g*) A veterinary term for a loose discharge from the bowels. See *scour*^{1}, *n.*, 2.

> Keep the calf a little hungry and eager for more rather than fill it to dullness. The endeavor should be to prevent the beginning of indigestion, which leads to *scouring* and perhaps fatal diarrhea.
> *Yearbook U. S. Dept. Agr.*, 1894, p. 308.

scouring-brick (skour′ing-brik), *n.* A molded mass of an abrasive or silicious earth, usually in the form of a brick, used in domestic affairs for scouring steel knives and other bright metal surfaces. Also *Bath brick* (which see, under *brick*^{2}).

scouring-cinder (skour′ing-sin″dėr), *n.* A basic slag which attacks the lining of a shaft-furnace.

scouring-machine, *n.* **2.** In *leather-manuf.*, a machine for scouring or grinding the flesh side of skins or hides by means of a cylinder fitted with stones or brushes. *C. T. Davis*, Manuf. of Leather, p. 209.

scouring-sluice (skour′ing-slös), *n.* A short flume or similar device the entrance to which is controlled by gates or valves in such a way that the water of an irrigating-ditch or -canal can be turned through the sluice to scour or wash out sediment accumulated in the ditch. *H. M. Wilson*, Irrigation Engineering, p. 216.

scouring-stone (skour′ing-stōn), *n.* A stone for scouring or rubbing the grain side of a hide. *Mod. Amer. Tanning*, p. 103.

scourway (skour′wā), *n.* In *phys. geog.*, a channel eroded by a stream; especially, a channel, now dry, made by a former glacial stream.

scourwort (skour′wėrt), *n.* The soapwort, *Saponaria officinalis.*

scouse-kettle (skous′ket″l), *n.* *Naut.*, an iron cooking-kettle.—**To man the scouse-kettle halyards,** to lift a cooking-pot off the range. The expression is also understood as an invitation to eat.

scout^1, *n.* **9.** *Naval*, a vessel employed in obtaining information concerning the positions and numbers of the enemy's fleet. See also *scout* ★*cruiser*.

scramble, *v. i.* **3.** In *bot.*, to run or climb in all directions, especially over other plants. See ★*scrambler*, 2.

scrambler, *n.* **2.** In *phytogeog.*, a liana which supports itself by resting its long, straggling branches upon other plants, sometimes, as in roses and brambles, with incidental assistance from prickles and thorns. The liana character is usually less developed in this class than in any other, but in this regard the palm lianas of the tropics are an exception. *A. F. W. Schimper.*

scrap^1, *n.* **6.** *pl.* A commercial name of crude rubber obtained from the drippings of milky juice which adhere to the bark of the tapped tree and which are peeled off when dry. See ★*rubber*^{1}, 3.—**Ceara scraps,** a trade-name for a kind of crude rubber from the state of Ceara in Brazil.—**Clean scrap,** wrought-iron scrap from which all cinder has been removed by hammering.—**Nicaragua scraps and sheets,** a trade-name for crude rubber of excellent quality, the product of *Castilloa elastica*, imported from Nicaragua.—**Scrap process.** See ★*process.*

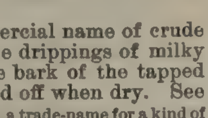
scrap^2 (skrap), *v. i.* [*scrap*^{2}, *n.*] **1.** To engage in a scrap or petty scrimmage; box. [Colloq.]—**2.** To engage in a war of words; squabble; quarrel.

scrap-basket (skrap′bȧs″ket), *n.* A basket for scraps, as of paper, etc.

scrape^1, *v.* **I.** *trans.* **5.** To scratch; draw sharply across something; "strike," as a match. *Cutcliffe Hyne*, A Master of Fortune, ix.

II. *intrans.* **6.** To remove the scrape, or concreted turpentine, from the faces of turpentined trees.—**7.** In *golf*, to drag the club slowly along the ground in the act of putting. *W. Park, Jr.*, Game of Golf, p. 217.

scrape^1, *n.* **6.** A small dredge which removes material by scraping the top; a scraper.—**7.** A plow or cultivator shovel consisting of a straight horizontal blade of steel, in use placed obliquely on the stock; a scraper. [Southern U. S.]—**Heel scrape,** a band of steel bent to a broad V-shape with the angle rounded like a heel, bolted to a light single-horse plow-stock, steadied by a full tongue blade, and used to scrape the weeds from the side of cotton beds, etc. Also *heelsweep.* [Southern U. S.]



Heel-scrape.

scraper, *n.* **1.** (*t*) In *calico-printing*, a thin steel blade that presses against the printing-roller to scrape off the color from the unengraved portions of the roller. Also called a *doctor.* *Georgievics* (trans.), Chem. Technol. Textile Fibers, p. 241. (*u*) A blade adjusted to the disk of a disk-harrow to remove adhering soil. Also *cleaner.* (*v*) Same as ★*scrape*, 6.—**Revolving scraper.** (*a*) A road scraper which turns on an axis and, in so doing, shifts or distributes the dirt. (*b*) A scraper for boiler-flues which turns on an axis as it is passed through the flue.

scraper-chaser (skrā′pėr-chā″sėr), *n.* In the transportation of petroleum by pipe-lines, a workman whose duties are to look after the go-devil (which see) when it is inserted for cleansing the pipe, and to give notice if it is arrested by a stoppage.

scraper-press (skrā′pėr-pres), *n.* An early form of lithographic press in which pressure was given to the stone by a straight edge that acted with a scraping motion.

scrap-hopper (skrap′hop″ėr), *n.* See the extract.

> As fast as the pieces of blubber are resolved into oil, the residuary fragments are transferred to a rough box called the "*scrap-hopper*" or "strainer-cooler." Its size depends upon the dimensions of the try-works, but usually it holds from 1 to 1½ pots of scrap. It consists of two compartments, the upper portion, or hopper, for the scrap and the lower part for the oil, the two separated by a wooden partition containing numerous holes, so that the oil may readily drain from the material.
> *Sci. Amer. Sup.*, March 5, 1904, p. 23551.

scraping, *n.*—**Dumb scraping,** the act of scraping a wet deck with a blunt-edged scraper.

scraping-wheel (skrā′ping-hwēl), *n.* A wheel with knives on its periphery for scraping and cleaning the surface of fiber leaves, as those of the Sisal hemp.

> The chains will then carry the leaves to the holding belts, by which they will be presented to the first *scraping wheel.* The leaves having been cleaned for the greater part of their length by the first wheel, a device placed between the two *scraping wheels* transfers the clean portion of the fiber to the second holding belt, and the remainder is cleaned by the second wheel, having no uncleaned or partially cleaned portions in the middle, as is usual in other machines.
> *U. S. Dept. Agr.*, Rep. No. 5, p. 25, note.

scrap-steel (skrap′stēl), *n.* See ★*steel*^{1}.

scratch^1, *v. t.* **6.** To treat with a scratch-brush, as in finishing metal.

> *Scratch* the silver article as bright as possible with the scratch brush and dip into the warm liquid. Remove the object after two minutes and rinse off in water. Then scratch it up again and return it into the liquid.
> *Sci. Amer. Sup.*, Jan. 24, 1903, p. 22636.

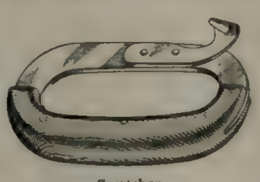
scratch^1. **I.** *n.* **5.** In *billiards :* (*b*) In handicaps, the zero starting-mark.—**9.** A 'fluke,' in any game.—**10.** In *pool*, the mark by which forfeitures are designated and tallied.—**Glacial scratches.** See ★*glacial.*—**On** or **at scratch,** in *racing* and *athletics*, in the position of having received no handicap, but obliged to give such advantage to any others who are entitled to it; at the starting-line: from the form of race in which less able contestants start at some distance in front of the real starting-line from which distances are measured, according to their handicaps, while the most competent start from the starting-line or 'scratch' on the ground.

> A dealers' handicap, in which $3,500 cars will be placed *on scratch* and the others will be allowed a certain number of seconds' start for each $100 less in price.
> *Automobile Topics*, May 27, 1905, p. 487.

II. *a.* **3.** In sports and games, so good as to be obliged to start at scratch (or give handicaps to opponents) literally or figuratively; very skilful.—**4.** Having been scratched off a list of entries, etc.: implying nothing dishonorable: as, a *scratch* colt, one which had been entered for the two year olds; a *scratch* nominee. [Colloq.]—**Scratch play,** play, as in golf or billiards, in which all the players start at scratch, or without handicap; hence, first-class play, or play of a high order of merit.—**Scratch player,** a player who starts at scratch, or without any handicap allowance.

scratch-brush (skrach′brush), *v. t.* To clean with a scratch-brush. *Electrochem. Industry*, April, 1904, p. 132.

scratcher, *n.* (*e*) An instrument for marking trees, usually a hook-like gouge fastened to a flat elliptical iron hoop with wooden handle-plates on the opposite side from the gouge. Also called *bark-blazer, cruiser's bark-blazer, tree-scribe,* and *bark-gouge.*



Scratcher.

scratch-gage (skrach′gāj), *n.* A marking-gage with a hard steel scribing-point.

scratch-man (skrach′man), *n.* In racing, athletics, and such games as billiards, one who starts at scratch, or without a handicap.

scrawl^2, *n.* **2.** In *law*, same as ★*scroll-seal.*

screamer (skrē′mėr), *n.* **4.** Specifically, in *golf*, an unusually long shot. [Slang.]—**5.** (*a*) The exclamation-point (!). (*b*) A heading in unusually bold type. [Printers' slang.]

screed, *n.* **5.** A band of paper or other material placed around a piece of cloth to keep the loose end in place, to prevent injury when cords are tied around it in packing, and for trade-mark and ornamental purposes. Generally used in sets of two. [Cloth trade.]

screen, *n.* **1.** (*d*) In *cricket*, the white canvas background placed behind the bowler to aid the batsman in seeing the ball. (*e*) In *meteor.* : (1) A shelter; something which protects from obnoxious meteorological influences but allows free action of any special influence whose intensity is to be observed. (2) Specifically, the Stevenson screen, a wooden frame or cage with louver sides 24 × 15 × 9 inches, holding thermometers, hygrometers, or evaporometers. This screen is allowable in very windy locations, but in general is objected to by meteorologists as being too small. The thermograph screen is a larger louvered cage for larger self-recording apparatus. The Weather Bureau screen is a cube of one yard or more. See *thermometer shelter.* (*f*) In *forestry*, same as ★*shade-frame.*

2. (*f*) In *paper manuf.*, a machine for sorting and separating the fine particles of the pulp from the large particles; a pulp-screen. It is made in a number of forms, some employing centrifugal force.

4. A transparent plate having ruled upon its surface lines, parallel or crossed, placed immediately in front of the sensitive plate in the manufacture of a half-tone negative, in order to break up the shadows by diffraction.—**Absorbent screen.** See ★*absorbent.*—**Aërial screen,** a transparent screen of smoke, gauze, etc., used in the production of lightning, ghosts, and similar scenic effects, with a magic lantern.—**Armored screen,** a thin vertical armor-plate in the interior of a war-ship in the vicinity of the guns, to protect them from flying splinters.—**Bunsen screen,** a photometric screen of the type devised by Robert Bunsen. It consists of a sheet of unsized paper a portion of which has been rendered translucent by soaking it in oil or paraffin. See *photometer.*—**Color-screen.** See ★*color-screen.*—**Crova's screen,** a solution composed of 22.3 grams of anhydrous ferric chlorid and 27.2 grams of nickel chlorid dissolved in 100 cubic centimeters of distilled water and used in a layer 7 millimeters thick as a screen through which to view a photometer-screen. Only light of 0.582μ, the clear yellow of the spectrum, is seen, since the iron cuts out the green and blue while the nickel cuts out the red rays. Lights of different color are thus comparable. *L. Bell*, Art of Illumination, p. 333.—**Dyed screen,** in *photog.*, a colored screen used in the orthochromatic process. *Woodbury*, Encyc. Dict. of Photog., p. 177.—**Electrostatic screen,** a conducting wall or layer, impenetrable to the lines of force of an electrostatic field and which thus serves to protect from the action of the field bodies which the wall surrounds. Thus a closed vessel of metal, however thin the walls, is a perfect electrostatic screen for objects within.—**Elster screen,** a photometer-screen for diffusing light. A two-inch cube of paraffin is divided centrally, and a sheet of metal or other substance impervious to light is inserted between the halves, which are then pressed together. The light, falling normally on the faces of the cube, is spherically diffused, and each half of the cube being illuminated from its respective light-source will present two illuminated fields from the face toward the observer, who views the screen in a sight-box. The fields will be sharply defined from each other by the thin partition. The screen is fairly sensitive. *W. M. Stine*, Photometrical Measurements, p. 41.—**Half-tone screen.** See ★*screen*, 4, and ★*half-tone.*—**Joly diffusive screen,** a photometer-screen resembling the Elster screen, consisting of a cube of paraffin centrally divided into two parallelepipeds, each 20×50×11 millimeters, which are then pressed together.—**Methven screen,** in *photom.*, a device for obtaining from an Argand gas-flame a light of standard intensity. It consists of a metal screen, with a rectangular opening, mounted in front of the flame. See ★*light standard.*—**Orthochromatic screen,** in *photog.*, a screen, as a plain yellow glass or a cell with parallel sides filled with potassium dichromate solution, placed either in front of or behind the objective of a camera, for the purpose of cutting off some of the blue and violet rays and leaving the less refrangible rays with such relative degree of intensity and of chemical actinicity as to produce a picture more correctly corresponding to the lights and shades as seen by the eye.—**Solar screen,** a small white plate or card supported a short distance before the eyepiece of a surveyor's transit to receive the image of the sun and the cross-wires of the telescope.

screening (skrē′ning), *n.* In *elect.* and *magnetism :* (*a*) The method of surrounding the apparatus inside of the screen with a shield of soft iron, so as to protect it from external magnetic influences. (*b*) The method of surrounding with a shield, cage, or netting made of good conducting material for protection against external electric forces. In large conductors carrying alternating currents, the outside part of the conductor may screen the inside so that less or no current flows in the interior, and the effective resistance of the conductor is thereby increased.

screenings, *n. pl.* **3.** The second grade of polished rice.

> One lot grown at Crowley, La., gave the following milling record in November, 1900: Eight hundred and seventy-one sacks, weighing 161,000 pounds, yielded 94,500 pounds of head rice, 9,400 pounds of *screenings*, and 3,500 pounds of brewer's rice, and the whole crop gave a profit of $3.85 per barrel of 162 pounds.
> *Yearbook U. S. Dept. Agr.*, 1900, p. 125.

screen-plate (skrēn′plāt), *n.* A brass or bronze cast plate having numerous narrow slots, used as a pulp-strainer in a pulp-screen. See ★*screen*, 2 (*f*).

screw^1, *n.* **8.** (*b*) In *Eng. billiards*, the draw shot. The movement actually is a screw, but so, in the opposite direction, is the follow shot, though it is not so named. When pocket-openings were larger it was by means of the screw, mainly, that long 'spot-ball' runs were made in England and America.—**13.** A mechanical loader for handling and lowering bales of cotton into the cargo-space of vessels. —**Capstan screw,** a large jack-screw having holes in the head in which bars may be inserted and used as levers in turning it; a capstan handscrew. It is used in raising buildings.—**Compressor screw,** a device employed on a slide gun-carriage for the purpose of increasing the friction and decreasing the recoil of the gun.—**Concave screw,** a female screw.—**Convex screw,** a male screw. Convex and concave screws are known respectively as 'male' and 'female' screws. A short, concave screw which is fitted to a convex screw is known as a *nut*.—**Hour-glass screw,** a name given to the screw in a worm-and-wheel combination in which the helix is developed upon a hyperboloid of revolution instead of on a cylinder. This enables the helix of the worm to drive the wheel by contact with several of the helical teeth on its periphery, instead of only one, as in the cylindrical type. The hyperboloidal section suggests the hour-glass. Also known as *Hindley's screw* (which see, with cut). —**Screw-slotting cutter,** a milling-cutter for making the slot in the head of a screw. It is a small disk armed on the edge with teeth. See *milling-machine* and *milling-cutter*.—**Square screw,** a screw with rectangular thread. The helix is generated by revolving a square or rectangle around a cylinder, while it moves axially in one turn through the distance of the hitch.—**Tangent screw.** (*a*) See *tangent*. (*b*) A screw placed against the edge of a disk and fitting into helical teeth formed on that edge, so that when the screw is turned a very fine angular motion of the disk results. It also acts as a clamp to prevent angular motion except when the screw is turned. It is used for index plates in gear-cutters to divide the circle into aliquot parts and on the graduated limbs and verniers of astronomical, surveying, and other instruments.

screw^1, *v. i.* **5.** In *golf*, to impart a side spin to a ball.

screw-auger, *n.* **2.** The nodding lady's-tresses, *Gyrostachis cernua*, so called from the spiral arrangement of the flowers.

screw-brake (skrö'brāk), *n.* Any brake applied by the action of a screw.

screw-conveyer (skrö'kon-vā"ėr), *n.* See ⋆*conveyer*, 4.

screw-down (skrö'doun), *n.* One who or that which adjusts the opening between the rolls in the roll-train of a rolling-mill, so that thicker or thinner material shall result from the rolling process. This adjustment of the bearings of the rolls is effected by screws which have a graduated scale and pointer by which the opening is indicated. In early forms of mill this adjustment and screwing was done by a workman; in modern mills it is done by power, either through belt-driven shafts or by an electric motor under the control of the man.

> A feature of the blooming mill is the electrical *screw-down*, which is driven by a 100-horse-power motor.
> *Sci. Amer. Supp.*, July 23, 1904, p. 23870.

screw-engine (skrö'en"jin), *n.* An engine used to drive the screw propeller of a steamer. The commonest type for this service is the vertical, inverted engine, with either compound, triple, or quadruple expansion, although horizontal and inclined engines are sometimes used, as are also single-cylinder engines and tandem engines. The steam-turbine when applied to turn a screw becomes a screw-engine.

screw-gun (skrö'gun), *n.* A gun used in mountain batteries, made to be taken apart in two sections for ease in transport, and screwed together again when in use.

> [The] mule . . . belonged to a *screw-gun* battery . . . The *screw-guns* are tidy little cannon made in two pieces that are screwed together when the time comes to use them. They are taken up mountains any where that a mule can find a road. *R. Kipling*, Her Majesty's Servants, in The Second Jungle Book, p. 202.

screw-hook (skrö'hůk), *n.* Any form of hook which is fitted with a screw.

screw-key, *n.* **2.** A socket-wrench in which the socket is formed on the end of the shank to receive the nut or head and the shank is turned by a crosspiece or T-head.—**3.** A form of adjustable wrench, or monkey-wrench, in which the movable jaw is held from slipping on the shank by a tapering wedge or key, the latter being adjustable lengthwise by a screw either on the shank or parallel to it.

screw-locket (skrö'lok"et), *n.* A locket the cover of which screws on; a dust- and moisture-proof locket which has the covers screwed on instead of hinged.

screwman (skrö'man), *n.* A stevedore who stows compressed cotton-bales in the holds of vessels by means of a device called a screw. See ⋆*screw*, 13. [Southern U. S.]

Screw-pine disease. Same as *Pandanus-*⋆*disease*.

screw-plug (skrö'plug), *n.* A design of plug upon which a thread is cut and which is screwed into the hole to be plugged. The plug is usually tapered three quarters of an inch to the foot or one in sixteen, and carries a squared end to receive a wrench by which it is screwed in to refusal.

screw-press, *n.* **2.** Same as ⋆*clay-press*.

screw-shaft (skrö'shȧft), *n.* The shaft which carries and drives a screw-propeller; a propeller-shaft.

screw-steamer (skrö'stē"mėr), *n.* A steam-vessel driven by a screw propeller. A vessel with two screws is called a *twin-screw steamer*; one with three screws, a *triple-screw steamer*.

> These spaces include the internal volume of the ship, below the deck forming the "crown" of the engine and boiler-rooms; the casings for engine-hatches, ventilation, funnels, etc., from this crown to the upper deck; and the shaft trunks in *screw-steamers*.
> *White*, Manual of Naval Arch., p. 61.

screw-stick (skrö'stik), *n.* A type-setter's composing-stick in which the adjustable knee is kept in place by a screw.

screw-tunnel (skrö'tun"el), *n.* The passage running aft through the hold of a vessel from the engine, in which are located the bearings of the propeller-shaft; a shaft-alley.

screw-turbine (skrö'tėr"bin), *n.* A device for propelling ships which consists of a propeller surrounded by a casing to which fixed guide-blades are attached. See *guide-blade* ⋆*propeller*.

> This was removed, and a *screw-turbine* 3 feet in diameter substituted. *White*, Manual of Naval Arch., p. 580.

screw-wedge (skrö'wej), *n.* A device for adjusting or taking up lost motion, in which an inclined surface, acting like a wedge, is moved forward by a screw and nut which form parts of it. *Jour. Brit. Inst. Elect. Engin.*, 1902–03, p. 411.

Screw-worm fly. See ⋆*fly*^{2}.

scribbling-card (skrib'ling-kärd), *n.* A wool-carding machine, consisting of a number of cylinders of different diameters, covered with card-clothing, revolving in opposite directions and at different speeds. *C. Vickerman*, Woollen Spinning, p. 175.

scriber, *n.* **2.** Same as ⋆*scribing-tool*, 3.

scribing-gage (skrī'bing-gāj), *n.* A recording-gage by which the record is made by means of a scribing-point moving over a graduated sheet of paper.

scribing-tool (skrī'bing-töl), *n.* **1.** Any tool by which lines can be drawn upon a piece which is to be machined or worked into shape or dimension.—**2.** A scratching-tool or point for marking the lines parallel to a plane upon a piece of work. Usually called a *marking-gage*.—**3.** A scratching-tool or point for marking lines parallel to the edges of work. Usually called a *scriber*.

Scrip. An abbreviation of *Scripture*.

scriptorial (skrip-tō'ri-al), *a.* [L. *scriptorius*, of writing, + *-al*^{1}.] Pertaining to or of the nature of writing; also, using the art of writing.

> The lower strata of *scriptorial* sculpture.
> *W. J. McGee*, in An. Rep. Bur. Amer. Ethnol., 1897–98, [p. 830.

Scrobicular circle, in the *Echinoidea* or sea-urchins, the outer limit of the scrobicule.

scrobicule (skrō'bi-kūl), *n.* [L. *scrobicula*.] Same as *scrobicula*.

scrodle (skrō'dl), *v. t.*; pret. and pp. *scrodled*, ppr. *scrodling*. [Origin obscure.] In *ceram.*, to marble or combine (differently colored clays) by wedging: as, *scrodled* ware.

scrofula-leaf (skrof'ụ-lạ̈-lēf), *n.* Same as ⋆*scrofula-weed*.

scrofula-plant (skrof'ụ-lạ̈-plant), *n.* **1.** The frostweed or Canadian rock-rose, *Helianthemum Canadense*.—**2.** The common figwort, *Scrophularia nodosa*; also the American or Maryland figwort, *S. Marylandica*.

scrofula-root (skrof'ụ-lạ̈-röt), *n.* The yellow adder's-tongue or dog-tooth violet, *Erythronium Americanum*.

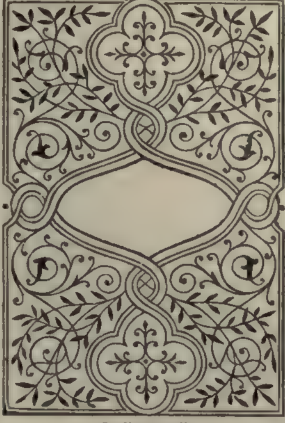
scrofula-weed (skrof'ū-lạ̈-wēd), *n.* The downy rattlesnake-plantain, *Peramium pubescens*. Also *scrofula-leaf*.

scrofulism (skrof'ụ-lizm), *n.* [*scrofula* + *-ism*.] The state of being scrofulous.

scrofuloderma (skrof"ụ-lọ-dėr'mạ̈), *n.* [NL.] Same as *scrofuloderm*.

scrofulosis (skrof-ụ-lō'sis), *n.* [NL., < *scrofula* + *-osis*.] Same as ⋆*scrofulism*.

scroll, *n.*—**Grolier scroll,** the flowing curved lines that surround and interlace the geometrical framework of a design for a book-cover in the style of Grolier.—**Quintic scroll,** in *geom.*, a non-developable ruled surface of the fifth degree.—**Tympanic scroll,** the tympanic bone.



Grolier Scroll.

scroll-band (skrōl'band), *n.* A rope or band that runs on a scroll in a spinning-mule, for operating the spindle-carriage. *Nasmith*, Cotton Spinning, p. 275.

scroll-finis (skrōl'fī"nis), *n.* A decorative design, in the form of a scroll, inclosing the word 'Finis' at the end of a book.

scroll-pick (skrōl'pik), *n.* A form of shuttle-picking motion in a loom, in which a disk with a scroll is used: a picking-scroll. *T. W. Fox*, Mechanism of Weaving, p. 309.

scroll-plate (skrōl'plāt), *n.* In *exper. psychol.*, an apparatus used to test steadiness of motor coördination. A glass plate is covered with a sheet of tin-foil, in which a narrow and complicated scroll pattern has been cut. The subject is given a tracing needle, and is required to follow out the pattern without touching the tin-foil. Electrical connections are so made that, for instance, a bell rings every time that the needle leaves the middle of the slit and comes into contact with its edge. *W. C. Bagley*, in Amer. Jour. Psychol., XII. 196.

scroll-seal (skrōl'sēl), *n.* Any flourish or scroll used in place of a seal: generally inclosing the letters L. S. or the word "seal."

scroll-shaft (skrōl'shȧft), *n.* A shaft on which band-scrolls are fixed in a spinning-mule. *Nasmith*, Cotton Spinning, p. 274.

scroll-tappet (skrōl'tap"et), *n.* A form of shedding-motion for operating the warp-threads in a loom, in the manufacture of fabrics which require a small number of harnesses. *T. W. Fox*, Mechanism of Weaving, p. 60.

scroll-wheel, *n.* **2.** A form of turbine water-wheel, in which the passages for the water and the buckets have a shape approximating that of a spiral or scroll.

scrowge, *v. t.* Same as *scrouge*.

> See 'em [the fishing fleet] comin' up one by one, lookin' fer nothin' in particular, o' course, but *scrowgin'* on us all the time? *R. Kipling*, Captains Courageous, iii.

scrub^1, *n.*—**Horizontal scrub.** See ⋆*horizontal*, *n.*, 2.

scrub-dangler (skrub'dang"glėr), *n.* In Australia, a wild bullock. *E. E. Morris*, Austral English.

> He is one of those infernal *scrub-danglers* from the Lachlan, come across to get a feed.
> *Rolf Boldrewood*, Colonial Reformer, xvi, quoted in E. [E. Morris, Austral English.

scrub-fowl (skrub'foul), *n.* The Australian mound-builder or scrub-hen.

scrub-hen (skrub'hen), *n.* A general name for the Australian mound-builders, or megapodes, which dwell in the thick underbrush or scrub.

scrub-vine (skrub'vīn), *n.* In Australia, same as ⋆*bauera*, 2.

scrub-wren (skrub'ren), *n.* One of several small passerine birds, of the genus *Sericornis*, belonging to the family *Lusciniidæ*, common in parts of Australia.

scruff^4 (skruf), *v. i.* [A variant of *scuff*^{1}, *v.*] In *golf*, to raze the grass slightly in striking.

scrum-pox (skrum'poks), *n.* An acneiform skin-disease acquired by infection: common in foot-ball players by reason of the frequent scratches on the skin and the intimate contact of the players.

scrutator, *n.* **2.** In *old Eng. law*, a bailiff appointed to protect the king's water-rights, as flotsam, jetsam, and wrecks; also, a public officer with like duties.

scrutch (skruch), *n.* [Origin obscure.] A trade-name of the residue obtained in the boiling part of the process of glue-making. It has a highly offensive odor.

As in the other processes employed for the utilization of all animal waste matter, the nuisance [of glue-making] comes from the decomposing material, from the odors given out during boiling, etc., and from the offensive residue or "*scrutch.*" *Buck*, Med. Handbook, VI. 332.

scrutinant (skrö'ti-nant), *a.* Scrutinizing; closely examining. *Stand. Dict.*

I would fain please you, and myself with you; and live here in my Venetian palace, luxurious; *scrutinant* of dome, cloud, and cockle-shell.
Ruskin, Fors Clavigera, VI. 245.

scry^1, *v. t.* **II.** *intrans.* To divine, or to attempt divination, by crystal-gazing; induce hypnagogic illusions by gazing into a glass or crystal sphere or some equivalent medium.

The practice of '*scrying*,' 'peeping,' or 'crystal gazing, has been revived in recent years.
A. Lang, Cock Lane and Common-sense, p. 212.

scryer (skrī'ėr), *n.* [*scry*^{1} + *-er*^{1}.] A crystal-seer.

As far as the '*scryer*' knows, however, her pictures of places and people are not revivals of memory.
A. Lang, Cock Lane and Common-sense, p. 218.

S. Cu. An abbreviation of *strato-cumulus.*

scud, *n.* **8.** Dirt, lime, and fat left in the grain of a skin after it comes from the puer. *C. T. Davis*, Manuf. of Leather, p. 161.

Scudder's blue. See ⋆*blue.*

scudding (skud'ing), *n.* In *leather-manuf.*, the process of removing scud by scraping with a knife. See ⋆*scud*, 8. *Sadtler*, Handbook of Indust. Chem., p. 329.

scudella (skö-del'ä), *n.* Same as ⋆*scodella.*

scuff^1 (skuf), *n.* [*scuff*^{1}, *v.*] A light shoe or slipper. [Local, U. S.]

scuffle^2 (skuf'l), *v. i.* [*scuffle*, *n.*] To use a scuffle or thrust-hoe. *Encyc. Dict.*

scul, *n.* and *v.* A simplified spelling of *scull.*

Sculda (skul'dä), *n.* [NL.] A genus of stomatopod *Crustacea* with highly ornate cephalothorax, three exposed thoracic segments, an elongate abdomen, and a semicircular telson. It is one of the few extinct representatives of the *Stomatopoda*, and occurs in three species in the Jurassic Lithographic limestones of Bavaria.

scull^2, *v. i.* **3.** In *skating*, to move forward or back without lifting the blades from the ice.

sculled, *a.* See ⋆*skulled.*

sculp., sculpt. Abbreviations (*a*) of the Latin *sculpsit*, he (or she) engraved or carved (it): also *sc.* and *sculps.*; (*b*) of *sculptor*; (*c*) of *sculptural*; (*d*) of *sculpture.*

sculpin, *n.*—**Arctic sculpin,** *Myoxocephalus scorpioides*, found in the arctic regions of America.—**Black sculpin,** *Myoxocephalus niger*, found in Bering Sea.—**European sculpin,** *Myoxocephalus scorpius*, of the northern Atlantic.—**Great sculpin,** *Myoxocephalus polyacanthocephalus*, known from Alaska to Kamchatka.—**Long-spined sculpin,** *Myoxocephalus octodecimspinosus*, found from Labrador south to Virginia.—**Red sculpin,** *Hemilepidotus hemilepidotus*, known from Kamchatka to San Francisco.—**Spineless sculpin,** a fish of the genus *Psychrolutes.*—**Stone sculpin,** a fish of the genus *Enophrys.*

sculps. See *sculpsit.*

sculptograph (skulp'tọ̄-gråf), *n.* [L. *sculptus*, pp. of *sculpere*, carve, engrave, + Gr. *γράφειν*, write.] A kind of photograph presenting figures in relief.

sculptor, *n.* **2.** [*cap.*] In *astron.*, an abbreviated name now generally used for the constellation Apparatus or Officina Sculptoris ('the sculptor's shop'), a modern constellation between Cetus and Phœnix, with no conspicuous stars.

sculpture, *n.* **1.** Sculpture is the expression of human thought and emotion in solid form, that is, in the three dimensions of space, length, breadth, and thickness. Sculpture may be created by carving, which is the removal of superfluous material, or by the addition of needed material, called modeling. Any material may be used for sculpture, if it is sufficiently permanent and valuable. A piece of sculpture appeals to the sense of sight solely by its light and shade,—that is, some portions receive more light and some less than others, which is equivalent to greater and less luminosity of the material. The color of the material, either natural or artificial, has therefore great importance. Until quite recently, and even now in the less sophisticated portions of the world, it has been the custom to enhance the value of sculpture by artificial color. If a work in sculpture gives to all three dimensions of space their full value, it is said to be "in the round"; if only length and breadth are completely expressed, and thickness or depth is abridged, it is said to be "in relief." According to the degree of this abridgment relief is said to be low, medium, or high (basso, mezzo, alto relievo). Historically, sculpture first appeared as decoration, in an attempt of the primitive artist to break up vacant spaces in an interesting way. At this stage it may express simple ornament or an extremely conventional representation of some familiar object. Primitive sculpture is usually in low relief. It may also be in the round, as in a totem pole, club, or paddle. In the recorded historical sequence sculpture first appeared in Egypt and attained its greatest perfection during the early or Memphitic dynasties. In the individual statues of this period there is an interesting realism, and sometimes, as in the colossal statue of the Sphinx, great monumental dignity. As Egyptian history advanced, individual statues became more and more formal and conventional, although always dignified. Throughout Egyptian work great use is made of the lowest forms of bas-relief. Sometimes it is cut below the general surface of the stone—the so-called 'sunken relief.' The areas of relief-work were always colored: the carving was little more than a definite way of drawing in the outlines of pictorial compositions. The style of Egyptian sculpture harmonizes with the architecture to which it is attached. The proportions of the human form are elegant, if monotonous. Animal life is represented with great realism. The sculpture of the nations which came under the influence of Egypt follows, in the main, the principles elaborated in the older country, that of Assyria, however, showing powerful local characteristics. The work of Persians, Phenicians, Cypriotes, and the peoples of Asia Minor expresses various degrees of degeneration. In the Mycenæan or prehistoric civilization of Greece, which corresponds roughly with the latter part of the middle or Theban period in Egypt, sculpture plays an important part and suggests slightly Egyptian influences. Hellenic brilliancy and power are, however, distinctly felt and occasionally individual genius of great distinction. The Lion gate of Mycenæ, certain figures found in Crete, and especially the gold cups of Vaphio have seldom been equaled in any period of art. The epoch of the so-called Dorian invasion, which is interposed between the Mycenæan and historic eras of Hellenic civilization, is barren of sculpture. Its reappearance in the latter part of the sixth century in Asia Minor, the islands of the Ægean, and at Delphi and Athens is marked by tentative qualities, occasionally picturesque and pleasing, as in the so-called pre-Persian statues of the Acropolis; or bold and virile, as in the decorations of the Treasury of the Cnidians at Delphi. The successful resistance to the Persian invasion in 490 and 480 B.C. seems to have revealed to the Greeks themselves the value of their system of athletic training. The perfect athlete and fighting man became a center of interest to the entire people and as such properly the chief preoccupation of the sculptors. From nude figures at rest and in action they evolved the type or "ideal" which has become definitely established. The Greek "ideal" is above all a matter of proportion—the relation of the length of the entire figure and of its several parts to their widths and masses. During the two centuries in which Greek sculpture enjoyed its highest development the proportions of the type varied. In the middle fifth century the heavy-armed soldier with large head and broad shoulders predominated, and was embodied in the so-called canon of Polycletus which is supposed to appear in the Doryphorus of the Naples Museum. In the middle fourth century the athlete predominated—tall, with small head and long limbs—as in the work of Lysippus, which is probably represented by the Apoxyomenus of the Vatican. Aside from its formal perfection Greek sculpture reflects in its spiritual qualities the extraordinary intellectual activity of the society which surrounded it. Its highest expression, in both a formal and a spiritual way, was found in the work of Phidias, which is doubtless represented by the recovered decorations of the Parthenon, most of which are in the British Museum. The emotional qualities predominated over the formal in the work of Scopas, and in the later schools of Pergamum and Rhodes dramatic action was carried to exaggeration. The actual work of the true Greek period has for the most part disappeared. What remains in modern museums is chiefly imitation dating from the Roman period. The original work of the Roman period has great interest. It is mainly decorative, attached to triumphal arches, columns, and the like, in Italy, France, and eastern countries. The Byzantine and Romanesque styles of sculpture are derived from the true Roman period by a process of degeneration. The influence of the Roman model became less and less dominant, and a decreasing interest in nature allowed the work to become more and more decorative. As decorative sculpture, in its entire subordination to dominating architectural conditions, the Byzantine and Romanesque work of Italy and France from the ninth to the twelfth centuries has not been surpassed. The most characteristic examples are the great portals of the church at Saint-Gilles and the church of Saint Trophinus at Arles. The three portals of the Cathedral of Chartres are quite similar to these, although they belong to the period of transition from the Romanesque to Gothic. During the Gothic period, the thirteenth and fourteenth centuries, the greatest activity in sculpture is associated with the construction of the leading cathedrals of France. The amount of work produced at this moment is enormous. It is thoroughly architectonic and decorative, but at the same time emotional, sometimes intensely so, and always shows a simple and keen appreciation of nature. The subject matter is mainly religious. The purpose of the work was the instruction of a public which could not read the few books which then existed. The Bible of the people was carved upon the stones of their buildings. In the latter part of the fourteenth and early fifteenth century, at the moment of birth of independent painting, French sculpture became intensely personal. The leading school was associated with the court of the dukes of Burgundy and the most noted sculptor was Claux Sluter, author of the "Puits de Moise" at Dijon. Until the thirteenth century, sculpture in Italy did not differ from the earlier Byzantine types. In the reign of the Emperor Frederick II. (1215–1250), there occurred a revival of interest in ancient art which found expression especially in the works of Niccola Pisano (or Niccolo d'Apulia), who studied directly from antique monuments. His son Giovanni Pisano, and their successor Andrea Pisano, returned to French sources of inspiration. French influence is dominant until the middle of the fifteenth century. Donatello (1386–1466), the leading sculptor of the cinquecento in Florence, was really much more a product of Gothic than of classic influences. The successors of Donatello in Tuscany, which during the early Renaissance is the chief seat of sculpture in Italy and in Europe, returned to classic sources of inspiration with an intensity of refinement similar to that expressed in the painting of the period. The works of Desiderio da Settignano (1428–1464), Antonio Rossellino (1427–1497), Mino da Fiesole (1431–1484), Benedetto da Majano (1442–1497), and the Della Robbias may especially be noted, although the body of production of works of this class is very large. The work of the fifteenth century, or quattro-cento, is largely confined to bas-relief. Toward the end of the century the sculptors Andrea (1460–1529) and Jacopo Sansovino (1479–1570) began to realize the importance of the proportion and structure of the individual Greek statues. This study of superior qualities was carried to a high point of exaltation by Michelangelo (1475–1564), always dominated by a temperament of extraordinary virility and the example of his predecessor Donatello. Michelangelo's interest was attracted mainly by the structural and emotional qualities of ancient art. His successors of the baroque period followed his example and produced a body of work which is, for the most part, degenerate, but occasionally shows great picturesqueness and power. The chief masters are John of Bologna (1530–1608), Benvenuto Cellini (1500–1571), Ammanati (1511–1592), and Bernini (1598–1680). The principles of the early Renaissance in Italy were carried across the boundary to France, Germany, Flanders, and Spain, and in each country acquired national characteristics. In France the period reached its highest attainment in the reign of Henry II. (1547–1559) in the sculptors Jean Goujon (1515–1568(?)), Germain Pilon (1535–1590), and their contemporaries. In the seventeenth and eighteenth centuries sculpture in France was dominated by the baroque influences of Italy, and especially by the work of Bernini. The translated style, however, acquires much elegance and refinement in French hands. The work of the period is best shown in the decoration of the palace and park of Versailles. Since the establishment of the French Academy in 1648, and especially since the foundation of its successor, the École des Beaux Arts, at the beginning of the nineteenth century the center of interest of the world's sculpture has been in Paris. The training of the modern French school has been based on thorough study of classic examples enriched by traditions derived from every other school. During the nineteenth century there was a succession of first-class masters in France: David d'Angers (1789–1856), Rude (1784–1855), Carpeaux (1827–1875), Rodin (1840–), and others. The sculpture of Europe outside of France, and of America, was much influenced by the formal classic tendencies of the critic Winckelmann (1717–1768) and the sculptor Canova (1757–1822). In Germany especially, appeared a school of sculptors who based their endeavor on a careful reproduction of classic formalism. The German sculptors of the more modern period have, however, followed generally the traditions of the French school. Practically the same may be said of modern sculpture in the smaller continental countries, England, and America. Sculpture in the United States was at first entirely provincial, being confined mainly to portraiture. Since the Civil War, the traditions of the French school have been dominant in this country. Among leading American sculptors may be mentioned Hiram Powers (1805–1873), Thomas Ball (1819–), William Rimmer (1816–1879), Augustus Saint-Gaudens (1848–1907), Daniel C. French (1850–), and Frederick MacMonnies (1863–). It is probable that the original impulse toward sculpture in the Orient came from Greek colonists and invaders. The Greek characteristics were, however, soon replaced by national and local qualities. In India, China, and Japan interest has centered on picturesque qualities. Much attention has been given to fine materials, such as jade, ivory, and bronze, and brilliancy and piquancy of style.

5. In *phys. geog.*, the change of land-forms by natural erosive processes.—**Pisan school of sculpture.** See ⋆*school.*

sculpture, *v. t.* **3.** In *phys. geog.*, to change the forms of (the land) by natural erosive processes.

sculpture-cast (skulp'ṭụ̈r-kåst), *n.* See ⋆*cast*^{1}, 14.

sculpture-gallery (skulp'ṭụ̈r-gal″ẹ-ri), *n.* A hall or large room for the exhibition of pieces of sculpture. It differs from the picture-gallery in being usually lighted from the sides, near the top, for skylights are less suitable.

sculpturing-machine (skulp'ṭụ̈r-ing-mạ̈-shēn″), *n.* A carving-machine; a profiling-machine for carving figures in marble, etc., from a model or from life.

scum-cock (skum'kok), *n.* A valve and its pipe-connections in a steam-boiler, by which scum floating on the surface of the water in the boiler may be blown off and the boiler cleansed without loss of pressure. The deposit from waters carrying magnesia in solution is light enough to float, and as it thickens the disengagement of steam-gas from the water-surface is impeded: as the gas bursts through the scum, it carries water with it, causing water to be entrained into the cylinders and producing the phenomenon known as 'priming' or 'foaming.' Since the water-surface is not at a fixed height and changes as the surface-water and scum are blown off, the scum-pipe has to have a flaring or trumpet mouth inside the boiler. There are often several of these scum blow-offs when the boiler is long, at different points in its length. In short boilers the flaring mouth can sometimes be turned, from outside the shell, so as to point in different directions. *W. S. Hutton*, Steam Boiler Construction, p. 490.

scummer, *n.* **2.** Same as ⋆*scum-cock.*

scum-pipe (skum'pīp), *n.* See ⋆*scum-cock.*

scupper-shoots (skup'ėr-shötz), *n. pl.* Tubes which carry overboard the water from the spar-deck.

scupper-shutters (skup′ėr-shut″ėrz), *n. pl.* Narrow horizontal lengths of board, or metal, which hang on hinges and cover the scupper holes or scupper openings on the upper deck. These scupper-shutters open outward to the pressure of water on the deck.

scup-seat (skup′sēt), *n.* A boatswain's chair; the wooden seat on which a sailor sits while working aloft where he can obtain no foothold.

scurf¹, *n.* **4.** A fungous disease of potatoes, due to *Rhizoctonia Solani*, which gives the tubers a scurfy appearance and is accompanied by decay.— **Retort scurf.** Same as *gas-carbon* (which see, under *carbon*).

scurfy-pea (skėr′fi-pē), *n.* A general name of plants of the genus *Psoralea*, which are scurfy with glandular dots: applied especially to *P. tenuiflora* and *P. floribunda*, in which this feature is most marked.

scurge, *n.* and *v.* **2.** A simplified spelling of *scourge*.

S-curve (es′kėrv), *n.* A curve shaped like the capital letter S.

scurvied (skėr′vid), *a.* [*scurvy*² + *-ed*².] Affected with scurvy; scorbutic.

scurvish (skėr′vish), *n.* The evening-primrose, *Œnothera biennis*.

scurvy², *n.* **2.** The black mustard, *Brassica nigra*.— **Infantile scurvy** or **scorbutus**, a form of scurvy which affects bottle-fed infants, due to improper food.

Scutata (skū-tā′tạ̈), *n. pl.* [NL., neut. pl. of *scutatus*, scutate.] A group of heteropterous insects of the gymnocerate series, having the scutellum very large, often covering the whole of the wings and abdomen. It corresponds to the family *Pentatomidæ* taken in a broad sense, or rather with a superfamily *Pentatomoidea*, and includes a number of families and more than 4,000 species.

scute¹, *n.* **4.** In *anat.*, a semilunar plate of bone forming the outer portion of the roof of the tympanum of the ear. Also called *scutum tympanicum*. *Buck*, Med. Handbook, III. 622.

Scutella limestone. See *Becraft* ★*limestone*.

scutellarin (skū-tel′ạ̈-rin), *n.* [*Scutellaria* + *-in*².] A yellow crystalline substance, $C_{10}H_8O_3$, found in the root of the mad-dog skullcap, *Scutellaria lateriflora*. It melts at 199° C. and is used in cases of chorea and insomnia.

scutellerid (skū-tel′ẹ-rid), *n.* and *a.* **I.** *n.* A member of the heteropterous family *Scutelleridæ*.

II. *a.* Having the characters of or belonging to the family *Scutelleridæ*.

scuttle², *n.*— **Magazine-scuttle**, the scuttleway in the magazine-passage of a warship through which the charges are passed.

scutular (skū′tụ̄-lạr), *a.* [*scutul*(*um*) + *-ar*³.] Relating to or of the nature of a favus-cup.

scutum, *n.* **5.** In *bot.*, the broad expansion of the style in plants of the milkweed family, especially in *Stapelia*.

scydmænid (sid-mē′nid), *n.* and *a.* **I.** *n.* A member of the coleopterous family *Scydmænidæ*.

II. *a.* Having the characters of or belonging to the family *Scydmænidæ*.

scyllite (sil′īt), *n.* [Gr. *σκύλλος*, a young dog (*σκύλιον*, a dogfish), + *-ite*².] A crystalline hexose found in the kidneys and livers of sharks, skates, etc. It has a slightly sweetish taste and does not reduce Fehling's solution.

scyphomancy (sī′fọ̄-man-si), *n.* [Gr. *σκύφος*, cup, + *μαντεία*, divination.] An old form of divination in which a cup was used.

scyphopolyp (sī-fọ̄-pol′ip), *n.* [Gr. *σκύφος*, cup, + E. *polyp*.] A scyphistoma.

scyphos (sī′fos), *n.* Same as *scyphus*.

scyphula (sif′ụ̄-lạ̈), *n.*; pl. *scyphulæ* (-lē). [NL. fem., after LL. *scyphulus*, masc. dim. of *scyphus*, ‹ Gr. *σκύφος*, a cup.] The fixed larval stage of an acraspedote medusa; the scyphistoma.

Scytalichthys (sit-ạ-lik′this), *n.* [NL., ‹ Gr. *σκυτάλη*, a staff, a serpent, + *ἰχθύς*, a fish.] A genus of eels of the family *Ophichthyidæ*, found near Cape San Lucas, Mexico.

Scytalinidæ (sit-ạ-lin′i-dē), *n. pl.* [NL., ‹ *Scytalina* + *-idæ*.] A family of ophidioid fishes found in the northern Pacific.

scythe, *v.* **II.** *intrans.* To make a curving movement like that of a scythe, in mowing. [Rare.]

> He . . . felt the keel answer to his hand on the spokes and slide over the long hollows as the foresail *scythed* back and forth against the blue sky.
>
> *R. Kipling*, Captains Courageous, v.

Scythian, *a.* **3.** In *geol.*, noting the lowest series of the Triassic system in the Mediterranean basin, comprising the Brahmanian and Jakutian stages.— **Scythian disease.** See ★*disease*.

scythropasmus (sith-rọ̄-paz′mus), *n.* [NL., ‹ Gr. *σκυθρωπασμός*, sadness of countenance.] An expression of dullness or fatigue sometimes observed in severe illnesses.

S. D. An abbreviation (*a*) of the Latin *Scientiæ Doctor*, Doctor of Science; (*b*) of the Latin *salutem dicet*, (he or she) sends greeting; (*c*) of *Senior Deacon*; (*d*) [*l. c.*] of the Latin *sine die*, without day.

S. Dak. An abbreviation of *South Dakota*.

sdegnoso (sdān-yō′sọ̄), *a.* [It. See *disdainous*.] In *music*, showing scorn or indignation: indicating passages to be so rendered.

S. D. M. In *astron.*, an abbreviation for *Southern Durchmusterung*. *S. B. D.* is sometimes used. See ★*Durchmusterung*.

S. D. U. K. An abbreviation of *Society for the Diffusion for Useful Knowledge*.

S-dump (es′dump), *n.* A chute curved or bent so that it somewhat resembles the letter S.

S. E. An abbreviation (*c*) of *Southeastern* (Postal District, London); (*d*) of *Sanitary Engineer*.

sea¹, *n.*— **Cockling sea**, waves which possess short and quick motions and tumble against one another; waves which have no common direction or translation, but dash against each other in an irregular way.— **Command of the sea**, the condition of maritime warfare in which one of the states or allies engaged is able to prevent or to control offensive movements of the enemy's vessels and to have its own vessels secure from serious molestation, owing to its greatly superior naval strength compared to that of the enemy.

> *Command of the sea*, is a technical term of naval warfare, and indicates a definite strategical condition. The term has been substituted sometimes for the much older "Dominion of the sea" or "Sovereignty of the sea," a legal term expressing a claim, if not a right. It has also been sometimes treated as though it were identical with the rhetorical expression, "Empire of the sea." Mahan, instead of it, uses the term "Control of the sea," which has the merit of precision. *Encyc. Brit.*, XXXII. 483.

Full sea, an old term for high tide.— **Hollow sea**, a curling sea resembling breakers on a shore; a short, deep sea.— **Moderate sea**, a comparatively light-running sea, or a sea neither smooth nor rough. See *log-book* ★*scale*.— **Open sea**, in *law*, all the sea except the mare clausum (which see).— **Quartering sea**, a sea that strikes the ship's quarter, or one whose first impact is against that part of the ship which is under the counter—45° abaft the beam.— **Sea attorney**, a name given to the brown shark; another title for a sea-lawyer.— **To keep the sea.** See ★*keep*.

sea-angler (sē′ang″glėr), *n.* One who fishes in the deep sea.

> The British *Sea-Anglers'* Society, which soon numbered very nearly a thousand members.
>
> *Encyc. Brit.*, XXXII. 485.

sea-bass, *n.*— **Gulf sea-bass**, *Centropristes ocyurus*, a serranoid fish found in the Gulf of Mexico.— **Rock sea-bass**, a common name of *Centropristes philadelphicus*, a serranoid fish found off the coast of South Carolina.

sea-beef (sē′bēf), *n.* The flesh of the porpoise or the whale.

sea-bent, *n.* **2.** Same as *sea-sedge*, 2.

sea-blackberry (sē′blak″ber-i), *n.* A name in the West Indies for a shrubby, fleshy seaside plant, *Lobelia Plumerii*, bearing fruits resembling blackberries. *Science*, Jan. 29, 1904, p. 167.

sea-bladder (sē′blad″ėr), *n.* The Portuguese man-of-war, *Physalia pelagica*.

sea-board² (sē′bōrd), *n.* [*sea* + *board*, *n.*] *Naval*, a board laid out in squares representing a fixed distance, upon which models of vessels made to the same scale as the squares on the board can be manœuvered in playing a naval tactical war game.

> When the hostile forces approach within sighting distance, the models of the ships are transferred to the large checkerboard, which is known as the "*seaboard.*"
>
> *Sci. Amer.*, Dec. 27, 1902, p. 458.

sea-bread (sē′bred), *n.* A silicious sponge, *Halichondria panicea*, of porous structure.

sea-brent (sē′brent), *n.* The goose-barnacle. [Local, North Carolina.]

sea-bug, *n.* **2.** Same as ★*ocean-bug*.

sea-builder (sē′bil″dėr), *n.* In England, a name given to a constructor of lighthouses. In many lighthouses the foundations are entirely beneath the sea and caisson building and other engineering problems, involving the strength of the structure to resist the shock of heavy seas, require the highest class of technical knowledge and judgment on the subject.

> The new lighthouse off Beachy Head, on the English Channel, is now completed. . . . It . . . represents the latest example of the *sea-builder's* skill, as the engineers who build these structures are called.
>
> *Sci. Amer.*, Nov. 29, 1902, p. 358.

sea-chest (sē′chest), *n.* In *ship-building*, a short open pipe extending from the outside plating to the interior just inside the inner bottom, the inner end of which is closed by a sea-valve placed in a position accessible from the interior of the vessel.

sea-cliff (sē′klif), *n.* A cliff facing the sea, usually formed by the erosive action of waves at its base. *Chamberlin and Salisbury*, Geol., I. 331.

sea-coal, *n.* **2.** Soft or flaming bituminous coal: so named to distinguish it from the anthracites.

sea-cow, *n.* **5.** The sea-cucumber, *Holothuria nigra*. [West of England.]

sea-cuckoo (sē′ku̇k″ö), *n.* The red gurnard, *Trigla cuculus*.

sea-devil, *n.* (*f*) Any one of the great rays of the family *Mantidæ*, sometimes reaching a breadth of over 20 feet. They inhabit tropical seas. (*g*) A fish of the family *Ceratidæ*, inhabiting the open seas.

sea-dog, *n.* **6.** In *meteor.*, the solar halo seen in the mist and fog near the surface of the sea opposite the sun.

sea-dove, *n.* **2.** In *ichth.*, a name sometimes given to the puffers.

sea-dragon, *n.* **3.** An Australian fish which belongs to any one of the species of the genus *Phyllopteryx*, of the family *Syngnathidæ*. *E. E. Morris*, Austral English.

sea-drum (sē′drum), *n.* A name given to different sciænoid fishes, but particularly to those of the genus *Pogonias*. *Jordan and Evermann*, Amer. Food and Game Fishes, p. 466.

sea-dust (sē′dust), *n.* In *geol.*, dust of deserts borne away by the wind and descending at a long distance in the form of 'red fog' or 'sirocco-dust.' It is usually of brick-red color, and when descending with rain occasions the so-called 'blood-rain.' *Geikie*, Text-book of Geol., p. 444.

sea-edge (sē′ej), *n.* A name applied by arctic navigators to the bounding-line between the frozen and the open sea.

sea-eel, *n.* **2.** Same as *silver* ★*eel* (*a*).

sea-endive (sē′en″div), *n.* See ★*endive*.

sea-frog (sē′frog), *n.* The angler, *Lophius piscatorious*.

sea-gall (sē′gâl), *n.* A jellyfish, as *Aurelia*.

sea-galliwasp (sē′gal″i-wosp), *n.* Same as *ten-pounder*, 3.

sea-gate (sē′gāt), *n.* The entrance from the sea into a harbor; the approach by sea to a city.

> May such ships of the future ever again enter the Port of London? If with a great bar with locks at Gravesend, yes, . . . but without it, then good-bye to London as a seaport of the world, and good-bye to Gravesend as the *sea-gate* key. *N. and Q.*, 10th ser., III. 136.

sea-going, *a.* **II.** *n.* A seafaring life.

> *Seagoin'* is all right . . . but . . . it 's a dreadful hard life. Boy on a schooner, even with the Cap'n here, ain't much of a place. *J. C. Lincoln*, Partners of the Tide, v.

sea-grape, *n.* **5.** The salt-grape (which see, under ★*grape*¹).

sea-grass, *n.* **3.** In *phytogeog.*, a marine vegetation, or one of the plants composing it, which roots in loose soil under shallow water and sends up long floating leaves or stems; an enalid. Algæ (*Caulerpa* and *Characeæ*) are included under this term, phanerogams (*Potamogetonaceæ* and *Vallisneriaceæ*, including *Enhalus*) predominating. Compare ★*benthos*.— **Iceland sea-grass**, the green algæ belonging to the genera *Ulva* and *Enteromorpha*.

sea-grocer† (sē′grō-sėr), *n.* A ship's purser.

sea-hay (sē′hā), *n.* The eel-grass, *Zostera marina*.

sea-horizon (sē′họ̄-rī″zọn), *n.* The circle which bounds the view of the observer at sea.

sea-horse, *n.*— **Common American sea-horse**, *Hippocampus hudsonius*, a fish found on the Atlantic coast of the United States.

Sea-island bale. See ★*bale*³.

seal¹, *n.* **3.** Sealskin; leather made from the skin of the seal.— **Bachelor seal**, a fur-seal, *Callorhinus ursinus*, from two to five or six years old: so named because the younger seals cannot enter the breeding-grounds, or rookeries, but herd by themselves on certain well-defined localities or 'hauling-grounds.' The larger bachelors are the 'half-bulls.' Also *holostiak*.

> All the male seals, from six years of age, are compelled to herd apart. . . . This class of seals is termed "holluschickie" or the "*bachelor*" *seals* by the people, a most fitting and expressive appellation.
>
> *H. W. Elliott*, Fur-seal Islands of Alaska, p. 43.

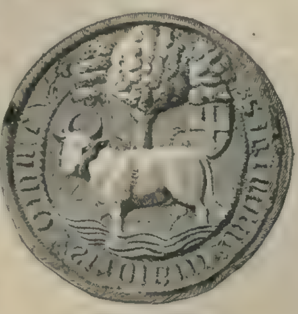
Caribbean seal, *Monachus tropicalis*, a large hair-seal, of a dark brown color, reaching a length of seven feet. It inhabits the shores of some of the West Indian islands, was discovered by Columbus, and is now nearly extinct.

Its nearest relative occurs in the Mediterranean.—**Native seal**, a Newfoundland name for the common or harbor-seal, *Phoca vitulina*, given because the animal is a resident species and not a spring or winter visitor. See *seal*1, 1.

seal2, *n.* 12. The amount of lap over the edge of an opening by which a lid or valve projects to make a tight joint and prevent leakage past it.—**Corporate seal**, the seal of a corporation, which renders valid and binding contracts and documents executed by it. In most jurisdictions a corporation is now held to any contract not sealed that would be valid unsealed between persons. See *common seal*, under *common*.—**French seal**, leather which has been embossed or printed with a small round or star-shaped figure, called a *seal-figure*.—**Riddle-seal**, a seal which contains a rebus, riddle, or other descriptive device.—**Seal days**1. See ★*day*1.

seal-figure (sēl′ fig″ ụ̄r), *n.* See *French* ★*seal*.

seal-grain (sēl′grān), *n.* Grain-leather with a seal pattern stamped or printed on the grain side. *Modern Amer. Tanning*, p. 114.

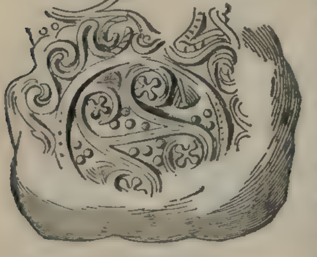


Riddle-seal of Oxford.

seal-indicator (sēl′in″di-kā-tọr), *n.* A thin rod, stuck through the snow in the breathing-hole of the seal, to indicate the approach of the animal.

> Sometimes a small implement [*seal-indicator*] is used in the hunt to indicate the approach of the seal. It is called qipekutang, and consists of a very thin rod with a knob or a knot at one end. It is stuck through the snow, the end passing into the water, the knob resting on the snow. As soon as the seal rises to blow, it strikes the rod, which, by its movements, warns the hunter.
> *Smithsonian Rep.* (Nat. Mus.), 1900, p. 209.

sealing2, *n.* 2. In the Mormon church, the rite of marriage 'for eternity' as opposed to marriage 'for time.' Such marriage is binding not only in life, but forever, and may be entered into by a man already married 'for time,' and vicariously after his death.—3. An impression in clay used to seal vases and other receptacles, examples of which are frequently found in archæological excavations. Very interesting ones have been discovered at Cnosus in Crete.



Ancient Cretan Sealing.
(From "Annual of the British School at Athens.")

sealing-stool (sē′ling-stöl), *n.* A stool used by the Eskimo hunter to sit on while waiting at the seal-hole for the seal to rise. *Smithsonian Rep.* (Nat. Mus.), 1900, p. 209.

sea-loch (sė′loċh), *n.* A narrow arm of the sea entering the land: as, the *sea-lochs* of Scotland.

> In general, it may be said that the detrital terraces are found chiefly in bays, *sea-lochs*, or other sheltered places, while the rock-terraces are conspicuous in more open sounds and exposed parts of the coast, where the tidal currents and wind-waves are most powerful.
> *Nature*, June 2, 1904, p. 112.

sea-lovage (sē′luv″ạ̄j), *n.* The Scotch lovage or sea-parsley, *Ligusticum Scoticum*.

seal-paper (sēl′pā″pėr), *n.* The daily calendar of official business issued by the Lord Chancellor for his own and the higher courts of Great Britain. Formerly the Master of the Rolls issued a similar seal-paper respecting his own court.

seal-scratcher (sēl′skrach″ėr), *n.* An implement consisting of a wooden handle, tipped with several seals' claws, used by the hunter when approaching the seal on the ice, to imitate the noise made by barking seals: used by Alaskan and Siberian Eskimos.

sealskin, *n.*—**Electric sealskin**, a pretentious name applied to rabbit-skin made to imitate sealskin.

sea-luce (sē′lūs), *n.* A common name of *Merlucius vulgaris*, the hake, a fish related to the codfish, found in the eastern Atlantic.

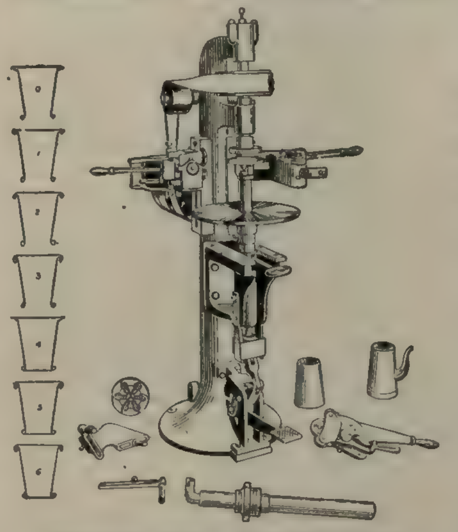
seam1, *n.* 10. Same as ★*slit-band*.—11. A joint used in sheet-metal work where two plates are joined by turning over the edge of the plate and hooking this turned edge into the similarly flexed edge of the next.—**Blastoporic seam.** See ★*blastoporic*.

seamanlike (sē′mạn-līk), *a.* Same as *seamanly*.

seam-dampener (sēm′damp″nėr), *n.* A hand-tool on small bench-machines for moistening the seams of garments without wetting other points.

sea-mignonette (sē′min-yọ-net″), *n.* A brilliantly colored, salmon-pink gorgonian, *Primnoa reseda*, found around Great Britain. *Nature*, April 11, 1907, p. 566.

seaming-machine, *n.*—**Double-seaming machine**, in the manufacture of sheet-metal ware, a name given to a large number of special power-machines for forming the double seam used in putting together the different parts of boxes, cans, bowls, pots, kettles, and other vessels. In all, the essential feature is the use of bending-and-pressing rolls, called *seaming-rolls*, which bend over and press together the edges of two pieces of sheet-metal to make a water-tight joint. In double-seaming the bottoms of tea-kettles and other flat-bottomed vessels a collapsible chuck is used to support the sides of the vessel while the seam is being formed, the chuck automatically collapsing and withdrawing from the vessel through the top on the completion of the seam. In some machines an inside roll is used, or the supporting table serves to hold the vessel. Special attachments are also used to center the parts and hold them firmly in place until the work is finished. All machines are automatic, carrying out every step in the work in turn, without attention from the operator beyond the placing of the parts in the machine and the removal of the finished vessel with the double seam closed. By employing machines of different sizes and by the use of a number of special attachments, the machines can be used in the manufacture of sheet-metal vessels of any size or shape, in great quantities and at a high speed. The illustration shows a typical machine with its different attachments and a partly finished double-seamed coffee-pot. At the side are diagrams which show the process of forming a double seam as done by this machine. Fig. 0 shows the pot upside down, with the burred-edge bottom in position. Figs. 1, 2, and 3 show the successive steps in the bending down and pressing together of the two edges to form the finished double seam shown in Fig. 3. Figs. 4, 5, and 6 show the steps used in double-seaming a plain blank bottom to the cylindrical sides of the pot.



Double-seaming Machine, with supplementary tools.

seaming-rolls (sē′ming-rōlz), *n. pl.* See *double-*★*seaming machine*.

seaming-tool (sē′ming-töl), *n.* The tool used by sheet-metal workers for bending over an edge to form a seam; also, the soldering-tool used to make a seam tight.

seam-lap (sēm′lap), *n.* In *iron ship-building*, a joint between two plates in the direction of their length, in which the edges are overlapped a sufficient width to receive one or more lines of rivets.

seamstering (sēm′stėr-ing), *n.* [*seamster* + *-ing*.] The work of a seamstress. [Colloq.]

> She's been picking up a living at *seamstering* in Melchester for several months.
> *T. Hardy*, Far from the Madding Crowd, xli.

seam-strap (sēm′strap), *n.* In *iron ship-building*, a long narrow strip of plate uniting two plates at a flush joint in the direction of their length. A *double seam-strap* is composed of two strips, one on each surface of the plates, the joint being between them. A seam-strap is further distinguished according to the number of lines of rivets on each side parallel to the joint, as a *single-riveted* or a *double-riveted seam-strap*.

sea-oats (sē′ōts), *n.* See *spike-grass* (*c*).

sea-parsley (sē′ pärs″ li), *n.* The Scotch lovage, *Ligusticum Scoticum*. Also called *sea-lovage*.

sea-partridge, *n.* 2†. The sole. *Cotgrave*.

sea-perch, *n.* 5. In New Zealand: (*a*) A scorpænoid fish, *Sebastapistes cottoides*. (*b*) A labroid fish, *Pseudolabrus celidotus*.—6. In Australia, *Latris antarcticus*, a fish of the family *Cirrhitidæ*.

sea-pike, *n.* 5. A fish of New South Wales, *Lanioperca mordax*.

sea-plain (sē′plān), *n.* A plain produced by the erosive action of waves, currents, tides, etc.; a plain of marine denudation.

> It is not always safe to assume, when we see the tops of a group of mountains all touching an approximately uniform level, that we have there the wreck of a *sea-plain* or, as some would call it, a plane of marine denudation or base level of erosion.
> *Nature*, Dec. 25, 1902, p. 172.

sea-plume (sē′plöm), *n.* Any gorgonian having a plumose form, as *Gorgonia acerosa*.

sea-postage (sē′pōs″tạ̄j), *n.* Postage paid on mail-matter sent by steamer or across the sea.

sea-power (sē′pou″ėr), *n.* 1. A nation or state having an important navy. Also called *naval power*.—2. Naval strength; ability to engage in military operations by sea. See the extracts.

> It must however be admitted, and will be seen, that the wise or unwise action of individual men has at certain periods had a great modifying influence upon the growth of *sea power* in the broad sense, which includes not only the military strength afloat, that rules the sea or any part of it by force of arms, but also the peaceful commerce and shipping from which alone a military fleet naturally and healthfully springs, and on which it securely rests.
> *A. T. Mahan*, The Influence of Sea Power upon History, [p. 28.
>
> Even in its present form the term is not of very recent date. Grote (Hist. of Greece, v. p. 67, published in 1849, but with preface dated 1848) speaks of "the conversion of Athens from a land-power into a *sea-power*." In a lecture published in 1883, but probably delivered earlier, the late Sir J. R. Seeley says that "commerce was swept out of the Mediterranean by the besom of the Turkish *sea-power*" (Expansion of England, p. 89). The term also occurs in vol. xviii. of this Encyclopædia, published in 1885. At p. 574 of that volume (Persia) we are told that Themistocles was "the founder of the Attic *sea-power*." The sense in which the term is used differs in these extracts. In the first it means what we generally call a "naval power"—that is to say, a State having a considerable navy in contradistinction to a "military power," a State with a considerable army but only a relatively small navy. In the last two extracts it means all the elements of the naval strength of the State referred to; and this is the meaning that is now generally, and is likely to be exclusively, attached to the term owing to the brilliant way in which it has been elucidated by Captain A. T. Mahan of the United States Navy in a series of remarkable works.
> *Encyc. Brit.*, XXXII. 491, 492.

sea-puss (sē′pus), *n.* Same as *sea-purse*, 2.

sea-quadrant (sē′kwod″rant), *n.* The Jacob's-staff, an old-fashioned instrument designed for measuring altitudes of the heavenly bodies.

seaquake (sē′kwāk), *n.* An earthquake which takes place beneath the ocean.

> Seismic geography, or the distribution of earthquakes over the surface of the earth, is adequately dealt with by Major Dutton; and his final chapter is devoted to "*seaquakes*," or those crustal disturbances which occur in submarine areas. *Athenæum*, April 1, 1905, p. 404.

sea-rate (sē′rāt), *n.* The running of a chronometer at sea in relation to its gain or loss on Greenwich mean time, or the mean time of any other prime meridian to which it may have been set.

search, *n.*—**Curve of search.** See ★*curve*.

search-coil (sėrch′koil), *n.* A small coil of insulated wire used for determining the strength of magnetic fields by means of the currents induced in the coil.

search-ephemeris (sėrch′e-fem″ẹ-ris), *n.* An ephemeris calculated from an approximate orbit of a comet or planet to aid in searching for it. *Nature*, Oct. 22, 1903, p. 606.

sea-region (sē′rē″jọn), *n.* A zoölogical region, or division, of the sea characterized by the presence of certain marine animals, especially fishes. *Geog. Jour.* (R. G. S.), X. 219.

sea-robin, *n.*—**Brown-winged sea-robin**, *Prionotus strigatus*, the northern striped gurnard.—**Red-winged sea-robin**, *Prionotus carolinus*, the common gurnard.

sea-sergeant (sē′sär″jant), *n.* A member of a Welsh secret society. This organization came into existence about the year 1725, and lasted for nearly half a century, when it was dissolved.

sea-serpent, *n.* 4. A name of *Ophichthys gomesii*, an eel of the family *Ophichthyidæ*, found in the West Indies.

sea-silk (sē′silk), *n.* The long, silky threads of the byssus of the bivalve *Pinna*, found in the Mediterranean. It has very little commercial value, the articles made from it, as purses, gloves, etc., being curious rather than useful.

> The marine products of the ocean have been investigated, with some success, in order to obtain a silk, independent of the silkworm culture, that may be used as a commercial article. This material has been termed *Sea Silk*. Certain marine mollusks, common on the coasts of Calabria and Sicily, attach themselves to rocks by means of stout threads. This material is combed and then treated with the juice of the lemon. Three parts of the material gives about one part of a lucid fibre of golden lustre, and from 3 to 8 centimetres long. It is of great strength, and bears a resemblance to real silk. It is made into articles such as gloves and purses.
> *Hannan*, Textile Fibres of Commerce, p. 183.

season, *n.* 1. (*d*) Any one of the chief periods or divisions of the ecclesiastical year, such as Advent, Lent, Easter, etc.

season-check (sē′zn-chek), *n.* Same as ★*check*¹, 19.

seasoning, *n.* 5. In *leather-manuf.*, the application of a solution of blood and logwood preparatory to blacking. *C. T. Davis*, Manuf. of Leather, p. 360.

seasoning-machine (sē′zn-ing-ma-shēn″), *n.* A machine for seasoning leather. The skin is brought into contact with revolving pads which apply the seasoning. *C. T. Davis*, Manuf. of Leather, p. 358.

sea-spry (sē′sprī), *n.* Sea-spray. [Rare.]

> Or, on a moonless night,
> To tinge, on syren shores, the salt *sea-spry?*
> *Keats*, Endymion, iv.

sea-stack (sē′stak), *n.* A sharp, isolated eminence which rises from the sea-bottom.

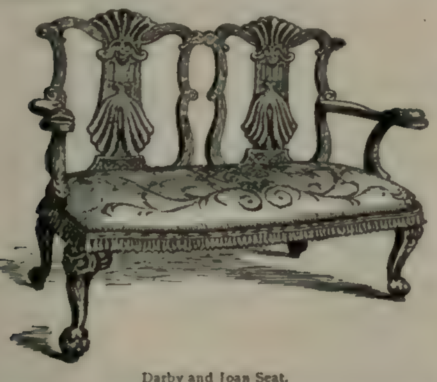
> The isolated rock-masses and *sea-stacks*, which we are enabled to trace by means of the soundings. One of these cases may be specially mentioned. The mass rises at a distance of about 36 miles off Cape Razo, in the submerged valley of the Tagus; it is an isolated *sea-stack*, with a height of 2340 feet from its base.
> *Geog. Jour.* (R. G. S.), XIII. 288.

sea-step (sē′step), *n.* One of a set of narrow steps fastened to the side of a war-ship and used in going on board from a small boat when the side ladders are unshipped, as at sea.

sea-stone (sē′stōn), *n.* Same as *sea* ★*amber*.

sea-swallow, *n.* 4. A West Indian name for the flying-fish. See *flying-fish* (*a*).

sea-swell (sē′swel), *n.* A wave of symmetrical form which has outrun the wind which produced it.



Darby and Joan Seat.

seat, *n.*—**Darby and Joan seat,** a settee having two chair-like backs, for two persons.

> If a name must be employed to differentiate between these and those with more splats, I should greatly prefer to revive the old and now forgotten term of '*Darby and Joan seats.*' *R. S. Clouston*, in Burlington Mag., V. 485.

seat, *v. i.* 3. To close tight upon its seat: said of a lifting-valve, which may be actuated mechanically from without or be self-acting by the variation of pressure within the passages which it controls.

seat-bone (sēt′bōn), *n.* The ischium.

sea-terrace (sē′ter″ās), *n.* A terrace formed by marine erosion. *Geikie*, Text-book of Geol., p. 29.

seath (sēth), *n.* The coalfish or pollack, *Pollachius virens*.

seating, *n.* 4. (*b*) In *iron ship-building*, a foundation or support built up of plates and angle-bars for the machinery in the interior of a vessel: as, an engine-*seating*; a boiler-*seating*.

seat-locker (sēt′lok″ėr), *n.* A locker whose lid, or top, forms a seat. In the forecastle these lockers run fore-and-aft on both the starboard and the port side.

seat-mast (sēt′mȧst), *n.* That member in a bicycle-frame to which the saddle is attached. It is the prolongation, above the horizontal upper member of the diamond frame, of the nearly vertical diagonal strut at whose lower end is the bearing for the pedals or crank-shaft.

> The purpose of this invention is so to construct the *seat-mast* that a perfect spring seat will be obtained, and that the distance between the seat and the pedals will remain constant. *Sci. Amer.*, Oct. 29, 1898, p. 284.

sea-transom (sē′tran″sum), *n.* In *naval arch.*, the stern transom. See *transom*, 4.

sea-trout, *n.*—**Spotted sea-trout,** *Cynoscion nebulosus*, a sciænoid fish found on the South Atlantic coast of the United States. It is not a trout, nor is it at all related to the trout.

seau (sō), *n.*; pl. *seaux* (sō). [F. *seau*, a bucket, < OF. *seel*, < ML. **sitellum*, dim., < L. *situla*, a vessel: see *situla*.] A pail-shaped vessel belonging to a dinner-service, made by English potters in the eighteenth century.

Seaward climate. See ★*climate*.

sebastine² (sẹ-bas′tin), *n.* A trade-name of a Swedish explosive which resembles dualin.

Sebastolobus (sē-bas-tol′ọ-bus), *n.* [NL., < *Sebastes*, a related genus, + Gr. λοβός, lobe.] A genus of scorpænoid fishes found in rather deep water in northern parts of the Pacific.

sebastopol (sē-bas′tọ-pōl), *n.* [Named in allusion to *Sebastopol*, famous for its siege.] A variety of the block-game in dominoes, in which the double-six leads and nothing but sixes can be played until both sides and both ends of the first set have been played to.

Sebastopsis (sē-bas-top′sis), *n.* [NL., < *Sebastes* + Gr. ὄψις, appearance.] A genus of scorpænoid fishes found on both sides of the northern and temperate Pacific.

sebolith (sē′bọ-lith), *n.* [L. *sebum*, tallow, + Gr. λίθος, stone.] A concretion in a sebaceous duct or gland.

Seborrhea nigricans, a form of chromidrosis in which there is an excretion of fat with the sweat, containing a dark pigment.

seborrheal, seborrhœal (sē-bọ-rē′ạl), *a.* Relating to or affected with seborrhea. *Buck*, Med. Handbook, I. 195.

sec (sek), *a.* [F.] Dry: said of champagne and other wines: opposed to *sweet*.

secant. I. *a.* 2. Specifically, noting a stream which cuts across folded strata.

> The author recognizes several classes of streams: consequent, inconsequent, obsequent (the definition of this term does not agree with that given by others) and *secant* (traversing an anticline).
> *W. M. Davis*, in Science, Dec. 20, 1901, p. 976.

II. *n.*—**Hyperbolic secant,** sech $x = \frac{2}{(e^x + e^{-x})}$.

Secchi's types of stars. See ★*star*¹.

seccotine (sek′ọ-tin), *n.* A trade-name of a cement used to unite surfaces of paper, cloth, leather, etc.

secentismo (sā-chen-tis′mō), *n.* [It., < *secento*, six hundred.] The literary style of Italian writers of the seventeenth century: a period of decadence in Italian literature. See ★*secentisti*.

> The Arcadia [1690] was a reaction against *Secentismo*, but a reaction which . . . only succeeded in impoverishing still further and completely withering up the literature.
> *Encyc. Brit.*, XIII. 511.

Secentisti (sā-chen-tis′ti), *n. pl.* [It. See ★*secentismo*.] The members of a decadent school of literature and art existing in Italy in the seventeenth century. It actually flourished for about 140 years from the middle of the sixteenth century. Its productions are marked by exaggeration of style and affectation.

> At the head of the school of the "*Secentisti*" comes Giovan Battista Marini of Naples . . . especially known by a poem called L'Adone. His aim was to excite wonder by novelties; hence the most extravagant metaphors, the most forced antitheses, the most far-fetched conceits, are to be found in his book. *Encyc. Brit.*, XIII. 511.

secessionist, *n.* 2. Specifically, a member of a body of artists which, in principles and methods, differs from and protests against the accepted traditions of older societies.

> The death, in his ninety-third year, is announced from Vienna of the distinguished painter in water colours, Rudolf Alt. His work presented a great contrast to that of the Viennese *secessionists*, whose Honorary President he was. *Athenæum*, March 25, 1905, p. 378.

séchard (sā-shär′), *n.* [F., < *sec*, *sèche*, dry, < L. *siccus*, dry.] The dry, warm, foehn wind which blows over Lake Geneva.

sechser (zech′sėr), *n.* [G., < *sechs* = E. *six*.] A copper coin of Ravensburg, Prussian Westphalia, of the early seventeenth century.

sechsling (zechs′ling), *n.* [G., < *sechs*, = E. *six*, + *-ling*, = E. *-ling*.] 1. A copper coin of Schleswig-Holstein under Danish rule, equal to half a skilling.—2. A copper coin of Hamburg.

Sec. Leg. An abbreviation (*a*) of *Secretary of Legation*; (*b*) [*l. c.*] of the Latin *secundum legem*, according to law.

second¹, *a.*—**Second dealing,** in *card-sharping*, the art of holding back the top card of the pack and dealing the one under it, so that the card held back may fall to the dealer himself. The cards having been previously marked on the backs, the dealer knows what cards to withhold.—**Second deliverance.** See ★*deliverance*.

second², *n.*—**Decimal second.** See ★*decimal*.—**Horse-power second,** one sixtieth of a horse-power minute.—**Metric horse-power second,** one metric horse-power exerted for one second; one sixtieth of a metric horse-power minute.—**Sidereal second,** $\frac{1}{86,400}$ part of the sidereal day, which is divided in the same way as the mean solar day into hours, minutes, and seconds.

secondary. I. *a.* 6. In *geol.*, applied to those rock-making minerals which are the products of the alteration or decay of the minerals, original or primary, in the rock. Thus quartz, feldspar, and mica are primary in granite, whereas kaolin, arising from the decay of the feldspar, is secondary. *Geikie*, Textbook of Geol., p. 89.—7. In *elect.*: (*a*) Pertaining to those parts of a transformer, or induction-coil, in which the induced currents occur, as distinguished from the corresponding parts of the primary or inducing circuit; as the secondary coils, windings, turns, or terminals of a transformer. (*b*) Pertaining to the induced current or electromotive force in a transformer or induction-coil.—**Secondary education,** the stage of education which follows the primary or elementary stage (of studies taught in the 'primary' schools to the age of ten or twelve) and is carried on in the 'secondary' or 'grammar' or 'high' schools (to the age of fourteen, sixteen, or eighteen). It concludes the formal education of the pupil, except in the cases in which he proceeds to a special or technical school (preparatory to business or trade), or to a college or university. See *secondary* ★*school*.

> *Secondary* instruction in high schools and academies continues the traditional course of study on the lines marked out already in the elementary schools.
> *W. T. Harris*, Psychol. Foundations of Education, p. 332.
>
> Perhaps the most serious defect of *secondary education* in the United States is its brevity.
> *De Garmo*, in Herbart (trans.), Outlines of Educational [Doctrine, p. 103.

Secondary insulation, the insulation of the secondary winding of a transformer or induction-coil.—**Secondary lag,** the difference of phase between the secondary and primary current or electromotive force in a transformer.—**Secondary resistance,** the resistance of the secondary circuit of a transformer.—**Secondary school.** See ★*school*.—**Secondary side,** that portion of a transformer in which the induced currents are formed, as distinguished from the primary or inducing side.—**Secondary terminals,** the free ends of the secondary winding of a transformer or induction-coil.—**Secondary turns,** the ampere turns in the secondary coil of a transformer.—**Secondary voltage,** the voltage at the terminals of that winding of a transformer or induction-coil within which currents are induced, as distinguished from the voltage of the primary or inducing circuit.—**Secondary winding,** the coil of the secondary circuit of a transformer or induction-coil.

II. *n.* 7. *pl.* The symptoms occurring in the second stage of syphilis.—8. One of the smaller tubercles on the surface of the test in the *Echinoidea* or sea-urchins. The secondaries are intermediate in size between the primaries and the miliaries.—9. In *Eng. law*, the second officer of the Courts of King's Bench and Common Pleas; also, an officer of the Corporation of London who hears inquiries to assess damages in cases where the defendant does not appear.—10. In an alternating-current transformer or other apparatus having several circuits in inductive relation to each other, that coil or circuit which receives power by induction from the primary coil.—**Movable secondary,** a secondary coil or winding of a transformer which is free to move with respect to the primary coil or is capable of adjustment with reference to the latter.—**Multipoint secondary,** a form of secondary coil of a transformer constructed so that it may be used in parts, for which purpose a series of terminal wires are brought out from various points of the coil.

second-foot (sek′und-fůt), *n.* Same as ★*foot-second*.

secondness (sek′und-nes), *n.* 1. The character of being second; the ordinal position in a series of the second member of it, whether this position is considered in itself or is spoken of as appertaining to the object that occupies it.—2. (*a*) The mode of being of an object which is such as it is by virtue of being connected with or related to another object or objects, regardless of any triadic relation. (*b*) The mode of connection or relation of such an object with such other. (*c*) In a looser sense, the secundal, or relative, character which belongs to an individual object, as having such a mode of being.

secondo, *n.* **II.** *a.* [fem. *seconda* (-dä).] Second: used of instruments or their parts in an orchestra: as, violino *secondo*, second violin. — **Seconda volta**, in *music*, the second time: used of a repeated passage.

secretaria (sä-krä-tä-rē′ä), *n.* [Sp., < *secretario*, secretary.] A secretary's office. [Philippine Is.]

secretariate, *n.* **3.** Specifically, in India, the central office of the administration: see the extract.

> The preceding sketch of Indian administration would be incomplete without a reference to the *secretariat*, or central office, which in some sense controls and gives life to the whole. From the *secretariat* are issued the orders which regulate or modify the details of administration; into the *secretariat* come all the multifarious reports from the local officers, to be there digested for future reference. But though the secretaries may enjoy the advantages of life at the presidency capitals, with higher salaries and better prospects of promotion, it is recognized that the efficiency of the empire rests ultimately upon the shoulders of the district officers, who bear the burden and heat of the day, with few opportunities of winning fame or reward. *Encyc. Brit.*, XII. 769.
>
> Even the *Secretariat* believes that it does good when it asks an over-driven Executive Officer to take a census of wheat-weevils through a district of five thousand square miles.
> *R. Kipling*, Wressley of the Foreign Office, in Indian [Tales, p. 671.

4. A number of secretaries forming a board or official body.

secretary, *a.* **2.** Knowing secrets; confidential; able to keep a secret.

> And when thou read'st a mooving syllable [in a love letter]
> Thinke that my soule was *secretary* to 't.
> *Marston*, Insatiate Countess, i. 1.

secretin (sē-krē′tin), *n.* [LL. *secretum*, a secretion, + *-in*².] A peculiar substance which is derived from the mucous membrane of the intestinal tract and, after absorption into the blood-current, stimulates the pancreas and possibly also the salivary glands to secretion. The substance is supposedly present in the epithelial cells of the intestinal mucosa in an inactive form which is termed *prosecretin*. Of its chemical nature nothing is known, but it appears certain that secretin is not a ferment.

secretion, *n.* **3.** A mineral deposit formed in a fissure or cavity by growth inward from the walls: contrasted with *concretion*, which grows outward from a nucleus. *Geikie*, Text-book of Geol., p. 135. — **Inner** or **internal secretion**, a specific product, elaborated in a glandular organ of the body, which is given off into the blood and lymph: such products are not waste products, but play an important part in the general metabolism. Products of this kind are furnished by the thyroid gland, the adrenals, the spleen, the pituitary body, the testicles, etc. — **Lateral secretion**, the process which accounts for the formation of ore-deposits by laterally moving currents of water.

> Some hold that the waters doing the work are descending; others that they are laterally moving; others that they are ascending. The first is known as the descension, the second as the *lateral-secretion*, and the third as the ascension theory.
> *Van Hise*, in Science, Nov. 15, 1901, p. 756.

secretionary (sē-krē′shon-ā-ri), *a.* [*secretion* + *-ary*.] Originating by secretion, in any sense, or pertaining to the process of secretion.

secreto-inhibitory (sē-krē″tō-in-hib′i-tō-ri), *a.* Causing diminished secretion: noting nerves which act in this manner upon the glands.

secretomotor (sē-krē-tō-mō′tor), *a.* [LL. *secretum*, a secretion, + *motor*, a mover.] Causing increased secretion: noting nerves which act in this manner upon the glands. *Nature*, Nov. 12, 1903, p. 48.

sect², *n.* **2.** In *geom.*: (*a*) A part cut out on a straight line; a limited straight line or rod; the part or piece of a straight line between two definite points (end-points of the sect); a portion of a given straight line, of definite length.

> Any two *sects* in plane space . . . determine a point, the intersection of the lines in which they lie, and an area, that of a parallelogram.
> *E. W. Hyde*, in Merriman and Woodward, Higher [Math., p. 394.

(*b*) A piece of a range bounded by two points. (*c*) Two points, A and B, upon a straight *a*. — **Explemental sects**, in *geom.*, two costraight sects with the same end-points and together making a complete straight or the complete point-row on a straight. See ★*explemental* (*c*). — **Perspective sect** of any point, the sect from the center of perspective to that point. — **Philo's sect.** See *Philo's* ★*line*. — **Product of two sects.** See ★*product*. — **Unit sect**, in *geom.*, an arbitrary sect, designated by 1, used to define the product of a sect *a* by a sect *b*.

II. *a.* In *math.*, of sects; operating with sects.

> He constructs a *sect* Calculus in which he shows that the theory of proportion can be founded without the introduction of irrational numbers.
> *J. W. Withers*, Euclid's Parallel Postulate, p. 56.

Sect calculus. See ★*calculus*.

sect. [*l. c.* or *cap.*] An abbreviation of *section*.

secta (sek′tä), *n.* [L. *secta*, sect, school, following.] In *law*: (*a*) A suit or action. (*b*) The pursuit of a criminal. (*c*) The feudal service of attendance at the lord's court. (*d*) The witnesses brought to court by a plaintiff to prove his count or declarations. In that sense they were his followers or suit, whence the term 'to bring suit.' — **Secta ad curiam**, in *old Eng. law*, the writ that lay against him who refused or neglected to perform his service or suit to the county court or to the court baron. *Cowel.* — **Secta ad molendinum**, service growing out of the established custom of carrying one's grain to a particular neighborhood mill for grinding; also, the writ that lay against one who neglected the service. *Kinney.* — **Secta curiæ**, attendance or service at court. This was due the feudal lord from his tenants, both to answer complaints against themselves, and to aid in the trial of others. *Cowel.*

Sectator² (sek-tā′tor), *n.* [NL., < L. *sectator*, a follower.] A genus of fishes of the family *Kyphosidæ*, known only from Panama.

sect-carrier (sekt′kar″i-ėr), *n.* In *geom.*, a physical instrument for the graphic performance of the following construction: to set off a given sect (piece of a straight line) on a given straight line, from a given point of this line, toward a given side of this point (in a given one of the line's two senses). — **Unit sect-carrier**, an instrument for laying off on any straight line, from any point on it and in either sense, a sect equal to the chosen unit sect: a simpler substitute for the compasses in elementary geometry.

section, *n.* **2.** (*j*) The smallest administrative subdivision of a railroad. It is usually a mile or two in length and is designated by a number.

10. In *petrog.*, in the quantitative classification of igneous rocks (see ★*rock*¹), a subdivision of any of the taxonomic divisions from class to subgrad. It is used wherever it is considered necessary to introduce a further subdivision. — **11.** In *geol.*, a group of several related stages, usually of the same kind of sedimentary rock; a series or formation. *Geikie*, Text-book of Geology, p. 860. — **12.** In *function-theory*, a line in the plane of the variable of a function upon crossing which the function abruptly changes its value. — **Development section.** Same as ★*development*, 6 (*c*). — **Effective section**, that part of the cross-section of any piece of material which is actually available for withstanding a stress. — **Median section.** Same as *golden section* (which see, under *golden*). — **Right section of a cylinder**, a section of which the plane is perpendicular to the elements. — **Section analysis.** See ★*tree analysis*. — **Working-out section.** Same as ★*development*, 6 (*c*).

section, *v.* **II.** *intrans.* To cut sections; divide into sections.

> They [the spores] are brown in color, somewhat flexible, and *section* readily on the microtome.
> *E. H. Sellards*, in Amer. Jour. Sci., July, 1903, p. 89.

section-angle (sek′shon-ang″gl), *n.* The angle between the planes which form the top face and either side face of a double-edged cutting-tool for a lathe or planer for metal.

section-boss (sek′shon-bos), *n.* The man who is in charge of the trackmen employed on a section of a railroad and is responsible for the maintenance of way for his section.

section-box (sek′shon-boks), *n.* **1.** In *railroading*, a tool-house or tool-box placed at some convenient point on a section for the storage of tools used by a section-gang. — **2.** The box or compartment within which connections between different sections of an electrical-wiring system are placed and fuses, switches, and other similar appliances are installed.

section-colors (sek′shon-kul″orz), *n. pl.* The colors used by draftsmen, on engineering or construction drawings, to represent the various materials where these appear in section. Conventional arrangement of lines in hatching the section is more usual in modern drawings, especially in such as are to be reproduced by printing processes.

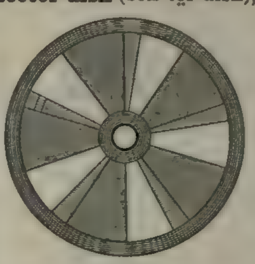
section-crew (sek′shon-krö), *n.* In *railroading*, the group or gang of track-hands or workmen employed under a section-boss in keeping the track in repair within the limits of a section.

section-finder (sek′shon-fīn″dėr), *n.* See ★*photophore*.

section-gang (sek′shon-gang), *n.* Same as ★*section-crew*.

sector, *n.* **6.** A cutting implement or device. — **Sectores coconis**, in *entom.*, the large black spines at the base of the fore-wings, having a cutting edge and teeth with which the adult saturniid moth cuts its way out of its cocoon. — **Spherical sector**, the solid generated by any sector of a semicircle when it revolves about its diameter.

sector-disk (sek′tor-disk), *n.* A rotating disk with open sectors the angular width of which is adjustable. The disk must be rotated at such a speed that it will make a complete rotation within the time limit of the persistence of vision (less than 0.04 second), Talbot's principle of diminution of the apparent intensity by intermission of the illumination being thus applied. *W. M. Stine*, Photometrical Measurements, p. 24.



Sector-disk.

sectored (sek′tord), *p. a.* [*sector* + *-ed*².] Divided into sectors: as, a *sectored* disk. *W. M. Stine*, Photometrical Measurements, p. 21.

sectoriform (sek′tor-i-fôrm), *a.* [L. *sector*, sector, + *forma*, form.] Shaped like the sector of a circle.

> Dorsal valve (of a fossil shell) considerably wider than long, "*sectoriform*," more gibbous than the ventral.
> *U. S. Geol. Surv.*, Monographs, XXXII. ii. 539.

sect-train (sekt′trān), *n.* A system of sects, AB, BC, CD, . . . KL.

secua (sā′kwä), *n.* [Native name.] A climbing vine of the gourd family, *Fevillea cordifolia*, native to northern South America and the West Indies. Its very large seeds yield a valuable medicinal oil. Also called *segra-seed*. See *antidote cacoon*, under *cacoon*.

Secular acceleration. See ★*acceleration*.

secundiflorous (sek-un-dif′lō-rus), *a.* [L. *secundus*, following, + *florere*, bloom.] Having secund flowers or inflorescence.

Secundum legem, in accordance with law. — **Secundum regulam**, by or according to rule.

security, *n.* — **Bond and disposition in security.** See ★*bond*¹. — **Liquid securities.** See ★*liquid assets*.

secus (sē′kus), *adv.* [L., otherwise, differently.] In *law*, otherwise; contrariwise: used in reports to indicate a different or dissenting opinion or an exception.

secutor (sē-kū′tōr), *n.* [L., a pursuer.] In *Rom. antiq.*, a light-armed gladiator with a square shield and a sword who was opposed to the retiarius in the gladiatorial contests. See *retiarius*.

sedarim, *n.* Plural of ★*seder*.

sedatin (sed′a-tin), *n.* [L. *sedatus*, pp. of *sedare*, make quiet, assuage, + *-in*².] **1.** An old trade-name of antipyrin. — **2.** A trade-name of paravaleryl-phenetidine, $C_2H_5OC_6H_4NHCOCH_2CH(CH_3)_2$, prepared by the action of valeric acid on paramino-ethoxybenzene (paraminophenetol). It is a colorless powder and is used in medicine as an analgesic and antipyretic.

sedentary, *a.* **5.** In *geol.*, remaining upon the rock from which it has been formed by disintegration: said of soil or loose rock material. — **6.** In *intern. law*, said of the private property of a neutral which has remained on belligerent soil or of a neutral vessel in foreign waters. See the extract.

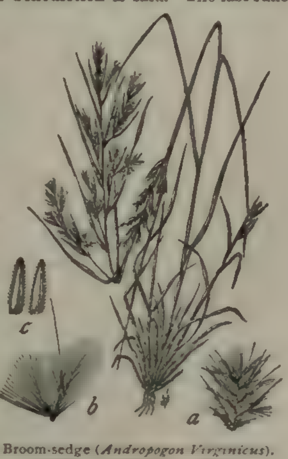
> Whereas private property of neutrals generally which has remained on belligerent soil is *sedentary*, or, so to speak, domiciled there, neutral vessels are mere visitors with a distinct external domicile. *Encyc. Brit.*, XXXI. 129.

sedentation (sed-en-tā′shon), *n.* [*sedent*(*ary*) + *-ation*.] The state of having become sedentary, or fixed in a given place or location.

> Climatic conditions, degree of *sedentation*, nature of food supply, and availability of material have each a marked influence on the condition of the arts.
> *An. Rep. Bur. Amer. Ethnol.*, 1898-99, p. 22.

seder (sā′dėr), *n.*; pl. *sedarim*. [< Aram. *sodar*, to arrange.] The order of the service and feast on the first night of the Jewish Passover, repeated on the second night by those who keep the second day. The seder table is very elaborately decorated. Three matsoth, or unleavened cakes (called mitsvoth or commandments), are placed one upon the other in front of the head of the family. The top cake is named 'Cohen,' the middle 'Levi,' and that at the bottom 'Israel,' the whole representing the three Mosaic categories of the Jewish nation. An oriental dish (a mixture composed of apples, almonds, cinnamon, etc.), called *haroseth*, horse-radish, called *maror* (bitter herbs), part of the shoulder-bone of a broiled lamb, called *zero'a* (shoulder), a baked egg, lettuce, and salt water are also placed upon the seder table. When it is fully spread, the celebrant, generally the head of the family, begins with the first of the thirteen functions in the seder service which is called *kadesh*, "sanctification," when a blessing (*berakah*) is pronounced upon the first cup of wine. The second function is called *rahats*, when the celebrant slightly washes his hands. The third is *karpas*, when celery or lettuce is eaten. At the fourth, *yahats*, the celebrant divides the middle cake, this 'Levi,' and hides one half under the cushion at the right, reserving it for the *afikomen*. At the fifth, *maggid*, the celebrant as well as all the participants recite the *hagadah* liturgy. At the sixth, *rah'tsah*, all wash their hands. The seventh, *motse*, is when the celebrant breaks the 'Cohen' and half of the 'Levi' cakes and distributes one piece of each to every member of the family, after which he says a blessing and the *motse* is eaten with avidity. The eighth, *maror*, is when a blessing is said and a piece of horse-radish or other bitter vegetable is eaten. At the ninth, *korekh* (Hillel's ceremony), horse-radish is placed between two pieces of matsa so as to fulfil to the letter the command (Exod. xii. 8) in the same manner that Hillel did "when the Temple (lit. the Holy House) existed." At the tenth, *shulhan*, the meal is eaten. At the eleventh, *tsaphon*, the half of the 'Levi' matsa which was put aside at the beginning of the service for the *afikomen* is produced, and the celebrant breaks it and distributes the pieces among the participants. At the twelfth, *berakh*, the benediction is said. The last function is called *hallel* (which see), when Ps. cxv-cxviii. are recited or chanted. Four cups of wine, called *kosoth*, are drunk by each member during the seder services. One special cup of wine is placed on the center of the table. It is called the 'Prophet Elijah's cup.' See *Elijah's* ★*cup*.

sedge^1, *n.*—**Broom-sedge.** See *broom-grass*, 2. Most properly, *Andropogon Virginicus*, a brown-colored tufted grass 2 to 4 feet high, with silky racemes in the fall, common along the coast from Massachusetts to Texas, perhaps the best-known native grass of the southern United States. It there affords excellent grazing when young, yet by preventing the formation of permanent pastures becomes one of the worst weeds of the section. Also called *broom-straw* and *sedge-grass*. See *Indian* ★*grass* (*b*). – **Coco sedge.** See ★*coco*^{3}.



Broom-sedge (*Andropogon Virginicus*). *a*, spike; *b*, spikelet; *c*, glumes.

sedge-grass (sej′gras), *n.* Any grass of the genus *Andropogon*, including the broom-sedges; beard-grass. See *broom-*★*sedge*.—**Feather sedge-grass.** Same as ★*feather-sedge*.

sedge-land (sej′land), *n.* Land between high- and low-water marks. Same as *sedge-flat*.

sediment, *n.* 2. In a steam-boiler, an internal deposit of precipitate from the feed-water, or of solid matter mechanically present, which lies as a loose or soft mud on the heating surfaces: distinguished from *scale*, which is a hard crystalline coating adhering to the metal.

sediment (sed′i-ment), *v. t.* and *i.* [*sediment*, *n.*] To allow to settle; settle: said of matter in suspension in a liquid.

> With the large number often required it is impossible to use the microscope, whilst in an afternoon several hundred *sedimenting* preparations can be put up.
> *Jour. Exper. Med.*, Jan. 15, 1901, p. 365.

sedimentation, *n.*—**Continental sedimentation**, accumulation of deposits by aggradation of continental valleys; sedimentation on land instead of on the sea-floor or in lake-basins: a term proposed by Professor Penck, then in Vienna. *Science*, Jan. 18, 1901, p. 97.—**Sedimentation test.** See ★*test*^{1}.

sedimented (sed′i-men-ted), *p. a.* Having settled into a sediment; having formed a sediment.

> Care will of course have to be taken not to overlook the *sedimented* bacteria which may be lying at the bottom of the tube.
> *Lancet*, June 1, 1901, p. 1533.

sedra (sed′rä), *n* [Aram. *sedra*, Syriac *sedro*, order, arrangement, row.] A name applied in the Jewish sabbatical liturgy to the weekly section of the Pentateuch which is read in the synagogue on the Sabbath. The Pentateuch is divided into fifty-four sedras or sections, which are subdivided into parashoth. The sedras must be read at the morning Sabbath services during the year, but as a year has only 52 weeks, in order to finish the sedras two of them are read on two special Sabbaths. The sedras bear different names. For example, the first, which is read on the first Sabbath after the feast of Succoth, is named *Bereshith*, "in the beginning." It is the first Hebrew word of the section (Gen. i. 1). The second section is called *Noah*, which is the third word of the first verse of that section (Gen. vi. 8). It specially treats of that patriarch and the history of the deluge. The last section is named *Vezoth Haberakah*, "and this is the blessing," which are the first two words of that section (Deut. xxxiii. 1).

see^1, *v. t.*—**To see one's way**, to see the possibility of accomplishing or permitting something, or of the feasibility of a certain course: with *to*.

> Could the major *see his way to* letting the Slane-McKenna wedding be adorned by the presence of four battery horses to pull a hired barouche?
> *Kipling*, In the Matter of a Private, in Soldiers Three, [p. 74.

see-bär (zā′bär), *n.* [G.] See *seiche*.

Seebeck effect. The phenomenon of thermo-electricity.

seecatch (sē′kach), *n.* Same as *seecatchie*.

seed, *n.* 10. The larvæ of the lac-insect.

> To some extent the lac is found occurring, so to speak, spontaneously, and is collected by the forest tribes, and brought by them to the fairs and bazars for sale. Where, however, there is a regular trade in stick-lac, propagation of the insect is systematically carried on by those who wish for a certain and abundant crop. This propagation is effected by tying small twigs, on which are crowded the eggs or larvæ of the insect, to the branches of the trees. These larvæ are technically called '*seed*.'
> *Sci. Amer. Sup.*, Feb. 14, 1903, p. 22671.

11. In *sugar-manuf.*, crystals of sugar placed in concentrated syrup to serve as starting-points for fresh crystallization.—**Reserve seed method**, that method of conservative lumbering in which, in a stand which is being reproduced by self-sown seed, a number of trees are left uncut for a period, usually a second rotation, after the stand itself is reproduced.—**Scattered seed method**, that method of conservative lumbering in which reproduction is provided for by leaving, after a single cutting, scattered seed-trees of the kind desired.—**Seed control**, the regulation of the quality of commercial seeds by means of stations equipped for testing samples. Such institutions (often in connection with agricultural experiment stations) exist in all the principal countries of Europe, Germany alone having more than forty, while the Department of Agriculture at Washington and the State experiment stations have taken up the work in the United States. The resort to these stations is voluntary. See *seed testing*, below.—**Seed coöperator**, an agriculturist who coöperates with an experiment station by growing seed of new varieties, selling it to the public, and furnishing reports of the yield.—**Seed races**, races or groups of plants that reproduce themselves with fidelity by means of seeds, or "come true from seed."—**Seed testing**, the examination of seed to determine its genuineness, purity, germinating power, and actual value. The question of genuineness is settled by expert inspection; of purity by the picking out of chaff, sand, weed seeds, etc., and weighing to ascertain percentage; of germinating power by a germination test consisting essentially of keeping the sample dark, moist, ventilated, and at the proper temperature and noting the percentage of seeds that sprout, also the promptness of their sprouting; that of actual value by a calculation based upon the data thus obtained. Various appliances have been devised for germinating tests, for some of which see ★*germinating-chamber* and *Geneva tester* (under ★*tester*^{1}).—**Seed variation**, variation or differences that arise in plants grown directly from seed as distinguished from those that arise from buds.

seed, *v. t.* 5. In *sugar-manuf.*, to start the process of crystallization in (concentrated syrup) by placing crystals of sugar, from a previous step in the process, to serve as seed or starting-points.

seedage (sē′dāj), *n.* [*seed* + *-age*.] The propagation of plants by means of sowing, that is, by means of seeds and spores. *L. H. Bailey*.

seed-bed, *n.* 2. In *forestry*, a specially prepared area, usually in the forest nursery, for the raising of seedlings.

seed-cake, *n.* 2. The cake left after oil has been expressed from such seeds as those of cotton, flax, rape, etc.

seed-cane (sēd′kān″), *n.* The stalk of sugar-cane as used for planting In most countries the upper part only is so used, but in Louisiana the whole stalk has generally been planted.

seeder, *n.* 1. The mechanical seeder consists of a large seed-box supported by a wheelbarrow and fitted with suitable seed-distributing machinery. It is operated by the movement of the machine as it is pushed over the ground and sows the seed in a thin film. Larger machines are operated by horse-power. Another form consists of a seed-holder and seed-distributing machine and is designed to be placed in a wagon, at or on the tail-board, and operated by a sprocket-chain from one of the wagon-wheels. These seeders are practically broadcast sowers, since the seed is discharged in a cloud (broadcast) as in the sowing-machine (which see).

Seeding stage. See *stand* ★*method*.

seed-leaf, *n.* 2. Same as *seed-leaf* ★*tobacco*.

seedling, *n.* 2. In *forestry*, specifically, a tree (grown from seed) which has not reached a height of three feet. See *tree* ★*class*.

seedling-disease (sēd′ling-di-zēz″), *n.* A disease of seedlings.—**Cabbage seedling disease, conifer seedling disease, oak seedling disease.** See ★*disease*.

seed-midge (sēd′mij), *n.* A midge that infests seeds.—**Clover seed-midge.** (*a*) An American cecidomyiid fly, *Dasyneura leguminicola*, whose larvæ live in the flowers of red clover. (*b*) See *clover* ★*flower-midge*.

seed-spot (sēd′spot), *n.* A small area, usually in a burn or in an opening in the forest, which is sown with tree-seed.

seed-tree (sēd′trē), *n.* Any tree which bears seed; specifically, in *forestry*, a tree which provides the seed for natural reproduction. Also called *mother-tree*.

seed-worm (sēd′wėrm), *n.* A worm that infests seeds.—**Clover seed-worm**, the larva of an American chalcidid, *Bruchophagus funebris*, that lives in the seeds of red clover. It was formerly thought to be a parasite on the clover flower-midge. Also called *clover-seed chalcis-fly*.—**Grape seed-worm**, the larva of a chalcidid, *Evoxysoma vitis*, which breeds in grape-seeds.

seed-year (sēd′yēr), *n.* In *forestry*, a year in which a given species of tree bears seed; specifically, a year in which a given species bears seed abundantly.

seep (sēp), *n.* [*seep*, *v.*] A small exudation of ground-water; a small spring.

> It is mentioned that at Comanche Spring, a small "*seep*," seven miles north of the Rio Grande, the limestone bluffs have been covered in a number of places with rude paintings of characteristic Indian design.
> *Nature*, Dec. 4, 1902, p. 113.

seep-well (sēp′wel), *n.* A well fed by the percolation into it of water through very small cracks in the surrounding rocks.

seer^4, *n.* 2. In Bombay, a dry measure equal to 1.41 liters; in Ceylon, a liquid measure equal to 1.14 liters.

seering (sēr′ing), *n.* A fish, *Elops saurus*, closely related to the tarpon, found on both coasts of the warm and tropical parts of America.

see-saw, *n.* 4. A motion of a steam-engine governor which oscillates on both sides of its mean or neutral position and causes the speed of rotation of the engine to vary above and below the mean.

see-town (sē′toun), *n.* The city which contains the cathedral and is the local center of a diocese. See *see*^{3}, 2.

> It was arranged that Winchester should remain the *see-town* of the older Wessex, whilst Sherborne was the ecclesiastical centre for Dorset and the rest of the newer Wessex.
> *Athenæum*, May 27, 1905, p. 650.

seevitchie (sē-vich′i), *n.* The northern sea-lion: a name adopted from the Russian and but little used.

Seewee bean. See ★*bean*^{1}.

Seger's cones. See ★*cone*.

segment, *n.* 4. An element of a machine, such as a toothed wheel, cam, or pulley, the active surface of which is not a full surface of revolution, but only a segment or part of such surface.—**Dark segment**, the ash-colored shadow of the earth seen in the eastern half of the horizon just after sunset or in the western half just before sunrise as defined by Von Bezold in 1864. See *twilight curve*.—**External segments**, of a sect AB, PA and PB when P is on the straight AB but not on the sect AB.—**Lower segment of a set**, in *math.*, the terms less than *u* if *u* is a single term, or less than a variable term of *u* if *u* is a class of terms all of which are less than some fixed term of the set, and if *u* has no maximum, that is, is such that every term of *u* is less than some other term of *u*.—**Median segment**, the so-called thoracabdominal segment of the aculeate *Hymenoptera*, the fourth thoracic segment, which is in reality morphologically the first abdominal segment, being transferred from the abdomen to the thorax in the semipupal stage.—**Premandibular segment**, a temporary segment in the head of an embryo insect, a temporary appendage of the tritocerebral segment.—**Segment of Rivinius**, a notch in the upper edge of the groove on the tympanic plate to which the drum-membrane is attached.—**Spinal segment**, a fraction of the spinal cord included between two imaginary frontal sections placed one on each side of a nerve pair and each half-way between the next pair below and the next above.

Segmental plate. See ★*plate*.

segmentation, *n.*—**Protoplasmic segmentation**, the cleavage or cutting up of the cytoplasm of the cell into pieces, as distinguished from the division or segmentation of the nucleus.

segregable (seg′rē-gä-bl), *a.* [NL. **segregabilis*, < L. *segregare*, segregate.] Admitting of segregation in Mendelian inheritance.

> An extracted type . . . may carry on *segregable* determinants.
> *Bateson and Punnett*, in Rep. Evol. Com. Roy. Soc., [1905, II. 124.

segregate, *v. i.* (*b*) To separate into dominants, recessives, and hybrids, in conformity to a numerical law: said of the descendants of Mendelian hybrids.

segregation, *n.* 4. The separation of the descendants of Mendelian hybrids into dominants, recessives, and hybrids, in conformity to a numerical law.

> This phenomenon is spoken of as *segregation*: which consists in the dispatch by the hybrid, at each generation, of offspring into dominant and recessive ranks.
> *A. B. Darbishire*, Manchester Memoirs, XLVIII. [xxiv. 4.

Law of segregation. See ★*law*^{1}.

segregator (seg′rē-gā-tor), *n.* [NL. **segregator*, < L. *segregare*, segregate.] One who or that which divides or separates.

> The *segregator* could not possibly have attained the results given thus by catheterism and the strong aspiration.
> *Annals of Surgery*, Jan., 1903, p. 30.

Urinary segregator, an appliance for obtaining the urine excreted by one kidney unmixed with that excreted by the other.

segundo (sā-gōn′dō), *n.* [Sp. *segundo*, < L. *secundus*, second.] A carangoid fish, *Hemicaranx secundus*, which inhabits West Indian waters.

sehta (seċh′tä), *n.* [E. Ind.] Cobalt ore from the Khetri mines in Jaipur, used under this name by Indian jewelers to give a blue color to enamel on ornaments of gold and silver.

seicentismo (sā-i-chen-tēs'mō), *n.* [It.] In Italian literature and art, the fashion of the seventeenth century. See ★*secentismo.*

Seicentist (sā-i-chen'tist), *n.* See ★*Secentisti.*

> The rest of the Italian School is of minor importance, though one or two of the *Seicentists* are here so well represented as to explain almost, even to modern eyes, the place they took for our forefathers.
> *Athenæum*, March 25, 1905, p. 376.

seicento (sā-i-chen'tō), *n.* [It. *seicento, secento*, six hundred, < L. *sex*, six, + *centum*, hundred. The term is elliptical, like cinque-cento.] In Italian art and literature, the seventeenth century considered as the period of certain styles and certain masters. It succeeds the cinque-cento, or sixteenth century.

seiche, *n.*—**Binodal seiche**, an oscillation of a body of water, in waves, in a lake in such a way that the surface shows two stationary nodal lines and the opposite ends of the lake rise or fall simultaneously while the central portion falls or rises respectively. The oscillations lengthwise of the lake are called *longitudinal* and those across the shorter diameter *transverse*, with respect to the axis of the lake.—**Dicrotic seiche**, a seiche due to the interference or combination of a uninodal and a binodal oscillation of a mass of water.—**Uninodal seiche**, the oscillation of a lake about one axial line near its surface, so that while one half rises the other half falls, like a balanced beam. According as the axial line trends lengthwise or transversely to the lake, this becomes a transverse uninodal seiche or a longitudinal uninodal seiche.

seichometer (sā-shom'e-tėr), *n.* [Irreg. < *seiche* + *-o-meter.*] An instrument for measuring the fluctuations of the level of the water in lakes.

> Sir John Murray communicated some preliminary observations on seiches in certain Scottish lochs, and exhibited a *seichometer* with which he hoped in the coming season to get a more definite and precise record of these oscillations. *Nature*, April 23, 1903, p. 599.

Seignette salt. See ★*salt.*

Seiji ware. See ★*ware*².

seine-block (sān'blok), *n.* In *fishing*, a block used for pursuing a seine.

Seis beds. See ★*bed*¹.

seisino (sā-i-sē'nō), *n.* [Sp. *seiseno*, sixth; whence *seisén*, a copper coin worth sixth dineros of Castile.] A Franco-Spanish copper money struck at Barcelona during the French occupation (1642–48).

seismetic (sīs-met'ik), *a.* [Irreg. < Gr. *σεισμός*, earthquake, + *-etic.*] Of or pertaining to earthquakes; of the nature of an earthquake.

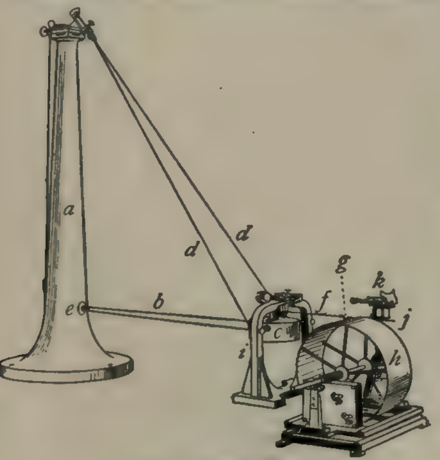
> The constant *seismetic* disturbances to which the cities of Cartago and San José are subject.
> *Geog. Jour.* (R. G. S.), X. 59.

seismicity (sīs-mis'i-ti), *n.* [*seismic* + *-ity.*] The ratio between the number of earthquakes in a region and the area of the region.

> If we pick out the well-marked earthquake districts of the world, and give to each of them a *seismicity* or earthquake frequency per unit area one-third of that in Japan, the conclusion arrived at is that considerable areas of our planet are on the average shaken every half-hour.
> *Encyc. Brit.*, XXVII. 603.

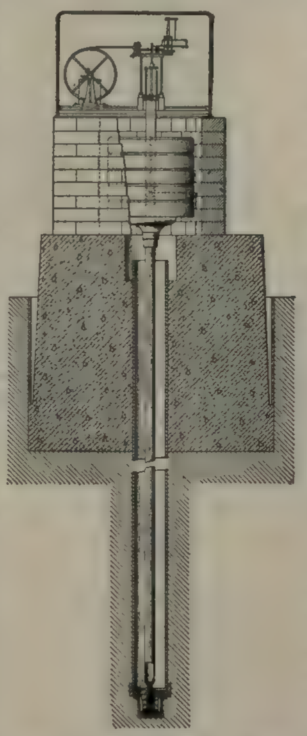
seismism (sīs'mizm), *n.* [*seism*(*ic*) + *-ism.*] The phenomena of earthquakes, collectively; seismic activity.

seismograph, *n.* See ★*seismometer.* A great variety of apparatus has been devised for recording earthquake phenomena, of which that perfected by Omori is used in Japan, that of Milne is established at about fifty British and international stations, and that known as the Bosch-Omori, improved by Marvin, is used at about thirty American and German stations. All these are adaptations of the horizontal pendulum at first used by Zolner in 1860 to investigate changes in terrestrial gravity, and they record the horizontal movements of the ground at great distances from the origin of the earthquake. A very different apparatus for this purpose is the inverted vertical pendulum devised by Wiechert (see ★*seismometer*) and greatly improved by Marvin at Washington. No apparatus for recording vertical movements of the ground and none for recording the largest movements near the epicenter have as yet been successful.—**Kreil's seismograph**, a pendulum hanging quietly by springs that allow of vibrations each in its own way, one meridionally, the other in the prime meridian, thus giving the north-south and the east-west components of an earthquake shock.—**Mallet's seismograph**, the first of modern simple and intelligible earthquake-recorders, constructed in 1846. It consisted of vertical and horizontal glass tubes each containing a small quantity of mercury. The movements of the mercury were recorded by electric currents on the revolving time-cylinder.—**Pendulum seismograph**, a recording instrument for earth-tremors, consisting of a large mass of metal mounted so as to have freedom of motion, as a pendulum about a point of support which is usually at the base. Owing to its great inertia the pendulum does not respond to sudden motions of its support and its displacement measures the amplitude of the tremor.



Bosch-Omori Seismograph.

a, cast-iron pillar; *b*, horizontal bar carrying very heavy weight *c* and held in place by steel wires *dd* and the pivot at *e*; *f*, light lever pivoted near one end and carrying at the other the pen *g*, which makes on a sheet of blackened paper wrapped around the revolving drum *h*, a magnified record of the motion of the ground and frame *i* relative to the steady mass *c*; *k*, an electromagnet actuated by a correct clock and causing the armature *j* to mark minutes on the record-sheet.



Inverted Vertical Pendulum Seismograph. Marvin System.

A stiff vertical tube, pivoted at its bottom end, carries a very heavy mass near its upper end, and is rendered stable or astatic by the elastic reaction of a central steel rod which has its bottom end firmly fixed inside the heavy mass and its top end attached to the framework on the pier. The horizontal motion of the ground and pier relative to the steady mass is magnified 120 times and inscribed on smoked-paper record-sheets by two sets of multiplying levers. One records the north-south, the other the east-west component of motion.

seismometer, *n.* In technical usage, the tendency is to restrict the application of the term "seismometer" to instruments of such high character that from the records or indications they give the actual motion of the ground may be inferred or worked out. Many instruments are sensitive to the vibrations of the ground, but their indications or records are very far from being exact measures of the disturbing influences. The Bosch-Omori and the Marvin seismographs while not absolutely perfect are seismometers, but, at the same time, they are seismographs, simply because they produce written records. The use of the term "seismoscope" is restricted to instruments that simply indicate the existence of seismic influences, without either measuring or recording them.—**Lamont's seismometer**, a delicately balanced needle carrying mirrors which reflect beams of light whose oscillations can be observed or recorded photographically.—**Wiechert's seismometer**, a stationary mass of iron, weighing about 1,000 kilograms, the inertia of which prevents it from moving appreciably during a sudden earthquake shock, while the relative movements of the earth, north-south and east-west, are recorded on a magnified scale of length and time.

seismometrograph (sīs-mọ̄-met'rọ̄-grȧf), *n.* [Gr. *σεισμός*, a shaking (an earthquake), + *μέτρον*, a measure, + *γράφειν*, write.] An instrument for recording the phenomena of earthquakes; a seismograph.

seismoscope, *n.*—**Mendenhall's seismoscope**, a small mass so supported that a shock of definite intensity will disturb its position and make an electric connection that will record the time or ring a bell and call attention to the fact. Also used as a burglar-alarm or bank-thief detector to give notice when a lock is dynamited or a vault is undermined.

seismotectonic (sīs″mọ̄-tek-ton'ik), *a.* Connected with the earth's structure so as to be related also to earthquakes: applied by W. H. Hobbs to fault-lines, at whose intersection earthquakes are believed to be specially frequent.

> Such straight lanes of special damage from earthquake have been called *seismotectonic* lines, or structure lines revealed by earthquakes.
> *W. H. Hobbs*, Earthquakes, p. 32.

seismotherapy (sīs-mọ̄-ther'ạ-pi), *n.* [Gr. *σεισμος*, a shaking, + *θεραπεία*, medical treatment.] Treatment by shaking or by vibration.

seismotic (sīs-mot'ik), *a.* [Gr. *σεισμός*, a shaking (an earthquake), + *-otic.*] Of or pertaining to earthquake movements; seismic.

seiz, *v.* A simplified spelling of *seize.*

seizer, *n.* 2. A hound trained to seize and hold game, especially wild boars.

> The deficiency is peculiarly marked in hounds, especially with those large dogs which I was accustomed to denominate as '*seizers.*'
> *Sir S. W. Baker*, Wild Beasts and Their Ways, p. 312.

seizin, *n.*—**Writ of seizin**, a writ giving possession of freehold to the plaintiff who has secured judgment in a suit for title.

seizing, *n.*—**Cross seizing**, an eye- or throat-seizing.—**Eye-seizing**, a seizing which is put on the strop of a block to form the eye, and to press the remainder of the strop into the score of the block.—**Flat seizing**, a seizing which has but one layer of turns.—**Riding seizing.** See *round* ★*seizing.*—**Round seizing**, a seizing which has what are called 'riding turns,' or upper turns, over the first layer of seizing stuff. This seizing is put on the eyes of rigging, etc.

sejant, *a.* **II.** *n.* A coin on which a lion or other animal is represented in a sitting attitude. *W. C. Hazlitt.*

sel, *v.* and *n.* A simplified spelling of *sell.*

sel. An abbreviation (*a*) of *selected* or *selection*; (*b*) [*cap.*] of *Selenium.*

Selaginaceæ (sẹ̄-laj-i-nā'sẹ̄-ē), *n. pl.* [NL.] Same as *Selagineæ.*

selaginellaceous (sẹ̄-laj″i-ne-lā'shius), *a.* Belonging to or resembling the *Selaginellaceæ*, a family of cryptogamous plants.

selah² (sē'lạ̈), *n.* [Heb.] A Jewish silver coin, equal to 2 shekels.

selamlik (sạ-läm'lik), *n.* [Turk.] 1. The part of a Turkish house reserved for the men.—2. The public visit to a place of worship made in state every Friday by the Sultan of Turkey.

> It is reported here officially from Constantinople that during to-day's *selamlik* an attempt was made to assassinate the sultan. *N. Y. Globe*, July 21, 1905.

Selbornian (sel-bōr'ni-an), *a.* and *n.* [*Selborne*, in Hampshire, + *-ian.*] In *Eng. geol.*, a term introduced by Jukes-Brown to embrace the Galt and Upper Greensand which, formerly regarded as consecutive, are now known to be continuous.

select, *v. t.* 2. To select and take up (land) under the land act; free-select. See ★*free-selection.* [Australia.]

selectance (sẹ̄-lėk'tạ̈ns), *n.* [*select*, *v.*] In *elect.*, the property of an alternating-current circuit of responding to oscillation of a certain frequency and not to others.

selection, *n.* 4. Same as ★*free-selection.*—5. In Australia, a station; land 'selected' or obtained cheaply from the government by a settler; a stock-farm.

> The size of Northern "*selections*," for instance, is proverbial throughout the Commonwealth, yet probably few Australians realize that there are outpost cattle stations each including country to the extent of between 1,800 and 3,000 square miles. *Living Age*, Dec. 9, 1905, p. 614.

5. *pl.* The highest grade of the heavy export tobacco. See *export* ★*tobacco.*—**Conscious selection.** (*a*) All those forms of selection in which individuals, or their properties, are deliberately and voluntarily picked out or chosen or selected. *J. M. Baldwin*, Development and Evolution, p. 167.—**Eliminative selection**, the extermination of the unfit. *H. E. Crampton*, in Biometrika, March-July, 1904, p. 129.—**Functional selection**, over-production of movements and the survival of the fittest functions. *J. M. Baldwin*, Development and Evolution, p. 167.—**Genetic selection**, a term proposed by Baldwin to designate changes that are produced in the birth-rate of organisms through the struggle for existence and the survival of the fittest.—**Germinal selection.** (*a*) A hypothetical struggle for existence among the germ-cells of an individual organism leading to the survival of the fittest, to the use of the unfit by them as food, and to the consequent modification of the race. (*b*) A hypothetical struggle for existence among the hereditary units in the chromatin of a germ-cell, and the survival of the fittest, and the corresponding modification of the germ-plasm or hereditary substance. See *substance of* ★*heredity.*—**Group selection**, natural selection acting upon entire aggregates of individuals. *K. Pearson.*—**Histonal selection**, the form of natural selection which results from the 'struggle for existence' between the cells of different tissues in the animal or plant body.—**Individual selection**, natural selection acting upon individuals. Compare *group* ★*selection.*—**Intrabiontic selection**, a struggle for existence which has been imagined as taking place between the component cells of an organism and as resulting in the survival of the fittest. *Weismann* (trans.), Germ-Plasm, p. 107.—**Organic selection**, a doctrine of the origin of species which has been advanced as supplementary to natural selection, or as a compromise between it and Lamarckism. Its advocates believe that species are modified along definite predetermined lines during the process of their adaptation to new conditions, or that they exhibit an innate tendency toward perfection; or, according to one of
